DEUTEROMYCETÆ Sacc.

SPHÆROPSIDACEÆ Lév. em. Sacc.

Syll. III p. 1, X p. 100, XI p. 472, XIV p. 814, XVI p. 825,
XVIII p. 219.

Fam. 1. Sphærioidaceæ em. Sacc.

Sect. 1. Hyalosporæ.

PHYLLOSTICTA Pers. — Syll. III p. 3, X p. 100, XI p. 472, XIV
p. 844 et 1137, XVI p. 825 et 1154, XVIII p. 220.

1. **Phyllosticta leucosticta** C. Mass., Osserv. fitol. in Madonna Ve- 6102
rona v. II (1908), Extr. p. 11. — Maculis minutis, angulosis, in-
ternerviis, dein candidis; pycnidiis nigris, punctiformibus epiphy-
lis; sporulis hyalinis saepe guttulatis, ovoideis, 5-7 \times 3-3,5.

Hab. in foliis languidis *Thalictri aquilegifolii*, Calavena
Verona, Italia bor. — Ab affini *Ph. Thalictri* West. colore ma-
cularum et magnitudine sporarum differt.

2. **Phyllosticta Trochodendri** Alm. et Cam., Bol. Soc. Broter. XXV 6103
(1908-1909), Extr. p. 28. — Maculis amplis, cinereis, castaneo-
limitatis, subinde fere totum folium occupantibus; pycnidiis epi-
phyllis, sparsis, primo epidermide tectis, dein erumpentibus, de-
pressis, ostiolo vix papillato, 300-400 μ . diam.; sporulis ellipsoi-
deis, utrinque rotundatis v. deorsum attenuatis, biguttulatis, con-
tinuis, hyalinis, 7-8 \times 2,5-3; sporophoris cylindraceis, hyalinis,
usque ad 20 μ . long.

Hab. in foliis *Trochodendri aralioidis* in horto botanico
Coimbra, Lusitania (A. MOLLER).

3. **Phyllosticta Armoraciæ** (Cooke) Sacc. III, p. 519 et XX, p. 381, 6104
Cooke Fung. Pests p. 84, t. VII, f. 103, *Ascochyta Armoraciæ*
Cooke F. B. n. 32. — Maculis angulo-orbicularibus, sordide al-
bis, anguste marginatis; pycnidiis punctiformibus, gregariis; spo-
rulis minutis, oblongis, hyalinis, 6 \times 3-4, copiosissimis.

Hab. in foliis Armoraciæ rusticane in Britannia, sociis *Ascochyta* et *Ramularia*.

4. **Phyllosticta Dentariæ** Kab. et Bub., Myc. Beitr., Hedwigia Bd. 6105 XLVII (1907) p. 288. — Maculis amphigenis, primum viridibus dein pallide brunneis et arescentibus, irregularibus, saepe latis quandoque indistinctis; pycnidiis hypophyllis, immersis, sparsis v. saepe gregariis, globosis, subdepressis, brunneis, 120-165 μ . lat., poro apicali parvo rotundo praeditis, contextu parenchymatico; sporulis bacillaribus, 3-5 \approx 1,5-2, utrinque rotundatis, rectis v. curvulis, unilocularibus, hyalinis, biguttulatis; sporophoris papilliformibus, supra in pedicellum brevem angustatis.

Hab. in foliis emortuis Dentariæ enneaphyllos prope Turnau Bohemia (KABAT).

- 5 **Phyllosticta alpina** Allesch. — Syll. XIV, p. 846 — var. **helvetica** 6106 Jaap, Beitr. Pilzfl. d. Schw., Ann. Myc. v. V (1907) p. 265. — A typo differt maculis distinctis, magnis, rotundatis v. elongatis; sporulis minoribus 5-7,5 \approx 2.

Hab. in foliis vivis Arabis alpinæ, Aufstieg Helvetia.

6. **Phyllosticta capparidicola** Speg., Mycet. Arg. V, p. 331, in Ann. 6107 Mus. Buenos Aires XX (1910). — Maculis epiphyllis angulato-diformibus, determinatis albido-cinerescentibus, 1-3 mm. diam.; pycnidiis laxe gregariis, atris, minute ostiolato-pertusis, 75-100 μ . diam., epidermide velatis, lenticularibus; sporulis anguste subnavigularibus saepe curvulis, 6-8 \approx 2, hyalinis.

Hab. ad folia viva Capparidis salicifoliæ in silvis prope Ledesma Jujuy, Argentina.

7. **Phyllosticta ?Capparidearum** Speg., Mycet. Argent. V, p. 331, in 6108 Ann. Mus. Buenos Aires XX (1910). — Maculis nullis; pycnidiis epiphyllis, hinc inde laxe gregariis, 50-80 μ . diam., epidermide a-trata tectis et concretis, atris, minute ostiolato-pertusis, contextu indistincte parenchymatico fuligineo; sporulis ex elliptico globosis, 5-6 \approx 4, hyalinis.

Hab. ad folia Capparidis salicifoliæ in silvis prope Ledesma Jujuy, Argentina. — Habitus quasi *Leptostromatis*.

8. **Phyllosticta negundicola** Sacc. in Ann. Mycol. VII (1909) p. 433. 6109 — Maculis ochraceis, minutis, subangulosis, amphigenis, demum in epiphylio centro dealbatis; pycnidiis paucis epiphyllis, punctiformibus, 60 μ . diam., centro pertusis; sporulis ellipsoideis, 4,5-5,5 \approx 2,8-3, hyalinis, saepe 1-nucleatis.

Hab. in foliis Aceris Negundinis in Gallia (P. HARIOT).

9. **Phyllosticta perniciosa** Kabát et Bubák, Hedwigia, XLIV (1905) 6110 p. 350. — Maculis epiphyllis, utrinque visilibus, magnis, indefinitis, e pallido brunneis, dein hinc inde arescendo griseis, mox disrumpentibus; pycnidiiis epiphyllis, gregariis, immersis, utrinque conspicuis, globoso-depressis, apice poro minuto papilliformi erumpentibus, 50-170 μ . diam., e succineo rubro-brunneis, contextu tenui parenchymatico flavo-brunneo; sporulis ex ellipsoideo oblongis 4-10 \approx 2-4, rectis vel curvulis, utrinque rotundatis, hyalinis, unilocularibus; sporophoris brevibus, hyalinis.
- Hab.* in foliis vivis Aceris Pseudoplatani prope Turnau Bohemia (KABAT). — A *Fh. Pseudoplatani* diversa.
10. **Phyllosticta Cocculi** Spög., Myc. Arg. V, p. 332, in An. Mus. 6111 Buenos Aires, XX (1910). — Maculis nullis; pycnidiiis hypophyllis hinc inde coacervatis, coriacellis, anguste rotundo-ostiolatis, 80-100 μ . diam., contextu subopaco, parenchymatico, fuligineo; sporulis ellipsoideis v. obovatis, minute biguttulatis, hyalinis, 4-6 \approx 2-3, rectis v. leniter curvulis.
- Hab.* ad folia emortua adhuc pendula Cocculi laurifolii in hortis La Plata, Argentina.
11. **Phyllosticta Cherimoliæ** Alm. et Cam., Bolet. Soc. Brot. XXV 6112 (1908-1909), Extr. pag. 25, *Phyllost. Anonæ* Alm. et Cam. (non P. Henn.) Rev. Agronom. IV, 83, tab. I, fig. 6-7. — Maculis inter nervulos dispositis, elongato-rotundatis, contiguis, arescendo griseo-ochraceis, castaneo-cinctis; pycnidiiis sparsis vel gregariis, epiphyllis, subglobosis, minutis, 120-150 μ . diam., atris; sporulis subovoideis, hyalinis, grosse biguttulatis, 7-10 \approx 2,5-3.
- Hab.* in foliis Anonæ Cherimoliæ in horto bot. Coimbra Lusitania (A. MOLLER). — A *Phoma helvola* B. et C. differt tantum sporulis majoribus.
12. **Phyllosticta Kobus** P. Henn., Engl. Jahrb. XXXVII (1905) p. 162. 6113 — Maculis irregularibus, gregarie sparsis, fuscidulis; pycnidiiis gregariis epiphyllis, innato-erumpentibus, hemisphæricis, atro-nitentibus, 80-100 μ ; sporulis ellipsoideis v. ovoideis, utrinque rotundatis, intus punctulatis, hyalinis, continuis, 9-12 \approx 6-8.
- Hab.* in foliis Magnoliæ Kobus, Omiya Japoniæ (NAMBU).
13. **Phyllosticta Winteri** Spög., Fungi Fueg. n. 375 — Syll. X, p. 101. 6114 — Huc ducenda est verisimiliter ut synonymon vel ut varietas *Phyll. Drymidis* Spög. — Syll. XVI, p. 827 — teste ipso auctore.
14. **Phyllosticta Malkoffii** Bubák, Ann. Myc. VI (1908) pag. 24. — 6115 Maculis crebris amphigenis, sæpe totum folium obtegentibus, brun-

neis, medio e flavo ochraceis, sordide albis, brunneo-marginatis, rotundatis v. polygoniis, 2-4 mm, latis, saepe confluentibus; pycnidiis epiphyllis subepidermicis demum liberis, globosis v. applanatis, 65-120 μ . latis, apice ostiolo conoideo depresso apertis, e brunneo nigricantibus, grosse parenchymaticis; sporulis ex ellipsoideo breviter cylindraceis, saepe irregulariter incurvatis et subreniformibus, 5-9 \approx 2-4, hyalinis, saepe parum distincte biguttulatis.

Hab. in foliis *Gossypii* herbacei culti, Sadovo, Bulgaria.

— A *Ph. gossypina* sporulis videtur diversa.

15. **Phyllosticta santiaguina** Speg., Fungi Chilenses (1910) p. 139. 611⁶
 — Maculis amphigenis, linearibus, sanguineis, subindeterminatis, 2-10 mm. long., 1-3 mm. lat.; pycnidiis innato-erumpentibus, globosis, 40-50 μ . diam., lineariter dispositis, tenuissime membranaceis, fusculis; sporulis cylindraceis pusillis, hyalinis, 4-5 \approx 1.

Hab. in foliis vivis *Cummingiae campanulatae* in collibus Salto prope Santiago Chile Amer. austr.

16. **Phyllosticta Lentisci** (Pass.) Allesch. *Phoma Lentisci* Pass. — Syll. 611⁷ X, p. 149 — var. **maculicola** Bubák, Bull. Herb. Boiss 2 sér. VI (1906) p. 404. — A typo dignoscitur maculis cinereis, inæqualiter rotundatis, 3-4 mm. diam.; pycnidiis hypophyllis, epidermide tectis, 150-250 μ . diam., papilla nigra 20 μ . lata erumpentibus.

Hab. in foliis vivis *Pistaciæ Lentisci*, Montenegro.

17. **Phyllosticta Odinæ** P. Henn. et Evans, Engl. Bot. Jahrb. XLI 611⁸ (1908) p. 273. — Maculis rotundatis vel effusis, fuscis; pycnidiis epiphyllis gregariis, erumpentibus globulosis, atris, pertusis, 50-60 μ ; sporulis ellipsoideis, hyalinis, 2 \approx 1,5.

Hab. in foliis *Odinæ discoloris*, Waterbey Transvaal, Africa austr. (EVANS).

18. **Phyllosticta coriariicola** Speg., Fungi Chilenses (1910) p. 138. — 611⁹ Maculis amphigenis fusco-pallescensibus, numerosis, saepius confluentibus, plus minusve angulosis, determinatis, areola angusta sordide purpurascenti cinctis; pycnidiis saepius epiphyllis innato-erumpentibus, pusillis, ostiolatis, lenticularibus, 75-80 μ . diam., tenuissime membranaceis, olivaceis; sporulis cylindraceis v. subbotuliformibus, rectis v. curvulis, 5-6 \approx 1, utrinque rotundatis, sporphoris quintuplo longioribus fultis.

Hab. in foliis vivis *Coriariæ ruscifoliae*, Cerro Caracol de Concepcion Chile Amer. austr.

19. **Phyllosticta Erodii** Speg., Myc. Argent. V, p. 334, in An. Mus. 612⁰ Buenos Aires XX (1910). — Maculis amphigenis suborbicularibus,

subdeterminatis, late purpureo-areolatis, 3-5 mm. diam.; pycnidiis epiphyllis, lenticularibus, epidermide velatis, 75-90 μ . diam., ostiolo impresso, 20 μ . diam. pertusis, tenui-membranaceis, contextu olivaceo subindistincto; sporulis rectis v. subinæquilateris, utrinque rotundatis, 6-8 \approx 3, hyalinis.

Hab. in foliis vivis *Erodii malachoidis* pr. Marmol Argentinæ.

20. **Phyllosticta Ampelopsidis** Ell. et Mart. Journ. of Mycol. II (1886) 6121
p. 14, Halst N. Jers. Agric. Coll. Exper. Stat. Rep. Bot. Depart.
(1896) p. 411. — Maculis læte brunneis, mox diffractis, 2-5 mm.
diam., anguste saturatius marginatis; pycnidiis epiphyllis, atro-
brunneis, sparsis, plerumque circinantibus, 100-150 μ . diam.; spo-
rulis hyalinis, ovoideis, utrinque obtusis, 9 \approx 6, in massulas albas
eructatis.

Hab. in foliis *Ampelopsidis* quinquefoliæ, Pennsylvania
et New Jersey. — A *Phyll. Allescheri* differt imprimis sporulis
multo majoribus.

21. **Phyllosticta Badhami** Cooke, Journ. R. Hort. Soc. (1878) p. 93 et 6122
Fung. Pests pag. 152, t. 13, f. 1. — Maculis marginalibus, inde-
terminatis, brunnescenscentibus, elongatis; pycnidiis laxe gregariis,
lenticularibus, poro pertusis; sporulis hyalinis, ellipsoideis v. ob-
longo-ellipsoideis, 6-7 \approx 2.

Hab. in foliis *Vitis viniferae* in Britannia.

22. **Phyllosticta Vulpinæ** Allesch., Deut. Krypt. Fl. Pilze VI, p. 98. 6123
— Ita vocanda est *Phyllosticta viticola* Thümen — Syll. III, p. 20
— non *Phyll. viticola* Sacc. — Syll. III, p. 19.

23. **Phyllosticta Pteleæ** Hollós, Ann. Mus. Nat. Hungar. VII (1909) 6124
p. 52. — Maculis magnis, irregularibus, utrinque visilibus, su-
pra atro-brunneis, infra griseo-brunneis, non marginatis, conflu-
entibus, medio pallescentibus; pycnidiis epiphyllis, sparsis, depresso-
globosis, poro pertusis, brunneis, 180-210 μ . diam., contextu cel-
luloso; sporulis oblongo-ellipsoideis, continuis, eguttulatis, hyalinis,
8-10 \approx 3-3,5.

Hab. in foliis vivis *Pteleæ trifoliatae*, prope Nagy-Körös
Hungariæ.

24. **Phyllosticta Dictamni** Fairm., Ann. Mycol. VIII (1910) p. 324. — 6125
Maculis primo suborbicularibus, dein subconfluentibus et irregula-
ribus, brunneis, rarius albidis; pycnidiis gregariis v. sparsis, ostiolo
c. 100-150 μ . lat. præditis, atris; sporulis ellipsoideis, utrinque ro-
tundatis, continuis, hyalinis, 7-10 \approx 3-3,5; sporophoris?

Hab. in foliis vivis Dictamni Fraxinellæ, Lyndonville N. Y. Amer. bor.

25. **Phyllosticta picroxylina** Speg., Myc. Argent. V, p. 337, in An. 6126 Mus. Buenos Aires, XX (1910). — Maculis fuscescentibus, diffusis, vagis, saepe majorem folii partem occupantibus; pycnidiis innato-erumpentibus, astomis, membranaceis, atris, 50-75 μ . diam., contextu minute parenchymatico, olivaceo; sporulis cylindraceis utrinque rotundatis, 3-4 \times 1, rectis curvulisve, hyalinis.

Hab. ad folia viva Simarubaceæ cujusdam, vulgo Palo amargo nuncupatæ, Puerto Leon, Misiones Argentina.

26. **Phyllosticta agnostaica** Speg., Fungi Paulist., Rev. Mus. La Plata 6127 t. XV (1908) p. 32. — Maculis non v. parce repandulis 2-5 mm. diam., ad hypophyllum ferrugineis, ambitu obscurioribus, ad epiphyllum plus minusve sordide cinerescentibus, nitidulis, ambitu zona stricta testacea eximie limitatis; pycnidiis centro macularum 1-5 laxe aggregatis, primo tectis dein erumpentibus, lenticularibus, 80-100 μ . diam., astomis ?, coriacellis, contextu indistincto opaco fusco-atro; sporulis saepius rectis, utrinque subacutiusculis, 5-6 \times 1,5-2, hyalinis, biguttulatis.

Hab. ad folia viva Cedrelæ? cujusdam prope Cambucy Ipiranga, Brasilia (USTERI).

27. **Phyllosticta pertundens** Sacc., Ann. mycol. VIII (1910) p. 338. — 6128 Maculis subcircularibus, amphigenis, ex alutaceo pallentibus, non v. vix discolori-marginatis, areolis mycelii ope mox contractis, dilabentibus et foramina subcircularia copiosissima relinquenteribus; pycnidiis epiphyllis, sparsis, globoso-depressis demum emergentibus, nigris, glabris, poro exiguo vix pertusis, 80-100 μ . diam., contextu distinete celluloso, atro-fuligineo; sporulis ellipsoideis, utrinque rotundatis, 3-4 \times 2-2,5, crasse 2-guttatis, hyalinis.

Hab. in foliis languidis Trichiliæ emeticæ, Ghinda-Baresa, alt. 830 m. (Hamasen), Africa (HADR. FIORI). — Folia, areolis dilapsis, demum tota pertusa fiunt, ut evenit ex aliis mycelibus perforantibus (*Cercosporæ* et *Phyllostictæ* sp.) qui tamen satis distincti sunt a specie præsente.

28. **Phyllosticta Azevinhi** Torrend, Broteria, Ser. Bot. VIII (1909) 6129 p. 142. — Maculis plerumque terminalibus (apicalibus v. laterali- bus), amphigenis, 4-5 mm. longis, vinoso-brunneis; pycnidiis epiphyllis, gregariis, nigris, primo tectis, deinde expositis, 100-200 μ ; sporulis ellipsoideis v. oblongis, hyalinis, protoplasmate æqualiter repletis, majoribus, 8-10 \times 4-5.

Hab. ad folia *Ilicis Azevinhae*, Ribeira de Machico in ins. Madeira (C. DE MENEZES). — A *Phyll. Ilicis* Oud. sporulis majoribus et maculis amphigenis bene distincta.

29. **Phyllosticta Corynocarpi** Alm. et Cam., Bol. Soc. Broteriana, XXV 6130 (1908-1909), Extr. p. 26. — Pycnidiis plerumque epiphyllis, sparsis v. saepe gregariis, in maculis aridis dispersis v. confluentibus, indeterminatis, præcipue apud nervum medianum dispositis, primo epidermide tectis, demum erumpentibus, subglobosis, 180-230 μ . diam.; sporulis ellipsoideis v. subclaviformibus, utrinque rotundatis, continuis, plasmate nubiloso, hyalinis, minoribus interdum biguttatis, 15-25 \times 6-7; sporophoris cylindraceis vel claviformibus, hyalinis, usque ad 30 μ . long.

Hab. in foliis emortuis *Corynocarpi* levigati in horto bot. Coimbra Lusitania (A. MOLLER). — An *Macrophomæ* sp.?

30. **Phyllosticta Mate** Speg., Anal. Mus. Nac. Buenos Aires t. XVII 6131 (1908) p. 134. — Maculis amphigenis superne subargenteis, inferne pallescentibus, primum orbicularibus dein confluendo difformibus, 1-5 mm. diam.; pycnidiis epiphyllis, subgregariis, submarginalibus, lenticularibus, coriacellis, 90-100 μ . diam., contextu opaco indistincto, nigro, ostiolo rotundo perforatis; sporulis subcylindraceis rectis v. leniter inæquilateralibus, utrinque acutiuscule obtusatis, 3-4 \times 1-1,5, biguttulatis, hyalinis.

Hab. in foliis languidis *Ilicis paraguariensis* in dumetis circa San Pedro Reip. Argentinæ.

31. **Phyllosticta Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires t. XVII 6132 (1908) p. 133. — Maculis amphigenis, fusco-arescentibus, determinatis, quandoque minutis, 2-3 mm. diam., orbicularibus, quandoque majusculis, 5-20 mm. diam., difformibus; pycnidiis epiphyllis lenticularibus, 80-160 μ . diam., obsolete ostiolatis, grosse parenchymaticis; sporulis obovatis v. ellipsoideis, utrinque obtusissimis, 10-12 \times 5-7 crassiuscule tunicatis, saepius grosse guttulatis, hyalinis.

Hab. vulgata ad folia languida *Ilicis paraguariensis* in silvis prope San Pedro Reip. Argentinæ.

32. **Phyllosticta Cardiospermi** Speg., Mycet. Arg. V, p. 332, in An. 6133 Mus. Buenos Aires XX (1910). — Maculis saepius epiphyllis orbiculari-difformibus, pallescentibus, subdeterminatis, 5-15 mm. d., areola ferruginascente cinctis; pycnidiis numerosis, confertis, epiphyllis, innatis, membranaceis, latiuscule perforatis, 100-150 μ . diam., contextu minute parenchymatico, pellucide fuligineo; spo-

rulis elongato-ellipsoideis, utrinque acutiuscule rotundatis minuteque 1-guttulatis, hyalinis, $7-9 \approx 2,5-3$.

Hab. ad folia viva *Cardiospermum velutini* in silvis pr. Posadas, Misiones, Argentina.

33. **Phyllosticta Nephelii** Delacroix, Bull. trim. Soc. Myc. de France, 61³⁴ vol. XXI (1905) p. 202, fig. XIV. — Maculis fulvis, latis, indeterminatis; pycnidiis punctiformibus, nigris, saepius epiphyllis, pallide coloratis, depressiusculis, $175 \approx 95$; sporulis fusoideis, extremis acutis, $7 \approx 2,5$, hyalinis; sporophoris gracillimis, $12-15 \mu$.

Hab. in foliis *Nephelii lappacei* et interdum *Durionis zibethini*, Congo Africæ (DYBOWSKI). — A *Phyll. Durionis* Zimm. ex descriptione verisimiliter diversa

34. **Phyllosticta Ribis-rubri** Vogl., Ann. R. Ac. Agr. Torino, XLIX ^{61³⁵} (1906) p. 189, *Phyllosticta montana* Vogl. Atti R. Ac. Sc. Torino v. XLIII (1907-1908, p. 93 (247). — Maculis rotundis, leniter inflatis, dimidiam partem foliorum, seu irregularibus, magna in parte foliorum lobos occupantibus, semper castaneis; pycnidiis minutis, prominulis, epiphyllis, nigris; sporulis ellipsoideis v. lenticularibus, hyalinis, $4-7$ rar. $9 \approx 3$.

Hab. in foliis vivis *Ribis rubri* in montanis Pedemontii Italiæ bor.

35. **Phyllosticta ribiseda** Bub. et Kab., Hedw. L (1909) pag. 39. — 61³⁶ Maculis epiphyllis sed utrinque visilibus, rotundatis, subbullatis, distincte v. obsolete zonatis, 1 cm. lat., rubro-brunneis v. sordide brunneis, arescendo subgriseis, non v. marginatis, plerumque in maculas amplas confluentibus; pycnidiis epiphyllis, subsparsis, innatis, diu cuticula tectis, eamque leniter elevantibus, globoso-depressis, $100-190 \mu$. diam., poro lato pertusis, contextu tenui ochraceo; sporulis copiosis, breve cylindraceis v. ellipsoideis, $6-13 \approx 2,5-4,5$, continuis, rectis, rarius curvulis, utrinque rotundatis, hyalinis; sporophoris papilliformibus.

Hab. in foliis morientibus *Ribis rubri* culti, Turnau Bohemiae.

36. **Phyllosticta ribesicida** Speg., Myc. Argent. V, pag. 339, in An. Mus. Buenos Aires, XX (1910). — Maculis amphigenis, orbicularibus, albescensibus, determinatis, exareolatis, 2-5 mm. diam., linea callosa vix pururascente cinctis; pycnidiis paucis, epiphyllis, subepidermicis, lenticularibus, $80-90 \mu$. diam., contextu indistincte parenchymatico, olivaceo; sporulis ellipsoideis, saepe biguttatis, utrinque rotundatis, $3-4 \approx 1-1,5$, hyalinis.

Hab. ad folia languida Ribis rubri in hortis Pringles, Argentina.

37. **Phyllosticta Balsaminæ** Voglino, Atti R. Acc. Sc. Torino XLIII 6138 (1907-1908) p. 93 (247). — Maculis epiphyllis, exaridis, ochraceo-ferrugineis, orbicularibus, usque ad 8 mm. latis, in foliis paullum bullatis; pycnidiis epiphylliis, sparsis, lenticulari-globosis, atris, submembranaceis, prominulis, ostiolo distincto perforatis, 90-100-120 μ . latis; sporulis cylindraceis, utrinque obtusis, rectis, hyalinis, 7 \approx 2,5.

Hab. in foliis Balsaminæ hortensis quæ maxime vexantur in hortis Taurinensibus Pedemontii, Italia bor. (TONELLI).

38. **Phyllosticta Kœlreuteriæ** Hollós, Ann. Mus. Nat. Hung. (1907) V 6139 p. 455. — Maculis oblongis, cinereis, brunneo-cinctis; pycnidiis epiphyllis, gregariis, lenticularibus, fuscis, 140-180 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, eguttulatis, hyalinis, 5-6 \approx 3-3,5.

Hab. in foliis vivis Kœlreuteriæ paniculatæ, Kecskemét Hungariæ.

39. **Phyllosticta Cinnamomi** Delacroix, Bull. trim. Soc. Myc. de Fr., 6140 vol. XXI (1905) p. 203, fig. XV. — Maculis ochraceis, irregularibus, margine incrassatis, mox abscissis; pycnidiis parcis, punctiformibus, nigris, 150 μ . diam., totam crassitudinem folii penetrantibus, ostiolo vix prominente; sporulis vix fusoides, hyalinis, 10-20 \approx 5; sporophoris brevissimis, vix visilibus.

Hab. in foliis Cinnamomi zeylanici, India or. v. occid.

40. **Phyllosticta opuntiicola** Bubák, Bull. Herb. Boiss., 2 sér. VI (1906) 6141 p. 405. — Maculis magnis, irregularibus, griseo-cinereis; pycnidiis sparsis v. gregariis, globosis, subdepressis, subepidermicis, 90-150 μ . latis, nigris, contextu castaneo-brunneo; sporulis bacillaribus, 4,5-5,5 \approx 1,5-3, rectis v. curvulis, utrinque guttulatis, hyalinis, unilocularibus; sporophoris minutis papilliformibus.

Hab. in cladodiis Opuntiae Fici-indicæ prope Ulcinj Montenegro. — Socia adest *Pleospora opuntiicola*.

41. **Phyllosticta Begoniæ** Brun. — Syll. XIV, pag. 851. — Maculis 6142 rotundatis v. ellipticis, sæpe confluentibus, sinuosis, majusculis, initio dilute olivaceis, centro pallescentibus, dein fulvo-fuligineis, arescentibus et facile dilabentibus; pycnidiis sparsis, minutissimis, punctiformibus, epiphyllis, 150-180 μ . latis, nigris; sporulis ovoides, hyalinis, 5 \approx 2, 5 \approx 3.

Hab. in foliis vivis Begoniæ Credneri et metallicæ

quæ maxime vexantur in Gallia et Italia. — Hæc nova diagn. emend. sec. Voglino, Atti R. Acc. Sc. Torino v. XLIII (1907-1908) p. 94 (248).

42. **Phyllosticta sycyna** Sacc., Ann. mycol. VIII (1910) p. 343. — Macululis amphigenis ex orbiculari angulosis, 3-6 mm. diam., demum candidis, margine subelevato non discolori; pycnidiiis epiphyllis, paucis, punctiformibus, lenticularibus, nigris, 140-150 μ . diam., poro pertusis; sporulis ovato-fusoideis, utrinque acutulis, 5,5-7 \times 3-4, eguttulatis, hyalinis.

Hab. in foliis languidis Sicyi angulati, Lyndonville, New York, Amer. bor. (C. E. FAIRMAN). — Ab affini *Ph. Cucurbitacearum* differre videtur pycnidiiis majoribus, sporulis quoque majoribus et imprimis crassioribus.

43. **Phyllosticta ramicola** Petch, Ann. Roy. Bot. Gard. Peradenya III, Pt. I (1906) p. 5. — Pycnidiiis 0,1-0,25 mm. diam., nigris, epidermide velatis, confertis, subprominulis, lenticularibus, 75-140 μ . alt.; sporulis anguste ovoideis, utrinque acutis, viridescenti-hyalinis, saepe biguttulatis, 8-12 \times 2-3, in cirrum albidum tenuem expulsis.

Hab. in maculis ramulorum Heveæ brasiliensis, Ceylon.

44. **Phyllosticta Ghæsembillæ** Koord., Botan. Untersuch. (1907) p. 205. — Maculis amphigenis, suborbicularibus, arescendo dealbatis, solitariis v. confluentibus; pycnidiiis globosis, ostiolatis, 80-110 μ . d.; sporulis 9-10 \times 4,5-5, elongatis, utrinque rotundatis; sporophoris brevissimis, 2,5 μ . c. longis.

Hab. in foliis vivis Antidesmatis Ghæsembillæ prope Penungalan prov. Kedu (Java) april. 1906 (KOORDERS).

45. **Phyllosticta Manioth** Speg., Myc. Arg. V, p. 335, in An. Mus. Buenos Aires, XX (1910). — Maculis amphigenis arescendo albescensibus, repandulo-suborbicularibus, determinatis, exareolatis, 3-10 mm. diam.; pycnidiiis innatis, ostiolatis, epiphyllis, atris, lenticularibus, 80-120 μ . diam., coriaceis, contextu olivaceo-atro, subindistincto; sporulis ellipsoideis, minute 2-guttulatis, rectis, 4-6 \times 1,5-2, hyalinis.

Hab. ad folia viva v. languida Manioth Aipi cultæ prope Fracrán, Misiones, Argentina.

46. **Phyllosticta Ætoxici** Speg., Fungi Chilenses (1910) pag. 136. — Maculis epiphyllis, orbicularibus, 2-7 mm. diam., albescensibus, determinatis, areola angusta atro-purpurea-cinctis; pycnidiiis lenticularibus, 75-80 μ . diam., epidermide tectis, ostiolatis, coriacellis, ni-

gris; sporulis subcylindraceis, 4-5 \approx 1,5-1,75, in sporophoris filiformibus, 15-20 \approx 1 acrogenis, hyalinis.

Hab. in foliis vivis *Ætoxici* punctati in silvis Cerro Caracol de Concepcion Chile Amer. austr.

47. **Phyllosticta cissicola** Speg., Mycet. Arg. V, p. 332, in An. Mus. 6148 Buenos Aires, XX (1910). — Maculis amphigenis, orbicularibus, parvis, candidis, determinatis, areola angusta fusco-livescente cinctis, 3-5 mm. diam.; pycnidiiis epiphyllis, laxe gregariis, fuscis, epidermide velatis, lenticularibus, 80 μ . diam., ostiolo latiusculo pertusis; contextu minute parenchymatico, pellucido-fuligineo; sporulis ellipsoideis v. obovatis, non v. 1-2-guttulatis, 5-6 \approx 2-3, hyalinis, rectis curvulisve.

Hab. ad folia viva *Cissi sycioidis* in sepibus Orán, Argentina.

48. **Phyllosticta Aristoteliæ** Speg., Fungi Chilenses (1910) p. 137. — 6149 Maculis amphigenis subdeterminatis, angulosis, 2-5 mm. diam., fuscis; pycnidiiis hypophyllis densiuscule gregariis, subhemisphæricis, 75-90 μ . diam., ostiolatis, prominulis, epidermide tectis; sporulis cylindraceis v. subbotuliformibus, rectis v. curvulis 3-4 \approx 1, hyalinis.

Hab. in foliis languidis Aristoteliæ Maqui in silvis Cerro Caracol de Concepcion Chile Amer. austr.

49. **Phyllosticta bacterioides** Vuill. Ann. mycol. III (1905) p. 425. 6150 — Mycelio hyalino tenuissimo, 1 μ . diam., septato, intercellulari, sub epidermide dorsali, in maculis atro-brunneis, medio fuscescentibus, 0,5-1,5 mm. diam.; pycnidiiis hypophyllis sparsis, 50 μ . (radius 42-73 μ .) diam., sphæroideis, olivaceis, contextu plectenchymatico; sporulis bacillaribus utrinque obtusis, minimis, hyalinis, medio non v. vix constrictis, 3,4-3,7 \approx 0,6.

Hab. in foliis vivis *Tiliæ silvestris*, Bois de la Fourasse inter Nancy et Champignelles, Gallia. — Socia adest *Cercospora microsora*.

50. **Phyllosticta osteospora** Sacc. — Syll. III, p. 34 — var. **Staphyloë** C. Mass., Osserv. fitolog. in Madonna Verona vol. II (1908) Extr. p. 8. — Maculis irregularibus, amphigenis, in pagina superiore foliorum subatratis, in inferiore umbrinis; pycnidiiis hypophyllis, nigris, punctiformibus, prominulis, parietibus membranaceis, ostiolo latiusculo perviis, 60-100 μ . diam.; sporulis bacillaribus, hyalinis, utrinque incrassatis 4-6 \approx 1-1,5.

Hab. in foliis languidis *Staphyleæ* pinnatæ prope Cogolo Verona Italiæ bor.

51. **Phyllosticta Vignæ** Speg., Myc. Argent. V, p. 341, in An. Mus. 6152 Buenos Aires XX (1910). — Maculis amphigenis, orbicularibus, subindeterminatis, sordide pallescentibus v. subcinerescentibus, 2-7 mm. diam.; pycnidiis paucis, saepius centralibus atris, subepidermicis, 75-90 μ . diam., modice ostiolatis, lenticularibus, contextu parenchymatico, olivaceo; sporulis tereti-ellipsoideis, grosse 2-guttulatis, 6-10 \approx 3-4, saepe subnavicularibus v. medio obsolete coarctatulis, hyalinis.

Hab. ad folia viva v. languida Vignæ luteolæ in uliginosis, Isla Santiago, prope La Plata, Argentina.

52. **Phyllosticta Oxytropidis** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6153 p. 336. — Maculis orbicularibus, ochraceis; pycnidiis hypophyllis, dense gregariis, globulosis, nigris, 100-140 μ . diam., contextu parenchymatico; sporulis cylindraceis, rectis, allantoideis, continuis, hyalinis 6 \approx 1.

Hab. in foliis languidis Oxytropidis pilosæ prope Tiszahugh Hungariæ.

53. **Phyllosticta Exscapi** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6154 pag. 335. — Maculis nullis; pycnidiis amphigenis, sparsis, tectis, globoso-depressis, nigro-brunneis, minutissime papillatis, 100-150 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, continuis, eguttulatis, hyalinis, 6-7 \approx 2-3.

Hab. in foliis languidis Astragali exscapi prope Kecskemét Hungariæ. — A *Phyll. desertorum* Sacc. valde diversa.

54. **Phyllosticta prosopidicola** Speg., Myc. Argent. V, pag. 338, in An. Mus. Buenos Aires XX (1910). — Maculis amphigenis, difformibus, albescenti-arescentibus, determinatis, saepius areola angustissime callosa, purpurascente limitatis, subinde totam partem dimidiam anter. foliorum occupantibus; pycnidiis velatis, laxe gregariis, sublenticularibus, 60-90 μ . diam., ostiolo parvo angulato pertusis, contextu obscure parenchymatico; sporulis ellipsoideis 2-guttulatis, hyalinis, 5-6 \approx 2,5-3.

Hab. ad folia viva Prosopidis albæ in silvis prope Oran, Argentina.

55. **Phyllosticta Derridis** P. Henn. in Fl. du Bas- et Moy.-Congo, in Ann. Mus. du Congo v. II, fasc. III (1908) p. 228. — Maculis rotundatis v. marginalibus effusis, pallidis; pycnidiis gregariis erum-

pentibus, atro-membranaceis, subsphæroideis, poro pertusis, 60-90 μ . c. cr.; sporulis ellipsoideis, hyalinis, eguttulatis, 2-2,5 \approx 1,5.

Hab. in foliis *Derridis* spec., Dembo Congo, Africa (VANDERYST).

56. **Phyllosticta Milletiae** P. Henn., in Fl. du Bas- et Moy.-Congo, in Ann. Mus. du Congo v. II, fasc. III (1908) p. 227. — Maculis rotundatis, angulatis v. confluentibus, pallidis, exaridis, zona brunnea circumdatis; pycnidiis sparse gregariis, saepe concentrice dispositis, sphæroideis, atris, cellulosis, poro pertusis, 90-100 μ . c. cr.; sporulis subglobosis, hyalinis, eguttulatis, 3-4 μ . cr.

Hab. in foliis *Milletiae* sp., Boko Sainte-Barbe Congo, Africa (VANDERYST).

57. **Phyllosticta Erythrinæ** Petch, Ann. Roy. Bot. Gard. Peradeniya III, Pt. I (1906) p. 4. — Pycnidiis nigris, minutis, lenticularibus, prominentibus, epidermide excepto ostiolo tectis, 90-180 \approx 60-70; ostiolis circ. 10 μ . diam.; sporulis linear-ovatis, hyalinis, utrinque acutis, 6-8 \approx 2; sporophoros circ. 10 μ . long.

Hab. in maculis ramealibus *Erythrinæ* lithospermæ, Ceylon.

58. **Phyllosticta sophoricola** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 456. — Maculis irregularibus, cinereis, fusco-cinctis; pycnidiis amphigenis, dense gregariis, depresso-globosis, brunneis, 80-100 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, continuis, eguttulatis, hyalinis, 7-8 \approx 2,5-3.

Hab. in foliis vivis *Sophoræ japonicæ* prope Kecskemét Hungariæ.

59. **Phyllosticta robinicola** Hollós, Ann. Mus. Nat. Hung. VIII (1910) p. 2. — Pycnidiis gregariis, tectis, globulosis, minutissime papillatis, ochraceis, 140-170 μ . diam., contextu cellulo; sporulis ellipsoideis, eguttulatis v. obscure biguttulatis, continuis, hyalinis, 6-7 \approx 2-3.

Hab. in floribus dejectis *Robiniae Pseudoacaciae* prope Kecskemét Hungariæ.

60. **Phyllosticta neomexicana** Bub. et Kab. Hedwigia L (1909) p. 38. — Maculis amphigenis, sparsis, e circulari angulosis, minutis, 1-2 mm. diam., superne alutaceis, arescendo griseis, subelevatis, margine lato flavo cinctis, subinde confluentibus; pycnidiis hypophyllis, confertis, minutis, greges internervios nigros, angulatos formantibus, globosis, variæ magnitudinis, 60-160 μ . diam., nigris,

subcutaneis, ostiolo brevi conico erumpentibus, dein poro pertusis, contextu minute celluloso, vertice obscuriore; sporulis breve bacillaribus, 3,5-4,5 \approx 1,5-2, utrinque rotundatis; sporophoris breve papilliformibus, hyalinis.

Hab. in foliis morientibus Robiniae neomexicanæ in Schola dendrologica pr. Turnau Bohemiæ.

61. **Phyllosticta Missionum** Speg., Myc. Argent. V, p. 336, in An. Mus. Buenos Aires, XX (1910). — Maculis amphigenis, maximis, cinereo-arescentibus, determinatis, areola angusta pururascenti limitatis, saepe totum folium occupantibus; pycnidiis sparsis v. laxè gregariis, amphigenis, innato-erumpentibus, lenticularibus, 78-80 μ . diam., ostiolo rotundo latiusculo pertusis, contextu minute parenchymatico fumoso-fusco; sporulis tereti-ellipsoideis, eguttulatis, hyalinis, rectis, 4-6 \approx 2-2,5.

Hab. ad folia viva Bauhiniae sp. in silvis pr. Puerto Leon Argentinæ.

62. **Phyllosticta calaritana** Briosi et Cav., Funghi parass. essic. n. 390 (1905) c. ic. — Maculis marginalibus, valde irregularibus, castaneo-brunneis; pycnidiis epiphyllis, tectis, parum prominulis, globosis, 135 μ . diam., peridio valido, carbonaceo donatis; sporulis oblongis, utrinque obtusiusculis, rectis v. curvulis, 15-20 \approx 4,5-5,5; sporophoris minimis suffultis.

Hab. in foliis vivis Ceratoniæ Siliquæ, in Horto botanico, Cagliari, Sardegna. — An *Macrophoma*?

63. **Phyllosticta mespilicola** Rota-Rossi, in Atti R. Ist. bot. Pavia (1905) XI, p. 307-308, Prima Contrib. Micol. Bergamo, l. c. — Maculis irregulariter orbicularibus, amplis, ferrugineis, fusco-cinctis; pycnidiis amphigenis, globosis, ostiolo prominulo praeditis, nigris, minusculis, 45-75 μ . diam.; sporulis hyalinis, bacillaribus, 2,5-3,5 \approx 1.

Hab. in foliis Mespili germanicæ, Palazzago, Bergamo Italiae borealis. — A *Ph. Mespili* et *Ph. mespilina* macularum colore, pycnidiorum diametro sporularumque forma et mensuris valde differt.

64. **Phyllosticta circinans** (Peyl) Sacc. et Trav. — Syll. XX, p. 1285 — *Sphaeronema circinans* Peyl, Beschreib. einig. neuer Pilze in Lotos VIII (1858) p. 31, t. I, f. 18. — Maculis subcircularibus, saepius marginalibus, brunneis, concentrice ruguloso-zonatis; pycnidiis membranaceis, subglobosis, subcutaneis, ostiolo sensim conoideo vix erumpente, prominulo (non rostellato), nucleo albo-

flavido in globulum eructato; sporulis globoso-ovoideis, hyalinis, majusculis.

Hab. in foliis vivis sed mox putrescentibus *Pruni Laurocerasi* in frigidariis cultæ, in Bohemia.

65. **Phyllosticta Pruni-domesticæ** Vogl., Annal. R. Ac. Agric. Torino 6166 XLVIII (1905) p. 441, *Phyll. domestica* Vogl., Atti R. Ac. Sc. Torino v. XLIII (1907-1908) p. 93 (247). — Maculis epiphyllis, griseis, arescendo albicantibus, paullum bullatis, late castaneo-marginalis, orbiculatis, 0,5-2-2,5 mm. diam, confluentibus, demum in centro corrosionis, in pagina inf. castaneis; pycnidiis epiphyllis, nigris, sparsis, minutis, 100-110 μ . lat., ovato-prominulis, pertusis; sporulis cylindraceis, rectis, utrinque rotundatis, hyalinis, 2,3-5,4 \approx 1,15.

Hab. in foliis *Pruni domesticæ* in Pedemontio Italiæ bor. 6167

66. **Phyllosticta Phytoptorum** Bubák, Myc. Beitr., Hedw. Bd. XLVI (1907) p. 289. — Pycnidiis plerumque epiphyllis, primum epidermide tectis, mox erumpentibus, globosis, subdepressis, 120-200 μ . latis, nigris, opacis, poro minuto obscuro papilliformi præeditis, basi flavido-brunneis, supra nigricantibus, contextu parenchymatico; sporulis minutis, bacillaribus, rectis, 2-3 \approx 1-1,5, hyalinis; sporophoris brevibus, indistinctis.

Hab. in pustulis tantum a *Phytopto Piri* generatis in foliis *Piri communis* et *Sorbi aucupariæ*, Bohemia et Austria.

67. **Phyllosticta innumerabilis** Peck, Bull. Torr. Bot. Club, XXXVI 6168 (1909) p. 336. — Maculis magnis, suborbicularibus, aliquando folii partem magnam occupantibus, brunneis, in margine flavidis; pycnidiis hypophyllis, minutis, 80-100 μ . lat., dense gregariis, numerosissimis, membranaceis, orbicularibus, melleis; sporulis oblongis v. cylindraceis, hyalinis, 6-8 \approx 1,5-2, sporophoribus 10-12 \approx 1-1,2 suffultis.

Hab. in foliis vivis *Amelanchieris*, Fort Niobrara Nebraska Amer. bor. (J. M. BATES).

68. **Phyllosticta persicophila** Trav. et Migliardi, Flora micol. prov. 6169 Venezia (1911) p. 11. — Maculis marginalibus, initio subcircularibus dein irregulariter extensis, $1\frac{1}{2}$ -2 cm. latis, arescendo ochraceo-stramineis, centro albicantibus, primitus regulariter fulvo-marginatis dein margine expanso, diluto, haud raro subzonato; pycnidiis densiuscule sparsis, punctiformibus, nigris, globoso-depressis, 250-400 μ . diam., poro circulari pertusis; sporulis cylindraceo-oblongis v.

ovoideo-elongatis, eguttulatis, hyalinis, $5-8 \approx 2\frac{1}{2}-3\frac{1}{2}$; sporophoris cylindraceis, irregularibus, hyalinis, $12-18 \approx 1\frac{1}{2}-2$.

Hab. in foliis *Persicæ vulgaris*, quas valde vexat in hortis S. Nicoletto di Lido, Venetiis, Ital. bor. — A *Ph. Persicæ* et *Ph. persicina* maculis majoribus, sporulis angustioribus et sporophoris distincte evolutis, facile dignoscenda species.

69. **Phyllosticta albo-maculans** Kab. et Bub., Hedw. XLVII (1908) 6170

p. 354. — Maculis amphigenis conspicuis, supra albis et siccis, infra alutaceo-brunneis, irregulariter angulosus, nervis limitatis, 1-3 mm. latis, plus minus distincte rubro-carmineo marginatis, saepe confluentibus; pycnidiis epiphyllis, punctiformibus, sparsis, globosis, depresso, 90-150 μ . latis, ex obscure brunneo nigricantibus, epidermide tectis, demum superficialibus, poro minuto rotundato apertis, contextu minute parenchymatico, obscure brunneo; sporulis ellipsoideis 3,5-6,5 (raro usque ad 8) μ . long., 2-3,5 μ . latis, unilocularibus, hyalinis, biguttulatis; sporophoris brevibus, papilliformibus, hyalinis.

Hab. in foliis vivis *Pruni Padi* prope Turnau Bohemia (KABAT). — A *Ph. sanguinea* maculis sporulisque minoribus diversa.

70. **Phyllosticta velata** Bubák, Beitr. Pilzfl. Ung., in Növenytani 6171

Közlemények (1907) Heft. 4, Extr. p. 27. — Maculis rotundatis v. ellipsoideis, distincte limitatis, e brunneo-alutaceis rubro-brunneis, numerosis, sparsis, saepe confluentibus, in hypophyllo tenuioribus; pycnidiis in mesophyllo immersis, epidermide velatis dein prominentibus, globosis v. sublenticularibus, 100-180 μ . diam., nigris, contextu brunneo parenchymatico, poro minuto apertis; sporulis ex ovoideo elongatis, 4-6 $\approx 2-3,5$, rectis, raro curvulis vel etiam inaequilateris, utrinque rotundatis, olivaceo-brunneis; sporophoris pallide brunneolis, papilliformibus.

Hab. in foliis vivis *Cydoniae vulgaris* in M. Allion prope Orsona Hungariæ. — A *Ph. Cydoniae* (Desm.) Sacc. et *Ph. cydoniicola* All. maculis et sporulis olivaceo-brunneis omnino diversa. Ad subgen. *Phyllostictella* spectat.

71. **Phyllosticta Spirææ-salicifoliæ** Kab et Bub. Hedwigia L (1909) 6172

p. 39. — Maculis epiphyllis, sed utrinque visilibus, e rotundato oblongis, alutaceis, v. atro-brunneis saepe, non semper, margine angusto purpureo-brunneo limbatis, interdum confluentibus; pycnidiis epiphyllis, innatis, subsparsis, interdum gregariis v. confertis, lenticularibus, 70-120 μ . diam., subcastaneis, poro minuto pertusis, pallide brunneis, subdiaphanis, laxè cellulosis; sporulis

copiosis, ellipsoideo-teretiusculis 4-8 \approx 2,5-3,5, utrinque rotundatis, continuis, hyalinis, rarissime sub-1-septatis; sporophoris papilliformibus.

Hab. in foliis vivis *Spirææ salicifoliae* pr. Turnau Bohem.

72. **Phyllosticta aruncina** Sacc., in Ann. Mycol. X (1912) p. 317. — 6173
Maculis caulinis, versiformibus, saepius minutis, albis, marginulo angustissimo leniter elevato limitatis; pycnidiis punctiformibus, lenticularibus, poro pertusis, 100 μ . diam., minute parenchymaticis, atris; sporulis ellipsoideis, 3-4 \approx 2, dilutissime flavidis, obsolete 2-guttulatis, sessilibus.

Hab. in caulibus *Spirææ Arunci*, Selva, Treviso, Ital. bor. — A *Phyll. Arunci* Sacc. differt sporulis paullo brevioribus et latioribus (non 5 \approx 0,7) et flavidulis, praeterea quia est species caulicola.

73. **Phyllosticta Theæ** Speschnew, Pilzparasiten d. Teestrauchen (1907) 6174
p. 16, tab. III, fig. 1-4. — Maculis epiphyllis, versiformibus dealbatis, non marginatis; pycnidiis sparsis, raris, lenticulari-punctiformibus, valde applanatis, 100-240 μ . cr., 60-80 μ . alt. poro lato pertusis; sporulis hyalinis, oblongo-ellipsoideis, semper obsolete biguttulatis, 6-8 \approx 1,5-2.

Hab. in foliis *Theæ sinensis* et *Th. assamicæ*, Tscha-kwa prope Batum Caucasia.

74. **Phyllosticta Comolliæ** Spegazz., Mycet. Argent. V, in An. Mus. 6175
Buenos Aires, XX (1910) p. 333. — Maculis amphigenis orbicularibus albescenti-subrufescens, determinatis, 1-5 mm. diam., areola purpurascens cinctis; pycnidiis epiphyllis laxe gregariis, atris, sublenticularibus, 50-80 μ . diam.; contextu membranaceo dense minuteque parenchymatico olivaceo, ostiolo rotundo minuto pertuso; sporulis rectis v. leniter inaequilateralibus, utrinque acutiuscule rotundatis, 3-4 \approx 1, hyalinis, eguttulatis.

Hab. ad folia *Comolliæ platensis* in insula Santiago, La Plata Argentinæ.

75. **Phyllosticta fuchsiicola** Speg., Fungi Chilenses (1910) p. 138. — 6176
Maculis albidis amphigenis orbicularibus determinatis, 1-5 mm. d., areola ampla purpurascens cinctis; pycnidiis innatis paucis epiphyllis lenticularibus, pusillis, 75-90 μ . diam., ostiolatis, membranaceis; sporulis subcylindraceo-ellipsoideis, 4-6 \approx 1,5-2, hyalinis.

Hab. in foliis vivis *Fuchsiae coccineaæ*, Bahia de Corral Chile Amer. austr.

76. **Phyllosticta Epilobii-rosei** Krieg., Ann. Mycol. VII (1909) p. 542; 6177
Krieg., Fungi saxon. n. 2096. — Maculis rotundatis v. irregula-

ribus, hinc inde confluentibus, primum flavo-brunneis, margine obscurioribus, dein centro pallescentibus et margine indefinitis; pycnidiis globosis, amphigenis, 130-150 μ . diam.; sporulis cylindraceis, utrinque rotundatis, hyalinis, guttulatis vel non, 4,5-6 \approx 1,5-2.

Hab. in foliis Epilobii rosei prope Königstein, Germania.

77. **Phyllosticta taurica** R. Maire, Champ. Asie Mineure, Bull. Soc. Sc. de Nancy (1906) Extr. p. 7. — Pycnidiis minutis, brunneis, sphæroideis, membranaceis, in macula arida grisea purpureo-marginata insidentibus; sporophoris brevissimis; sporulis bacillaribus, hyalinis, utrinque acutatis, rectis v. curvulis, 6-8 \approx 1-1,5.

Hab. in foliis Corni maris in monte Tauro prope Pilas Ciliicias, Anatolia.

78. **Phyllosticta Milenæ** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 6179 p. 404. — Maculis magnis irregularibus griseis v. pallide alutaceis; pycnidiis gregariis globosis v. e globoso depressis discoideis, 45-130 μ . diam., nigris, primum subepidermicis dein erumpentibus, crasse tunicatis, contextu parenchymatico castaneo-brunneo; sporulis variabilibus, ovoideis, elongatis, v. e cylindraceo fusoideis, 6-9 \approx 2,5-4, rectis v. curvulis, utrinque rotundato-angustatis, saepe uno latere latioribus, hyalinis, unilocularibus; sporophoris latis papilliformibus, flavidis.

Hab. in foliis senioribus Hederæ Helicis prope Ulcinj Montenegro.

79. **Phyllosticta Paratropiæ** Sacc., Ann. Mycol. VI (1908) p. 554 — 6180 Maculis amphigenis orbiculari-angulatis, 3-10 mm. lat., pallide alutaceis, elevato-marginatis, demum albicantibus; pycnidiis punctiformibus, nigris, densiusculis, plerumque epiphyllis, lenticularibus, 150-180 μ . diam., minute pertusis, contextu minute celluloso, fuligineo; sporulis oblongo-ellipsoideis, 2,5-3 \approx 1,5-2, hyalinis.

Hab. in foliis Paratropiæ rotundifoliæ (Araliac.) in Horto botanico Panormitano, Sicilia (J. H. MATTEI).

80. **Phyllosticta Arthrophylli** Koord., Bot. Unters. Java (1907) p. 204, 6181 fig. 25. — Maculis circularibus expallescentibus 3 mm. c. latis, zona crassiuscula fusca limitatis; pycnidiis paucis punctiformibus, lenticularibus, ostiolatis, ad centrum maculæ sitis; sporulis cylindraceo-fusiformibus, rectis, utrinque acutis, hyalinis, 10-14 \approx 3,5-4.

Hab. in foliis vivis Arthrophylli diversifolii pr. Kaliwiro prov. Kedu Java (KOORDERS).

81. **Phyllosticta ulcinjensis** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 6182

p. 405. — Pycnidiis in maculis magnis albo-flavidis v. viridibus, anguste brunneo-marginatis parce gregariis, 100-180 μ . latis, diu epidermide tectis, globoso-depressis, pallide flavis, colliculosis, contextu tenui flavo-brunneo, minute parenchymatico; sporulis cylindraceis, rectis v. curvulis, 5-9 \approx 2,5-3,5, utrinque rotundatis, hyalinis, guttulatis, unilocularibus v. nonnullis spurie biseptatis.

Hab. in foliis vivis tenuioribus *Hederæ* *Helicis* prope Ulcinj, Montenegro.

82. **Phyllosticta belgradensis** Bubák et Ranojevic, Ann. Myc. VIII 6183

(1910) pag. 381. — Maculis epiphyllis, plerumque marginalibus, irregularibus, griseo-cinereis, dein brunneo-marginatis; pycnidiis epiphyllis, congregatis, globosis, epidermide tectis, dein erumpentibus, 120-160 μ . cr., contextu parenchymatico obscure brunneo, ostiolo distincto, immarginato præditis; sporulis ovoideis, subinde ellipsoideis, 5,5-7,5 \approx 3-4,5.

Hab. in foliis *Hederæ* *Helicis* prope Belgrad, Serbia. —

Phyll. hederaceæ proxima sed sporulis majoribus diversa.

83. **Phyllosticta eryngiicola** Bubák, Beitr. Pilzfl. Ung., in Növénytani Közlemények (1907) Heft 4, Extr. p. 24. — 6184 Pycnidiis nigris, 90-160 μ . diam., parietibus crassis præditis, contextu grosse parenchymatico; sporulis ovoideis v. ellipsoideis, 4-5 \approx 2,5-3,5, pallide olivaceis.

Hab. in foliis vivis *Eryngii* campestris prope Orsava Hungariæ. — Magnitudine et colore sporularum, colore pycnidiorum a *Ph. eryngiella* præcipue diversa. — Ad subgen. *Phyllostictella* spectat.

84. **Phyllosticta eryngiella** Bub., Beitr. Pilzfl. Ung., in Növenyt. Közlemények (1907) Heft 4, Extr. p. 24. — 6185 Maculis polygoniis, parvis, nervis indistincte limitatis, sæpe confluentibus, arescendo albis, utrinque visilibus subpellucidis; pycnidiis in parvos greges dispositis, immersis, demum erumpentibus, globosis vel leniter depresso-crenatis, obscure brunneis, 100-180 μ . diam., parietibus tenuibus præditis, contextu parenchymatico brunneo, poro minuto papilliformi apertis; sporulis variabilibus, ovoideis, ellipsoideis, elongatis v. cylindraceis, 5-11 \approx 2-4,5, utrinque rotundatis v. raro uno apice angustatis, quandoque indistincte guttulatis; sporophoris brevibus, papilliformibus, hyalinis.

Hab. in foliis vivis *Eryngii* campestris prope Orsava Hungariæ.

85. **Phyllosticta malisorica** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 6186

pag. 404. — Maculis rotundatis v. elongatis, 2-3 mm. latis, arescendo sordide albidis, indistincte marginatis; pycnidiis gregariis, globoso-depressis, 100-120 μ . latis, obscure brunneis, tenuiter tunicatis, poro centrali minuto apertis, contextu parenchymatico flavo-brunneolo; sporulis ex ellipsoideo elongatis, 6-9 \times 2,5-3,5, rectis v. curvulis, utrinque rotundatis, hyalinis, unilocularibus.

Hab. in foliis *Opoponacis Chironii* prope Ulcinj, Montenegro.

86. **Phyllosticta Cicutæ** Lind, Ann. Mycol. V (1907) p. 275. — 6187
Maculis foliicolis magnis utrinque visilibus, elongatis, nervis limitatis, arescendo griseo-ochraceis, obscure brunneo-marginatis; pycnidiis minutis, lenticularibus, nigris, epiphyllis, gregariis, subsuperficialibus, 80-110 μ . diam.; sporulis unilocularibus, hyalinis, 5-7 μ . long., latitudine variabilibus, plerumque 1,5 μ . cr. et tunc cylindraceis v. 3 μ . cr. et tunc subovoideis.

Hab. in foliis vivis *Cicutæ virosæ* prope Rindsholm Jütlandia, Dania.

87. **Phyllosticta hamasensis** Sacc. Ann. Mycol. VIII (1910) p. 338. — 6188
Maculis vagis, amphigenis, subochraceis, immarginatis; pycnidiis amphigenis, nigris, confertissimis maculasque atras reddentibus, globulosis, innato-prominulis, 80-110 μ . diam., poro latiusculo hiantibus; sporulis cylindraceis, rectis, 5-6 \times 1,5-2, hyalinis.

Hab. in foliis languidis Peucedani fraxinifolii, Nefasit ad Mahabar, alt. 1600 m. (Hamasen) Africa (HADR. FIORI). — Pycnidia videntur oriri ex tuberculis *Cercosporæ hamasensis*, de qua cfr.

88. **Phyllosticta albanica** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 6189 p. 403. — Maculis epiphyllis, 2-6 mm. latis, rotundatis v. irregularibus, griseis, brunneo-marginatis; pycnidiis epiphyllis, sparsis, depressis, 80-150 μ . latis, nigris, contextu obscure castaneo-brunneo, distincte parenchymatico; sporulis bacilliformibus, subirregularibus, 2-5 \times 1, rectis v. curvulis, hyalinis; sporophoribus papilliformibus.

Hab. in foliis vivis Lamii Galeobdoli prope Andrijevice, in Montenegro.

89. **Phyllosticta Galeobdoli** Syd., Ann. Mycol. VI (1908) p. 484. — 6190
Maculis irregularibus, distinctis, 2-10 mm. longis, albidis, brunneo- v. atropurpureo-marginatis; pycnidiis epiphyllis, sparsis, globosis, atro-brunneis, 130-200 μ . diam.; sporulis oblongis, continuis, hyalinis, utrinque rotundatis, utrinque 1-guttulatis, 4-5 \times 1-1 $\frac{1}{2}$.

Hab. in foliis *Galeobdoli lutei*, Rotstein prope Sohland Saxoniæ (A. SCHADE). — An diversa a *Ph. albanica*?

90. **Phyllosticta Melissæ** Bubák, Beitr. Pilzfl. Ung., in Növénytani Közlemények (1907) Heft 4, Extr. p. 25. — Maculis sparsis, parvis, 1-3 mm. diam., rotundato-sinuatis, primum brunneis siccis, dein pallescentibus et subpellucidis, linea tenui, obscure brunnea limitatis; pycnidiiis sparsis, globosis, subepidermicis, nigris, epidermidem inflantibus, 40-55 μ . diam., contextu parenchymatico brunneo, ostiolo minuto erumpentibus; sporidiis breviter cylindraceis v. elongatis, 4,5-8,5 \approx 2,5-3,5, utrinque rotundatis v. uno latere leviter angustatis, hyalinis.

Hab. in foliis vivis *Melissæ officinalis* prope Báziás Hungariæ. — A *Phyll. Lamii* colore et magnitudine pycnidiorum diversa.

91. **Phyllosticta montellica** Saccardo, Not. Myc. VI, Ann. Myc. III (1905) p. 512. — Maculis amphigenis, e rotundo angulosis, atro-sanguineis, centro arescendo candidantibus; pycnidiiis plerumque epiphyllis, punctiformibus, lenticularibus 80-90 μ . diam., poro rotundo pertusis; sporulis oblongo-ellipsoideis, 4-5 \approx 1,5, hyalinis, intus granulosis.

Hab. in foliis vivis *Melittidis Melissophylli* in silva Montello (Treviso) Ital. bor. — *Phyll. Melissophylli* differt sporulis 6 \approx 4.

92. **Phyllosticta variicolor** Bubák, Beitr. Pilzfl. Ung., in Növénytani Közlemények (1907) Heft 4, Extr. pag. 27. — Maculis foliicolis epiphyllis, paucis, plerumque 1-4, brunneis, irregularibus, medio arescendo albo-flavidis, areola brunnea v. brunneo-coriacea sublimitatis, et tunc usque ad 1,5 cm. latis; pycnidiiis epiphyllis in medio macularum sparse dispositis, subepidermicis, globosis v. parum depresso, 70-100 μ . diam., obscure brunneis, contextu distinete parenchymatico, pallide brunneo; sporulis bacillaribus, raro ellipsoideis, 5-8 \approx 2-2,5, utrinque rotundatis, hyalinis, guttulatis.

Hab. in foliis vivis *Stachydis germanicæ*, Csernatale pr. Herculesfürdö Hungariæ. — A *Ph. Stachydis* Br. et ejusdem var. *arvensis* All. omnino diversa.

93. **Phyllosticta Aloysiæ** Spög., Mycet. Arg. V, p. 329, in An. Mus. Buenos Aires, XX (1910). — Maculis suborbicularibus, amphigenis, subdeterminatis, fuscescentibus, centro albicantibus, 1-3 mm. diam.; pycnidiiis solitariis v. laxè gregariis, innato-erumpentibus, pusillis, minute ostiolato-pertusis, 75 μ . diam., lenticularibus; con-

textu parenchymatico olivaceo; sporulis e cylindraceo ellipsoideis, eguttulatis, utrinque obtuse rotundatis, 4-6 \approx 1,5-2, hyalinis.

Hab. ad folia languida Lippiæ (Aloysiæ) citriodora in horto SPEGAZZINI, La Plata, Argentina.

94. **Phyllosticta cyclaminella** Bubák, Bull. Herb. Boiss. 2 sér. VI 6195 (1906) p. 404. — Maculis utrinque visilibus, rotundatis v. elongatis, 1-3 mm. latis, arescendo albidis, linea brunnea vix limitatis; pycnidiis epiphyllis, sparsis, subepidermicis dein erumpentibus, globosis, 90-170 μ . latis, brunneo-nigris, contextu pallide brunneo; sporulis ex ellipsoideo cylindraceis, 6-9 \approx 2-3, utrinque rotundatis, hyalinis, unilocularibus, guttulatis.

Hab. in foliis Cyclaminis neapolitani prope Virpazar Montenegro. — A *Ph. Cyclaminis* Br. pycnidiis sporulisque majoribus præcipue distincta.

95. **Phyllosticta Rapanææ** Speg., Myc. Arg. V, p. 338, in An. Mus. 6196 Buenos Aires, XX (1910). — Maculis repando-orbicularibus, amphigenis, determinatis, fuscescentibus, 5-10 mm. diam., linea angustissima callosa limitatis, exareolatis, centro saepius maculis 1 v. 2 pusillis determinatis cinereis ornatis; pycnidiis paucis, centralibus, epidermide tectis, epiphyllis, 90-100 μ . diam., contextu tenui parenchymatico fuligineo, ostiolo rotundo pertuso; sporulis elongato-ellipsoideis v. subnavicularibus, 2-guttulatis, 5-8 \approx 1,5, hyalinis.

Hab. ad folia viva Rapanææ Lorentzii in uliginosis, Isla Santiago, La Plata, Argentina.

96. **Phyllosticta Sapotæ** Sacc. in Ann. Mycol. X (1912) p. 312. — 6197 Maculis versiformibus, saepe marginalibus, cinereo-brunneis, ambitu saturationibus, amphigenis; pycnidiis raris, lenticulari-globosis, 100 μ . diam., poro pertusis, distincte cellulosis, nigricantibus; sporulis ellipsoideis, 10-12 \approx 5,5-6, granuloso-guttulatis, subsessilibus.

Hab. in follis subvivis Achræ Sapotæ in insulis Bahama Americæ centr. Legit Rev. H. Q. MORTON, comm. Dr. FAIRMAN.

97. **Phyllosticta Diervillæ** Davis, Trans. Wisconsin Ac. of Sc. XVI, 6198 Pt. II (1909) pag. 761. — Maculis irregularibus, saepe apicalibus, brunneis, margine flavido indefinito, 1-4 cm. diam.; pycnidiis amphigenis, sparsis, globosis, brunneolis, 80-110 μ . diam.; sporulis hyalinis, oblongis 3-5 \approx 1,5-2.

Hab. in foliis Diervillæ trifidæ, Gordon Amer. bor.

98. **Phyllosticta campanulina** Moesz, Gomb. Budapest, I (1909) t. II, 6199 f. 9 (Bot. Közlem.) p. 18. — Maculis variis, 1-5 mm. diam., sor-

dide albicantibus, rubiginoso marginatis; pycnidiis centro macularum insidentibus, gregariis, punctiformibus, epiphyllis, epidermide tectis, dein erumpentibus, globosis, epapillatis, 70-100 μ . diam., contextu membranaceo, parenchymatico, fuligineo; sporulis cylindraceis, anguste ellipsoideis v. panduriformibus, 4,5 \approx 1,5, hyalinis, eguttulatis.

Hab. in pagina superiore foliorum vivorum Campanulæ persicifoliæ prope Budapest Hungariæ.

99. **Phyllosticta Rehmi** Bubák, Beitr. Pilzfl. Ung., in Növénytani Közlemények (1907) Heft 4, Extr. p. 26. — Maculis nullis; pycnidiis epiphyllis sparsis, sæpe nervos sequentibus, pallide brunneis, globosis, 80-120 μ . latis, in mesophyllo immersis, contextu parenchymatico pallido v. brunneolo; sporulis breviter cylindraceis, 4,5-9 \approx 2-3,5, rectis v. curvulis, apice rotundatis guttulatis; sporophoris hyalinis, breviter papilliformibus.

Hab. in foliis vivis Campanulæ Trachelii in Csernatale prope Herkulesfürdö Hungaria. — A ceteris 4 speciebus in *Campanula* vigentibus distincta.

100. **Phyllosticta veraltiana** C. Mass. ap. Sacc., in Ann. Mycol (1911) 6201 p. 251. — Maculis versiformibus, amphigenis, sordide albis, 5-6 mm. diam. subinde confluentibus, linea fusca cinctis; pycnidiis membranaceis nigris, globoso-lenticularibus, 100-150 μ . diam., epiphyllis; sporulis ovoideis, 3-5 \approx 2-2,5, hyalinis, plerumque biguttatis.

Hab. in foliis languentibus Campanulæ Trachelii prope S. Marco di Saline, loco Veralta agri Veronensis, Ital. bor. (MASALONGO). — A *Ph. Campanulæ* satis distincta.

101. **Phyllosticta Asperulæ** (Lasch?) D. Sacc., in Atti Soc. Ven. Trent. (1897) p. 22, t. 5, f. 6, ? *Depazea Asperulae* Lasch — Syll. III, p. 63. — Toto folio arescendo brunnescente; pycnidiis subsparsis, lentiformibus, perexiguis, 60-90 μ . diam., poro pertusis; sporulis perexiguis ellipsoideo-oblongis, 3-4 \approx 0,5, subrectis, hyalinis.

Hab. in foliis Asperulæ odoratae in M. Holik pr. Schemitz Hungariæ (Ab. A. KMET).

102. **Phyllosticta Usteri** Spég., Fungi Paulist., Rev. Mus. La Plata (1908) t. XV, f. 34. — Maculis primo orbicularibus 3-5 mm. diam. dein confluendo difformibus ac sæpe totum folium occupantibus, ad hypophyllum levibus nitidulis sordide testaceis, ad epiphyllum centro sordide cinerascentibus ambitu pallidioribus v. subpurpurascentibus, non v. vix circinatim rugulosis, linea angustissima cal-

losa, ad hypophyllum præcipue elevatis, abrupte limitatis; pycnidiiis epiphyllis sparsis v. laxe gregariis, epidermide tectis, prominulis depressis, 50-90 μ . diam., membranaceis, contextu parum distincto parenchymatico fuligineo; sporulis rectis v. leniter inaequilateralibus, utrinque acutiuscule rotundatis, 4-6 \times 1,5-2, eguttulatis, hyalinis.

Hab. ad folia languida Coffea arabica in Horto Scholæ Polytechnicæ, São Paulo Brasilia (USTERI).

103. **Phyllosticta Cinchonæ** Koord., Botan. Untersuch. (1907) p. 203, 6204 fig. 24. — Maculis sinuosis variis, arescendo ochraceis, haud marginatis, 5 mm. c. latis; pycnidiiis globoso-lenticularibus, laxiuscule gregariis, c. 120 μ . diam., poro pertusis; sporulis cylindraceis, hyalinis, 8-10 \times 3,25.

Hab. in foliis Cinchonæ sp. in Gunung Sendoro prope Anggrong-Gondok prov. Kedu Java (KOORDERS).

104. **Phyllosticta kalmicola** (Schw.) Ell. et Ev. — Syll. XI, p. 475 6205 var. **berolinensiformis** Fairm., Ann. Mycol. (1910) p. 324. — Maculis foliicolis, irregularibus, purpureo-cinctis, epidermide albo-bullosa elevata, brunneis v. rubris; pycnidiiis minutis, sparsis vel gregariis, atris; sporulis oblongo-cylindraceis, utrinque rotundatis, hyalinis, 6-8 \times 3.

Hab. in foliis vivis Kalmiae latifoliæ cultæ, Lyndonville New York Amer. bor.

105. **Phyllosticta Rhododendri-flavi** Bub. et Kab. Hedwigia L (1909) 6206 p. 38. — Maculis utrinque conspicuis, ad 2 cm. lat., circularibus v. circulari-inæqualibus, læte rubro-brunneis, dein atro-purpureo-brunneis, postremo expallentibus interdum concentrica zonatis, non v. obsolete discolori-limbatis; pycnidiiis epiphyllis, sparsis, globosis, 120-150 μ . diam., subcuticularibus, dein erumpentibus, contextu læte brunneo, parenchymatico; sporulis breve ellipsoideis v. ovoideis, rectis curvulis, 6-9,5 \times 3-3,5, utrinque rotundatis, hyalinis; sporophoris cylindraceis sursum tenuatis, 8-12 μ . long., hyalinis.

Hab. in foliis vivis Rhododendri flavi culti, Turnau. Bohemiæ. — A ceteris speciebus rhododendricolis diversa.

106. **Phyllosticta putrefaciens** Shear, Bull. Torr. Bot. Club XXXIV 6207 (1907) pag. 307. — Pycnidiiis gregariis, immersis v. subglobosis, membranaceis, obscure brunneis v. subnigris, ostiolatis, 75-100 μ . diam.; ostiolo conspicuo, margine leniter elevato subirregulari circumdato; sporulis forma variabilibus, ovoideis v. ovoido-ellipsoi-

deis, quandoque inæquilateris vel subcurvulis, continuis, hyalinis v. in massa tenuiter flavidis, 3,5-5 \approx 2,5-3; sporophoribus simplicibus brevissimis.

Hab. in foliis emortuis *Vaccinii macrocarpi*, Amer. bor. 6208

107. **Phyllosticta erythræa** Bacc., Funghi d. colonia Eritr., Ann. Bot. v. IV (1906) p. 276. — Maculis amphigenis, arescentibus, nigro-cinctis; pycnidiiis minutis, lenticularibus, parenchymate immersis; sporulis ovatis, minutis, 8 \approx 6.

Hab. in foliis *Diospyri mespilifoliae*, Monte Fegherat alt. m. 2000-2500, Erythræa Africæ.

108. **Phyllosticta trapezuntica** Bubák in Handel-Mazzetti, Bot. Reis. 6209 Pont. Randgeb. in Ann. Naturhist. Hofmus. Wien (1909) XXII, p. 104. — Pycnidiiis rotundatis v. irregularibus, sæpe confluentibus, evolutis, epiphyllis, sparsis, atris, opacis, 100-150 μ . diam., contextu densissimo, parenchymatico, atro-brunneo, poro magno, irregulari, centro pertusis; sporulis 4-4,5 \approx 2-2,5, breviter bacillaribus, rectis v. curvulis, utrinque rotundatis, ibidem 2-guttulatis, hyalinis; basidiis latis, papilliformibus, apice rotundatis, longitudo sporulas æquantibus v. eas superantibus.

Hab. in phytoptocecidiiis foliicolis [an potius dipterocecidiiis?] *Phillyreae Vilmorinianæ* in montibus Ponticis Anatoliæ (BLUMENCRON). — *Phyll. phillyrinæ* proxima sed differt sporulis minoribus, hyalinis nec chlorinis.

109. **Phyllosticta Oleæ** Petri, in Atti R. Accad. Linc. XVIII, 2 (1909) 6210 p. 636, c. icon. — Maculis amphigenis circularibus, 1 mm. circ. diam., initio ochraceis, dein albescientibus, annulo fusco cinctis; pycnidiiis epiphyllis, sparsis, paucis, globosis, punctiformibus, atris, 60-80 μ . diam.; sporulis bacillaribus, hyalinis, 2,5-3 \approx 0,3-0,4.

Hab. in foliis vivis juvenilibus *Oleæ europææ* prope Terni, Frosinone, Lazio et in prov. Siena, Toscana.

110. **Phyllosticta ambigua** Scalia, Sul seccume del Frassino da Manna, 6211 Catania (1909) p. 13. — Maculis amphigenis, sparsis v. confluentibus, irregularibus, in epiphylllo arescendo dealbatis, in hypophyllo fuscidulis; pycnidiiis epiphyllis sparsis, profunde immersis, ostiolo vix prominulo, globosis v. globoso-conicis; contextu tenuissimo, parenchymatico, subchlorino, circa ostiolum atro-fuligineo; sporulis copiosissimis, ellipsoideis, 4-5 \approx 2,5-3, minute guttulatis, hyalinis.

Hab. in maculis exaridis albidis foliorum *Fraxini Orni*, socio *Cylindrosporio Orni* (Pass.) Pegl. in Horto Bot. Cagliari, Sardegna (FR. CAVARA).

111. *Phyllosticta Orni* Bubák, Beitr. Pilzfl. Ung., in Novénytani Közlemények (1907) Heft 4, Extr. pag. 26. — Maculis foliicolis sparsis, rotundatis v. ellipsoideis, flavo-coriaceis, anguste brunneo marginatis; pycnidiis numerosis, gregariis, sæpe confertis, globosis v. parum depresso-nigris, hemisphærice prominentibus, in mesophyllo immersis, epidermidem pustulatam efficientibus, poro papilliformi erumpentibus, 60-100 μ . diam., contextu indistincte parenchymatico præditis; sporulis ex ovoideo ellipsoideis, 4-7 \times 3-4,5, rectis, utrinque rotundatis, nonnullis pallide brunneo-olivaceis, in massa brunneis, eguttulatis; sporophoris brevibus, papilliformibus.

Hab. in foliis vivis Fraxini Orni in M. Domugled prope Herkulesfürdö Hungariæ. — Ad subgen. *Phyllostictella* pertinet.

112. *Phyllosticta nicotianicola* Speg. Myc. Argent. V, pag. 336, in An. Mus. Buenos Aires XX (1910). — Maculis amphigenis determinatis exareolatis plus minusve cinerescentibus, 1-10 mm. diam., centro demum albicantibus; pycnidiis epiphyllis innatis, subsparsis, lenticularibus, 75-80 μ . diam., tenuissime membranaceis, contextu vix perspicuo atro-olivaceo, ostiolo rotundo minuto pertuso; sporulis subcylindraceis, eguttulatis, utrinque obtusulis, 6-10 \times 2, hyalinis.

Hab. ad folia viva Nicotianæ acutifloræ in herbosis, Ensenada pr. La Plata, Argentina.

113. *Phyllosticta humerispora* Speg., Fungi Paulist., Rev. Mus. La Plata t. XV (1908) p. 33. — Maculis sæpius epiphyllis repando-orbicularibus 0,5-2 mm. d., convexo-prominulis, areola angustissima fusco-violascente sublimitatis, cinereis, sæpe confluentibus; pycnidiis lenticularibus 90-120 μ . diam., innato-prominulis, solitariis vel pauci-gregariis, glabris, ostiolo minuto, olivaceis; sporulis bacillaribus, sæpius rectiusculis, 14-16 \times 1,5-2, non vel grosse guttulatis, hyalinis.

Hab. ad folia languida arbusculæ cujusdam (Cestrum?) in Horto bot. Sao Paulo Brasilia (USTERI). — Species a *Ph. ulnispora* Speg. (*Ph. osteospora* Speg., nec Sacc.) longissime recedens neque comparanda.

114. *Phyllosticta Himeranthi* Speg., Myc. Argent. V, p. 335, in An. Mus. Buenos Aires XX (1910). — Maculis orbicularibus determinatis, albescenti-subrufescens, exareolatis, 3-10 mm. diam.; pycnidiis epiphyllis numerosis innatis, atris, tenuissime membranaceis, sublenticularibus, 80-90 μ . diam., ostiolo pro ratione maximo

25-30 μ . diam. pertusis; contextu dense minuteque parenchymatico olivaceo-fuligineo; sporulis rectis v. lenissime inaequilateris, utrinque rotundatis, $5 \approx 1,5-2$, hyalinis.

Hab. ad folia viva v. languida *Himeranthi runcinati* ad viarum latera La Plata Argentinæ.

115. **Phyllosticta Gratiolæ** Hollós, Ann. Mus. Nat. Hung. VIII (1910) 6216 p. 2. — Maculis ochraceis, apicem foliorum occupantibus; pycnidiiis epiphyllis, gregariis, lenticularibus, ochraceis, poro pertusis, 70-90 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque obtuse rotundatis, eguttulatis, dilute flavidulis, $8-9 \approx 1,5-2$.

Hab. in foliis languidis *Gratiolæ officinalis* pr. Kecskemét Hungariæ.

116. **Phyllosticta Calceolariæ** Spég., Mycet. Argent. V, p. 331, in 6217 An. Mus. Buenos Aires XX (1910). — Maculis amphigenis, pusillis, elliptico-repandulis, determinatis, candidis, 1-3 mm. diam., areola angusta subferruginea cinctis; pycnidiiis epiphyllis, paucis, lenticularibus, epidermide velatis, 80-90 μ . diam., contextu minute parenchymatico fuligineo, ostiolo 15 μ . diam. pertuso; sporulis subcylindraceis hyalinis, utrinque rotundatis, 4-5 ≈ 1 , rectis v. lenissime inaequilateris.

Hab. ad folia languida *Calceolariæ foliosæ* in montanis pr. Tucuman, Argentina (C. BRUCH).

117. **Phyllosticta Scrophulariæ-bosniacæ** Bubák, Bull. Herb. Boiss. 6218 2 sér. VI (1906) pag. 406. — Maculis irregulariter rotundatis v. ellipsoideis, 2-4 mm. latis, brunneo-alutaceis, subconcentricis, tenuiter brunneo-marginatis, extus subareolatis; pycnidiiis epiphyllis, sparsis, 90-130 μ . latis, depresso-depressis, flavo-ochraceis, ostiolatis, contextu tenui grosse parenchymatico; sporulis ex elongato fusoides, 6,5-11 $\approx 3-3,5$, utrinque rotundatis v. angustatis, guttulatis, hyalinis, unilocularibus.

Hab. in foliis vivis *Scrophulariæ bosniacæ* prope Njegus Montenegro.

118. **Phyllosticta banatica** Bubák, Beitr. Pilzfl. Ung. in Növénytani Közlemények (1907) Heft 4. Extr. p. 23. — Maculis epiphyllis magnis, infra tenuissimis, irregularibus, opace virentibus, extus brunnescentibus et brunneo-marginatis; pycnidiiis epiphyllis sparsis v. hinc inde gregariis, subglobosis v. leniter depresso-depressis, siccis collabescientibus, epidermide tectis, 100-230 μ . diam., flavo-ochraceis, parietibus tenuibus 6-8 μ . cr. præeditis, contextu grosse parenchymatico, poro papilliformi præeditis; sporulis bacillaribus v.

elongatis, 3-4,5 \vee 1,5-2, rectis v. curvulis, apice rotundatis, guttulatis, hyalinis; sporophoris papilliformibus, flavidulis.

Hab. in foliis vivis *Verbasci* banatici, Csernatai pr. Herkulesfürdö Hungariæ. — A *Ph. Verbasci* Sacc. maculis, sporularum formâ et magnitudine diversa.

119. **Phyllosticta Bridgesii** Speg., Fungi Chilenses (1910) p. 140. — 6220

Maculis amphigenis albescens tibus subindeterminatis irregulariter subrotundis, 2-10 mm. diam.; pycnidiiis epiphyllis laxe gregariis innato-erumpentibus minute ostiolatis, membranaceis, lenticularibus, 90 μ . diam.; sporulis subcylindraceis, utrinque rotundatis, 4-5 \vee 1, hyalinis.

Hab. in foliis vivis *Lobeliæ Bridgesii* in pratis prope Bahia de Corral, Chile, Amer. austr.

120. **Phyllosticta Vandæ** Namyslowski, Kosmos XXXIII (1908) 6221

pag. 329. — Pycnidiiis dense sparsis, punctiformibus, minutis, nigris, sphæroideis, 60-80 μ . diam., epiphyllis; sporulis hyalinis, bacillaribus, rectis, 3-4 μ . longis, numerosissimis.

Hab. in foliis vivis *Dipsaci silvestris* prope Zagórzany Poloniæ, Galicia. — A *Phyll. Dipsaci* videtur diversa.

121. **Phyllosticta prousticola** Speg., Fungi Chilenses (1910) p. 139. 6222

— Maculis repando-orbicularibus, irregulariter rotundatis, 5-20 mm. diam., amphigenis, tabacinis, ambitu obscurioribus, determinatis; pycnidiiis epiphyllis innato-erumpentibus, subglobosis, 75-80 μ . diam., ostiolatis, coriacellis, atris; sporulis elongato-ellipsoideis, 4-5 \vee 1,5-2, quandoque biguttulatis, hyalinis.

Hab. in foliis vivis *Proustiæ pirifoliæ*, Cerro Caracol de Concepción Chile Amer. austr.

122. **Phyllosticta Proustiæ** Speg., Myc. Argent. V, p. 338, in An. 6223

Mus. Buenos Aires XX (1910). — Maculis amphigenis indeterminatis, leniter fuscescentibus, confluendo difformibus, 3-15 mm. diam.; pycnidiiis confertis, amphigenis, innatis, 75-80 μ . diam., lenticularibus, velatis, obsolete ostiolatis, contextu parenchymatico olivaceo; sporulis linearibus, apicibus sæpe lenissime incrassatis obtusisque, 5-7 \vee 1,5, eguttulatis, hyalinis.

Hab. in foliis vivis *Proustiæ ilicifoliæ* in dumetis prope Cacheuta, Mendoza, Argentina.

123. **Phyllosticta Pitcheriana** Fairm., Ann. Mycol. VIII, (1910) p. 324. 6224

— Maculis brunneis, primo purpureo-cinctis, rotundatis v. irregulares; pycnidiiis minutis, sparsis, epiphyllis; sporulis oblongo-cylindraceis, utrinque rotundatis, continuis, hyalinis, 6-7 \vee 3-4.

Hab. in foliis vivis *Heliosidis Pitcherianæ* cultæ, Lyndonville, New York, Amer. bor.

124. **Phyllosticta Garretii** Syd., Ann. Myc. VI (1908) p. 484. — Ma- 6225 culis amphigenis, orbicularibus, usque ad 1 cm. diam., flavidis, me- dio dein arescentibus; pycnidiis amphigenis, punctiformibus, gre- gariis, nitidis, globosis, 60-100 μ . diam., poro rotundo lato pertu- sis; sporulis cylindraceis, continuis, eguttulatis, 3-4 \approx 1.

Hab. in foliis *Senecionis disparis*, Big Cottonwood Ca- nyon, Utah Amer. bor. (A. O. GARRETT).

125. **Phyllosticta eupatoricola** Kab. et Bub., Myc. Beitr., Hedwigia 6226 Bd. XLVI (1907) p. 288. — Maculis epiphyllis sparsis, irregula- ribus, nervis limitatis, subpolygoniis, 2-4 mm. latis, sæpe conflu- entibus, sordide obscure brunneis; pycnidiis epiphyllis, immersis, globosis, parum depresso-epidermide tectis, dein apiculo subco- nico erumpentibus, crebris, confluentibus, 50-85 μ . diam., brunneis, diu clausis, demum apice apertis, contextu parenchymatico pallide brunneo; sporulis bacillaribus, 3-4 \approx 1-1,5, rectis v. curvulis, utrin- que rotundatis, subincrassatis, biguttulatis.

Hab. in foliis *Eupatorii cannabini* prope Turnau Bohemiae (KABAT). — A *Ph. eupatorina* et *Ph. Eupatorii* forma et ma- gnitudine sporarum distincta.

126. **Phyllosticta Asterisci** Speg., Fungi Chilenses (1910) p. 137. — 6227 Maculis amphigenis rotundatis, 3-8 mm. diam., subdeterminatis, fuscis; pycnidiis amphigenis minutis lenticularibus, 50-60 μ . diam., epidermide tectis, ostiolatis, obscuris, membranaceis; sporulis ellipsoideis, hyalinis, 3-5 \approx 1,5-2.

Hab. in foliis vivis *Asterisci chilensis*, Cerro Caracol de Concepcion, Chile, Amer. austr.

127. **Phyllosticta Arnicæ** (Fuck.) Sacc. — Syll. III, p. 45. — Huc 6228 verisimilime ducendum est *Coniosporium Arnicæ* Lib. in Pl. crypt. Ardenn. exs. n. 382. Cfr. Sacc. Funghi delle Ardenne in Malp. I (1888) p. 14 (extr.).

128. **Phyllosticta doronicella** R. Maire ad int., Champ. Asie Mineure, 6229 Bull. Soc. Sc. d. Nancy (1906), Extr. pag. 7. — Maculis nigris, valde limitatis, hypophyllis; pycnidiis globosis, atro-brunneis, a- pice pertusis, epapillatis; sporophoris brevibus, hyalinis; sporulis hyalinis, ovoideis v. cylindraceis, levibus, 5 \approx 1; mycelii membra- crassa intus brunnea extus pallidiore; peritheciis immaturis con- comitantibus.

Hab. in foliis vivis v. languidis *Doronici Thirkei*, in M. Olympo Bithynico 1700 m. alt. Anatolia.

129. **Phyllosticta doronicigena** Bubák, Beitr. Pilzfl. Ung., in Növé- 6230
nytani Közlemények (1907) Heft 4, Extr. p. 23. — Pycnidiis glo-
bosis, subepidermicis, dein erumpentibus et ostiolo conoideo promi-
nentibus, nigris, 90-120 μ . latis, confertis, contextu nigrescente;
sporulis bacillaribus, 3-4,5 \times 1, rectis, biguttulatis; sporophoris co-
noideo-papilliformibus, minutis, flavidis.

Hab. in foliis vivis *Doronici cordati* in Suskuluj prope
Herkulesfürdö Hungariæ. — In superficie plagularum *Fusicladii*
Aronici (Fuck.) Sacc.

130. **Phyllosticta flourensiicola** Spèg., Fungi Chilenses (1910) p. 137. 6231
— Maculis amphigenis plus v. minus rotundatis, 1-7 mm. diam.,
cinerescenti-arescentibus determinatis, areola angusta subpurpura-
scenti cinctis; pycnidiis gregariis, innato-erumpentibus, membra-
naceis, ostiolatis, lenticularibns, 60-75 μ . diam., nigrescentibus;
sporulis ellipsoideis v. ovoideis non v. 2-guttulatis, hyalinis, 2-
4 \times 1,5-3.

Hab. in foliis *Flourensiæ thuriferæ*, Cerro Caracol de
Concepcion, Chile, Amer. austr.

131. **Phyllosticta Mulgedii** Davis, Trans. Wiscons. Ac. of Sc. XVI, Pt. 6232
II (1909) p. 761. — Maculis irregularibus, obscure brunneis, immar-
ginatis, 1-3 cm. diam.; pycnidiis epiphyllis, inconspicuis, sparsis,
brunneis, globosis, 75-100 μ ; sporulis hyalinis, ellipsoideo-oblon-
gis v. globosis, 3-7 \times 3, plerumque biguttulatis et demum proba-
biliter septatis.

Hab. in foliis *Lactucæ leucophææ*, Racine Amer. bor.

132. **Phyllosticta Taraxaci** Hollós, Ann. Mus. Nat. Hung. V (1907) 6233
p. 456. — Maculis irregularibus, cinereis, nigro-cinctis; pycnidiis
epiphyllis sparsis, lenticularibus, brunneis, poro pertusis, 80-90 μ .
diam., contextu parenchymatico; sporulis ellipsoideis, biguttulatis,
continuis, dilute ochraceis, 5-6 \times 1,5-2.

Hab. in foliis vivis *Taraxaci officinalis* prope Kecskemét
Hungariæ.

133. **Phyllosticta Tassiana** Sacc. et Trav. — Syll. XX, pag. 389 — 6234
Ita dicatur *Phyll. Aristolochiæ* Tassi (1896) — Syll. XIV, p. 860
— non *Ph. Aristolochiæ* Mass. (1888).

134. **Phyllosticta Aristolochiæ** Mass. in Bull. Soc. Bot. Ital. XX (1888) 6235
pag. 439, fig. II. — Maculis et pycnidiis non descriptis; sporulis
oblongis v. teretiusculis v. ovoideis, 2-3-guttulatis, hyalinis, in-

terdum curvulis, 4-8 \approx 2,5-3,5, germinando saccharomycetiformibus.

Hab. in foliis *Aristolochiae Clematitis* in agro Veronensi Italiæ bor.

135. **Phyllosticta Asclepiadearum** West. — Syll. III, p. 52. — var. 6236
minor Rota-Rossi, Atti R. Ist. Bot. Pavia ser. II, v. IX (1905)
 p. 12. — A typo differt pycnidiis punctiformibus 80 μ . diam.;
 sporulis minimis botuliformibus, 3-5 \approx 1.

Hab. in foliis *Cynanchi Vincetoxicii*, Palazzago Bergamo Italia bor.

136. **Phyllosticta dimorphospora** Speg., Mycet. Argent. V, p. 334, in 6237
 An. Mus. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus pallescentibus, subindeterminatis, bullosis, 3-10 mm. d.;
 pycnidiis epiphyllis, innato-erumpentibus, nigris, laxe gregariis,
 membranaceis, subastomis, 90-100 μ . diam., contextu rufescente indistincto; sporulis in eodem pycnidio biformibus, alteris majusculis 16-20 \approx 4, alteris minimis, 3-4 \approx 1,5, omnibus subcylindraceis, eguttulatis, hyalinis.

Hab. copiose ad folia viva *Chenopodii hircini* in ruderatis prope La Plata Argentinæ.

137. **Phyllosticta Spinaciæ** A. Zimmermann in Verhandl. naturf. 6238
 Ver. Brünn XLVII (1908-1909) p. 30, t. I, f. 6 (extr.). — Maculis magnis saepe maximam partem foliorum occupantibus, flaveolis; pycnidiis epiphyllis, sparsis aut secundum nervos dispositis, prominentibus, globosis, nigris, pertusis, 150-170 μ . diam.;
 sporulis cylindraceis vel ovoideis, saepe irregularibus, 5-6 \approx 3-4, decoloribus, interdum guttulatis.

Hab. in foliis vivis *Spinaciæ oleraceæ* cultæ prope Eisgrub Austriæ.

138. **Phyllosticta atriplicicola** Speg., Mycet. Argent. V, p. 330, in 6239
 An. Mus. Buenos Aires, XX (1910). — Maculis orbicularibus, amphigenis determinatis, subcinerescentibus, eximie determinatis, 3-6 mm. diam.; pycnidiis epiphyllis sublenticularibus, 75-80 μ . diam., innato-erumpentibus, minute ostiolato-pertusis; contextu parenchymatico denso, olivaceo; sporulis elliptico-cylindraceis, pusillis, eguttulatis, 5-8 \approx 3, hyalinis, utrinque obtusis.

Hab. ad folia viva v. languida *Atriplicis hastatae* prope La Plata, Argentina.

139. **Phyllosticta Rivinæ** Speg., Myc. Argent. V, pag. 339, in An. 6240
 Mus. Buenos Aires, XX (1910). — Maculis orbicularibus, determi-

natis, albicantibus, areola diffusa subpurpurascente cinctis, 5-10 mm. diam.; pycnidiis epiphyllis, subepidermicis, lenticularibus, 60-80 μ . diam., contextu tenui, minute parenchymatico, fuligineo, ostiolo parvo rotundo; sporulis elongato-ellipsoideis, subacutiuscule rotundatis, 4-6 \times 1,5, saepius grosse 2-guttulatis, hyalinis, in sporophoris filiformibus, 20 \times 1 acrogenis.

Hab. ad folia viva *Rivinæ levæ* in dumetis Metán Salta, Argentina.

140. **Phyllosticta ? Boërhaviæ** Speg., Mycet. Arg. V, p. 330, in An. 6241 Mus. Buenos Aires XX (1910), — Maculis amphigenis, orbicularibus, albescensibus, areola livescente cinctis, 1-3 mm. diam.; pycnidiis epiphyllis, late ostiolato-pertusis, atris, 100-150 μ . diam., contextu parum distincte parenchymatico, olivaceo, ostiolo 20 μ . diam.; sporulis superne rotundatis, obovato-subclavulatis, continuis v. diblastis, 8-11 \times 3, hyalinis.

Hab. ad folia viva *Boërhaviæ pulchellæ* in pratis prope Jujuy, Argentina.

141. **Phyllosticta Tricyclæ** Speg., Myc. Argent. V, pag. 340, in An. 6242 Mus. Buenos Aires, XX (1910). — Pycnidiis hinc inde dense gregariis, amphigenis v. hypophyllis, atris, subepidermicis, sublenticularibus, 75-120 μ . diam., folia tota cinerescentia arescendo efficiensibus; ostiolo impresso mediocri, pertuso; contextu parenchymatico olivaceo; sporulis cylindraceis minimis, eguttulatis, lenissime inæquilateris, hyalinis, 2-5 \times 1.

Hab. ad folia languida *Tricyclæ spinosæ* in montanis Cacheuta pr. Mendoza, Argentina.

142. **Phyllosticta ? Artocarpi** Speg. Mycet. Arg. V, p. 330, in An. 6243 Mus. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus determinatis, albidis, margine latiusculo atro cinctis, 5-10 mm. diam.; pycnidiis innato-erumpentibus, epiphyllis, minutis, atris, 80-100 μ . diam., ostiolo lato obsoleto impresso pertusis; contextu indistincto, fuligineo, superne subincompleto; sporulis ellipsoideis, non v. leniter obovatis, submediocribus, grosse 1-guttulatis, 12-14 \times 5-6, hyalinis.

Hab. ad folia viva *Artocarpi integrifoliæ* in horto San Lorenzo, Salta Argentinæ. — Ad *Glæosporium* vergit.

143. **Phyllosticta Acanthosyridis** Speg., Myc. Arg. V, p. 329, in An. 6244 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis albescensibus, subdeterminatis, 3-7 mm. diam.; pycnidiis epiphyllis, sparsis, innato-erumpentibus, atris, pusillis, 90-120 μ . diam., sub-

lenticularibus, contextu minute parenchymatico, fuligineo; sporulis elliptico-subcylindraceis, utrinque acutiusculis, leniter inæquilateralibus, minute biguttulatis, 8-10 \approx 2,5-3, hyalinis.

Hab. ad folia viva *Acanthosyridis falcatae*, Rio Caimancito, Salta, Argentina.

144. **Phyllosticta Talæ** Speg., Myc. Argent. V, p. 340, in An. Mus. 6245

Buenos Aires, XX (1910). — Maculis amphigenis orbicularibus subdeterminatis exareolatis, subcinerescentibus, 5-15 mm. diam., sæpe lineis v. rugulis tenuissimis concentricis notatis; pycnidiis epiphyllis subepidermico-erumpentibus, lenticularibus, 80-90 μ . d., ostiolo latiusculo, 15 μ . diam. pertusis, contextu subolivaceo parenchymatico; sporulis ellipsoideis utrinque obtusiusculis, 5-8 \approx 2,5-3, biguttulatis, hyalinis.

Hab. ad folia viva v. languida *Celtidis Talæ* in silva Santa Catalina, Buenos Aires, Argentina.

145. **Phyllosticta immersa** Bubák, Beitr. Pilzfl. Ung., in Novénytani 6246

Közlemények (1907) Heft 4, Extr. pag. 25. — Maculis foliicolis utrinque visilibus, rotundato-sinuatis, parvis, 1-3 mm. diam., indistincte limitatis, primum viridibus demum arescendo alutaceis, sparsis; pycnidiis sparsis, in mesophyllo immersis, epidermidem pustulatam efficientibus, globosis, 80-120 μ . latis, brunneis, contextu parenchymatico, pallide brunneo, poro minuto obscuriore papilliformi prominentibus; sporulis ex ellipsoideo elongatis, 4,5-7,5 \approx 3-4,5, utrinque rotundatis, olivaceo-brunneis.

Hab. in foliis vivis *Celtidis australis* prope Báziás Hungariæ. — *Ph. destruens* Desm. et *Ph. celtidicola* Bub. in *Celtide* vigentibus omnino diversæ. Ad subgenus *Phyllostictella* pertinet.

146. **Phyllosticta celtidicola** Bub. et Kab., Sechst. Beitr. Pilzfl. Tir. 6247

in Ann. Myc. V (1907) p. 42. — Maculis amphigenis varie angulosis v. plerumque irregularibus, folium plus minusve obtegentibus, ochraceis, alutaceis v. pallide brunneis, non marginatis, sæpe confluentibus, arescendo dissilientibus; pycnidiis amphigenis, sparsis v. gregariis, immersis, epidermide tectis, poro minuto rotundato apertis, globoso-depressis, 80-120 μ . diam., e brunneo obscure brunneis, contextu parenchymatico firmo; sporulis ellipsoideis v. ovoideis 6-8 \approx 3-4,5, hyalinis.

Hab. in foliis vivis *Celtidis australis*, prope Ponte Alto prope Tridentum Austriæ. — Socia *Stigmella Celtidis*. — A *Ph. destruenti* sporulis diversa.

147. **Phyllosticta guevinicola** Speg., Fungi Chilenses (1910) p. 139. 6248

— Maculis orbicularibus v. repando-diformibus, 5-20 mm. diam., amphigenis, superne cinerescentibus inferne subtabacinis determinatis, linea callosa elevata fuscula cinctis; pycnidiiis epiphyllis sparsis v. hinc inde pauci-gregariis, subglobosis, 75-90 μ . diam., atris, coriaceis; sporulis cylindraceis, rectis v. curvulis, 5-8 \times 1-1,25, hyalinis.

Hab. in foliis vivis Guévinæ Avellanæ in silvis prope Bahia de Corral, Chile, Amer. austr.

148. **Phyllosticta ambiguella** Sacc., *Ph. ambigua* Sacc. in Ann Mycol. 6249 X (1912) p. 317, nec Scalia (1909). — Maculis amplis ex oblongo irregularibus, epiphyllis, superne albis, inferne pallide alutaceis, margine angustissimo rufulo cinctis, 3-6 cm. long.; pycnidiiis epiphyllis, dense gregariis, subcutaneo-erumpentibus, depresso globosis, 90-150 μ . diam., poro lato impresso pertusis; sporulis oblongo-fusoideis, utrinque acutiusculis, 8 \times 2,5, hyalinis, subrectis, utrinque minute guttulatis; sporophoris dense fasciculatis, bacillaribus, inaequilongis, 10-20 \times 2,5, hyalinis.

Hab. in foliis languidis Fici rubiginosæ v. affinis in Horto bot. Patareno, Ital. bor. — Maculæ et pycnidia *Phyllostictæ*, fructificatio vero potius *Phomopsisidis*.

149. **Phyllosticta Elasticæ** Koord., Botan. Untersuch. (1907) p. 203. 6250

— Maculis vagis v. nullis; pycnidiiis epiphyllis, epidermide tectis, globulosis, subcarbonaceis, gregariis v. sparsis, poro circulari pertusis, 50-150 μ . diam., glabris; sporulis ovoideis v. oblongis, 2,5 \times 1,5-1,75, continuis, hyalinis, sporophoris inconspicuis.

Hab. in foliis siccis emortuis Fici elasticæ prope Loano prov. Kedu, Java (KOORDERS).

150. **Phyllosticta convexula** Bubák, Journ. of Mycol. XII (1906) 6251 p. 52. — Maculis brunneolis, indeterminatis v. nullis; pycnidiiis hypophyllis primum subepidermicis dein apice conoideo prominentibus, globosis, parum depresso, demum late apertis, 60-100 μ . latis, nigris, contextu indistincto parenchymatico flavo-brunneo, basi obscuriore; sporulis bacillaribus 1,5-2 \times 1, hyalinis; sporophoris hyalinis cylindraceis.

Hab. in foliis Caryæ tomentosæ, Missouri Emma Salina Co. Amer. bor. (C. H. DEMETRIO). — Socia *Sphærella convexula* (Schw.) Thüm.

151. **Phyllosticta Broussonetiæ** Trav. et Migliardi, Flora micol. prov. Venezia, p. 11 (1911). — Maculis per totum foliorum marginem plerumque expansis, irregularibus, $1\frac{1}{2}$ -1 cm. latis, exaridis, albido-

cremeis, tenuiter hinc inde lateritio-marginatis, fragilibus; pycnidiiis epiphyllis, dense sparsis, punctiformibus, nigris, erumpentibus, globoso-depressis, 200-300 μ . diam., distincte et minute ostiolato-papillatis, contextu pseudoparenchymatico nigricante; sporulis cylindraceo-ellipsoideis, rectis, rarius leniter curvulis, continuis, hyalinis, haud raro 2-guttulatis, 8-12 \approx 2¹/₂-3; sporophoris non visis.

Hab. in foliis vivis *Broussonetiæ* papyriferæ prope S. Elisabetta di Lido, Venetiis, Ital. bor.

152. **Phyllosticta Langarum** Ferr., Malpighia XX (1906) p. 146. — 6253

— Maculis candidis, brunneo-marginatis, irregulariter rotundatis, 4-8 mm. diam.; pycnidiiis minutis, sparsis, membranaceis, poro magno, rotundato pertusis, 140-190 μ . diam.; sporulis hyalinis, cylindrico-rotundatis, 6-7 \approx 3-3,5, eguttulatis.

Hab. in foliis Mori albæ, Alba in Pedemontio. — *Ph. moricola* proxima, a qua differt pycnidiiis majoribus et colore macularum.

153. **Phyllosticta consors** Saccardo, Microm. Amer. novi, Journ. of 6254

Myc. v. XII (1906) p. 51. — Pycnidiiis hypophyllis, raro et epiphyllis, in maculis *Phleospora Mori* hinc inde dense aggregatis, globulosis, prominulis, 70-80 μ . diam., ostiolo exiguo impresso; sporulis ellipsoideo-oblongis, saepe curvulis, 4-4,5 \approx 2-2,1, hyalinis, minutissime 2-guttulatis.

Hab. in maculis ochraceo-brunneis *Phleosporæ Mori*, ad folia Mori albæ cultæ, Tenancingo, Mexico (BONANSEA).

154. **Phyllosticta Quercus-cocciferæ** Bubák, Bull. Herb. Boiss. 2 sér. 6255

VI (1906) p. 405. — Maculis rotundatis v. irregulariter angulosis, 2-4 mm. latis, albis, arescendo subpellucidis, tenuiter purpureo-brunneo-marginatis; pycnidiiis subepidermicis, demum erumpentibus, globosis v. subdepressis, 180-350 μ . latis, contextu crasso, infra castaneo-brunneo supra nigrescente, minute parenchymatico; sporulis breviter cylindraceis, elongatis v. fusoideis, 5-7,5 mm. longis, 2-2,5 μ . cr., apice rotundatis v. tenuiter angustatis, guttulatis, leniter viridulis; sporophoris cylindraceis 8-10 \approx 2-2,5.

Hab. in foliis vivis senioribus *Quercus cocciferæ* prope Ulcinj Montenegro.

155. **Phyllosticta phæospora** Scalia ap. Lopriore Rass. fitopatol. in 6256

Boll. Minist. Agric. VIII, vol. II (1909) p. 12 (extr.). — Maculis exaridis, albidis, sparsis v. raro confluentibus, irregularibus; pycnidiiis profunde immersis, globosis, ostiolo conico, atro, erum-

pente, 100-110 μ . diam.; contextu tenui, parenchymatico, subolivaceo; sporulis ovoideis, 4-5 \approx 3-3,5, chlorino-fuscidulis.

Hab. in foliis *Quercus Ilicis*, Mascalucia, Catania Siciliæ. — A *Ph. Quercus-Ilicis* et *Ph. ilicina* satis diversa. Ad subgen. *Phyllostictella* Tassi spectat.

156. **Phyllosticta Bresadoleana** Bub. et Kab., Fünft. Beitr. Pilzfl. Tir. 6257 in Ber. naturw.-med. Ver. Innsbruck, XXX Jahrg. (1905-1906) Extr. p. 8. — Maculis epiphyllis, utrinque visilibus, solitariis v. sparsis, plerumque minutis, usque ad 5 mm. latis, orbiculatim v. subpolygonæ dispositis, brunneis v. subalutaceis, anguste brunneo-purpureo-marginatis, nervis limitatis; pycnidiiis plerumque hypophyllis, raro epiphyllis, in maculis sparsis, quandoque binis v. pluribus confluentibus, subepidermicis, 120-250 μ . diam., globosis, e succineo obscure brunneis, primum clausis dein late apertis; sporulis ellipsoideis v. breviter cylindraceis, utrinque leniter angustatis, rotundatis, 4-7 \approx 2-2,5, rectis, hyalinis, biguttulatis, in circum brevem crassum productis; sporophoribus filiformibus rectis, 10-12 \approx 1,5-2.

Hab. in foliis vivis *Quercus pubescens*, prope Ponte alto, Tirolia aust. — Socium adest *Camarosporium Oreades*.

157. **Phyllosticta salicina** Kabát et Bubák, Hedwigia XLIV (1905) 6258 p. 351. — Maculis epiphyllis utrinque visilibus, angulosis v. rotundato-angulosis, nervis limitatis, e brunneo nigro-brunneis, confluentibus, magnis; pycnidiiis plerumque hypophyllis, confertis, quandoque confluentibus, immersis, epidermide tectis, udis pustuliformibus siccis plicatis et plerumque collabescentibus, globoso-compressis, 60-120 μ . diam., obscure brunneis, poro rotundato papilliformi apertis, contextu tenui parenchymatico, hyalino v. pallide brunneo; sporulis breviter subcylindraceis 3-4,5 \approx 1-1,5, rectis v. curvulis, utrinque rotundatis, hyalinis, unilocularibus, minute guttulatis; sporophoribus brevibus hyalinis.

Hab. in foliis emortuis *Salicis albæ* prope Turnau Bohemia (KABAT).

158. **Phyllosticta iserana** Kabát et Bub., Hedwigia, XLVII (1908) 6259 p. 454; Fungi imperf. exsicc. fasc. XI (1909) n. 501. — Maculis epiphyllis, singulis v. gregariis, raro binis v. paucis confluentibus, rotundatis v. rotundato-angulosis, siccis alutaceis v. brunneo-griseis, modice purpureo-brunneo- v. nigro-marginatis; pycnidiiis numerosis, sparsis, quandoque gregariis, immersis, epidermide tectis, poro papilliformi erumpentibus, brunneis, subglobosis, 120-180 μ .

diam., contextu grosse parenchymatico, pallide brunneo; sporulis numerosis, ovoideis, ellipsoideis v. breviter cylindraceis, 5-8 \approx 2-3, rectis v. curvulis, utrinque rotundatis, hyalinis; sporophoribus brevibus, papilliformibus.

Hab. in foliis vivis Salicis fragilis prope Turnau Bohemia (KABAT). — A ceteris speciebus salicicolis distincta.

159. **Phyllosticta apicalis** Davis, Trans. Wisconsin Ac. of Sc. XVI, 6260 Pt. II (1909) p. 761. — Maculis brunneis plerumque secus nervum medium extensis, basi quandoque angustatis, immarginatis; pycnidiis numerosis, amphigenis, obscure brunneis v. nigris, ostiolatis; sporulis ex oblongo ovoideis, hyalinis, continuis, 4-7 \approx 1-3.

Hab. in foliis Salicis lucidæ, Dousman Amer. bor.

160. **Phyllosticta Taxi** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 6261 p. 3. — Maculis amphigenis, ochraceis, apicem foliorum occupantibus; pycnidiis epiphyllis, sparsis, epidermide velatis, lenticularibus, dilute umbrinis, poro pertusis, 170-210 μ . diam., contextu celluloso; sporulis ellipsoideis v. ovoideis, continuis, hyalinis, 6-8 \approx 3,5-4.

Hab. in foliis languidis Taxi baccatæ prope Kecskemét Hungariæ.

161. **Phyllosticta Stangeriæ** H. Zimmermann, in Verhandl. naturf. Ver. Brünn XLVII (1908-1909) pag. 31, t. I, f. 1-2 (extr.). — Maculis majusculis, ochraceis, ad marginem foliorum plerumque sitis; pycnidiis usque ad 425 μ . diam., epiphyllis, nigris, globosis; sporulis 6-8 \approx 2,5, cylindraceis, uno fine angustatis, 2-3-guttulatis; sporophoribus decoloribus, septatis, 30-40 \approx 1,5.

Hab. in foliis vivis Stangeriæ paradoxæ in tepidario cultæ Eisgrub Austriae.

162. **Phyllosticta sabalicola** Szabó, Annal. d. k. k. naturhist. Hofmus. 6263 Wien Bd. XVIII, p. 356 (1903) et Crypt. exs. n. 828. — Pycnidiis globuloso-depressis, punctiformibus, atris, parenchymate innatis, epiphyllis, cuticula hyalina tectis, epidermidem subelevantibus et irregulariter dehiscentibus, plerumque sparsis, sed hinc inde lineariter dispositis, diametro 300-500 μ ; sporulis oblongo-ellipsoideis, subchlorinis, 13-15 \approx 4-5, eguttulatis, hyphis non visis.

Hab. in petiolis exsiccatis Sabalis Blackburnianæ Glazbr. in calidariis horti botanici Universitatis Budapest Hungariæ (J. SZABÓ).

163. **Phyllosticta valparadisiaca** Speg., Fungi Chilenses (1910) p. 140. 6264 — Maculis amphigenis orbicularibus, 1 3 mm. diam., fuscescentibus, margine callosulo limitatis; pycnidiis paucis (2-3) innatis, len-

ticularibus, 60-80 μ . diam., minute ostiolatis, membranaceis, olivaceis; sporulis elongato-ellipsoideis, hyalinis, utrinque rotundatis, 4-6 \approx 1.

Hab. in foliis Orchidaceæ terrestris cujusdam, Cerro Alegræ de Valparaiso Chile, Amer. austr.

164. **Phyllosticta Acoridii** P. Henn., Hedwigia XLVII (1908) p. 262. 6265

— Maculis amphigenis, rotundatis, incrassatis, rufo-brunneis v. hyalinis, exaridis, atro-cingulatis; pycnidiis singularibus (rarissimis) lenticularibus, atris, c. 50 μ ; sporulis oblonge cylindraceis, obtusis, hyalinis, 4-5 \approx 0,8.

Hab. in foliis Acoridii, Mindanao, Mt. Mohisdang ins. Philippin. (MEARUS).

165. **Phyllosticta Bletiæ** H. Zimmermann, in Verhandl. naturf. Ver. 6266

Brünn, XLVII (1908-1909) p. 27 (extr.) t. I, f. 4-5. — Pycnidiis in maculis magnis, ochraceis v. albidis, nigro-purpureo-marginalis, utrobique dispositis, globosis, 130-150 μ . diam., cum ostiolo 10 μ . lato; sporulis ovoideis 6-7 \approx 3,4-4, decoloribus.

Hab. in foliis vivis Bletiæ (Bletillæ) hyacinthinæ cultæ in calidario in Eisgrub Austria.

166. **Phyllosticta Dracænæ** Griff. et Maubl. Bull. Soc. Myc. France, 6267

XXV (1909) p. 239, t. 27, f. 2. — Maculis magnitudine forma-que irregularibus, amphigenis, fulvis, linea angusta, elevata vix obscuriore cinctis; pycnidiis sparsis, amphigenis, minutissimis, immersis, poro apertis; sporulis cirrose expulsis, hyalinis, oblongis, eguttulatis, 5-7 \approx 2-2,5.

Hab. in foliis vivis Dracænæ sp. cultæ pr. Parisios Galliæ.

167. **Phyllosticta Draconis** Berk. in Welw. F. Port. p. 5 — Syll. III, 6268

p. 60 (sine diagn.) — Cooke, Fung. Pests p. 169, t. XV, f. 25.

— Maculis amphigenis, irregularibus, pallidis, purpureo-marginalis; pycnidiis sparsis, minutis, sphæroideis, innatis, epidermide initio velatis; sporulis profusis, minutis, ellipsoideis, hyalinis, demum eructatis, 7 \approx 3.

Hab. in foliis Dracænæ Draconis, D. terminalis, D. Cooperi in Lusitania, Gallia, Britannia. Species valde noxia. — Verisimiliter *Phyll. maculicola* Halst. in N. J. Agric. Exp. St. Rep. IV (1893) p. 412 et Dugg. Pl. Dis. p. 347, f. 168 (hab.), in foliis Dracænæ et Cordylinæ cultarum et æque noxia, in calidariis Amer., bor. ab hac non differt.

168. **Phyllosticta pallidior** Peck, New York State Mus. Bull. n. 105 6269

(381) (1906) p. 26. — Maculis ellipticis v. orbicularibus, 5-10 cm.

long., 3,5-7,5 cm. latis, albidis v. griseis, rubido-marginatis; pycnidiiis minutis, epiphyllis, centrum macularum occupantibus, nigris; sporulis globosis v. late ellipsoideis, 10-13 \approx 7-10.

Hab. in foliis vivis Wagneræ stellatae, Bergen Swamp Amer. bor. — *Ph. cruentæ* affinis.

169. **Phyllosticta Funkiae** Ferraris, Malpighia XX (1906) p. 146. — 6270
Maculis pallidis, brunneo-zonato-marginatis, irregularibus; pycnidiiis epiphyllis, gregariis, pallidis, fere roseis, minutis, membranaceis, eximie perforatis, 115-150 μ . diam.; sporulis hyalinis, obovatis v. cylindraceis, apice rotundatis, numerosissimis, eguttulatis, 9-11 \approx 3-3,5; sporophoris brevissimis.

Hab. in foliis Funkiae ovatae cultæ in hortis, Alba Pedemontii Italiæ bor.

170. **Phyllosticta Crini** Sacc., Ann. Mycol. VI (1908) p. 555. — Ma- 6271
culis amphigenis, superne bullatis, suborbicularibus, 2-5 mm. d., alutaceis dein centro expallentibus; pycnidiiis paucis, epiphyllis, globoso-depressis, punctiformibus, atris, 60-80 μ . diam.; sporulis ovoideis, hyalinis, 3 \approx 1.

Hab. in foliis languidis Crini sp. in Horto bot. Panormitano, Sicilia (J. H. MATTEI).

171. **Phyllosticta Bromeliæ** Alm. et Cam., Bol. Soc. Brot. XXV (1908- 6272
1909), Extr. p. 25. — Maculis amphigenis, indeterminatis, albescenscentibus; pycnidiiis epi-hypophyllisve, subglobosis, nigris, innatis, plerumque sparsis v. raro gregariis, poro pertusis, 150-200 μ . d.; sporulis ellipsoideis, hyalinis, continuis, biguttulatis, utrinque attenuatis, 8-10 \approx 3.

Hab. in foliis Bromeliæ Acangæ in Horto bot. Coimbra Lusitania (A. MOLLER).

172. **Phyllosticta Dioscoracearum** Bacc., Funghi Schen-si sett., Nuovo 6273
Giorn. bot. it. N. S. v. XII (1905) p. 697. — Maculis amphigenis, suborbicularibus, minutis, margine crassiore, arescendo griseis, non areolatis; pycnidiiis minimis orbicularibus, contextu tenui parenchymatico, membranaceis, pallidis, 38 μ . latis, ostiolo minuto pertusis, epiphyllis in quaque macula singulis; sporulis continuis 10-11 \approx 3,8-4.

Hab. in foliis Dioscoreaceæ cujusdam, ad In-kia-po Sinæ.

173. **Phyllosticta Cavaræ** Trinchieri, Rend. Ac. Sc. Fis. Napoli 6274
(1909) fasc. 3-4, marzo-aprile p. 89. — Maculis amphigenis, irregularibus, sinuosus, copiosissimis, sparsis confluentibusque, plerumque folium late occupantibus, initio flavescentibus, dein brunneo-

cinereis vel sordide albicantibus, margine distincto, elevato, castaneo cinctis, aridis, $\frac{1}{2}$ -14 cm. diam., 1-16 cm. longis; pycnidiis dense gregariis, punctiformibus, atris, subcutaneo-erumpentibus, globuloso-depressis, poro ampliusculo hiantibus, 245-367 μ . diam., 220-245 μ . altis, excipulo firmulo, parenchymatico, fuligineo donatis; sporulis elongato-ellipticis, utrinque rotundatis, exquisite 2-3-guttatis, hyalinis, 7-12 \times 2-4,5.

Hab. in foliis vivis Anthurii crassinervii culti in calidario Horti regii botanici neapolitani Ital. austr. (TRINCHIERI).

174. **Phyllosticta Tuzsonii** Bubák, Beitr. Pilzfl. Ung., in Növénytani Közlemények (1907) Heft 4, Extr. pag. 27. — Maculis foliicolis utrinque visilibus, elongatis v. irregularibus, flavo-ochraceis, indistincte limitatis, demum arescendo albidis, sparsis; pycnidiis in mesophyllo immersis, utrinque prominulis, globosis, 150-220 μ . diam., flavo-ochraceis, contextu tenui parenchymatico flavidio, poro breviter papilliformi; sporulis bacillaribus, 4-5 \times 2-2,5, rectis, raro curvulis v. irregularibus, utrinque rotundatis, guttulatis, hyalinis.

Hab. in foliis vivis Ari italicici in Suskuluj prope Herkulesfürdö Hungariæ. — A *Ph. aricola* Bub. pycnidiis majoribus, pallidioribus sporulisque minoribus diversa.

175. **Phyllosticta aricola** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 6276 p. 404, tab. 15, fig. 1-2. — Maculis rotundatis v. elongatis, 4-7 mm. latis, sparsis, e medio albo-arescentibus, mox brunneis, obscure marginatis, saepè concentrica zonatis; pycnidiis epiphyllis in maculis sparsis, plus v. minus gregariis, 100-150 μ . latis, obscure brunneis, globoso-depressis, in mesophyllo immersis epidermidem vix lacerantibus; contextu pallide brunneo apice obscuriore, intus subhyalino; sporulis breviter cylindraceis, 5-9 \times 2,3, utrinque rotundatis, hyalinis, unilocularibus.

Hab. in foliis vivis Ari italicici prope Ulcinj Montenegro.

176. **Phyllosticta colocasicola** v. Höhn., Sitzb. k. Ak. d. Wiss. Wien CXVI (1907) p. 142. — Maculis nullis; pycnidiis sparsis v. paucis gregariis, amphigenis, nigris, punctiformibus, globosis, subepidermicis, distincte ostiolatis, 100-120 μ . diam., obscure brunneo-membranaceis, distincte parenchymaticis; sporulis hyalinis, contentu granuloso, ovoideis, 10 \times 5-6; sporophoris brevissimis.

Hab. in foliis languidis Colocasiæ sp., Malisa in ins. Samoa (RECHINGER).

177. **Phyllosticta Colocasiæ** v. Höhnel, Fragm. z. Mykol., Sitzb. k. Ak. d. Wiss. Wien Bd. CXVI, Abt. I (1907) p. 142. — Maculis

amphigenis, numerosis, rotundatis, brunneis, obscure marginatis, concentrica sulcato-zonatis, 3-7 mm. lat.; pycnidiis amphigenis, copiosis, sub stomatibus immersis, tenui-membranaceis, obscure brunneis, globosis, 70 μ . circ. latis; sporulis hyalinis, rectis, cylindraceis, apice parum incrassatis, 3-4 \times 1; sporophoris brevissimis.

Hab. in foliis languidis *Colocasiæ* sp., Malifa in ins. Samoa (RECHINGER). — Cum *Cercospora Caladii* Cke. var. *Colocasiæ* v. Höhn. verisimiliter metagenetice connectitur.

178. **Phyllosticta Turconii** Trinchieri, in litt. 27 Jul. 1909, *Phyll.* 6279
Philodendri Turconi, in Atti R. Ist. bot. Pavia (1905) p. 314-318, tab. XXI, fig. 11-13, non *Phyll. Philodendri* Allesch. — Syll. XI, p. 482. — Maculis initio brunneis, zona lutea circumscriptis, subrotundis, arescendo albo-griseis, fusco- vel purpureo-marginatis, maximis (aliquando totum folii limbum invadentibus); pycnidiis plerumque irregulariter sparsis v. subconcentrica dispositis, innato-erumpentibus, 170-200 μ . diam., globosis v. globoso-lenticularibus; sporulis magnis, cylindraceo-ellipsoideis, granulosis, 18-20 \times 5-7, hyalinis; sporophoris brevibus v. nullis.

Hab. in foliis *Philodendri* bipinnatifidi culti in horto botanico, Pavia Italiæ borealis

179. **Phyllosticta saccharicola** P. Henn., in Fl. du Bas et Moy.-Congo, 6280 v. II, fasc. II (1907) pag. 105. — Maculis amphigenis, oblongis, pallidis, exaridis, margine fuscidulo v. sanguinolento cinctis; pycnidiis hypophyllis, subgregariis, lenticularibus, atris, vertice pertusis, 60-90 μ ; sporulis oblongis, subfusoideis, hyalinis, 2-3-guttulatis, 10-30 \times 3-3,5.

Hab. in foliis *Sacchari officinarum*, Kisantu Congo Africa (VANDERYST).

180. **Phyllosticta Take Miyake et Hara**, in Bot. Mag. Tokyo (1910) 6281 p. (351) [japonice].

Hab. in foliis *Bambusæ* sp., in Japonia.

181. **Phyllosticta glumarum-Setariæ** P. Henn., in Fl. du Bas- et Moy.- 6282 Congo, Ann. Mus. du Congo v. II, fasc. II (1907) pag. 101. — Maculis pallidis exaridis; pycnidiis sparsis v. subgregariis, lenticularibus, atris, vertice perforatis, atro-fuscis, 60-70 μ ; sporulis ellipsoideis, obtusis, eguttulatis, hyalinis, 3,5-4 \times 2-2,5.

Hab. in glumis *Setariæ aureæ*, Kisantu Congo, Africa (VANDERYST).

182. **Phyllosticta glumarum-Sorghii** P. Henn., in Fl. du Bas- et Moy.- 6283 Congo, Ann. Mus. du Congo, v. II, fasc. II (1907) pag. 101. —

Maculis pallidis effusis; pycnidiis sparsis v. gregariis, lenticularibus, atris, vertice perforatis, 40-60 μ . diam.; sporulis ellipsoideis, hyalinis, 1-guttulatis, 4-5 \approx 2-3.

Hab. in glumis *Sorghum vulgare*, Kisantu Congo, Africa (VANDERYST).

183. **Phyllosticta Bromi** Potebnia, Mycol. Stud., Ann. Myc. VI (1907) 6284 pag. 14 et Trav. Soc. Nat. Univ. Charkov XXXXIII (1907). — Pycnidiis sphæroideis pallide brunneis, ostiolatis, 100-140 μ . cr.; sporulis elongatis obtusatis, uni-guttulatis, 12 \approx 3.

Hab. in foliis *Bromi patuli* socia *Septoria Bromi* prope Kharkov Rossiae.

184. **Phyllosticta Miurai** I. Miyake, Pilze Reispfl. Japan (Journ. College Agric. Tokyo, II (1910) p. 253, t. XIV, f. 31-32. — Pycnidiis immersis ostiolo prominulis, ellipsoideis, nigro-brunneis, 80-125 μ . diam., 50-70 μ . alt.; sporophoris parvis; sporulis cylindraceis apice rotundatis, 3-4 \approx 1-1,5.

Hab. in foliis *Oryzae sativæ*, Kagoshima, Aichi Japoniæ (SHIRAI).

185. **Phyllosticta japonica** I. Miyake, Pilze Reispfl. Japan (Journ. College Agricult. Tokyo, II (1910) p. 253, t. XIV, f. 29-30. — Maculis effusis brunneis dein albescensibus; pycnidiis globosis v. ellipsoideis, immersis, nigris, 75-100 μ . diam., 55-90 μ . alt.; sporophoris parvis; sporulis fusoides, 7,5-10 \approx 3-4, biguttulatis.

Hab. in foliis glumisque *Oryzae sativæ*, Nara Japoniæ.

186. **Phyllosticta Danthoniæ** Speg., Myc. Arg. V, pag. 333, in An. 6287 Mus. Buenos Aires XX (1910). — Maculis nullis; pycnidiis hinc inde confertiusculis, innato-erumpentibus, nigris, subcarbonaceis, glabris, minute ostiolatis, lenticularibus, 10-150 μ . diam., velato-erumpentibus, contextu indistincto; sporulis ellipsoideis vel ob-ovatis, non vel 1-2-guttulatis, hyalinis, 5-6 \approx 3, rectis vel leniter curvulis.

Hab. ad folia vaginasque *Danthoniæ* sp. in pratis Neuquen Argentinæ. — Ad *Phomam* vergit.

187. **Phyllosticta Phari** Speg., Myc. Argent. V, p. 337, in An. Mus. 6258 Buenos Aires XX (1910). — Maculis amphigenis repandulis, determinatis, cinerescenti-albescensibus, areola angustissima rufescente cinctis, 2-15 mm: diam.; pycnidiis innatis, sparsis, epiphyllis, 50-75 μ . diam., ostiolo rotundo parvo pertusis, contextu subparenchymatico olivaceo; sporulis elliptico-cylindraceis, eguttulatis, utrinque obtusis, 4-5 \approx 2, hyalinis.

Hab. ad folia viva Phari glabri in silvis prope Tucuman Argentina.

188. **Phyllosticta kerguelensis** P. Henn., Deutsche Südpolar-Exped. 6289 Bd. VIII (1906) Extr. pag. 13, tab. II, fig. 14 *a-b.* — Maculis pallidulis v. fuscidulis, explanatis; pycnidiis innatis, subgloboso-lenticularibus, atro-fuscis, membranaceis, medio pertusis, 60-80 μ . diam.; sporulis ellipsoideis v. ovoideis, 1-guttulatis, 5-8 \times 3-3,5, hyalinis.

Hab. in foliis siccis Poæ Cookii, Kerguelen-Station (E. WERTH). — A *Ph. fuegiana* diversa.

189. **Phyllosticta paleicola** P. Henn., Deutsche Südpolar-Exped. Bd. 6290 VIII (1906) Extr. p. 13, tab. II, fig. 15 *a-b.* — Pycnidiis sparsis, innato-erumpentibus, subglobosis, vertice perforatis, atro-fuscis, membranaceis, 50-60 μ . diam.; sporulis ellipsoideis v. ovoideis, utrinque obtusis, 1-guttulatis, 5-7 \times 3-4.

Hab. in foiliis paleisque Festucæ erectæ, Kerguelen. — Socia adest *Sphaerella paleicola* P. Henn.

190. **Phyllosticta coralliolobola** Bubák et Kabát Hedw. XLIV (1905) 6291 p. 351. — Maculis amphigenis, irregularibus, elongatis, ochraceis, subferrugineis v. brunneis, demum medio præcipue pallescentibus, immarginatis; pycnidiis amphigenis, sparsis v. secus nervos sæpe lateraliter seriatis, immersis, globosis, subdepressis, 90-140 μ . d., epidermide tectis, dein erumpentibus; contextu tenui parenchymatico, flavo-brunneolo, supra obscuriore et firmiore; sporulis ex ovoideo elongatis, 4-7 \times 2-3, rectis v. curvulis, apice rotundatis, hyalinis, unilocularibus; sporophoris sporulas subæquantibus.

Hab. in foliis vivis et emortuis Typhæ latifoliæ et angustifoliæ, Bohemia (KABAT).

191. **Phyllosticta Polypodii-australis** P. Henn., Deutsche Südpolar- 6292 Exped. Bd. VIII (1906) Extr. p. 13. — Maculis griseo-pallidis, exaridis, irregularibus; pycnidiis sparsis, innatis, sublenticularibus, poro pertusis, atro-fuscis, c. 40-60 μ . cr.; sporulis ovoideis, 1-guttulatis, hyalinis, 5-6 \times 3-4.

Hab. in Polypodio australi, in ins. Kerguelen (WERTH).

192. **Phyllosticta Amphiptyrygii** Ricker, Journ. of Myc. (1905) p. 111. 6293 — Maculis subcircularibus, pallide brunneis, 2-8 mm. diam., sæpe confluentibus, tenuiter rubro-brunneo-marginatis; pycnidiis sparsis, nigris, epiphyllis, 55-80 μ . diam.; sporulis oblongis, sæpe inæquilateralibus, hyalinis, biguttatis, apice acutis, 8-10 \times 2,5-3.

Hab. in foliis *Amphipterygii amphifolii*, prope Guadalajara, Jalisco Mexico (ROOSE et PAINTER).

193. **Phyllosticta Cufiniana** Trinchieri, in litt. 27 Jul. 1909. — Sic 6294 nominanda est *Ph. Mimusopsis* Cufino — Syll. XVIII, p. 233 — non P. Henn. — Syll. XI, p. 474.

194. **Phyllosticta Berlesiana** Sacc., Notæ Myc. VIII, Ann. Myc. v. IV 6295 (1906) p. 491, tab. X, fig. 4. — Pycnidiis entomophilis, in alis Cicadæ hinc inde dealbatis laxe gregariis, amphigenis, lenticularibus, 80-120 μ . diam., poro impresso rotundo pertusis, nigricantibus; contextu distinete parenchymatico, dilute fuligineo; sporulis ellipsoideis v. ovoideis, saepe leviter inæquilateris, 7 \approx 4, farctis, hyalinis; sporophoris obsoletis.

Hab. in alis Cicadæ plebejæ jam emortuæ, Valdipurga pr. Rosignano Marittimo, in agro Pisano Etruriæ (prof. ANT. BERLESE).

195. **Phyllosticta adeloica** Spieg., Fungi Paulist., Rev. Mus. La Plata 6296 t. XV, p. 32. — Maculis amphigenis irregularibus, 2-8 mm. d., cinereo-arescentibus; pycnidiis erumpenti - superficialibus, saepius epiphyllis, laxe gregariis, 60-90 μ . diam., ostiolo late aperto 20-30 mm. diam., umbilicato-perforatis, tenui - membranaceis, contextu minute denseque parenchymatico, fuligineo; sporulis rectis v. leniter inæquilateralibus, utrinque subacutiusculis, rotundatis, 4-6 \approx 2, hyalinis.

Hab. ad folia coriacea arbusculæ ignotæ cujusdam, Cambucy Ipiranga, Brasilia (USTERI).

196. **Phyllosticta aporoica** Spieg., Fungi Paulist., Rev. Mus. La Plata 6297 t. XV, p. 32. — Maculis amphigenis repandulo-angulosis, linea non callosa, saepius angusta, sordide fusco-testacea cinctis, 3-10 mm. diam., inferne fere semper pallide lateritiis et quandoque *Coccis* tectis, superne primo fusco-cinerescentibus dein albescientibus; pycnidiis laxe sparsis, lenticularibus, 60-80 μ . diam., poro minuto pertusis, contextu minute denseque parenchymatico, fuligineo; sporulis rectis v. inæquilateralibus, utrinque obtusiuscule rotundatis, 4-6 \approx 1,5-2, hyalinis, sporophoris paullo longioribus, tenuissimis, concoloribus suffultis, grosse biguttulatis.

Hab. ad folia arboris ignotæ cujusdam in Horto bot. Sao Paulo Brasilia (USTERI).

197. **Phyllosticta ? leptosperma** Spieg. Fungi Paulist., Rev. Museo La Plata, t. XV, pag. 33. — Pycnidiis epiphyllis epidermide tectis dense gregariis, plagulas nubilosas subcinerescentes v. confluendo difformes efficientibus, e globoso lenticularibus, astomis ?, ferrugi-

neis glabris, membranaceo-carnosulis, contextu testaceo minuto denso subimperspicuo; sporulis cylindraceis rectis v. leniter curvulis utrinque obtusiuscule rotundatis, 4-5 \approx 1, eguttulatis, hyalinis.

Hab. ad folia coriacea arboris cujusdam ignotæ, Ipiranga Moca Brasilia (USTERI).

198. **Phyllosticta heterospora** Spieg., Fungi Paulist., Rev. Mus. La 6299

Plata t. XV, p. 33. — Maculis amphigenis suborbicularibus, 5-10 mm. diam., centro bullosis, circinatim rugulosis, pallescentibus; pycnidiis minutis 60-80 μ . diam., tecto-prominulis, epiphyllis, glabris, olivaceis, ostiolo majusculo 20 μ . diam. perforatis, tenui-membranaceis, contextu olivaceo dense minuteque parenchymatico donatis; sporulis rectis v. inaequilateralibus utrinque obtusiusculis, 8-11 \approx 4-5, hyalinis, continuis v. rarius uniseptatis.

Hab. ad folia languida plantæ cujusdam in Horto Escola polytechnica, Sao Paulo Brasilia (USTERI).

199. **Phyllosticta Malabailæ** C. Mass. in litt. 23. III (1913). — Pycni- 6300

diis vulgo hypophyllis, punctiformibus, minutissimis, 35-45 μ . d., nigris, prominulis, in maculis sordide albidis, parvis, suborbicularibus aut irregularibus internerviis, magis minusve dense aggregatis; sporulis breviter bacillaribus, hyalinis, utrinque extremitate incrassatulis, rectis v. vix curvulis, 3-4 \approx 1.

Hab. in foliis languentibus Malabailæ (Hladnikiae) Hacquetii infra rupes loco Malera Mont. Lessini prov. Verona Ital. bor. (Prof. AG. GOIRAN). — Ob sporulas utrinque incrassatulas *Ph. osteosporam* et *Ph. bacteriformem* in mentem revocat, sed certe diversa.

Species (verisim. ad gen. *Phyllostictam* spectantes) inquirendæ.

200. **Depazea myrticola** Rabenh. in Kl. Herb. viv. myc. n. 1146 et 6301
Bot. Zeit. VI (1848) p. 293 (nomen nudum).

Hab. in foliis Myrti communis in Italia bor.

201. **Depazea Umbelliferarum** Lasch in Kl. Herb. viv. mycol. n. 1158 6301*
et Bot. Zeit. VI (1848) p. 294. — Cirri albi subincarnati.

Hab. in foliis Chærophylli sp. pr. Driesen Germaniæ.

202. **Depazea grossularicola** Fr. ? ap. Klotzsch Herb. viv. mycol. 6302
n. 568 (1844) (nomen nudum).

Hab. in foliis Ribis Grossulariæ in Germania.

203. **Depazea hedericola** Klotzsch, Herb. viv. mycol. n. 1074 (1846) 6303
(nomen nudum) = *Septoria Hederæ* Desm. ?

Hab. in foliis *Hederæ* *Helicis* in Germania.

204. **Depazea brassicicola** (Fr.) Kl. Herb. viv. mycol. n. 1142 (1848). 6304

— An = *Sphaerella brassicæcola* (Fr. et Duby) Ces. et De Not.?

Hab. in foliis *Brassicæ* in Germania.

205. **Depazea Bidentis** Lasch, in Klotzsch Herb. viv. myc. n. 871 6305

(1846) (nomen nudum).

Hab. in foliis *Bidentis* sp. in agro Driesen.

206. **Depazea Clematidis** Rabenh. in Kl. Herb. viv. myc. n. 1647 6306

(1852) (nomen nudum).

Hab. in foliis *Clematidis* sp. in Germania.

207. **Depazea lyciicola** Lasch, in Kl. Herb. viv. mycol. n. 1252 (1849) 6307

(nomen nudum).

Hab. in foliis *Lycii* sp. in agro Driesen.

208. **Depazea Tiliæ** Lasch, in Kl. Herb. viv. mycol. n. 1160, Bot. 6308

Zeit. VI (1848) p. 294. — *Cirrus albus*.

Hab. in foliis *Tiliæ* in agro Driesen.

209. **Depazea Hieracii** Lasch, in Kl. Herb. viv. mycol. n. 872 (1846) 6309

(nomen nudum).

Hab. in foliis *Hieracii* in agro Driesen.

210. **Depazea syringicola** Lasch, in Kl. Herb. viv. mycol. n. 569 6310

(1844) (nomen nudum).

Hab. in foliis *Syringæ* in agro Driesen Germaniæ.

HAPALOSPHÆRIA Sydow, Ann. Mycol. VI (1908) p. 305 et in Die-dike, Aufzähl. Micromyc. Erfurts (1910) p. 73 (Etym. *hapalos* mollis et *Sphæria*). — Pycnidia pallide brunnea, mollia, parietibus crassiusculis sed mox collabescientibus donata; sporulæ globosæ, uniloculares, hyalinæ. — Parasitica in floribus pulvere sporularum demum intus farctis.

1. **Hapalosphaeria deformans** Sydow, Ann. Myc. l. c. p. 305 cum ic. 6311
Pæpalopsis deformans Sydow, Ann. Myc. V (1907) pag. 398. — Mycelio in gemmis primum verisimiliter evoluto, demum etiam in antheris, 2-3,5 μ . cr., varie irregulariterque ramoso-incurvato, septato, hyalino, intercellulari, hinc inde nodulos efformante; pycnidii nunc solitariis, nunc plus v. minus aggregatis, in antheris efformatis, e globoso conoideis, 50-80 μ . diam., contextu parenchymatico, parietibus crassiusculis, loculum plerumque parvum limitantibus; sporulis globosis, hyalinis, levibus, 3-5 μ . diam. numerosis.

Hab. in floribus deformatiis et præcipue in antheris Ruborum, in pluribus locis Thuringiæ, Germania.

PHOMA Fr. — Syll. III p. 65, X p. 138, XI p. 482, XIV p. 866, XVI p. 851 et 1154, XVIII p. 245.

1. **Phoma pæonicola** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6312 p. 339. — Pycnidiis epidermide tectis, gregariis, depresso-globosis, nigris, poro pertusis, 120-175 μ . diam., contextu parenchymatico; sporulis ovoideis, continuis, eguttulatis, dilute brunneis, 6-7 \approx 3,5-4.

Hab. in ramis siccis Pæoniæ arboreæ, Kecskemét Hungariæ. — A *Ph. Pæoniæ* All. differt pycnidiis majoribus, sporulis dilute brunneolis; a *Ph. lirellata* Sacc. sporulis dilute brunneolis minoribus.

2. **Phoma Adonidis** Moesz, Gomb. Budapest. I (1909) p. 19, t. II, 6313 fig. 6 (Bot. Közlem.). — Pycnidiis sparsis, epidermide tectis, depresso-globosis, nigris, c. 200 μ . diam., epapillatis, ostiolo 50-60 μ . diam., contextu parenchymatico, fuligineo; sporulis curvulis, semilunaribus, utrinque acutiusculis, 8,8-15 \approx 3-4,5, continuis, hyalinis, minute guttulatis.

Hab. in petiolis siccis Adonidis vernalis prope Budapest Hungariæ.

3. **Phoma Pulsatillæ** Karst., Acta Soc. pro Fauna et Fl. fenn. XXVII, 6314 4 (1905) p. 8. — Pycnidiis sparsis, innato-erumpentibus, sphæroideo-applanatis, ostiolo papillato, atris, punctiformibus; sporulis elongatis, 4 \approx 1.

Hab. in caulis aridis Pulsatillæ prope Polovinca Sibiriæ.

4. **Phoma Ranunculi** Karst., Acta Soc. pro Faun. et Fl. fenn. XXVII, 6315 4 (1905) p. 8. — Pycnidiis erumpentibus, conoideis, ostiolo acuto, atris, punctiformibus; sporulis elongatis, eguttulatis, 4-6 \approx 1-1,5.

Hab. in caulis Ranunculi acris, Tammela Fenniæ.

5. **Phoma complanatula** Karst., Acta Soc. pro Fauna et Fl. fenn. 6316 XXVII (1905) 4, p. 8. — Pycnidiis erumpenti-superficialibus, ellipsoideis, raro globulosis, complanatis, ostiolo papillato, atris, circiter 400 μ . latis; sporulis elongatis, eguttulatis, 3-4 \approx 1.

Hab. in caulis emortuis Ranunculi acris prope Mustiala Fenniæ.

6. **Phoma longirostrata** Bubák, Bull. Herb. Boiss., 2 sér., VI (1906) 6317 p. 406. — Pycnidiis sparsis, subepidermicis, rostello 50-200 \approx 45-70, cylindraceo erumpentibus demum nudis, 250-450 μ . latis, lenticularibus, centro subumbonatis, piceis, contextu crasso nigro-brunneo; sporulis bacillaribus, 3-4 \approx 1, guttulatis, hyalinis; sporophoris hyalinis minutis brevibus.

Hab. in caulis Ranunculi Villarsii prope Andrijevica Montenegro. — *Phomæ acutæ* Fuck. affinis.

7. **Phoma malisorica** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 6318 p. 406. — Pycnidiis sparsis v. gregariis, globosis, nonnullis fortiter depresso-epidermicis, papilliformi-erumpentibus, 90-100 µ. latis, nigris, contextu 10-12 µ. cr. brunneo-nigro parenchymatico; sporulis ellipsoideis v. elongato-cylindraceis, 4,5-7,5 ≈ 2,5-3, utrinque rotundatis, guttulatis, hyalinis, unilocularibus; sporophoris hyalinis papilliformibus.

Hab. in caulis Clematidis Viticellæ prope Ulcinj, Montenegro.

8. **Phoma Berteroæ** Hollós, Ann. Mus. Nat. Hung. VI (1908) p. 529. 6319 — Pycnidiis epidermide tectis, gregariis, lenticularibus, fuscis, poro pertusis, 170-220 µ. diam., contextu celluloso; sporulis oblongo-ellipsoideis, continua, biguttulatis, hyalinis, 3-3,5 ≈ 1.

Hab. in caulis siccis Berteroæ incanæ, Kecskemét Hungariæ.

9. **Phoma lepidiicola** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 457. 6320 — Pycnidiis epidermide velatis, gregariis, lenticularibus, fuscis, poro pertusis, 140-180 µ. diam., contextu parenchymatico; sporulis ovoides, continua, eguttulatis, hyalinis, 5-6 ≈ 4.

Hab. in caulis siccis Lepidii crassifolii prope Kecskemét Hungariæ. — A *Phoma Lepidii* (Sacc.) All. diversa.

10. **Phoma gregaria** Syd. — Syll. XVI, p. 852. — subsp. **Thlaspeos** 6321 Karst., Acta Soc. pro Faun. et Fl. fenn. XXVII, 4 (1905) p. 9. — Pycnidiis gregariis v. sparsis, erumpenti-superficialibus, atris, punctiformibus; sporulis oblongatis, eguttulatis, 3-4 ≈ 1-1,5.

Hab. ad caules exsiccatos Thlaspeos arvensis in ditione Mustialensi Fenniæ.

11. **Phoma lardizabalicola** Speg., Fungi Chilenses (1910) p. 143. — 6322 Maculis nullis; pycnidiis saepius hypophyllis sparsis, parenchymate innatis, epidermide tectis, lenticularibus, 100-120 µ. diam., coriacellis, ostiolatis; sporulis cylindraceo-subellipsoideis, rectis v. sub-inaequilateris, 14 ≈ 3-4, hyalinis.

Hab. in foliis siccis Lardizabalæ biternatæ in silvaticis Cerro Caracol de Concepción, Chile, Amer. austr.

12. **Phoma Lardizabalæ** Speg., Fungi Chilenses (1910) pag. 143. — 6323 Maculis amphigenis indeterminatis suborbicularibus, 2-5 mm. d., fuscescentibus; pycnidiis amphigenis epidermide velatis confertiusculis lenticularibus, 50-80 µ. diam., atris, coriacellis, minute per-

forato-ostiolatis; sporulis cylindraceis sæpe medio coarctatulis, rectis v. curvulis, 3-4 \approx 1, hyalinis.

Hab. in foliis siccis Lardizabalæ biternatæ in silvaticis Cerro Caracol de Concepción, Chile, Amer. austr.

13. **Phoma pteleicola** Hollós, Növényt. Közlemén. (1907) VI, Extr. 6324 p. 4. — Pycnidiis epidermide tectis, dein superficialibus, gregariis, lenticularibus, fuscis, poro pertusis, 80-180 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, eguttulatis biguttulatisve, hyalinis, 4-6 \approx 2,5-3.

Hab. in ramulis emortuis Pteleæ trifoliatae, Kecskemét et Nagy-Körös Hungariæ. — A *Phoma samararum* Oud. f. *Pteleæ* Oud. et *Ph. Pteleæ* Oud. pycnidiis et sporulis minoribus satis diversa.

14. **Phoma flaccida** Mc Alpine, Fung. Diseas. Citr. pag. 94, t. 22, 6325 f. 81-82. — Pustulis minutis, nigris, immersis, in foliorum apice dealbato gregariis; pycnidiis minutis, gregariis, nigro-brunneis, globoso-depressis, 170 μ . diam. papilla ellipsoidea, 45 \approx 32 præditis; sporulis hyalinis, coacervatis chlorinis, ellipsoideis v. ovoideis, 1-guttulatis, continuis, 3,5-4,5 \approx 2,5-3; sporophoris tenuibus, hyalinis, filiformibus, 5-5,5 μ . long.

Hab. in foliis Citri Aurantii pr. Melbourne, Australia.

15. **Phoma oxalidicola** Speg. Myc. Argent. V, p. 344, in An. Mus. 6326 Buenos Aires, XX (1910). — Pycnidiis innato-erumpentibus, pusillis, atris, sparsis, epidermide tectis dein erumpentibus, 80-100 μ . diam., subglobosis, contextu minute parenchymatico, pellucide olivaceo; sporulis elliptico-cylindraceis, utrinque rotundatis, 5-7 \approx 2,5-3, eguttulatis, subchlorinis.

Hab. ad petiolas aridos Oxalidis teneræ in montanis Cacheuta pr. Mendoza, Argentina.

16. **Phoma melicola** Sacc. et Trott., Ann. Mycol. (1912) pag. 513. — 6327 Pycnidiis gregariis, copiosis, innato-erumpentibus, diu tectis, prominulis, minutissimis, 100-150 μ . diam., ostiolo 25 μ . circ. lato; præditis contextu tenui parenchymatico brunneolo; sporulis sub cylindraceis minutissimis, utrinque obtusis, copiosissimis, 3,5-4,5 \approx 2-2,5, hyalinis; sporophoris fasciculatis, hyalinis, acicularibus, sporulas subæquantibus.

Hab. in axe infructescentiæ Meliae Azedarach, pr. Tripoli Africæ borealis, martio 1912 (A. TROTTER).

17. **Phoma Hyperici-perforati** P. Henn., Verh. Bot. Ver. Prov. Brandb. 6328 XLVII (1905) pag. 221. — Pycnidiis gregariis, epidermide tectis

dein erumpentibus, subglobosis, pertusis, atris, 100-150 μ . cr.; sporulis oblonge ellipsoideis, continuis, hyalinis $5 \times 3-3,5$.

Hab. in caulis siccis Hyperici perforati, Hellmühle Germaniae.

18. **Phoma Boldoæ** Speg. *Fungi Chilenses* (1910) p. 141. — Maculi, 6329 nullis; pycnidiis hypophyllis, innato-erumpentibus, sparsis, membranaceis, ostiolo minuto perforatis, subglobosis, 150-250 μ . diam., nigris; sporulis botuliformibus plerumque fortiter arcuatis, utrinque rotundatis, $4-5 \times 1$, hyalinis.

Hab. in foliis siccis dejectis subputrescentibus Boldoæ fragrantis, prope Talcahuano Chile, Amer. austr.

19. **Phoma boldoicola** Speg., *Fuugi Chilenses* (1910) p. 142. — Py- 6330 cnidiis cortice innatis, epidermide velatis, sparsis, subhemisphæricis, 90-100 μ . diam., nigris, membranaceis, vix papillato-ostiolatis; sporulis ellipsoideis, hyalinis, grosse biguttulatis, $3-4 \times 2$, in sporophoris 12-14 $\times 1,5$, simplicibus acrogenis.

Hab. in ramulis siccis dejectis Boldoæ fragrantis prope Talcahuano Chile, Amer. austr.

20. **Phoma Kühniana** Oertel, *Annal. Mycol.* V (1907) p. 431. — Py- 6331 cnidiis sparsis, globosis, sero depresso-depressis, coriaceis, atro-brunneis, 0,3-0,5 mm. diam., contextu distinete parenchymatico, sine ostiolis; sporulis minutis, $5-7 \times 1-1,5$, cylindraceis, obtusis, hyalinis, non guttulatis; basidiis brevissimis.

Hab. in flagellis emortuis Violæ odoratæ cult. in hortis, Sondershausen Thuringiæ. — A *Ph. violicola* differt præcipue sporulis minoribus eguttulatis, a *Ph. Violæ-tricoloris* magnitudine pycnidiorum sporularumque diversa.

21. **Phoma Mentzeliae** Speg., *Myc. Argent.* V, p. 343, in *An. Mus. Buenos Aires* XX (1911). — Pycnidiis globoso-depressis, sparsis, hypodermicis, nigris, minute obtuseque ostiolatis, membranaceis, 100-150 μ . diam. dein nudis, contextu parenchymatico olivaceo; sporulis subcylindraceis, peregrinis, utrinque rotundatis, $2-3 \times 1$, eguttulatis, hyalinis v. perdilute chlorinis.

Hab. ad caules aridos Mentzeliae albescens prope Ca- cheuta, Argentina.

22. **Phoma silenicola** Bubák et Ranojevic, *Ann. Mycol.* VIII (1910) 6333 p. 383. — Pycnidiis in caulis nigrescentibus crebre distributis, epidermide nigro-viridescenti tectis, dein erumpentibus, nigris, punctiformibus, globosis, ostiolo papilliformi præditis, 90-150 μ . cr.,

contextu pseudoparenchymatico obscure brunneo; sporulis bacillaribus, 3,5-4 \approx 1-1,5, hyalinis, biguttulatis.

Hab. in caulibus siccis *Silenes tinctæ* prope Vranjc Serbia.

— A *Ph. melæna* sporularum magnitudine diversa.

23. **Phoma Gypsophilæ** Hollós, Annal. Mus. Nat. Hungar. V (1907) 6384 p. 48. — Pycnidiis epidermide atrata tectis, dense gregariis, lenticularibus, nigris, poro pertusis, 240-280 μ . diam., contextu parenchymatico; sporulis oblongis, utrinque acutatis, biguttulatis, continuis, hyalinis, 6-9 \approx 2,5-3.

Hab. in caulibus siccis *Gypsophilæ paniculatæ* prope Kecskemét Hungariæ.

24. **Phoma Roumii** Fron, in Bull. Soc. Mycol. Fr. XXV (1909) p. 67, 6335 f. I-IV. — Maculis amplis, candidis v. subluteolis; pycnidiis immersis, subgregariis, depresso rotundis, 150-170 μ . diam., non papillatis; sporulis tereti-oblongis, utrinque rotundatis, rectis curvulisve, parce guttulatis, hyalinis, 4 \approx 2; sporophoris bacillaribus subæquilongis.

Hab. in caulibus vivis *Gossypii*, Dahomey. Afric. occid. — Species valde noxia.

25. **Phoma Bonanseana** Sacc., Ann. Mycol. VI (1908) p. 567. — Py- 6336 cnidiis dense gregariis, subcutaneo-erumpentibus, minutis globosis, obtusis, nigris, 70-80 μ . diam.; sporulis ellipsoideo-oblongis, 4 \approx 1,5, copiosissimis, ex hyalino dilutissime flavidis; sporophoris non visis.

Hab. in ulceribus et circum ea in caule *Cerei* geometrizantis, Apaseo Mexico (BONANSEA).

26. **Phoma Echinopsidis** Speg., Myc. Argent. V, p. 432, in An. Mus. 6337 Buenos Aires XX (1910). — Pycnidiis innato-erumpentibus, nigris, epidermide atrata tectis, obsolete ostiolatis, coriaceis, 150-200 μ . diam., depressis; sporulis tereti-ellipsoideis, utrinque obtusiusculis, 7-9 \approx 3-4, grosse 2-guttatis, hyalinis.

Hab. sub epidermide *Echinopsidis* Schickendantzii in montanis Catamarca, Argentina.

27. **Phoma suspecta** Massee, Diseases. cult. Plants (1910) pag. 406, 6338 fig. 126: 5-7. — Pycnidiis depressis, ostiolo subprominenti præditis, 125-150 μ . diam.; sporulis ellipsoideis 3,5-5 \approx 2-2,5.

Hab. in ramulis Ribis sp. cultæ, quam vexat, in Amer. bor.

28. **Phoma valdiviensis** Speg., Fungi Chilenses (1910) pag. 145. — 6339 Pycnidiis sparsis v. late gregariis, cortice innatis, epidermide sublevata lacerataque tectis, lenticularibus, 100-120 μ . diam., subcar-

bonaceis, obsolete ostiolatis; sporulis ellipsoideis v. subovoideis, utrinque rotundatis, 3-4 \approx 1,75-2, hyalinis.

Hab. in ramis siccis Perseæ Lingue prope Ciudad de Valdivia, Chile Amer. austr.

29. **Phoma Ceanothi** P. Henn. in Kabat et Bubák, Fungi imp. exs. 6340 (1908) n. 502. — Maculis griseis, exaridis; pycnidiis gregariis, subcutaneo-erumpentibus, globulosis, atris, poro pertusis, 100-140 μ . diam.; sporulis ellipsoideis vel ovatis, obtusis, hyalinis, eguttulatis, 4-6 \approx 2 $\frac{1}{2}$ -3.

Hab. in ramis Ceanothi americanæ, in horto botanico berolinensi Dahlem Germaniæ.

30. **Phoma Trevoæ** Spæg., Fungi Chilenses (1910) p. 145. — 6341 Pycnidiis sparsis v. laxe gregariis subsuperficialibus atris subhemisphæricis, 90-100 μ . diam., carbonaceis, vix ostiolatis; sporulis cylindraceo-ellipsoideis, utrinque rotundatis, 2-3 \approx 1, primum hyalinis dein subchlorinis.

Hab. in ramis emortuis Trevoæ trinervis in collibus Batuco, Chile Amer. austr.

31. **Phoma Villaresiæ** Spæg., Myc. Argent. V, p. 346, in An. Mus. 6342 Buenos Aires, XX (1910). — Pycnidiis hypophyllis, numerosis, laxe gregariis, innato-subsuperficialibus, atris, astomis, 50-80 μ . d., contextu parenchymatico, subindistincto, fusco-olivaceo; sporulis elliptico-subcylindraceis, perexiguis, rectis curvulisve, 2-3 \approx 1, hyalinis, eguttulatis.

Hab. ad folia viva Villaresiæ megaphyllæ in foliis pr. Puerto Leon, Misiones, Argentina. — Maculæ nullæ sed folia lenissime pallescentia.

32. **Phoma Myricariæ** P. Henn. in Kabat et Bubák, Fungi imp. exs. 6343 n. 455 (1907). — Peritheciis gregariis, erumpentibus, subglobosis vel sublenticularibus, atris, perforatis, 80-120 μ . diam.; sporulis oblongo-ellipticis vel ovatis, obtusis, hyalinis, eguttulatis, 3-4 \approx 1-1 $\frac{1}{2}$.

Hab. in ramis Myricariæ dahuricæ in horto bot. berolin. Dahlem Germaniæ.

33. **Phoma ?matecola** Spæg., Ann. Mus. Nac. Buenos Aires t. XVII 6344 (1908) p. 133. — Pycnidiis matrice denudata sordide cinerescente insculptis, laxe gregariis, subcarbonaceis, glabris, astomis (?), lenticularibus 100-120 μ . diam., contextu opaco indistincto; sporophoris non visis; sporulis e globoso ellipsoideis utrinque obtusis, 3-4 \approx 2-2,5 primo hyalinis serius perdilute chlorinulis.

Hab. ad ramos decorticatos *Ilicis paraguariensis* putrescentes circa San Pedro Reip. Argentinæ.

34. **Phoma Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires, t. XVII 6345 (1908) p. 133. — Maculis nullis; pycnidiis subepidermicis lenticularibus 50-75 μ . diam., confertiusculis; contextu fusco-fumoso, subindistincte parenchymatico, ostiolo rotundo parvo perforatis; sporophoris fasciculatis 10-15 \times 1,5-2, simplicibus monosporis; sporulis ellipsoideis utrinque obtusiusculis, biguttulatis 2-3 \times 1-1,5, hyalinis.

Hab. in ramulis aridis *Ilicis paraguariensis* in silvis pr. San Pedro Reip. Argentinæ.

35. **Phoma Coriariæ** Speg., Fungi Chilenses (1910) p. 142. — Pycnidii sparsis v. quandoque parce gregariis, subepidermicis, globosis, 90-100 μ . diam., subcarbonaceis, vix papillato-ostiolatis; sporulis late ellipsoideis, subchlorinis, 3-4 \times 2-2,5.

Hab. in ramulis siccis *Coriariæ ruscifoliae*, Cerro Caracol de Concepcion Chile Amer. austr.

36. **Phoma ricinicola** Speg., Myc. Argent. V, p. 344, in An. Mus. Buenos Aires, XX (1910). — Pycnidiis cortice innatis, solitariis v. dense gregariis, subconfluentibus, epidermide vestitis, dein nudatis, depressis, carbonaceis, obsolete ostiolatis, 200 μ . diam., contextu opaco indistincto; sporulis sursum subrotundatis deorsum subcuneatis, 7-8 \times 3-4, hyalinis.

Hab. ad ramos aridos subputrescentes *Ricini communis* in særibus circa La Plata, Argentina. — An potius *Phomopsis* observante auctore?

37. **Phoma Heveæ** Petch, Ann. Roy. Bot. Gard. Peradenya, III, Pt. I 6348 (1906) p. 5. — Pycnidiis nigris, gregariis, immersis, subprominulis, semi-globosis, 0,1-0,2 mm. diam.; sporulis ellipsoideis, hyalinis, 4-5 \times 2, in cirrum viridi-flavum expulsis.

Hab. in ramis *Heveæ brasiliensis*, Ceylon.

38. **Phoma Rohlenæ** Bubák, Bull. Herb. Boiss. 2 sér., VI (1906) 6349 p. 402. — Pycnidiis æque distributis, 110-220 μ . latis, globosis, subdepressis, crasse tunicatis, immersis, apice tantum prominentibus, nigris, contextu obscure brunneo fimo; sporulis elongatis 7-10 (raro 11) \times 2-3,5, rectis, utrinque angustatis, rotundatis vel tenuiter apiculatis, hyalinis, unilocularibus; sporophoris brevibus.

Hab. in caulinis siccis *Euphorbiæ spinosæ* prope Njegusi Montenegro.

39. **Phoma Vignæ** P. Henn., in Fl. du Bas- et Moy.-Congo, Ann. 6350

Mus. du Congo, v. II, fasc. II (1907) p. 100. — Pycnidiis sparsis, subhemisphæricis, atris, vertice perforatis, 60-90 μ . diam.; sporulis ellipsoideis, hyalinis, eguttulatis, 3-3,5 \times 2.

Hab. in foliis Vignæ (? venulosæ Bak.), Kisantu Congo, Africa (VANDERYST).

40. **Phoma ononidicola** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6351 p. 338, tab. VIII, fig. 11. — Pycnidiis epidermide tectis, gregariis, nigris, ellipsoideis, 240-300 \times 210-230, ostiolo rotundato 17-28 μ . diam.; sporulis ellipsoideis, continuis, biguttulatis, hyalinis, 10-12 \times 3,5-4.

Hab. in caulis siccis Ononidis spinosæ prope Izsak Hungariæ. — A *Ph. Zopfiana* All. et *Ph. Ononidis* All. satis diversa.

41. **Phoma herbarum** Westendorp — Syll. III, p. 133 — f. **Glycyrrhizæ** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 457. — Pycnidiis gregariis, epidermide velatis, globoso-depressis, nigris, poro pertusis, 600 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, biguttulatis, hyalinis, 6-10 \times 3-3,5.

Hab. in caulis siccis Glycyrrhizæ echinatae pr. Kecskemét Hungariae. — fm. **Lycopi** Hollós, l. c. — Pycnidiis gregariis, epidermide velatis, globoso-depressis, poro pertusis, fuscis, 190-250 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, biguttulatis hyalinis, 8-10 \times 3-4. — In caulis siccis Lycopi exaltati, Kecskemét Hungariae. — var. **Daturæ** Poteb., Annal. Mycol. V (1907) pag. 14 et Trav. Soc. Nat. Kharkow XXXIII (1907). — Pycnidiis 170-250 μ . cr.; sporulis 4-5 \times 2. — In ramis siccis Daturæ Stramonii pr. Kursk Rossiæ. — var. **Sii** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 340. — Pycnidiis 350-550 \times 210-280; sporulis ellipsoideis biguttulatis, 9-10 \times 3-4. — In caulis siccis Sii latifolii prope Nagy-Körös Hungariae. — Var. **tageticola** (Schw.) Starb, Stud. Fries Herb. I, p. 52, t. II, f. 25 a, *Sphaeria tageticola* Schw. — Syll. II, p. 428. — Pycnidiis plerumque aggregatis, rarissime solitariis, globoso-depressis, distante globuloso-papillatis; sporulis majoribus, 8-10 \times 2-3, bimaculatis; sporophoribus brevissimis. — In caule Tagetum cultarum in America boreali.

42. **Phoma astragalicola** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6353 pag. 337. — Pycnidiis epidermide tectis, nigris, ellipsoideis, 280-310 \times 210-220, poro pertusis, contextu parenchymatico; sporulis ellipsoideis, continuis, biguttulatis, 6-8 \times 2,5-3.

Hab. in foliis pergamenteis ex rhizomate Astragali exscapi

prope Kecskemét Hungariæ. — A *Ph. Astragali-alpini* Oud. et *Ph. Astragali* Cooke et Harkn. diversa.

43. **Phoma semiplena** Bubák, Bull. Herb. Boiss. 2 ser., VI (1906) 6354 p. 407. — Pycnidiis parce gregariis v. seriatis, in maculis nigricantibus dispositis, globosis, 200-250 μ . cr. subepidermicis, dein collo 70-90 crasso prominentibus, nigris, contextu parenchymatico, collo e cellulis seriatim dispositis formato; parietibus 45-50 μ . cr., intus hyalinis inæqualibus usque ad 35 μ . cr., extus flavo-brunneis 10-15 μ . tantum cr.; sporulis variabilibus, bacillaribus, ellipsoideis v. elongatis v. breviter cylindraceis, 2-6,5 \times 0,75-2, rectis v. curvulis, guttulatis, hyalinis; sporophoris papilliformibus conoideis 5 \times 4, supra rotundatis, hyalinis.

Hab. in caulinis siccis Coronillæ Emeri prope Ulcinj Montenegro.

44. **Phoma Sagittalis** Jaap, Allg. Bot. Ztschr. XII (1906) p. 124. — 6355 Pycnidiis gregariis, innatis, globosis, punctiformibus, nigris, circ. 200 μ . diam.; sporulis oblongis, 4-5 \times 2, biguttulatis, hyalinis.

Hab. in ramis Cytisi sagittalis, Schwarzwald in Germania, socia *Pleospora Cytisi*.

45. **Phoma Ulicis** Syd. Ann. Mycol. III (1905) p. 420. — 6356 Pycnidiis sparsis, primo tectis, punctiformibus, atris, usque ad 280 μ . d., globosis; sporulis numerosis, ovoideis, hyalinis, biguttulatis, continuis, 6 \times 2,5.

Hab. in spinis Ulicis europææ, Lobbe ins. Rugiæ Germania.

46. **Phoma gymnocladicola** Hollós, Növényt. Kézlemén. (1907) VI, 6357 Extr. p. 3. — Pycnidiis superficialibus, gregariis, lenticularibus, fuscis, poro pertusis, 60-80 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, eguttulatis, hyalinis, 6-7 \times 3-3,5.

Hab. in ramis siccis Gymnocladi canadensis, Kecskemét Hungariæ. — A *Phoma Sophoræ* Sacc. var. *Gymnocladi* Sacc. et Scal. differt pycnidiis et sporulis minoribus.

47. **Phoma rhodocarpa** Sacc., Ann. Mycol. IX (1911) p. 251. — 6358 Pycnidiis laxe gregariis, fructicolis, subcutaneo-erumpentibus, globoso-depressis, obtuse papillatis, 180-200 μ . diam., nigris, firmulis; sporulis oblongo-ellipsoideis, utrinque obtusulis, rectis, 8-8,5 \times 3, inæqualiter guttulatis granulosisque, hyalinis; sporophoris brevissimis acicularibus, 6-7 \times 2, e basi sporifera subochracea oriundis.

Hab. in fructibus emortuis, plerumque atratis, Rosæ cultæ var. « Persian Yellow » dictæ, Lyndonville, New York Amer. bor. (C. E. FAIRMAN).

48. **Phoma ulcinjensis** Bubák, Bull. Herb. Boiss. 2 sér., VI (1906) 6359

p. 408. — Pycnidiis parce gregariis, in maculis griseis insidentibus, globosis, supra conoideis, 70-100 μ . latis, subepidermicis, demum collo elongato prominentibus, contextu grosse celluloso nigro-brunneo; sporulis bacillaribus 3-4 \approx 0,75, hyalinis, unilocularibus; sporophoribus brevibus hyalinis.

Hab. in caulibus siccis Rubi amoeni prope Ulcinj Montenegro.

49. **Phoma Rubi** Marignoni, Micromiceti di Schio, (1909) p. 20, cum 6360

icone. — Pycnidiis gregariis $\frac{1}{5}$ - $\frac{1}{3}$ mm. diam., globoso-depressis, poro pertusis, epidermide initio velatis, dein erumpentibus, nigris, nucleo albo; sporulis ellipsoideo-globosis, hyalinis, 2 μ . diam., basidiis 15-25 \approx 1,5 suffultis.

Hab. in ramis emortuis Rubi cæsii prope Schio Ital. bor.

50. **Phoma rubicola** Sacc., Notæ myc. VIII, Ann. Myc. v. V (1906) 6361

p. 492, tab. X, fig. 9. — Pycnidiis laxè gregariis, longitudinaliter elliptico-oblongis, depresso-tectis, dein ostiolo minuto erumpentibus, nucleo farcto ex albo griseo, majusculis, 0,7 mm. long., vix 0,5 mm. latis; sporulis oblongo-ellipsoideis, utrinque rotundatis, rectis, 10-12 \approx 4-4,3, crassiuscule tunicatis, intus farctis, hyalinis; basidiis bacillaribus brevibus, 4 \approx 2, e strato proligero olivaceo-fusco oriundis.

Hab. in ramis emortuis corticatis Rubi fruticosi, Ambert Galliæ (BRÉVIÈRE, communic. P. HARIOT). — Imprimis pycnidiis oblongis majusculis, sporulis crassiuscule tunicatis etc. a ceteris speciebus rubicolis dignoscitur.

51. **Phoma Ruborum** (West. ?) P. Henn. Pilzfl. v. Lanke, II, in Ver-

handl. d. bot. Vereins Brandenb. (1905) p. 221. — An Ph. *Ruborum* West. — Syll. III, p. 76. — Pycnidiis 130-160 μ . diam. fere astomis, atro-brunneis; sporulis oblongo-ellipsoideis, minute biguttulatis, 4-6 \approx 2,5-3, hyalinis.

Hab. in ramis emortuis Rubi Idæi prope Utzdorf, Lanke Germaniæ.

52. **Phoma Comari** Jaap, Weit. Beitr. Pilzfl. nordfries. Ins. in Schrifft.

Naturw. Ver. f. Schlesw.-Holst. Bd. XIV (1907) Heft 1, p. 28. — Pycnidiis sparsis, subcorticis, prominulis dein erumpentibus, depresso-globosis v. ellipsoideis, 0,4 mm. latis, ostiolo rotundato v. elongato 35 μ . circ. lato, contextu parenchymatico; sporophoribus cylindraceis usque ad 20 μ . long.; sporulis elongatis, rotundatis, 5-7 \approx 1,5, unilocularibus, biguttulatis, hyalinis.

Hab. in caulis siccis Comari palustris prope Twismark in ins. Röm Frisia

53. **Phoma putaminum** Hollós, Növénnyt. Közlemén. (1907) VI, Extr. 6364 p. 3. — Pycnidiis gregariis, superficiibus, globoso-depressis, nigris, apice ostiolo minuto, 250-300 μ . diam.; sporulis ellipsoideis, continuis, biguttulatis, dilute brunneolis, 4-5 \approx 2,5-3.

Hab. in putamine putrescente Armeniacæ vulgaris, Kecskemét Hungariæ.

54. **Phoma persiciphila** Spegazz., Rev. Ministerio Agricolt. Buenos Aires II, n. 2 (1908) p. 37 Nota, cum icon. — Maculis repando-orbicularibus, arescentibus, impressis, determinatis; pycnidiis erumpentibus laxe gregariis, pusillis, 75-90 μ . diam., late ostiolatis, coriacellis, atris, contextu parenchymatico, olivaceo; sporulis ellipsoideis v. ovatis, 5-6 \approx 2-3, utrinque obtusis, chlorinulis.

Hab. in ramulis Persicæ vulgaris morbum « virucla de uvas peras » dictum efficiens, prope La Plata Reip. Argentinæ.

55. **Phoma Acænæ** P. Henn., Deutsche Südpolar-Exped. Bd. VIII 6366 (1906) Extr. p. 13, tab. II, fig. 16 a-c. — Pycnidiis in caulis decorticatis sparse gregariis, innato-superficialibus, subglobosis v. ellipsoideis, atro-olivaceis, membranaceis, 180-220 μ . diam., vertice longitudinaliter porosis; sporulis ellipsoideis v. ovoideis, obtusis, hyalinis, 4-6 \approx 2-2,5; sporophoris haud conspicuis.

Hab. in caulis emortuis dealbatis Acænæ adscendentis, in insul. Kerguelen (WERTH).

56. **Phoma cava** Schulz. v. Mügg. in Verh. zool. bot. Ges. Wien 6367 (1871) pag. 1248, t. 13, f. 28. — Pycnidiis innato-erumpentibus, subsuperficialibus globoso-depressis $1\frac{1}{4}$ - $1\frac{1}{3}$ mm. diam., atro-brunneis, nigris, non papillatis, poro pertusis, intus cavis; sporulis oblongo-teretiusculis, saepius curvulis, hyalinis, 5 \approx 2; sporophoris bacillaribus, parallele stipatis; sporulis triplo v. quadruplo longioribus, hyalinis.

Hab. in ramis corticatis Cydoniæ vulgaris in Hungaria.

57. **Phoma rhabdosporica** Alm. et Cam., Bollet. Soc. Broter. XXIV 6368 (1908-1909), Extr. p. 36. — Pycnidiis amphigenis, præcipue hypophyllis, plerumque sparsis, semiliberis, atris, lenticularibus, 800-1000 μ . diam.; sporulis elongato-ellipsoideis, integris, leniter curvulis, raro rectis, utrinque attenuato-rotundatis, biguttulatis, hyalinis, 8-10 \approx 1; sporophoris filiformibus, achrois, rectiusculis, usque ad 45 μ . long.

Hab. in foliis dejectis *Eucalypti Globuli*, in horto botan.

Coimbra Lusitaniæ (A. MOLLER).

58. **Phoma polypsecadiospora** d'Alm. et Da Cam., Bol. Soc. Brot. 6369 XXIV (1908-1909), Extr. p. 36. — Pycnidiis amphigenis, suborbicularibus, atris, primo diu tectis demumque poro erumpente pertusis, 120-180 μ . diam.; sporulis ovoideis v. subglobosis, hyalinis, continuis, pluriguttulatis, 10-12 \approx 7,5-8.

Hab. in foliis *Hederæ Helicis*, Coimbra, Cérca de S. Bento, Lusitania (A. MOLLER).

59. **Phoma Seseli** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 340. 6370 — Pycnidiis epidermide tectis, sparsis, depresso-globosis, atro-brunneis, poro pertusis, 300-350 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, biguttulatis, hyalinis, 6-8 \approx 2-2,5.

Hab. in caulis siccis *Seseli glauci* prope Keckskémet Hungariæ. — *Phoma acuta* Sacc. et *Ph. longissima* (Pers.) sporulis minoribus diversæ.

60. **Phoma deflectens** Karst., Acta Soc. pro Fauna et Fl. fenn. XXVII 6371 4 (1905) p. 8. — Pycnidiis gregariis, denudatis, initio verisimiliter velatis, globulosis, difformibus, ostiolo papillato, atris, 0,2-0,3 mm. diam.; sporulis oblongatis, eguttulatis, 3-4 \approx 0,5-1.

Hab. in caulis siccis *Heraclei sibirici* ad Mustiala Fenniæ.

61. **Phoma Torilis** Sydow, Ann. Myc. VIII (1910) p. 492, Myc. germ. 6372 n. 914. — Pycnidiis sparsis, minutis, globoso-lenticularibus, atris, 200-350 μ . diam., poro pertusis; sporulis ovato-oblongis, continuis, hyalinis, biguttulatis, 5-6 \approx 2.

Hab. in caulis siccis *Torilis Anthrisci*, Tiefensee prope Werneuchen Germaniæ (H. SYDOW).

62. **Phoma ambiens** Syd., Ann. Mycol. VI (1908) p. 530. — Pycni. 6373 diis caulinis v. petiolicolis, dense aggregatis et petiolos plerumque per magnam partem æquali dispositione ambientibus, applanato-globosis, epidermide tectis, 120-200 μ . diam., atris, pariete tenui; sporulis numerosis, oblongo-ellipsoideis, utrinque rotundatis, hyalinis, eguttulatis, 2,5-3,5 \approx 1.

Hab. in petiolis caulinisque vivis v. languidis Prangi ulopteræ, Sultanabad Persiæ occ. (STRAUSS).

63. **Phoma apiicola** Klebahn, in Zeitschr. für Pflanzenkr. XX (1910) 6374 p. 22-33, f. 8-14 et t. II. — Pycnidiis sparsis v. gregariis, subcutaneo-erumpentibus, globulosis, nigricantibus, magnitudine va-

riis, 90-240 μ . diam. superne depresso-depressis, non v. obsolete papillatis, ore rotundo pertusis; contextu minute sed distincte parenchymatico; sporulis breviter cylindraceis, utrinque rotundatis, 3-4 \approx 1,2-1,8, hyalinis, plasmatæ saepius bipartito præditis, ex cellulis interioribus pycnidii apiculatis orientibus.

Hab. in caule petiolisque Apii graveolentis in Germania.

— Morbum gravem (*Schorfkrankheit*) affert. — Cfr. expositionem absolutam auctoris l. c.

64. **Phoma rostellata** Karst., Acta Soc. pro Fauna et Fl. fenn. XXVII, 6375 4, (1905) p. 14. — Pycnidii globulosi, initio velatis, dein denu-datis, atris, exiguis, rostro tereti, longitudine pycnidii; sporulis ellipsoideis, circ. 2 \approx 1.

Hab. in caulibus emortuis Cerefolii silvestris pr. Kuopio Fenniae (LÖNNBOHM).

65. **Phoma punctoidea** Karst., Acta Soc. pro Faun. et Fl. fenn. 6376 XXVII, 4 (1905) p. 7. — Pycnidii subcutaneis, erumpentibus, gregariis, atris, minimis; sporulis elongatis, 2-guttulatis, 5-6 \approx 2.

Hab. ad caules emortuos Angelicæ in reg. Mustialensi Fenniae.

66. **Phoma Tommasiniæ** Bres. in Dalla Torre et Sarnth. Fl. Tir. IV, 6377 p. 582 (nomen nudum).

Hab. in caulibus emortuis Tommasiniæ verticularis pr. M. Isel Innsbruck Tiroliæ (SARNTHEIN).

67. **Phoma Tupæ** Speg., Fungi Chilenses (1910) p. 144. — Maculis 6378 nullis; pycnidii sparsis v. laxe gregariis, superficialibus, subhemisphæricis, 90-110 μ . diam., atris, subcarbonaceis, obsolete ostiolatis; sporulis subellipsoideis, utrinque obtusiusculis atque minute uniguttulatis, 4-5 \approx 1,5-1,75, hyalinis.

Hab. frequens in ramis siccis Lobeliæ salicifoliæ, Cerro Alegre de Valparaiso, Chile Amer. austr.

68. **Phoma Lophanthi** Bubák, Journ. of Myc. XII (1906) pag. 53, 6379 *Septoria Lophanthi* Ellis in sched. — Pycnidii sparsis, lenticularibus, confertis, subepidermicis, dein apice prominentibus, 200-300 μ . latis, nigris, parietibus 10-15 μ . cr., contextu parenchymatico; sporulis cylindraceis 4,5-9 \approx 1,5-2, rectis v. curvulis, biguttulatis, hyalinis; sporophoribus papilliformibus, hyalinis.

Hab. in ramis emortuis Lophanthi nepetoidis, Amanda Fairfield Co. Ohio Amer. bor. (W. A. KELLERMAN).

69. **Phoma leonuricola** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6380 p. 337, tab. VIII, fig. 13. — Pycnidii epidermide tectis, seriatim digestis, depresso-globosis, atro-brunneis, poro pertusis, 140-
Syll. fung. XXII (III-1913)

190 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, biguttulatis, hyalinis, 7-11 \approx 3-4.

Hab. in caulis siccis *Leonuri Cardiacæ* prope Kecskemet Hungariæ. — A *Phoma Leonuri* Let. differt sporulis majoribus. — Var. *minor* Hollós, l. c. p. 338, t. VIII, f. 14. — Pycnidiis cinereis, 90-120 μ . diam.; sporulis eguttulatis 3 \approx 1.

70. **Phoma lanuginis** Fairm., Ann. Myc. VIII (1910) p. 325. — Pycni- 6381 diis c. 115-150 μ . diam., globosis, erumpentibus, ostiolo 15-20 μ . præditis, sub lanagine caulis nidulantibus v. demum denudatis, atris, sub microscopio dilute brunneis; sporulis oblongis, utrinque rotundatis, continuis, 6-8 \approx 3-4.

Hab. in caulis *Marrubii vulgaris*, Lyndonville New York Amer. bor.

71. **Phoma Menthæ** Strasser, Verh. k. k. zool. bot. Ges. Wien LX (1910) 6382 p. 310. — Pycnidiis subsphæroideis, epidermide tectis, ostiolo prominentibus, brunneis, 200-280 μ . diam.; massa sporarum roseola; sporulis singulis hyalinis, elongato-ellipsoideis v. ovoideis, 4-5 \approx 3-3,5, biguttulatis.

Hab. in caulis *Menthæ silvestris* Sonntagberg Austriæ. 6383

72. **Phoma Daniloi** Bub., Bull. Herb. Boiss. 2 sér., VI (1906) p. 406.

— Pycnidiis æque distributis, globoso-depressis, 100-160 μ . latis, subepidermicis, demum papilliformi-erumpentibus, contextu tenui parenchymatico obscure brunneo apice obscuriore; sporulis ovoideis v. breviter ellipsoideis, 3-4 \approx 2-2,5 apice rotundatis, guttulatis, unilocularibus, hyalinis; sporophoris papilliformibus hyalinis.

Hab. in caulis siccis *Salviæ officinalis* prope Ulcinj Montenegro.

73. **Phoma Zappaniæ** Speg., Myc. Argent. V, p. 346, in An. Mus. 6384 Buenos Aires, XX (1910). — Pycnidiis subseriatis, per rimulas corticis suberumpentibus, difformibus, depressis, subcarbonaceis, 100-120 μ . diam., subastomis, contextu indistincto; sporulis subcylindraceis, non v. leniter inæquilateris, eguttulatis, 6-8 \approx 1,5, hyalinis.

Hab. ad ramulos aridos *Lippiæ nodifloræ* in arvis prope La Plata, Argentina.

74. **Phoma Symphyti** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 458. 6385 — Pycnidiis epidermide velatis, gregariis, lenticularibus, nigris, poro pertusis, 100-120 μ . diam. contextu parenchymatico; sporulis ellipsoideis, continuis, eguttulatis, hyalinis, 6-7 \approx 3.

Hab. in caulis siccis *Symphyti officinalis* prope Kecskemét Hungariæ.

75. **Phoma Onosmatis** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6386 p. 339. — Pycnidiis epidermide tectis, sparsis, globoso-depressis, brunneis, poro pertusis, 120-160 μ . diam., contextu parenchymatico; sporulis oblongis, utrinque rotundatis, continuis, biguttulatis, hyalinis, 4-5 \times 1-1,5.

Hab. in caulis siccis *Onosmatis arenarii* prope Izsák Hungariæ.

76. **Phoma Alkannæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 336. 6387 Pycnidiis epidermide tectis, sparsis, globoso-depressis, fuscis, poro pertusis, 100-140 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, eguttulatis, hyalinis, 6-7 \times 3-3,5.

Hab. in caulis siccis *Alkannæ tinctoriae* prope Nagy-Körös Hungariæ.

77. **Phoma Physalidis** Hollós, Ann. Mus. Nat. Hung. v. IV (1906) 6388 p. 339. — Pycnidiis epidermide tectis, gregariis, depresso-globosis, brunneis, poro pertusis, 140-180 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, eguttulatis, hyalinis, 5-7,5 \times 2-3,5.

Hab. in caulis siccis *Physalidis Alkekengi*, Kecskemét Hungariæ.

78. **Phoma Nicotianæ** Maubl., Bull. Soc. Myc. Fr. XXIII (1907) 6389 pag. 144, tab. XX, fig. 16-18. — Pycnidiis nigris, depresso-ad basim applanatis, sursum in collum crassum, epidermidem perforans, interdum pilis rigidis, septatis præditum desinentibus, 150-200 \times 75; sporulis elongatis, utrinque obtusis, 2-3-guttulatis, hyalinis, 6-5 \times 2,75; sporophoris acicularibus, rectis, 8-10 \times 1.

Hab. in foliis Nicotianæ Tabaci, Razac Dordogne Galliæ.

— Socia adsunt *Sphaerella Tabaci* et *Ophiobolus porphyrogonus*.

79. **Phoma Cestri** Trav. et Spessa, Bol. Soc. Broter. XXV (1910) 6390 p. 175, t. II, f. 9. — Pycnidiis densiusculæ sparsis, epidermide vix erumpentibus, depresso ideoque ellipsoideis, 280-300 \times 250, ostiolo vix papillato et poro circulari pertuso præditis, atris, contextu minute pseudoparenchymatico, tenui, melleo; sporulis ellipsoideo-oblongis, subfusoideis, interdum inaequilateris vel subcurvulis, intus saepe granulosis, eguttulatis, 8 $\frac{1}{2}$ -11 \times 2-2 $\frac{1}{2}$, sporophoris cylindraceis 11-18 \times 1 $\frac{1}{2}$, suffultis.

Hab. in ramulis siccis Cestri Parqui in horto botanico co-nimbricensi Lusitaniæ (A. MOLLER).

80. **Phoma Capsici** Magnaghi — Syll. XVIII, p. 256 — f. **caulicola** 6391
 Bianchi, Micol. prov. Mantova, Atti R. Ist. bot. Pavia ser. II,
 v. IX, p. 308. — Pycnidiis gregariis, globoso-depressis, 100 \approx 6;
 sporulis cylindraceis nec allantoideis; sporophoris 10 μ . circ. long.
Hab. in caulis Capsici annui prope Redondesco Mantova
 Ital. bor.
81. **Phoma scrophularina** Karst., Acta Soc. pro Fauna et Fl. fenn. 6392
 XXVII, 4 (1905) pag. 8. — Pycnidiis subsparsis, erumpentibus,
 globulosis, ostiolo acuto præditis, atris, 0,1-0,2 mm. diam.; spo-
 rulis elongatis, eguttulatis, 3-4 \approx 0,5-1.
Hab. in caulis emortuis Scrophulariæ nodosæ prope
 Mustiala Fenniæ.
82. **Phoma Melampyri** Karst., Acta Soc. pro Faun. et Fl. fenn. XXVII, 6393
 4 (1905) p. 14. — Pycnidiis gregariis, erumpentibus, sphæroideis,
 cupulatis, atris, minutis; sporulis elongatis, utrinque obtusissimis,
 subcurvatis, eguttulatis, 6-10 \approx 2.
Hab. in caulis exsiccatis Melampyri pr. Kuopio Fenniæ.
83. **Phoma montenegrina** Bubák, Bull. Herb. Boiss. 2 sér., VI (1906) 6394
 pag. 407. — Pycnidiis sparsis, 120-160 μ . latis, fortiter depressis,
 nigris, subepidermicis, dein conoideo-erumpentibus, demum nudis,
 contextu 20-25 μ . cr. parenchymatico brunneo-nigro; sporulis cy-
 lindraceis 6-8 \approx 2, apice rotundatis, guttulatis, hyalinis, unilocula-
 ribus; sporophoris papilliformibus.
Hab. in caulis emortuis Pedicularis comosæ, Kom Va-
 sojevicki Montenegro.
84. **Phyllosticta Montteæ** Speg., Myc. Argent. V, pag. 343, in An. 6395
 Mus. Buenos Aires, XX (1910). — Pycnidiis primo cortice tectis
 dein nudis, subconoideis, carbonaceis, pusillis, 90-100 μ . diam., con-
 textu indistincto, ostiolo obsoleto; sporulis cylindraceis peregrinis,
 eguttulatis, 4-5 \approx 1, hyalinis.
Hab. in ramulis emortuis subputrescentibus Montteæ aphy-
 læ prope Pontrerillos, Mendoza, Argentina.
85. **Phoma Russeliæ** Trav. et Spessa, Bol. Soc. Brot. XXV (1910) 6396
 p. 176, t. II, f. 11. — Pycnidiis dense sparsis, epidermide velatis,
 globoso-depressis, 130-140 \approx 110-120, atris, poro distincto pertusis;
 excipulo minute celluloso, fuligineo; sporulis minutissimis, cylin-
 draceis, utrinque obtusis, rectis, 2-guttulatis, 3-4 \approx $\frac{3}{4}$ -1 μ ; spo-
 rophoris indistinctis.
Hab. in ramis siccis Russeliæ juncæ in horto botanico
 conimbricensi Lusitaniæ (A. MOLLER).

86. **Phoma Kaki** Trav. et Spessa, Bol. Soc. Brot. XXV (1910) p. 176 6397
tab. I, f. 6. — Pycnidiis hypophyllis, hinc inde gregariis, initio
epidermide tectis, dein erumpentibus, subglobosis, 80-100 μ . diam.,
atris, excipulo minute pseudoparenchymatico, fuligineo-griseo; spo-
rulis minutissimis, bacillaribus, utrinque obtusis, 2-guttulatis, re-
ctis, $3-4 \approx \frac{1}{2}-\frac{3}{4}$.
- Hab.* in foliis siccis *Diospyri Kaki* in horto botanico co-
nimbricensi Lusitaniæ (A. MOLLER).
87. **Phoma dipsacina** Bubák, Beitr. Pilzfl. Ung. in Növényt. Közle- 6398
mények (1907) Heft. 4, Extr. p. 28. — Pycnidiis in maculis ni-
gricantibus, parvis, elongatis, confertis, immersis, globosis, 100–
130 μ . diam., nigris, contextu crasso parenchymatico obscure brun-
neo; sporulis cylindraceis v. elongatis, 6,5-9 \approx 2-3,5, utrinque ro-
tundatis, guttulatis, olivaceo-brunneis; sporophoris breviter pa-
pilliformibus.
- Hab.* in caulis emortuis *Dipsaci pilosi*, Csernatal prope
Herculesfürdö Hungariæ.
88. **Phoma chrysanthemicola** Hollós, Ann. Mus. Nat. Hung. (1907) 6399
V, p. 456. — Pycnidiis gregariis, superficialibus, depresso-globo-
sis, fuscis, poro pertusis, 200-250 μ . diam.; contextu parenchy-
matico; sporulis oblongo-ellipsoideis, continuis, biguttulatis, hya-
linis, 5-6 \approx 1,75-2.
- Hab.* in caulis siccis decorticatis *Chrysanthemi* indici
culti, Kecskemét Hungariæ. — A *Ph. Chrysanthemi* Voglino di-
gnoscitur sporulis minoribus.
89. **Phoma Zinniæ** Speg., Myc. Argent. V, pag. 347, in An. Mus. 6400
Buenos Aires, XX (1910). — Maculis nullis; pycnidiis laxè gregariis subepidermicis, atris, membranaceis, modice ostiolatis, 60-
90 μ . diam., contextu dense minuteque parenchymatico, fuligineo;
sporulis subcylindraceo-ellipsoideis, utrinque obtusissimis, 4-8 \approx
2,5-3, eguttulatis v. rarius 2-guttulatis, hyalinis.
- Hab.* ad caules aridos *Zinniæ* paucifloræ prope Villa Ca-
silda, Argentina.
90. **Phoma Centrophylli** Speg., Myc. Argent. V, p. 343, in An. Mus. 6401
Buenos Aires XX (1910). — Pycnidiis sparsis v. laxè gregariis,
hypodermicis, conoideo-hemisphæricis, minute papillato-ostiolatis,
carbonaceis, 100-120 μ . diam., contextu indistincto; sporulis utrin-
que plus minusve acutiuscule rotundatis, subellipticis, grosse bi-
guttatis, 9-10 \approx 2,5-3, hyalinis.

Hab. ad caules aridos *Centrophyllo lanati* prope La Plata, Argentina.

91. **Phoma helichrysicola** Hollós, Növényt. Közlemén. (1907), Extr. 6402 p. 3. — Pycnidiis superficialibus, sparsis, fuscis, ellipsoideis, 100-110 \approx 70-90, poro pertusis, contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, continuis, biguttulatis, hyalinis, 3-4 \approx 1.

Hab. in caulis siccis decorticatis *Helichrysi arenarii* socia *Pleospora Helichrysi* (cujus videtur status pycnidicus) prope Kecskemét Hungariæ.

92. **Phoma Echinopis** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 6403 p. 3. — Pycnidiis seriatim dispositis, epidermide velatis, fuscis, ellipsoideis, 270-300 \approx 170-200, poro pertusis, contextu celluloso; sporulis ellipsoideis, utrinque acuminatis, continuis, biguttulatis, hyalinis, 8-10 \approx 3-4.

Hab. in caulis siccis *Echinopis ruthenici* prope Kecskemét Hungariæ.

93. **Phoma Bidentis** Hollós, Ann. Mus. Nat. Hungar. VII (1909) 6404 p. 52. — Pycnidiis epidermide velatis, gregariis, globoso-depressionis, papillatis, atris, 140-180 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque rotundatis, continuis, biguttulatis, hyalinis, 4-5 \approx 1-1,5.

Hab. in caulis siccis *Bidentis tripartiti* prope Kecskemét Hungariæ.

94. **Phoma Lampsanæ** Karst., Acta Soc. pro Fauna et Fl. fenn. 6405 XXVII, 4 (1905) p. 7. — Pycnidiis gregariis, velatis, dein denu-datis, ostiolo conoideo, acuto, atris, circiter 0,2 mm. diam.; sporulis elongatis, eguttulatis, 4-6 \approx 1-1,5.

Hab. in caulis aridis *Lampsanæ communis*, Tammela Fenniæ — *Ph. acutæ* affinis sed pycnidiis minoribus sporulisque angustioribus diversa.

95. **Phoma Scorzonerae** Hollós, Ann. Mus. Nat. Hungar. VII (1909) 6406 p. 52. — Pycnidiis epidermide tectis, sparsis, ostiolo conico erumpentibus, globosis, nigris, 240-280 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque obtusis, continuis, biguttulatis, 5-6 \approx 2-2,5.

Hab. in caulis siccis *Scorzonerae purpureæ*, Nagy-Körös Hungariæ.

96. **Phoma Chondrillæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6407 p. 337, tab. VIII, fig. 12. — Pycnidiis epidermide tectis, grega-

riis, ostiolo conico erumpentibus, globosis, nigris, 210-280 μ . d., contextu parenchymatico; sporulis oblongis, continuis, hyalinis, biguttulatis, inferne acutatis, 9-10 \approx 3-3,5; sporophoris filiformibus, sporulis duplo longioribus.

Hab. in caulis siccis Chondrillæ juncæ prope Izsák Hungariæ.

97. **Phoma Xanthii** Hollós, Ann. Mus. Nat. Hung. VI (1908) p. 530. 6408

— Pycnidiis epidermide tectis, gregariis, lenticularibus, fuscis, poro pertusis, 170-210 μ . diam., contextu celluloso; sporulis ellipsoideis, continuis, biguttulatis, hyalinis, 5-6 \approx 2.

Hab. in caulis siccis Xanthii strumarii prope Kecske-mét Hungariæ.

98. **Phoma subglobosa** Speg., Myc. Argent. V, p. 345, in An. Mus. 6409

Buenos Aires, XX (1910). — Maculis nullis; pycnidiis epiphyllis, hypodermicis, prominulis, laxe gregariis, coriacellis, atris, 120-150 μ . diam.; contextu indistincto, atro, subopaco, ostiolo imperspicuo; sporulis e globoso ovoideis, inferne acutatis, grosse 1-guttulatis, 10-12 \approx 9-11, hyalinis.

Hab. ad folia dejecta putrescentia Viburni Tini in horto Santa Catalina prope Buenos Aires, Argentina.

99. **Phoma oleracea** Sacc. — Syll. III, p. 135 — f. **Bryoniæ** Sacc., 6410

Ann. Mycol. VII (1909) p. 435. — Pycnidiis 300-330 μ . diam.; sporulis 4-5 \approx 2-2,5.

Hab. in caulis emortuis Bryoniæ albæ, Tamsel Ger- (P. VOGEL).

100. **Phoma Siolmatræ** Speg., Myc. Argent. V, p. 345, in An. Mus. 6411

Buenos Aires, XX (1910). — Maculis nullis; pycnidiis hypodermicis, hinc inde laxe gregariis, membranaceis, ostiolo minuto rotundo pertusis, 100-120 μ . diam., sublenticularibus; contextu parenchymatico fuligineo; sporulis subellipticis, non v. minute biguttulatis, hyalinis, 4-5 \approx 2.

Hab. in epicarpi arido Siolmatræ brasiliensis in silvis prope Ledesma Argentinæ.

101. **Phoma oleandrina** Delacroix, Bull. trim. Soc. Myc. de France 6412

vol. XXI (1905) p. 186, fig. V. — Maculis fulvo-lividis, latis, indeterminatis; pycnidiis sub epidermide in parenchymate immersis, pariete mox tenuiore, mox crassiore ex contextu parenchymatico, plerumque altioribus quam latioribus, 130-180 \approx 100-150, colore dilutiore, fulvo, ostiolo vix prominente pertusis; sporulis inæquilateralibus etiamque interdum medio constrictulis, hyalinis, gra-

nulatis, eguttulatis, $3,5 \approx 2,5\text{-}3$; sporophoris exiguis, basi incrasatis, apice obtusatis, $3\text{-}4 \approx 2$ circiter.

Hab. in foliis teneris et in parte super. ramorum juniorum Neri Oleandri culti circa Parisios, cui graviter nocet. — A *Ph. Nerii, neriicola, heteromorpha* certe valde differt.

102. **Phoma Pirolæ** (Ehrenb.) Rostr. Fgi. Groenl. p. 569 (Medd. on Grönland. III (1888)) *Depazea Pirolæ* (Ehrenb.) Rab. — Syll. IV, p. 64 — *Sphæria Pirolæ* Ehrenb. Berol. p. 29. Observante cl. Rostr. l. c. sporulæ sunt fusoideo-lunulatæ, curvæ, $7\text{-}8 \approx 1\text{-}2$.

Hab. in foliis Pirolæ grandifloræ in Groenlandia. — An *Phyllostictæ* species? Sec. cl. Allescher fungillus Ehrenbergii est probabiliter *Phyllosticta Pirolæ* Allesch. — Cfr. Syll. XIV, p. 858 — sed hæc ob sporulas pere exigua $3\text{-}4 \mu$. longas omnino differt a præsenti fungo Rostrupiano; tamen quid sit *Sphæria Pirolæ* Ehrenb. adhuc incertum manet, nisi exempl. originalia comparari possint.

103. **Phoma radicis-Andromedæ** Ternetz Carola, Jahrb. f. wissenschaft. Bot. XLVI (1907). — Pycnidiis diu flavo-brunneis, serius nigricantibus, distincte papillatis, subæqualibus, 78μ . cr., 78μ . alt. (inclusa papilla), poro singulo pertusis; cirro mox vehementer diffracto; sporulis ellipsoideis, $4 \approx 2,6$, hyalinis, eguttulatis.

Hab. in radice Andromedæ sp. in Helvetia. — Conidia muriformia, atro-brunnea, solitaria v. seriata et tunc indistincte inter se separata.

104. **Phoma radicis-Tetralicis** Ternetz, Jahrb. f. wissenschaft. Bot. XLIV (1907). — Pycnidiis atris, carbonaceis, æqualibus, 137μ . diam., 157μ . altis, poro unico pertusis, obsolete papillatis; cirro firmo basi crasso, demum facile evanido; sporulis oblongis, $5 \approx 1,3\text{-}2$, hyalinis, debiliter refringentibus, eguttulatis.

Hab. in radice Ericæ Tetralicis in Germania.

105. **Phoma radicis-Vaccinii** Ternetz, Jahrb. f. wissenschaft. Bot. XLIV (1907). — Pycnidiis diu dilute brunneis, serius atris, sat conformibus, 80μ . diam., 76μ . alt., poro singulo sed interdum 2-3 poris dehiscentibus, distincte papillatis; cirro laxo sed satis firmo; sporulis ellipsoideis, $5 \approx 2\text{-}3$, hyalinis, ætate brunneolis, uno polo v. utrinque 1-guttatis.

Hab. in radice Vaccinii sp. in Germania. — Conidia atro-brunnea, muriformia, solitaria v. seriata et tunc inter se acute distincta.

106. **Phoma pilulifera** Sacc. Notæ myc. VIII, Ann. Myc. IV (1906) 6417

p. 492, tab. X, fig. 8. — Pycnidiis laxe gregariis, subcutaneis et epidermide supra pycnidium atrata tectis, globoso-depressis, 150-180 μ . diam., poro orbiculari non v. vix papillato vix erumpentibus; contextu minute parenchymatico, fuligineo; sporulis globosis, intus minute granulosis, 6 μ . diam., hyalinis; basidiis bacillaribus 5-7 \times 1, hyalinis.

Hab. in ramulis emortuis Vaccinii Myrtilli, Ambert Galliae (BRÉVIÈRE, comm. P. HARIOT). — Præsertim sporulis perfecte globosis dignoscenda species.

107. **Phoma radicis-Oxycocci** Ternetz, Jahrb. f. Wissenschaft. Bot. 6418 XLIV (1907). — Pycnidiis atro-brunneis, magnitudine ludibundis, 176-196 μ . cr., 176-196 μ . altis, poro unico pertusis, leviter papillatis; cirro firmo; sporulis oblongis, 4-5 \times 2, utrinque guttula oleosa præditis.

Hab. in radice Vaccinii Oxycocci in Germania.

108. **Phoma radicis-Ericæ** Ternetz, Jahrb. f. Wissenschaft. Bot. XLIV 6419 (1907), — Pycnidiis nigro-brunneis, subæqualibus, 107 μ . cr., 157 alt., obsolete papillatis, serius poris 1-5 dehiscentibus, cirro crasso, firmo; sporulis regulariter oblongis 3,9 \times 1,3, hyalinis.

Hab. in radice Ericæ sp. in Germania.

109. **Phoma ligustrina** Sacc., Ann. Mycol. VI (1908) p. 565. — Py- 6420 cnidiis dense gregariis, subcutaneo-erumpentibus, globoso-conoideis, nigricantibus, intus griseo-flavidis, $1/2$ mm. diam.; sporulis fusoides, curvulis, 11 \times 2,5-3, hyalinis (guttulis non visis); sporophoris filiformibus, fasciculatis, 18-20 \times 1-1,5.

Hab. in ramis corticatis Ligustri Ibotæ, socio st. ascophoro *Diaporthe ligustrina* (cfr.), Lyndonville New York Amer. bor. (FAIRMAN).

110. **Phoma Armeriæ** Jaap, Weit. Beitr. Pilzfl. nordfries. Ins., Schr. Naturw. Ver. f. Schlesw.-Holst. Bd. XIV (1907) Heft I, p. 28. — Py- 6421 cnidiis gregariis, subcorticis, corticem pustulatim inflantibus, diu tectis, nigris, lenticularibus, 0,2-0,3 mm. latis, ostiolo elongato 40 μ . circ. lato; sporulis elongatis, 3-4 \times 1-1,5, biguttulatis, unilocularibus, hyalinis.

Hab. in pedunculis siccis Armeriæ vulgaris prope Wyk in ins. Föhz, Frisia.

111. **Phoma bacterioides** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 6422 p. 408. — Pycnidiis sparsis, globosis v. subdepressis, 65-80 μ . cr., nigris, subepidermicis, demum poro brevi papilliformi apertis, contextu grosse parenchymatico pallide flavo-brunneo, supra circa po-

rum obscuriore; sporulis bacilliformibus 2 ~ 1, hyalinis, unilocularibus; sporophoris subconoideo-papilliformibus.

Hab. in ramulis siccis Osyridis albæ prope Ulcinj Montenegro.

112. **Phoma Suædæ** Jaap, Weit. Beitr. Pilzfl. nordfries. Ins., Schrift. 6423 Naturw. Ver. f. Schleswig-Holst. Bd. XIV (1907) Heft I, p. 27. — Pycnidiis gregariis, mox erumpentibus et superficialibus, punctiformibus, minutis, nigris, 0,2 mm. circ. cr., ostiolo breviter conoideo 15 µ. circ. lato, dein medio collabescente, contextu flavobrunneo parenchymatico, circa ostiolum obscuriore; sporulis ellipsoideis, elongatis v. breviter cylindraceis, raro ovoideo-elongatis, subclavatis, rotundatis, 5-10 ~ 3-4, rectis v. curvulis, plerumque grosse 2- raro minute 3-4-guttulatis, hyalinis, demum flavescentibus.

Hab. in ramulis siccis Suædæ maritimæ prope Norddorf in ins. Amrum, Frisia.

113. **Phoma Lomatiæ** Speg., Fungi Chilenses (1910) p. 143. — Ma- 6424 culis fuscescentibus ægre perspicuis diffusis, 10-15 mm. diam., hypophyllis; pycnidiis plus v. minus confertiusculis, epidermide tectis, submembranaceis, subglobosis, 60-75 µ. diam., ostiolo proportione maximo perforatis; sporulis cylindraceis, plerumque rectis, 2 ~ 0,75, hyalinis.

Hab. in foliis emortuis Lomatiæ obliquæ in silvaticis Cerro Caracol de Concepcion Chile, Amer. austr.

114. **Phoma Guevinæ** Speg., Fungi Chilenses (1910) p. 142. — Ma- 6425 culis nullis; pycnidiis parenchymate innatis, epidermide velatis, saepius hypophyllis, numerosis, confertiusculis, lenticulari-subconoideis, 75-100 µ. diam., subcarbonaceis, vix papillato-ostiolatis: sporulis cylindraceis, utrinque rotundatis, rectis v. curvulis, 3 ~ 1, hyalinis.

Hab. in foliis siccis subputrescentibus Guevinæ Avellanæ in silvaticis Cerro Caracol de Concepcion Chile, Amer. austr.

115. **Phoma Tricyclæ** Speg., Myc. Argent. V, p. 346, in An. Mus. 6426 Buenos Aires XX (1910). — Foliicola, amphigena, epidermide tecta; pycnidiis plagulas suborbicularis nigrescentes v. fuscescentes 1-3 mm. latas efficientibus, subglobosis, 100-120 µ. diam., obsolete ostiolatis, contextu minute denseque parenchymatico; sporulis ellipsoideis, 2-2,5 ~ 1, eguttulatis, hyalinis.

Hab. ad folia dejecta putrescentia Tricyclæ spinosæ in montanis Potrerillos pr. Mendoza, Argentina.

116. **Phoma Zelintneri** Koord., Botan. Untersuch. Java (1907) p. 205, 6427

fig. 26. — Pycnidiis corticolis, gregariis, globoso-depressis, subcutaneis, vix erumpentibus, nigris, loculo irregulari 50-130 μ . lato; sporulis 7-10 \approx 3-5, hyalinis, fusoideis, utrinque acutis; sporophoris filiformibus, rectis v. curvulis 20-35 μ . longis.

Hab. in cortice Fici elasticæ, quam valde vexat, prope Kalawiro prov. Kedu Java (KOORDERS). — Socia sunt *Diplodia Wurthii* et *Fusicoccum Elasticæ*.

117. **Phoma Almeidæ** Sacc. et Trav. — Syll. XX, p. 350, *Phoma* 6428

sp. d'Alm. et S. Cam. in Rev. Agron. IV (1906) p. 137, t. III, f. 1-2 et in Bol. Soc. Brot. XIV (1909) p. 38. — Pycnidiis sparsis, globoso-depressis, subcutaneo erumpentibus, olivaceo-farctis, sursum deorsumque hic illic intus elevatis sed non distincte plurilocellatis; sporulis breviter fusoideis, acutiusculis, hyalinis, biguttulatis, 8-10 \approx 2,5-3; sporophoris filiformibus, curvulis, sporulâ duplo-triplo longioribus suffultis.

Hab. in cortice Platani occidentalis pr. Coimbra Lusitaniæ. — An diversa a *Ph. scabra* v. *Ph. notha*, ipsis auctoribus observantibus?

118. **Phoma frigida** Sacc., Ann. Mycol. VI (1908) p. 561. — Pycni- 6429

diis dense et late gregariis, subcutaneis, vix erumpentibus, globulosis, atris, 300-400 μ . diam., nucleo albido; sporulis fusoideo-oblongis, utrinque obtusulis, 8 \approx 2,8-4, hyalinis, farctis, non guttulatis; sporophoris filiformibus, exiguis, sporulâ brevioribus.

Hab. in ramis junioribus Populi Tremulæ frigore, ut videtur, necatis, Rüdnitz pr. Bernau Germaniæ (H. SYDOW). — Subaffinis *Phomæ Mororum*.

119. **Phoma canadensis** Voglino, in Annal. R. Accad. Agricolt. To- 6430

rino, LIII, 1910 (1911) p. 360. — Pycnidiis subcorticalibus, prominulis, liberis, minutis, 80-100 μ . latis, globosis, raro ovoideis, nigris, diu clausis, inde pertusis; sporulis hyalinis, ellipsoideis v. ovoideis, minutissimis, 2,5-3 \approx 1-1,5, rarissime 4 \approx 2, plerumque 3 \approx 1, sporophoris brevissimis.

Hab. in cortice lacero Populi canadensis, inducens pustulas cancerosas, Santena Pedemontii, Italia bor.

120. **Phoma platysperma** Peck, Bull. Torr. Bot. Cl. XXXVI (1909) 6431

p. 336. — Pycnidiis minutis 0,5 mm. latis, numerosis, epidermide tectis, erumpentibus, nigris; sporulis subglobosis aut late ellipsoideis, 10-12 \approx 8-10.

Hab. in ramis Salicis nigræ, River Forest Chicago Illinois Amer. bor. (E. T. et S. A. HARPER).

121. **Phoma Pterocaryæ** Syd., Ann. Mycol. IV (1906) pag. 344. — 6432

Pycnidiis late densiuscule gregariis (non cæspitosis), globoso-depressis, subcutaneis, demum vertice obtuso vix pertuso erumpentibus, 0,5 mm. diam. atris; sporulis oblongis, rectis, continuis, hyalinis, eguttulatis, 7-9 \times 2-3; sporophoris nullis vel obsoletis.

Hab. in ramis Pterocaryæ caucasicae, pr. Scholam silviculturæ Tamsel Germaniæ (P. VOGEL).

122. **Phoma proximella** Sacc., Not. Myc. VII, in Ann. Myc. IV (1906) 6433

pag. 274. — Pycnidiis gregariis, innato-erumpentibus, globulosis 150-180 μ . diam., interdum irregularibus, nigris, vix papillosis, poro pertusis; contextu membranaceo, olivaceo-fuligineo, ex cellululis 5-7 μ . diam. formato; sporulis minutissimis, ovoideis, inaequilateris, 2-3 \times 0,7-1, hyalinis; sporophoris brevissimis, subnullis.

Hab. in conis emortuis Pin i silvestris prope Parisios in Gallia (P. HARIOT). — Ab affini *Phoma Pinastri* differt contextu haud atro-violaceo, ostiolo subrotundo, sporulis adhuc angustioribus etc.

123. **Phoma bohemica** Bubák et Kabát, Naturw. Ztschr. f. Land- u. 6434

Forstwirtsch. (1910) p. 320, fig. 2, *Macrophoma bohemica* Bub. et Kab. — Pycnidiis subepidermicis, biserialibus, globosis, basi appلانatis, 150-200 μ . latis, nigris, opacis, contextu crasso, nigro-fusco, pseudoparenchymatico, intus paulatim hyalino, papilla conica erumpentibus, ibique irregulariter dehiscentibus; sporulis oblongis v. fusiformibus, 10-16 \times 4-6,5, hyalinis, continuis; sporophoris cylindricis, brevibus, ad apicem attenuatis, hyalinis v. parum luteolis.

Hab. in foliis Abietis albæ, Turnau Bohemiæ. — Socia adest *Rehmiellopsis bohemica* Bub. et Kab.

124. **Phoma Welwitschiæ** Massee, Kew Bull. (1910) p. 253. — Py- 6435

cnidiis erumpenti-superficialibus, dense aggregatis, hemisphæricis, atris, contextu dense parenchymatico fuligineo, ostiolo minuto, pertuso præditis, 150-180 μ . diam.; sporulis ellipsoideis utrinque obtusiuscule rotundatis, grosse 2-guttulatis, hyalinis, 5 \times 3, sporophoris simplicibus 8-10 \times 1,5 fultis.

Hab. in apicibus emortuis foliorum Welwitschiæ mirabilis, Damara pr. Welwitsch, Africa trop. (W. C. WORSDELL).

125. **Phoma roseo-nigra** Nadson et Sulimà Gamoilo, Bull. Jard. Im- 6436
per. Bot. St. Petersb. VIII (1908) p. 344 (rossice).

Hab. in ramis? ex fundo lacus Ladoga prope St. Petersbourg

Rossiæ. — Nisi male interpretamur, pycnidia sunt intus rosea, $\frac{1}{5}$ - $\frac{1}{4}$ mm. diam.; sporulæ 7 \approx 2,8-3,2.

126. **Phoma musicola** Speg., Myc. Argent. V, p. 344, in An. Mus. 6437 Buenos Aires, XX (1911). — Pycnidiis laxe gregariis, subepidermicis, lenticularibus, membranaceis, ostiolo rotundo perforatis, atris, 80-100 μ . diam., contextu olivaceo indistincte parenchymatico; sporulis ellipsoideis, eguttulatis, 4-5 \approx 1,7-2, hyalinis, raro subinæquilateris.

Hab. ad rachides aridas foliorum Musæ paradisiacæ in hortis Oran, Jujui, Argentina. .

127. **Phoma Neottiæ** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 6438 p. 3. — Pycnidiis sparsis, epidermide velatis, lenticularibus, ochraceis, poro pertusis, 100-120 μ . diam., contextu celluloso; sporulis ellipsoideis, continuis, eguttulatis, hyalinis, 4,5-5 \approx 3.

Hab. in caulibus siccis Neottiæ nid-i-avis prope Kecskemét Hungariæ.

128. **Phoma araucana** Speg., Fungi Chilenses (1910) p. 141. — Maculis nullis; pycnidiis amphigenis confertis, parenchymate foliorum innatis, atris, subglobosis, 40-50 μ . diam., membranaceis; sporulis ellipsoideis, hyalinis, utrinque rotundatis, 2-3 \approx 1.

Hab. in foliis emortuis Libertiae ixioidis prope Ciudad de Valdivia Chile, Amer. austr.

129. **Phoma conimbricensis** Trav. et Spessa, Bol. Soc. Brot. XXV 6440 (1910) p. 175, t. II, f. 8. — Pycnidiis in areolis dealbatis gregariis, epidermide velatis, poro distincto pertusis, globoso-depressis, 125-175 μ . diam., fuligineo-atris, excipulo minute pseudoparenchymatico, fuligineo-melleo; sporulis ellipsoideo-oblongis, intus plus minusve granulosis, rarius biguttulatis, 8-11 \approx 2-2 $\frac{1}{2}$, rectis v. leniter curvulis; sporophoris indistinctis.

Hab. in scapis siccis Gladioli cardinalis in horto botan. conimbricensi Lusitaniæ (A. MOLLER).

130. **Phoma Puyæ** Speg., Fungi Chilenses (1910) p. 144. — Maculis 6441 nullis; pycnidiis pusillis parenchymate innatis, epiphyllis, epidermide tectis, subglobosis, 75-100 μ . diam., atris, minute ostiolato-perforatis; sporulis ellipsoideis v. obovatis, hyalinis v. subchlorinis eguttulatis, 4-6 \approx 2,5-3.

Hab. in foliis siccis emortuis Puyæ cæruleæ, Cerro San Cristobal de Santiago Chile Amer. austr.

131. **Phoma cacheutensis** Speg., Myc. Argent. V, p. 341, in Anal. 6442 Mus. Buenos Aires XX (1910). — Maculis nullis; pycnidiis hy-

pophyllis hypodermicis, dense constipatis, subglobosis, membranaceo-coriacellis, papillato-ostiolatis, 90-100 μ . diam., crustam nigram 5-15 mm. diam. prominulam erumpentem formantibus, glabris, contextu obscure parenchymatico; sporulis subellipsoideis, saepe leniter inaequilateris, 4-6 \approx 2-3, hyalinis.

Hab. ad folia arida Dyckiae sp. in rupestribus montanis pr. Cacheuta, Argentina.

132. **Phoma Bromeliæ** Trav. et Spessa, Bol. Soc. Brot. XXV (1910) 6443 p. 175, t. II, f. 7. — Pycnidiis dense sparsis, primum epidermide velatis dein erumpentibus, globoso-depressis, 120-140 \approx 100-110, atris, excipulo minute pseudoparenchymatico, fuligineo; sporulis ovoideo-fusoideis, rectis, 8-9 \approx 2 $\frac{1}{2}$ -3; sporophoris nullis distinctis.

Hab. in areis dealbatis foliorum exsiccatorum Bromeliæ A-cangæ in horto botanico conimbricensi Lusitaniæ (A. MOLLER).

133. **Phoma yuccicola** Pat. Add. Cat. Champ. Tunis. in C. R. du Congrès des Soc. Sav. 1908 (1909) p. 254. — Pycnidiis præcipue epiphyllis, sparsis, erumpentibus, atris, coriaceis, globosis, 60-150 μ . diam., poro pertusis, nucleo albo; sporulis numerosissimis, ovoides, hyalinis, 4-5 \approx 2.

Hab. in foliis emortuis Yuccæ, Alger (TRABUT). — Ab affinis Ph. Yuccæ et Ph. gloriae sporulis brevissimis distinguitur.

134. **Phoma aloicola** Trinchieri, Rend. R. Acc. Sc. Fis. Matem. Napoli (1909) fasc. 3-4, p. 90. — Pycnidiis sparsis, numerosis, minutis, evidenter brunneis, innato-erumpentibus, oblongis, poro pertusis, 73-225 μ . diam., 49-147 μ . altis; excipulo membranaceo, flavescenti-fusco præditis; sporophoris brevissimis, subnullis, hyalinis; sporulis ellipsoideo-oblongis, utrinque obtusiusculis vel rarius subsphæroideis, eximie 2-guttulatis, hyalinis, 4.5-7 \approx 2-4,5.

Hab. in scapis siccis Aloës brevifoliae Mill., in Horto regio botanico neapolitano Ital austr. (TRINCHIERI). — A Ph. Debeauxiana Sacc. macularum constanti defectu, pycnidiorum forma et dispositione, sporularum magnitudine et matrice (in scapis) omnino differt.

135. **Phoma herbarum** West. — Syll. III, pag. 133 — f. **Antherici** 6446 Hollós, Ann. Mus. Nat. Hungar. VIII (1910) p. 3. — Pycnidiis gregariis epidermide velatis, globulosis, fuscis, poro pertusis, 120-140 μ . diam., contextu celluloso; sporulis ellipsoideis, continuis, eguttulatis, hyalinis, 7-8 \approx 3-3,5.

Hab. in caulinis siccis Antherici Liliaginæ prope Nagy-Körös Hungariæ.

136. **Phoma Zuccagniæ** Speg., Myc. Argent. V, p. 347, in An. Mus. 6447

Buenos Aires, XX (1910). — Pycnidiis sparsis, superficialibus, minutis, siccis, e globoso collabascentibus, late ostiolatis, udis subglobosis, minute papillatis, 120-150 μ . diam.; sporulis suballantoideis, rectis curvulisve, utrinque obtusiusculis, 2-3 \times 0,7-1, hyalinis; sporophoris simplicibus, 15 \times 1, fasciculatis, hyalinis.

Hab. ad ramos aridos decorticatosque Zuccagniæ punctatæ in montanis Potrerillos pr. Mendoza, Argentina.

137. **Phoma platycarpa** Bubák, Bull. Herb. Boiss. 2 sér., VI (1906) 6448

pag. 407. — Pycnidiis sparsis, ellipsoideis v. elongatis, depresso-lenticularibus, 200-250 μ . latis, nigris, subepidermicis, demum prominentibus, contextu basi pallide castaneo-brunneo, supra crassiori nigrescenti; sporulis fusoides 8-11 \times 2, apice angustatis, medio guttulatis, hyalinis, unilocularibus; sporophoris cylindraceis, 15-20 \times 1, in massa flavescentibus, simplicibus, hyalinis.

Hab. in caulis siccis Asphodeli microcarpi pr. Ulcinj Montenegro.

138. **Phoma bulbicola** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 457. 6449

— Pycnidiis epidermide velatis, sparsis, lenticularibus, nigris, 240-280 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, biguttulatis, hyalinis, 4-5 \times 2,5-3.

Hab. in bulbis Muscari comosi pr. Kecskemét Hungariæ.

139. **Phoma Heleocharidis** Karst., Acta Soc. pro Faun. et Fl. fenn. 6450

XXVII 4 (1906) p. 9. — Pycnidiis sparsis, innatis, dein leviter erumpentibus, sphæroideo-applanatis, atris, minutis; sporulis oblongatis, 8-10 \times 3-4.

Hab. in calamis aridis Heleocharidis palustris, Tammela, Fennia.

140. **Phoma Usteriana** Spegazz., Fungi Paulist., Rev. Mus. La Plata, 6451

t. XV (1908) p. 36. — Maculis nullis; pycnidiis dense seriatim constipatis, primo epidermide velatis, dein erumpenti-prominulis, ex hemisphærico depresso-lenticularibus, 75-90 μ . diam., ostiolo latiusculo perforatis, membranaceis, contextu parum distincto olivaceo; sporulis rectis v. leniter curvulis, utrinque obtusiusculis, 6-8 \times 2, eguttulatis, hyalinis.

Hab. ad folia Oryzæ sativæ in Horto Escola Polytechnica Sao Paulo, Brasilia (USTERI).

141. **Phoma glumicola** Spegazz., Fungi Paulist., Rev. Mus. La Plata 6452

t. XV, p. 36. — Maculis cinerascentibus parum manifestis sæpe totam matricem occupantibus; pycnidiis innato-erumpentibus, laxè

gregariis, lenticularibus, 75-100 μ . diam., glabris, atris, ostiolo latiusculo perforatis, tenui-membranaceis, contextu grosse parenchymatico, fuligineo; sporulis rectis v. leniter inaequilateralibus, utrinque obtusiusculis, 4-5 \approx 2, eguttulatis.

Hab. ad glumas Oryzæ sativæ in Horto Escola Polytechnica Sao Paulo, Brasilia (USTERI). — Status sporulifer *Didymellæ glumicolæ* Speg. l. c.

142. **Phoma Milii** Alm. et Cam., Bol. Soc. Brot. XXV (1908-1909), 6453

Extr. p. 34. — Pycnidiis sparsis, globoso-depressis, atris, immersis, primum diu epidermide tectis, demum ostiolo pertuso erumpentibus, 250-300 μ . d.; sporulis oblongo-ellipsoideis v. subclaviformibus, hyalinis, continuis, sursum rotundatis, deorsum attenuatis, plerumque rectis v. raro lenissime curvulis, biguttulatis, 7,5-10 \approx 3-4; sporophoris simplicibus, plus v. minus cylindraceis, subaequilongis fultis.

Hab. in culmis Milii multiflori Cav. prope Coimbra, cerca de S. Bento Lusitania (A. MOLLER). — Socia *Pyrenochæta leptospora* Sacc. et Br.

143. **Phoma Stenotaphri** Speg., Myc. Argent. V, p. 345, in An. Mus. 6454

Buenos Aires, XX (1910). — Pycnidiis laxe gregariis, innatis, lenticularibus, eximie ostiolatis, pertusis, membranaceis, 80-90 μ . d., contextu grosse parenchymatico, olivaceo; sporulis ellipsoideis non v. minute biguttulatis, utrinque subacutiusculis, 4-5 \approx 1,5, rectis curvulisve, hyalinis.

Hab. ad rhachides florales Stenotaphri americani in hortis La Plata, Argentina.

144. **Phoma muscicola** A. L. Smith, Trans. Brit. Mycol. Soc. III 6455

(1910) p. 221. — Peritheciis minutis 120-150 μ . diam., poro minuto dehiscentibus; sporulis oblongo-ellipsoideis, minutis, hyalinis, 5 \approx 2.

Hab. in capsulis muscorum (Bryii spp.), Lancashire Britanniae.

145. **Phoma Mycenastri** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6456

p. 534. — Pycnidiis dense gregariis, lenticularibus, fuscis, poro pertusis, 50-80 μ . diam., contextu parenchymatico; sporulis ellipsoideis, continuis, eguttulatis, hyalinis, 5-6 \approx 2.

Hab. in endoperidio Mycenastri Corii, prope Kecskemét Hungariæ.

146. **Phoma Geasteris** Hollós, Annal. Mus. Nat. Hungar. V (1907) 6457

p. 280. — Pycnidiis gregariis, immersis, lenticularibus, ochraceis,

poro pertusis, 50-100 μ diam., contextu parenchymatico; sporulis ellipsoideis, continuis, eguttulatis biguttulatisve, hyalinis, 5-6 \approx 2-2,5.

Hab. in strato interno exoperidii Geasteris fornicati pr. Kecskemét Hungariæ.

147. **Phoma Calvatiæ** Hollós, Annal. Mus. Nat. Hungar. V (1907) 6458 p. 280. — Pycnidiis sparsis lenticularibus, fuscis, poro pertusis, 100-120 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, continuis, eguttulatis, hyalinis, 6-8 \approx 2-2,5.

Hab. in endoperidio Calvatiæ candidæ prope Fehértémplom Hungariæ.

148. **Phoma Geasteropsidis** Hollós, Annal. Mus. Nat. Hungar. V 6459 (1907) p. 280. — Pycnidiis gregariis, lenticularibus, ochraceis, poro pertusis, 100-160 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, eguttulatis v. obscure biguttulatis, continuis, hyalinis, 6-7 \approx 2-3.

Hab. in stratu interno exoperidii Geasteropsidis Conrathi prope Modderfontein Africæ meridionalis.

149. **Phoma Bovistæ** Hollós, Annal. Mus. Nat. Hungar. V (1907) 6460 p. 279. — Pycnidiis sparsis, lenticularibus, ochraceis, poro pertusis, 80-100 μ . diam.; contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, continuis, obscure biguttulatis, hyalinis, 4-5 \approx 1,5-2.

Hab. in exoperidio Bovistæ plumbæ prope Sókamara Hungariæ.

150. **Phoma ?dubia** (Linds.) Sacc. et Trott., *Phymaiopsis dubia* Linds. 6461 Lich. and Fungi Otago, p. 442, (1866) t. XXX, f. 36-42. — Pycnidiis gregariis, punctiformibus, nigris, innato-emergentibus, globulosis; sporulis oblongo-teretiusculis, hyalinis, exiguis, 3-4 \approx 1,7; sporophoris bacillaribus fasciculatis paullo longioribus.

Hab. in apotheciis Usneæ barbatæ v. floridæ, Dunedin pr. Otago in Nova Zelandia.

151. **Phoma ornithophila** B. R. S. in Saccardo, Not. Myc. VI; Ann. 6462 Myc. III (1905) p. 509. — Pycnidiis subsparsis, saepeque dense approximatis, subcuticularibus, prominulis, demum superficialibus, spheroideo-depressis, atris, nitidulis, 240-320 μ . diam., breve obtuse papillatis, pertusis; contextu minute parenchymatico fuligineo; sporulis ellipsoideis, 9-12 \approx 4-5, hyalinis, 2-guttulatis; sporophoris bacillaribus, simplicibus v. furcatis, 12-15 \approx 2-3.

Hab. in caule pennarum subputrescentium Phasiani, et Hi-Syll. fung. XXII (III-1913)

rundinis, La Panne pr. Furnes Belgii (MARIA, ROUSSEAU). — Socius sæpe adest *Pteromyces ambiguus*.

152. **Phoma ? leptospora** Speg., Fungi Chilenses (1910) p. 145, cum 6463 icon. — Pycnidiis sparsis v. laxe gregariis, innato-erumpentibus, ex hemisphærico lenticularibus, 50-120 μ . diam., atris, coriaceis, late ostiolato-perforatis; sporulis hyalinis, cylindraceis, utrinque plus minusve rotundatis, 10-20 \approx 2-3, sæpe minute uniguttulatis.

Hab. frequens in foliis coriaceis subputrescentibus et in ramulis siccis plurimarum plantarum, Talcahuano, Concepcion, Valparaiso, Chile Amer. austr. — Sec. Auct. hæ distinguuntur formæ: fm. **Boldoæ fragrantis**: pycnidiis 50-80 μ . diam., sporulis cylindraceis utrinque acutiusculis, biguttulatis, 18-20 \approx 2,5. — fm. **Lardizabalæ biternatae**: pycnidiis 90-110 μ . diam., sporulis cylindraceis, quandoque apice acutatiusculis, raro guttulatis, 18-20 \approx 2,75-3. — fm. **Lomatiae obliquæ**: pycnidiis 100-120 μ . diam., sporulis cylindraceis, utrinque rotundatis, 10-18 \approx 2. — fm. **Puyæ chilensis**: pycnidiis 100 μ . diam., sporulis cylindraceis v. leniter fusoideis, rectis, apice obtusis v. subtruncatis, eguttulatis, 10-14 \approx 2-2,25.

153. **Phoma radicalis** Sacc. et Trav. — Syll. XX, pag. 358. — Ita 6464 vocetur *Phoma radicicola* Maubl. (1905) — Syll. XVIII, p. 250 — non Mac Alp. (1902). — Syll. XVIII, p. 247.

PHOMOPSIS Sacc. — Syll. III p. 614, XVIII p. 264 (*).

1. **Phomopsis viridarii** (Sacc.) Trav. et Spessa — Syll. III, p. 89, sub 6465 *Phoma* — fm. **nervicola** Trav. et Spessa, Bol. Soc. Brot. XXV (1910) p. 178. — A typo differt ob pycnidia secus feliorum nervos disposita et ob sporophora sporulas subæquantia vel paullo longiora.

Hab. in foliis Magnoliæ grandifloræ, in Horto botanico Coimbra (A. MOLLER).

2. **Phomopsis Coronillæ** (West.) Bubák, Bull. Herb. Boiss. (1906) 6466 pag. 473, tab. XV, fig. 4. — Ita vocanda est *Phoma Coronillæ* West. — Syll. III, p. 67. — Nascitur quoque in Montenegro.
3. **Phomopsis Psoraleæ** Bubák, Bull. Herb. Boiss. 2 sér., VI (1906) 6467 pag. 473. — Pycnidiis in maculis nigrescentibus insidentibus v.

(*) De speciebus hujus generis cfr. DIEDICKE in Ann. Mycol. IX (1911), BUBACK Pilzfl. Hung. Budapest 1906, p. 28, et TRAVERSO in Fl. it. crypt. Pyren. p. 215-284 passim, sub *Diaporthe*.

sparsis et tunc areola nigrescente circumdatis, depresso lenticularibus usque ad 180 μ . latis, subepidermicis demum apice late conoideo erumpentibus, contextu firmo, flavo-brunneo supra obscuriore; sporulis fusoideis, ex fusoideo ovoideis, 5,5-9 \times 2-3, utrinque plus vel minus angustatis, hyalinis, spuriæ uniseptatis, supra fortiter cuneatis, 20-25 \times 1-1,5, hyalinis, sporophorïs filiformibus usque ad 12 μ . long., rectis, confertis.

Hab. in caulis siccis Psoraleæ bituminosæ pr. Ulcinj Montenegro.

4. **Phomopsis epicarpa** Sacc., Ann. Mycol. VII (1909) pag. 433. — 6468
Pycnidiis sparse gregariis, subcutaneo-erumpentibus, prominulis, nigris, globoso-depressis, 250-300 μ . diam., intus cavis, pallidis, ostiolo irregulari; sporophorïs filiformibus, subinde flexuosis, hyalinis, fasciculatis, 15-17 \times 1,5; sporulis fusoideis, utrinque acutiusculis, rectis curvulisve, hyalinis, 8-9 \times 2,5.

Hab. in leguminibus languidis Robiniae Pseudacaciæ pr. Parisios (P. HARIOT). — *Ph. Pseudacaciæ* affinis sed loco et habitu diversa.

5. **Phomopsis Cydoniæ** (Schulz.) Sacc. et Trav. — Syll. XX, p. 362 6469
Næmaspora Cydoniæ Schulz. v. Mügg. in Verh. zool. bot. Ges. Wien, 1871, p. 1237, t. 13, f. 15. — *Pycnidiis subcutaneis, pu-*
stulatim elevatis, globoso-conicis, intus pallide griseis, $\frac{1}{2}$ mm. d.;
sporulis numerosis, tereti-oblongis, hyalinis, 7-9 μ . longis; sporo-
phorïs filiformibus, stipatis, sporulâ multo longioribus, demum ha-
matis, hyalinis.

Hab. in ramis corticatis Cydoniæ vulgaris in Hungaria. —
Pycnidium Diaporthes speciei.

6. **Phomopsis Francoæ** Speg., Fungi Chilenses (1910) pag. 147. — 6470
Maculis tenuibus obscuris indefinitis subellipticis, 3-10 mm. diam.;
pycnidiis ligno immersis, globosis, 75-100 μ . diam., late ostiolato-
perforatis; sporulis subcylindraceis, medio sæpe lenissime coarcta-
tulis utrinque rotundatis 6-7 \times 1,75, non v. grosse biguttulatis,
hyalinis.

Hab. in ramulis junioribus emortuis siccis Francoæ son-
chifoliæ in collibus Bahia de Corral Chile, Amer. austr.

7. **Phomopsis coriariicola** Speg., Fungi Chilenses (1910) p. 146. — 6471
Pycnidiis ligno cortice tecto infossis, subglobosis, 50-60 μ . diam.,
atris, membranaceis, bene ostiolatis; sporulis cylindraceis, rectis v.
curvulis, utrinque subtruncato-rotundatis, 3-4 \times 1,5, minute unigut-
tulatis, hyalinis.

Hab. in ramis siccis *Coriariæ ruscifoliæ*, Cerro Caracol de Concepcion Chile Amer. austr.

8. **Phomopsis Tommaseana** L. Gaja, Flora micol. prov. Padova, (1911) 6472 p. 22 (sunto litogr.). — Pycnidiis solitariis, raro gregariis, pseudoparenchymatice contextis, atris, irregulariter subglobosis, fuscis, erumpentibus, 300-350 circiter μ . diam.; sporulis hyalinis, fusoideis, 2-guttulatis, 6-7 \approx 2 $\frac{1}{2}$ -3; sporophoris cylindraceis, hyalinis, hamatis, 18-20 μ . longis.

Hab. in ramis corticatis *Calycanthe* in viridario Convictus Universitatorum Patavii Ital. bor. (L. GAJA).

9. **Phomopsis Martyniae** Speg., Myc. Argent. V, pag. 347, in An. 6473 Mus. Buenos Aires, XX (1910). — Macula stromatica nigra, irregulares, late effusa, nuda, interdum 5-15 mm. diam.; pycnidiis ligno superficie atrato nidulantibus, tenui-membranaceis, 90-100 μ . diam., non v. vix prominulis, contextu indistincto; sporulis ellipsoideis, grosse biguttulatis, 5-6 \approx 2-3, rectis curvulisve, sporophoris simplicibus, fasciculatis, 15-20 \approx 1-1,5 suffultis.

Hab. ad caules aridos putresque Martyniae luteæ in pratis circa La Plata Argentina.

10. **Phomopsis Almeidæ** Trav. et Spessa, Bol. Soc. Brot. XXV (1910) 6474 p. 177, t. II, f. 10. — Pycnidiis sparsis vel hinc inde subgregariis, cortice nidulantibus et vix erumpentibus, depressis, $\frac{3}{4}$ -1 \approx $\frac{1}{3}$ - $\frac{1}{2}$ mm., atris; contextu indistincte pseudoparenchymatico, fuligineo-atro; sporulis oblongo-ovoideis vel fusiformibus, interdum minute biguttulatis, 7-9 \approx 2-3; sporophoris cylindraceis 10-15 \approx 1- $\frac{1}{2}$ suffultis.

Hab. in caulis emortuis *Solanum nigrum* in horto botanico conimbricensi Lusit. (A. MOLLER). — A *Phoma pampeana* differt matrice aliena, pycnidiis minoribus et sporulis typice minusculis et biguttulatis; a *Ph. solanophila* pycnidiis multo majoribus et sporophoris distinctis.

11. **Phomopsis majuscula** Sacc. Not. Myc. VII, Ann. Myc. IV (1906) 6475 p. 275. — Pycnidiis laxe gregariis, sphæroideo-oblongis, depressionis, sordide nigricantibus, 600-700 μ . long., supra veluti e matrice atrata formatis et irregulariter dehiscentibus, deorsum contextu grosse parenchymatico fuligineo praeditis, peridermio paullulum pustulato et demum lacerato tectis; sporulis oblongo-ellipsoideis, utrinque leniter tenuatis, saepius inaequilateris, 10-12 \approx 3,5-4, sed perfecte maturis usque ad 12-16 \approx 5, intus granulosis, hyalinis;

sporophoris bacillaribus, 6-8 \approx 2,5-3, non secédentibus, hyalinis, e strato proligero fuligineo oriundis.

Hab. in ramis emortuis *Tecomæ radicantis*, Lyndonville N. Y. (C. E. FAIRMAN). — A *Ph. Tecomæ* differt pycnidiis et sporulis subdupo majoribus, sporophoris brevioribus etc.

12. **Phomopsis Rojana** L. Gaja, Flora micol. prov. Padova, (1911) p. 22 6476 (sunto litogr.). — Pycnidiis sæpe proximatis, contextu pseudoparenchymatico nigrescente præditis, irregulariter subglobosis, per ostiola breviter papillata erumpentibus, 300-400 μ . diam.; sporulis hyalinis, continuis, subfusoideis, 2-guttulatis, 8-10 \approx 3-3 $\frac{1}{2}$; sporophoris cylindraceis, hyalinis, 18-20 μ . longis.

Hab. in ramis corticatis *Diospyri Kaki* in viridario Convictus Universitariorum, Patavii Ital. bor. (L. GAJA). — Differt a *Phoma Diospyri*, substrato, longitudine sporularum et sporophorum, denique habitatione in ramo corticato.

13. **Phomopsis Stewartii** Peck, New York St. Mus. Bull. n. 139 6477 (1909) p. 27. — Peritheciis gregariis, maculas griseas seu brunneas vulgo occupantibus, tenuibus, subcutaneis, dein erumpentibus, depresso-depressis, minutis, $\frac{1}{3}$ - $\frac{1}{2}$ mm. latis, nigris; sporulis dimorphis, primum filiformibus, curvatis, flexuosis v. hamatis, 16-25 \approx 1-1,5, deinceps oblongis v. subfusiformibus, hyalinis, vulgo binucleatis, 8-12 \approx 2; sporophoris gracilibus, sporulas æquantibus vel brevioribus.

Hab. in ramis *Cosmi bipinnati*, Geneva Ontario co. America boreali.

14. **Phomopsis oblita** Sacc. Ann. Mycol. VIII p. 383 (1910). — Pycnidiiis dense et late gregariis subcutaneo-erumpentibus, inæqualiter globulosis, 0,5 mm. diam., nigris, obtusis non papillatis, intus e griseo nigricantibus, farctis; sporulis fusoideo-oblongis, 2-guttatis, 8-9 \approx 2-3, interdum inæquilateris, hyalinis; sporophoris e strato viridulo oriundis bacillaribus, 11-12 \approx 1-1,5 hyalinis; sæpe curvulis.

Hab. in caulis *Artemisiae Absinthii* morientibus, prope Graal Germaniæ (H. SYDOW). — Probabiliter est pycnidium *Dia-phorthes oblitæ*.

15. **Phomopsis missouriensis** Bubák, Journ. of Mycol. XII (1906) 6479 p. 53. — Pycnidiis sparsis subepidermicis, collo brevi prominentibus, epidermide nigricante tectis, primum lenticularibus dein depresso conoideis usque ad $\frac{1}{4}$ mm. latis, parietibus crassis usque ad 60 μ ., contextu parenchymatico intus flavo-brunneo extus obscure

brunneo; sporulis variabilibus aliis fusoideis 9-13 \approx 2,5-3,5, utrinque acutis, sæpe bipartitis, aliis cylindraceis, rectis vel curvulis, usque ad 20 \approx 1,5-2; sporophoris filiformibus, usque ad 18 \approx 1,5, basi subfasciculatis, hyalinis.

Hab. in caulis emortuis *Asclepiadis verticillatae*, Emma Salina Co. Missouri Amer. bor. (C. H. DEMETRIO). — Status pycnidicus verisimiliter *Diaporthe Asclepiadis* Ell. et Ev.

16. Phomopsis Osyridis Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 6480

p. 473. — Pycnidiiis sæpe in stromate nigro depresso efformatis, nigris, ex ellipsoideo elongatis, 150-250 μ . cr., contextu firmo grosse parenchymatico, supra brunneo-nigro infra flavo-brunneo; sporulis fusoideis, utrinque angustatis, acutatis, 6-9 \approx 2-2,5, hyalinis; sporophoris subphialiformibus, apice fortiter acutatis, basi confertis, 10-15 \approx 1-1,5.

Hab. in ramulis siccis Osyridis albæ prope Ulcinj Montenegro.

17. Phomopsis Fagopyri Trav. et Spessa, Bolet. Soc. Brot. XXV (1910) 6481

p. 177, t. II, f. 13. — Pycnidiiis dense sparsis, epidermide initio tectis dein apice crasso erumpentibus, depresso-oblongis, 1-1 $\frac{1}{4}$ \approx $\frac{1}{3}-\frac{1}{2}$ mm., atris, interdum plus minusve bilocularibus; sporulis oblongis, utrinque obtusiusculis, 6-9 \approx 2-2 $\frac{1}{2}$, sæpe biguttulatis; sporophoris cylindraceo-bacillaribus, 10-15 μ . longis.

Hab. in caulis emortuis Fagopyri esculenti in horto botanico conimbricensi Lusit. (A. MOLLER). — Ob pycnidia interdum bilocularia et valde depressa ad *Placosphaeriam* vergit.

18. Phomopsis Kochiana L. Gaja, Flora micol. prov. Padova, (1911) p. 6482

23 (sunto litogr.). — Pycnidiiis immersis, prominulis, epidermide a-trata per aream dealbatam sparsis, dein erumpentibus, irregulariter subglobosis, pseudoparenchymatice contextis, atris, 300-400 μ . circiter diam.; sporulis hyalinis, fusoideis, 2-guttulatis, 6-7,5 $\frac{1}{2}$ \approx 2-2,5; sporophoris cylindraceis, hyalinis, rectis, tandem hamatis, 20-26 \approx 1-2.

Hab. in ramulis et in caulis emortuis Kochiae trichophyllæ, in viridario Convictus Universitariorum, Patavii, Ital. bor. (L. GAJA).

19. Phomopsis urticicola Trav. et Spessa, Bol. Soc. Brot. XXV (1910) 6483

pag. 178, t. II, f. 14. — Pycnidiiis dense sparsis, erumpentibus, valde depresso, 200-250 μ . latis, ostiolo incrassato et vix perforato, atris, contextu minute pseudoparenchymatico, fuligineo-atro; sporulis ellipsoideo-fusoideis, biguttulatis, 7-8 $\frac{1}{2}$ \approx 2 $\frac{1}{2}$ -3; sporopho-

ris cylindraceo-bacillaribus, demum hamatis et facillime secedentibus, hyalinis, $25-30 \approx 1-1\frac{1}{2}$.

Hab. in caulis exaridis Urticæ niveæ, prope S. Bento Coimbra Lusit. ubi legit A. MOLLER majo 1903.

20. **Phomopsis populina** Voglino, Ann. R. Acc. Agric. Torino v. LI 6484 (1908) Extract. p. 19, Nota 1. — Pycnidiis gregariis, prominentibus, nigris, primo lenticularibus, peridermio tectis, dein conicis, erumpentibus, $200-400 \approx 200-250$, mm. excipulo superne spisso et in collum oblongato, medio excavato cylindriformi; sporulis primo filiformibus, facile secendentibus, $24-40 \approx 1-1,5$, inde ellipsoideis, acutis, biguttulatis, $8 \approx 3-3,5$; sporophoris bacillaribus $16-24 \approx 3$.

Hab. in ramis corticatis Populi canadensis, Pancalieri Pedem. Ital. bor.

21. **Phomopsis conorum** (Sacc.) Diedicke in Ann. Mycol. (1911) p. 22; 6485 — Syll. III, p. 150 — Allesch. Sphærops. I, p. 195, sub *Phoma* — var. **naviculispora** Trav., in Bull. n. 8 Société Flore Valdôtaine, pag. 27 extr. (1912). — A typo differt sporulis plerumque eximie inæquilateris, navicularibus, rarissime rectis; pycnidiis subastomis, excipulo crustaceo-carbonaceo, deorsum sæpe tenui vel subnullo, sparsis vel confluentibus, interdum nucleo subdimidiato, $150-250 \mu$. latis; sporophoris rectis $12-15 \approx 2$; sporulis minutis obscureque 2-guttulatis, $8\frac{1}{2}-11 \approx 2\frac{1}{2}-3$, utrinque tenuatis.

Hab. in squamis conorum dejectorum Abietis excelsæ supra Valpelline, Valle d'Aosta, Ital. bor.

22. **Phomopsis phœnicicola** Trav. et Spessa. Bol. Soc. Brot. XXV 6486 (1910) p. 177, t. II, f. 12. — Pycnidiis gregariis, per epidermidem erumpentibus, atris, oblongo-depressis, $250-280 \approx 140-180$, contextu spurie pseudoparenchymatico, fuligineo-atro, circa ostiolum incrassato; sporulis fusoideis vel oblongis, utrinque parum attenuatis, sæpe intus minute granulosis et plerumque spurie biguttulatis, rectis vel leniter curvulis, $8-12 \approx 2-2\frac{1}{2}$; sporophoris longe bacillaribus sporula paullo longioribus.

Hab. in rhachidibus siccis Phœnicis dactyliferae in horto botanico conimbricensi Lusitaniæ (A. MOLLER).

23. **Phomopsis Ranojevicii** Bubák, Ann. Mycol. VIII (1910) p. 383. 6487 — Pycnidiis irregulariter sparsis, globoso-applanatis, lenticularibus v. irregularibus, subepidermicis, dein papillato-erumpentibus, nigris, $40-120 \mu$. diam., contextu pseudoparenchymatico brunneo-olivaceo; sporulis e cylindraceo fusoideis, $7,5-10 \approx 2-2,5$, utrinque

angustatis, hyalinis, indistincte biguttulatis, contentu distincte biloculari; sporophoris elongato-cylindraceis, apice fortiter angustatis, 10-19 μ . long., hyalinis.

Hab. in bracteis emortuis *Allii asperi* prope Pirot, Serbia.

24. **Phomopsis Fourcroyæ** Saccardo, Not. Myc. VI, Ann. Myc. III 6488 (1905) pag. 512. — Pycnidiis gregariis, amphigenis, globoso-depressis, subcutaneis, vix erumpentibus, 150-160 μ . diam.; ostiolo obsoleto depresso, irregulariter dehiscenti, epidermide punctiformi-subclavata alba tecto; sporulis tereti-oblongis, saepius curvulis, utrinque obtusulis, 6-8 \approx 3,5, 2-guttulatis, hyalinis; sporophoris acicularibus, sursum tenuatis, 14 \approx 2, demum secedentibus curvulis.

Hab. in foliis emortuis *Fourcroyæ giganteæ* in horto botanico Cagliari Sardiniæ (X. BELL).

25. **Phomopsis Aloës-percrassæ** Trinchieri, Rend. R. Ac. Sc. Napoli 6489 (1909) fasc. 8-12, Extr. p. 2. — Pycnidiis copiosis, longitudinaliter et regulariter seriatis, epidermide atrata tectis, dein vix erumpentibus, valde depressis, imperfecte pertusis, nigricantibus, 122-220, μ . diam., 49-110 μ . altis, excipulo parenchymatico, intus flavofusco donatis; sporophoris manifestis, filiformibus, quandoque deformatis, eximie hamatis, hyalinis, 22-26,5 μ . longis, 2 μ . crassis; sporulis fusoideo-oblongis, distincte 2-guttatis, continuis, hyalinis, 7-9,5 \approx 2.

Hab. in scapo emortuo *Aloës percrassæ*, in Horto botan. neapolitano Ital. austr. (TRINCHIERI). — A *Phoma Debeauxiana* Sacc. macularum constanti defectu, pycnidiorum forma et dispositione, sporularum magnitudine et matrice (in scapo) facile dignoscenda; et a *Ph. aloicola* etiam macularum defectu, pycnidiorum dispositione, forma, magnitudine et contextu, sporophori forma et longitudine sporularumque magnitudine certe diversa species.

26. **Phomopsis Actinidiæ** (P. Henn.) Diedicke in litt. — Ita vocetur 6490 *Cytospora Actinidiæ* P. Henn. — Syll. XVI, p. 902 — *Cytospora Actinidiæ* Syd. genuina est species *Cytosporæ* et nomen sydowianum servari debet.

Teste cl. Bubák, in Bull. Herb. Boiss. sér. 2, VI (1906) p. 473 et in Növényt. Közlem. 1907, Heft. 4, pag. 28-29 extr. species sequentes ad gen. *Phomopsis* spectant: *Phoma Coronillæ* West. — Syll. III, p. 67 — *Phoma picea* (Pers.) Sacc. — Syll. III, p. 140 — *Phoma Cichoriacearum* Sacc. — Syll. III, p. 124 — *Phoma Lactucæ* Sacc. — Syll. III, p. 124 — *Phoma Spartii* Sacs. — Syll. III, p. 67 — *Phoma demissa* Sacc. — Syll. III, p. 118 — *Phoma*

Asparagi Sacc. — Syll. III, p. 162. — Quæ species ll. cc. *Phomopsis* nomine donantur.

PLECTOPHOMA v. Höhnel, Frigm. z. Myk. IV in Sitzb. k. Ak. d. Wiss. Wien, Bd. CXVI, Abt. I (1907) p. 639 (Etym. *plectos* con-nexus et *Phoma*). — Stromata subepidermica, intus pluri-pycnidica. Pycnidia immersa intus plus v. minus hyphis fertilibus ir-regulariter radiantibus inter se subreticulatis farcta. Hyphæ ex sporophoribus brevibus papillas sporigeras minutissimas ferentibus constantes. Sporulæ 1-cellulares, minutæ, hyalinæ.

1. **Plectophoma Umbelliferarum** v. Höhnel, Frigm. z. Myk., Sitzb. k. 6491 Ak. d. Wiss. Wien, Bd. CXVI, Abt. I (1907) p. 640. — Stroma-tibus plus minusve distinctis, subepidermicis, 1-6 mm. long., 0,5-1 mm. lat., mollibus, ex hyphis pallide olivaceis, septatis, 6-10 μ . cr. efformatis; pycnidii immersis, rotundato-ovoideis, 160-170 μ . diam., ostiolatis; parietibus mollibus, brunneo-olivaceis, ex hyphis flocoosis efformatis; nucleo ex hyphis breviter ramosis, 4-5 μ . cr., arcte anastomosantibus et fertilibus aspectu parenchymatico consti-tuto; sporulis hyalinis, cylindraceis, plerumque rectis, 4-5 \times 1-1,5.

Hab. in caulis siccis Fœniculi dulcis pr. Bastia, Corsica. — Ad hoc genus pertinent etiam *Sphaeropsis Anethi* P. et *Phyllosticta bacteriosperma* Pass., teste v. Höhnel.

MACROPLODIELLA Speg., Anal. Mus. Nac. Buenos Aires v. XVII (1908) p. 134, cum icon. (Etym. a *Macropodia*, cuius analogum genus). — Pycnidia subepidermica, lenticularia, ostiolata, subcar-bonacea; sporulæ maximæ, hyalinæ, continuæ.

1. **Macroplodiella maticola** Speg., l. c. p. 134, cum icon. — Pycnidii 6492 cortice insidentibus, epidermide velatis eaque arcte adnatis, nigris, lenticularibus, 150 μ . diam., hyphis ramulosis tenuibus 2,5-3 μ . cr. septulatis intricatis olivaceis pellucidis vestitis, ostiolo impresso perforatis, contextu indistincto, atro; sporophoris majusculis, 15 \times 5, hyalinis, sublageniformibus; sporulis subcylindraceis superne rectis v. oblique rotundatis, postice subcuneatis 45-60 \times 10-15, crassiu-scule tunicatis, levibus, intus dense granuloso-nubilosis, semper hyalinis.

Hab. ad ramos dejectos putrescentes *Ilicis paraguarien-sis* in silvis circa San Pedro Reip. Argentinæ.

MACROPHOMA Sacc. — Syll. X p. 189, XI p. 495, XIV p. 889, XVI p. 879, XVIII p. 267.

1. **Macrophoma Ranunculi** Alm. et Cam., Revista Agronom. V (1907) 6493 p 53, tab. I, fig. 5-6. — Pycnidiis primo tectis, demum erumpentibus, sparsis, subglobosis, atro-brunneis, 150-200 μ . diam.; sporulis saepe longe ellipsoideis, interdum cymbiformibus v. raro unilateraliter gibbulosis, utrinque rotundatis, hyalinis, plasmate granuloso farctis, 1-4-nucleatis, 17-22 \times 5-6; sporophoris non visis.

Hab. in caulis aridis Ranunculi acris, in horto bot. Coimbra Lusitaniæ (A. MOLLER).

2. **Macrophoma chilicola** Speg., Fungi Chilenses (1910) p. 147, cum 6494 icon. — Maculis nullis; pycnidiis parenchymate innatis, epidermide tectis, saepius hypophyllis, e lenticulari subglobosis, 100-120 μ . diam., sparsis, atris, coriaceis, ostiolo minuto perforatis; sporulis obovatis non v. plus minusve navicularibus, apice altero obtuso, altero subapiculato, 20-26 \times 10-15, primo hyalinis, tunica mucosa tenui obvolutis, dein chlorinis nudis.

Hab. in foliis dejectis subputrescentibus Lardizabalæ bibernatæ in silvaticis Cerro Caracol de Concepcion Chile, Amer. austr.

3. **Macrophoma nuptialis** Bubák, Bull. Herb. Boiss. 2 ser. VI (1906) 6495 p. 474, tab. 14, fig. 9-10. — Maculis flavo-brunneis, magnis, limitatis; pycnidiis amphigenis, sparsis, globoso-depressis, 180-250 μ . cr., nigris, primum epidermide tectis, demum collo firme prominentibus, contextu grosse parenchymatico, pallide castaneo-brunneo; sporulis fusoideis v. elongatis, 18-24 \times 5,5-6,5, infra obtuso-angustatis, supra angustato-acutatis, unilocularibus, hyalinis vel chlorinis, contentu granuloso; sporophoris 15 μ . long., apice angustatis, hyalinis.

Hab. in foliis vivis senioribus Myrti communis, prope Ulcinj Montenegro

4. **Macrophoma Camarana** Trav. et Spessa, Bol. Soc. Brot. XXV (1910) 6496 p. 174, t. III, f. 15. — Pycnidiis gregariis peridermium pustulatim sublevantibus et demum lacerantibus sed extus non prominentibus, subglobosis, $1\frac{1}{4}$ mm. diam., atris, contextu denso, indistincte pseudoparenchymatico, fuligineo-nigro; sporulis oblongo-fusoideis, rectis, utrinque acutiusculis, granuloso-farctis, 20-23 \times 5 $\frac{1}{2}$ -7; sporophoris cylindraceo-bacillaribus, hyalinis, 7-10 \times 1 $\frac{1}{2}$ -2.

Hab. in ramis Rosæ damascenæ cerca de S. Bento, Coim-

bra (A. MOLLER). — Species claro prof. Souza da Camara dicata. Affinis *M. conicæ* Pass. in *Rubo*, a qua differt præcipue pycnidiis gregariis et ostiolo conico distincto omnino carentibus.

5. **Macrophoma tiliacea** Peck, Bull. Torr. Bot. Club XXXIV (1907) 6497 p. 348. — Pycnidiis sparsis, in cortice immersis, epidermide ostiolis minute perforata tectis, depressis v. late conoideis, ostiolo circulari præditis, nigris; sporulis oblongis, hyalinis, utrinque rotundatis, 18-30 \times 8-9.

Hab. in ramis emortuis *Tiliæ americanæ*, Oberlin Ohio Amer. bor. (F. O. GROVER).

6. **Macrophoma paulistana** Speg., Fungi Paulist., Rev. Mus. La Plata, 6498 t. XV, (1908) p. 34. — Maculis nullis; pycnidiis lenticularibus 80-100 μ . diam., glabris, epidermide velatis vix prominulis ostiolo mediocri perforatis, membranaceo-coriacellis, contextu fusco-fuligineo dense minuteque parenchymatico; sporulis rectis, rarissime medio leniter subattenuatis, utrinque rotundatis, 24-26 \times 6, primo 2-4-guttulatis, dein eguttulatis, hyalinis.

Hab. ad ramos vivos et languidos Melastomaceæ cujusdam, Cambucy Ipiranga, Brasilia (USTERI).

7. **Macrophoma duvauicola** (Speg.) Sacc. et Trott., *Phoma duvauicola* 6499 Speg., Myc. Argent. V, p. 342, in An. Mus. Buenos Aires XX (1910). — Maculis nullis; pycnidiis amphigenis, sparsis, parenchymate foliorum innatis, subastomis, coriaceis, atris, 100-150 μ . diam., subhemisphæricis, contextu indistincto; sporulis cylindraceo-subnavicularibus, eguttulatis, 15-20 \times 4-5, rectis curvulisve, hyalinis.

Hab. ad folia dejecta fuscescentia Duvauæ longifoliæ pr. La Plata, Argentina.

8. **Macrophoma acinicola** (Speg.) Sacc. et Trott., *Phoma acinicola* 6500 Speg., Myc. Argent. V, p. 341, in An. Mus. Buenos Aires XX (1910). — Maculis nullis; pycnidiis innatis, lenticularibus, minutis, confertiusculis sed discretis, 110-120 μ . diam., fusco-atris, contextu molliusculo indistincto; sporulis subclavato-navicularibus 20-22 \times 5-6, basi saepius paulo acutioribus, nubiloso-farctis, hyalinis; sporophoris linearibus, 5-8 \times 1, e fronte piriformibus, 5-8 \times 3-4, hyalinis.

Hab. in baccis arescentibus *Vitis viniferae* in hortis La Plata, Argentina. — A *Macr. acinorum* sporophoris brevioribus, a *Macr. flaccida* sporulis obtusioribus distincta.

9. **Macrophoma Mygindæ** Spegazz., Myc. Argent. V, p. 349, in An. 6501

Mus. Buenos Aires, XX (1910). — Maculis nullis; pycnidiis parenchymate innatis, per epidermidem erumpentibus, carbonaceis, atris, 100-120 μ . diam., ostiolo minuto rotundo pertusis; contextu indistincto; sporulis subellipsoideis, nubilosо-guttulatis, utrinque rotundatis, 14-18 \times 7-9, hyalinis.

Hab. ad folia, demum fusco cinerescentia Rhacomæ (Mygindæ) distichæ in dumetosis secus Carrenleofú, Patagonia.

10. **Macrophoma Theæ** Speschnew, Pilzparasiten d. Teestrauchen 6502 (1907) p. 17, tab. III, fig. 5-7. — Pycnidiis hypophyllis, sparsis, contextu parenchymatico, fuligineis, primo epidermide tectis, dein erumpentibus et fere subliberis, 60-140 μ . cr.; sporulis oblongo-ellipsoideis, continuis, hyalinis, intus granulosis, 16-18 \times 3; sporophoris filiformibus, brevibus, indistinctis.

Hab. in foliis vivis Theæ sinensis, Tschakwa prope Batum Caucasia. — *M. Mantegazzianæ* affinis a qua differt pycnidiis sporulisque minoribus et præcipue sporophoris fere inconspicuis.

11. **Macrophoma scaphidiospora** Da Camara, Mycetæ aliquot Theobromæ Cacao in Sancti Thomensis Insula, Lisboa (1910) p. 5, t. V, fig. 3-5. — Pycnidiis suborbicularibus, depresso-globosis elongatisve (piriformibus), sæpe solitariis, interdum gregariis, atris, primo immersis, dein ostiolo pertuso prominulis, 200-260 \times 150-200; sporulis navicularibus, hyalinis, continuis, deorsum rotundatis v. raro truncatis, sursum attenuatis, utrinque minime guttulatis, 15-18 \times 5-6; basidiis cylindraceis, hyalinis, rectis v. vix curvulis, minutissimis, demum obsoletis, 5-6 μ . long.

Hab. in fructibus Theobromæ Cacao in ins. St. Thomé (J. J. DE ALMEIDA et CANNAS MENDES).

12. **Macrophoma Coronillæ** (Desm.?) v. Höhnel in Neger, Ber. Deut. Bot. Gesellsch. XXVIII (1910) pag. 478, *M. Coronillæ-Emeri* Neger, l. c. XXVI A (1908) p. 747, *Sphæria Coronillæ* Desm.? — Pycnidiis variabilibus, in superficie vel in pariete interna positis, 50 μ . diam. v. usque ad 120-160 μ ; sporulis variabilibus, subovoideis, subfuscoides vel ampulliformibus, 13-45 \times 5-12, plerumque hyalinis v. raro brunneolis, continuis, rarissime 1-3-septatis.

Hab. in gallis Asphondiliæ in Coronilla Emoro, Dalmatia, Littorale etc. — Est certe diversa a *Phomopsi Coronillæ* (West.) Bub. sed incerti generis.

13. **Macrophoma Phyllocacti** Speg., Myc. Argent. V, p. 349, in An. Mus. Buenos Aires, XX (1910). — Maculis nullis; pycnidiis gregariis, eximie circinantibus, subepidermicis, atris, minutis, coria-

cellis, 150-200 μ . diam., obsolete ostiolatis, lenticulari-depressis; contextu indistincto; sporulis sub-ellipticis, minute guttulatis, utrinque obtusulis, 16-18 \approx 8-9, hyalinis, interdum subinæquilateris.

Hab. ad cladodia languida vel arida demum subcinerescentia *Phyllocacti* sp. in hortis La Plata, Argentina.

14. **Macrophoma Heraclei** Da Camara, Bol. Soc. Broteriana XXV 6506 (1910) Extr. p. 14. — Pycnidiis solitariis, epidermide diu velatis, ostiolo impresso pertusis, globoso-depressis. atris, 125-200 \approx 70-120; sporulis oblongo-ellipsoideis, rectis v. leniter curvulis, utrinque plus minusve rotundatis, hyalinis, continuis, intus granulosis, 15-18 \approx 5-6.

Hab. in ramulis Heraclei Sphondylii prope Coimbra, cerca de S. Bento Lusitanæ (A. MOLLER).

15. **Macrophoma heterospora** Trav. et Migliardi, Fl. micol. Venezia 6507 pag. 12, tav. 2, fig. 4 (1911). — Pycnidiis minutis, hinc inde gregariis, subglobosis, prominulis, erumpentibus, brunneolis, 150-180 μ . d., late pertusis, excipulo distincte pseudoparenchymatico, tenuiusculo, fulvo-umbrino; sporulis plerumque fusiformibus vel ovato-oblongis, hyalinis, intus minute granulosis, 20-28 \approx 8-10, aliis dimidio minoribus sæpe commixtis; sporophoris copiosis, cylindraceis, hyalinis, 15-22 \approx 3-3 $\frac{1}{2}$.

Hab. in caulis emortuis Calystegiæ sæpium, Lido, Venetiis, Ital. bor. — Species, ut videtur, bene distincta, sed ulterius inquirenda. Ad subgen. *Cylindrophoma* spectat.

16. **Macrophoma Vincetoxici** Trav. et Spessa, Bol. Soc. Brot. XXV 6508 (1910) p. 175, t. III, f. 22. — Pycnidiis densiuscule sparsis, epidermide nigrificata velatis, demum vix erumpentibus, globulosis, 200-240 μ . diam, fuligineo-atris, poro circulari latiusculo pertusis, excipulo distincte pseudoparenchymatico, fuligineo; sporulis oblongo-ovoideis vel fusiformibus, utrinque attenuatis, intus minute granulosis, eguttulatis, rectis vel inæquilateris, 16-22 \approx 5 $\frac{1}{2}$ -7; sporophoris breviusculis, 8-10 μ . longis, cylindraceo-bacillaribus, hyalinis.

Hab. in sarmentis Vincetoxici officinalis in horto botanico conimbricensi Lusitanæ (A. MOLLER).

17. **Macrophoma Phoradendri** F. A. Wolf, in Mycologia (1910) n. 5, 6509 p. 242, tab. XXXII. — Pycnidiis in foliis matrix initio flavescentibus, demum atro-brunneis amphigenis, sparsis, globosis, brunneis, primo innatis, dein ostiolo obtuso erumpentibus, 180-210 μ . diam.; contextu parenchymatico; sporulis oblongis v. ellipsoideis, utrin-

que rotundatis, plasmate granuloso farctis, continuis, hyalinis, 24-34 \approx 15-18; sporophoris brevissimis, papilliformibus.

Hab. in foliis vivis *Phoradendri flavescentis*, Texas Amer. bor.

18. **Macrophoma Visci** Aderh. in Arb. Biol. Anstalt f. Land- u. Forstwirtschaft IV (1905) p. 462, fig. 4. — Pycnidiiis numerosis, dense gregariis, globosis, atris, immersis, erumpentibus, 0,3-0,4 mm. d.; sporophoris nullis; sporulis continuis, hyalinis, oblongo-ellipticis v. oblongo-ovatis, medio plerumque leniter contractis, granulatis, 43-66 \approx 18-21, in cirros longos tenues albidos expulsis.

Hab. in ramis dejectis *Visci albi*, Proskau Silesiæ.

19. **Macrophoma Pituranthi** Sacc. et Trott. in Trott. Mycet. Tripolit. pugill., Ann. Mycol, X (1912) p. 513. — Pycnidiiis gregariis copiosis punctiformibus nigris, innato-erumpentibus, primo tectis dein epidermide operculatim rupta prominentibus, 200-250 μ . diam., contextu tenui parenchymatico brunneolo; sporulis inæqualiter cylindraceis, curvulis, utrinque obtusis v. subattenuatis longitudine variabilibus: majusculis et magis copiosis 19-23 \approx 5-6, minoribus 13-16 \approx 4,5-5, irregulariter guttulatis

Hab. in caulis *Pituranthi tortuosi* in rupestribus Gargaresc prope Tripoli Africæ bor. (A. TROTTER). Ad sect. *Cylindrophomam* spectat. *M. striolæ* Sacc. affinis, sed diversa.

- 20 **Macrophoma ulcinjensis** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) p. 475. — Maculis magnis flavo-alutaceis v. griseis; pycnidiiis sparsis v. hinc inde gregariis, globosis v. parum depressis, 150-170 μ . latis, sordide flavo-brunneis, distinete perforatis, crasse tunicatis, subepidermicis, dein breviter papilliformi-prominentibus, contextu e flavo flavo-brunneo, supra obscuriori; sporulis elongatis, 20-28,5 \approx 6,5-7, infra subapiculatis supra rotundatis, hyalinis, unilocularibus, contextu granuloso; sporophoris, papilliformibus.

Hab. in foliis vivis senioribus *Hederæ Helicis* prope Ulcinj Montenegro.

21. **Macrophoma Cucurbitacearum** Trav. et Migliardi, Fl. micol. Venezia, p. 12, tav. 2 fig. 6 (1911). — Pycnidiiis sub epidermide nidulantis eamque sublevantibus, demum erumpentibus, atro-brunneis, globoso-papillatis, 180-200 μ . diam., ostiolo pro ratione angusto præditis; sporulis oblongo-ellipsoideis vel ovatis, utrinque obtusis, granuloso-farctis, hyalinis, 13-18 \approx 6-8; sporophoris nullis visis.

Hab. in caulis emortuis *Cucurbitæ* cultæ in hortis insulæ «Murano» prope Venetias, Ital. bor.

22. *Macrophoma hypomutilospora* d'Alm. et da Cam., Revista Agron. IV 6514 (1906) p. 138, tab. III, fig. 3-4; Bol. Soc. Brot. XXV (1908-1909) Extr. p. 40. — Pycnidiis sparsis, raro gregariis, subglobosis, circ. 300 μ . diam.; leniter depresso-rotundatis, 300-350 \approx 200-250 primo tectis, demum erumpentibus, aterrimis; sporulis hyalinis, ovoideis v. ellipsoideis, sursum rotundatis deorsum truncatis, granuloso-farctis, 17-22,5 \approx 7-10; sporophoris cylindraceis rectis, raro curvulis sporulas plus minus æquantibus.

Hab. in ramulis *Helianthi tuberosi* in horto bot. Coimbra Lusitania (A. MOLLER).

23. *Macrophoma Senecionis* d'Alm. et da Cam., Bol. Soc. Brot. XXIV 6515 (1908-1909) Extr. p. 42. — Pycnidiis subglobosis, sparsis, immersis, epidermide tectis, contextu parenchymatico, atro-fuligineo, ostiolo pertusis, 150-200 μ . diam.; sporulis oblongo-ellipsoideis, hyalinis, rectis, utrinque rotundatis, nubilosis, 16-24 \approx 6-7,5.

Hab. in ramis exsiccatis *Senecionis scandentis*, prope Coimbra et Cerca de S. Bento, Lusitania (A. MOLLER).

24. *Macrophoma Guevinæ* Spieg. Fungi Chilenses (1910) p. 148. — 6516 Pycnidiis sparsis v. laxissime gregariis, globosis, minutis, 100-120 μ . diam., ligno infossis, epidermide circa ostiolum vix nigrificata tectis, subcarbonaceis; sporulis e cylindraceo ellipsoideis utrinque obtusis, rotundatis 30 \approx 12-14, inferne sæpe obsoletissime subapiculatis, hyalinis.

Hab. in petiolis siccis subputrescentibus *Guevinæ Avelanæ* in silvaticis Cerro Caracol de Concepcion Chile Amer. austr.

25. *Macrophoma sycophila* (Massee) Sacc. et D. Sacc. - Syll. XVIII 6517 pag. 273 - var. **corticola** Trav. et Migliardi, Fl. micol. Venezia, p. 12 (1911). — A typo differt quia corticola nec foliicola; differt etiam sporulis crassioribus, 15-17 \approx 5-6.

Hab. in ramis siccis Fici Caricæ in hortis «alla Giudecca», Venetiis, Ital. bor. — An species distincta?

26. *Macrophoma Fici* d'Alm. et da Cam., Rev. Agronom. IV (1906) 6518 pag. 61, tab. I, fig. 4-5; Bol. Soc. Brot. XXV (1908-1909), Extr. p. 39. — Pycnidiis sparsis, globoso-depressis, 250-350 μ . diam., contextu parenchymatico fuligineo; sporulis diversiformibus (ovoideis, ellipsoideis, ellipsoideo-ovoideis, conoideis v. piriformibus) utrinque rotundatis, hyalinis, granulosis, 22-28 \approx 10-12; sporophoris spora longioribus, hyalinis, claviformibus (demum evanidis?).

Hab. in ramis Fici macrophyllæ in horto bot. Coimbra Lusitaniæ (A. MOLLER).

27. **Macrophoma fusispora** Bubák, Beitr. Pilzfl. Ung. in Növénytani Közlemények (1907) Heft 4, Extr. pag. 29. — Maculis utrinque visilibus 1-3 in quoque folio, irregulariter rotundatis v. elongatis, sinuosus, coriaceis, medio arescendo albidis, obscure marginatis, distincte limitatis; pycnidiis epiphyllis, in mesophyllo immersis, epidermide tectis, globosis, 120-160 μ . diam., nigris, contextu parenchymatico nigro-brunneo, ostiolo brevi ebscuriori prominentibus; sporulis fusoideis, 18-26 \approx 3,5-6, apice sæpe longe acutatis et tunc 20-35 μ ., infra subinflatilis, hyalino-nubilosis; sporophoris hyalinis, cylindraceis.

Hab. in foliis vivis Quercus confertæ in M. Allion prope Orsova Hungariæ.

28. **Macrophoma Polygonati** Ferr. Malpiglia XX (1906) p. 147. — 6520 Maculis sparsis v. confluentibus, ovato-irregularibus, late et intense fusco-marginatis; pycnidiis prominulis, majusculis, 200-250 μ . cr., globosis, brunneis, perforatis; sporulis numerosis, hyalinis, ovoideis v. subcylindraceis, apice rotundatis, intus granulosis, 12-17 \approx 6-7,5.

Hab. in foliis Polygonati officinalis, Alba Pedemontii Italia. bor.

29. **Macrophoma Pinsaponis** Neger, Naturw. Ztschr. f. Land. u. Forstwirtsch. V (1907) p. 402. — Pycnidiis sæpius hypophyllis, raro epiphyllis, in binas series secus nervum dispositis, innatis, astomatis, udis subdiaphanis, siccis fere opacis, vertice rimose dehiscentibus, 300 μ . diam.; sporulis elliptico-fusoideis, utrinque subrotundatis v. apiculatis, hyalinis, 20-25 \approx 6-10, maturis eguttulatis.

Hab. in acubus Abietis Pinsaponis in Hispania merid. — *Macrophomæ excelsæ* et *M. Abietis* offinis videtur.

30. **Macrophoma Abietis-pectinatæ** Bubák, Ann. Mycol. IV (1906) 6522 p. 112. — Pycnidiis immersis, globoso-depressis, nigris, collo breviter prominenti erumpentibus, usque ad $1/2$ mm. cr., contextu brunneo apice obscuriore; sporulis fusoideis raro ovoideis, 22-31 \approx 9-13, utrinque plus v. minus rotundatis, contentu hyalino nubiloso; sporophoris cylindraceis sporulas æquantibus v. longioribus 3-5 μ . cr., hyalinis.

Hab. in foliis Abietis pectinatæ prope Tabor Bohemia. — *Macr. excelsæ* proxima sed sporulis majoribus præcipue diversa.

31. **Macrophoma Abietis** Mangin et Hariot, Bull. Soc. myc. France, 6523

t. XXIII (1907) fasc. 1, Extr. p. 9, fig. 7. — Pycnidiis amphigenis, præcipue epiphyllis, 200-300 μ . circ. cr., sparsis v. subgregariis, atris, primo epidermide tectis, dein erumpentibus, rotundato-ellipticis, pertusis; sporophoris brevibus, simplicibus; sporulis ovoideis v. plus minus fusiformibus, eguttulatis, hyalinis, 20-23 \approx 8.

Hab. in foliis Abietis pectinatae in silva La Savine dicta, in regione jurassensi Galliae. — *M. excelsæ* (Karst.) affinis, sporulis vero eguttulatis et conceptaculis numquam fusco-furfuraceis distincta; sed verisimilime non diversa a præcedente.

32. **Macrophoma Livistonæ** d' Alm. et da Cam., Rev. Agron. V (1907) 6524 p. 20, tab. I, fig. 1-2. — Pycnidiis epiphyllis, sparsis, subglobosis, atris, primo tectis, demum erumpentibus, 150-200 μ . diam.; sporulis subcylindraceis, hyalinis, plerumque medio depresso, utrinque rotundatis, granuloso-farctis, 25-27,5 \approx 12,5-15; sporophoris non visis.

Hab. in foliis siccis Livistonæ sinensis, prope Povoa de Lanhoso, Lusitania (BALTH. DE MELLO).

33. **Macrophoma Miltoniæ** Da Camara, Bol. Soc. Broteriana XXV (1910) p. 14. — Maculis subnullis; pycnidiis amphigenis, præcipue epiphyllis, valde numerosis, subglobosis, primo immersis demum ostiolo vix papillato erumpentibus, 200-250 \approx 150-200; sporulis ellipsoideis, ovalibus, amygdaliformibus v. reniformibus, saepe utrinque rotundatis, plerumque deorsum attenuatis, eguttulatis, nubilosso-farctis, hyalinis, 22-28 \approx 13-16; sporophoris longitudine sporularum v. paullo longioribus, subcylindraceis, hyalinis.

Hab. in foliis Miltoniæ candidæ, in horto botanico Coimbra Lusitaniæ (A. MOLLER).

34. **Macrophoma Bakeri** Syd., Hedwigia XLIX (1909) pag. 82. — 6526 Pycnidiis amphigenis, maculis nullis vel obsolete decoloratis insidentibus, sparsis vel hinc inde aggregatis, diu epidermide tectis, dein erumpentibus et subliberis, aterrimis, globosis, 150-200 μ . diam., poro ca. 20-25 μ . lato pertusis; sporulis ellipsoideis vel ovato-ellipsoideis, utrinque rotundatis vel subinde uno fine leniter attenuatis, hyalinis, continuis, intus minute guttulatis, 20-32 \approx 10-18; sporophoris hyalinis, usque ad 30 μ . longis.

Hab. in foliis vivis Cordylinæ spec., Para Brasiliæ (C. F. BAKER).

35. **Macrophoma Agapanthi** Trav. et Spessa, Bol. Soc. Broter. XXV (1910) p. 174, t. III, f. 16. — Pycnidiis gregariis, erumpentibus, globosis, 180-230 μ . diam., atris, poro circulari pertusis, excipulo

minute pseudoparenchymatico, fuligineo; sporulis ovoideo-fusoides, utrinque obtusatis, rectis vel saepius inaequilateris, 25-28 \approx 5-6, intus minute granulosis; sporophoris indistinctis.

Hab. in scapis siccis Agapanthi umbellati in horto botanico conimbricensi Lusitaniæ (A. MOLLER).

36. **Macrophoma Dyckiae** Trinchieri, Rend. R. Acc. Sc. Napoli (1909) 6528 fasc. 8-12, Extr. p. 3. — Pycnidiis gregariis, immersis, denique suberumpentibus, globoso-depressis, pertusis, atris, 172-208 μ . diam., 147-178 μ . altis; excipulo parenchymatico, dilute castaneo præeditis; sporophoris nullis visis; sporulis valde copiosis, polymorphis, ovatis, cylindraceis, utrinque rotundatis, subclavatis, rarissime globosis, plasmate granuloso non raro minute guttulato farctis, continuis, hyalinis, 7-19,5 \approx 4,5-7.

Hab. in scapis jam emortuis Dyckiae sulphureæ cultæ in horto botanico neapolitano Ital. austr. (TRINCHIERI).

37. **Macrophoma Spegazzinii** Sacc. et Trott., *Macrophoma Dyckiae* 6529 Speg., Myc. Argent. V, p. 349, in An. Mus. Buenos Aires XX (1910). — Maculis nullis; pycnidiis matrici infossis, subcoriaceis, atris, minute ostiolatis, subglobosis, 100-120 μ . diam., contextu indistincto olivaceo; sporulis cylindraceo-ellipsoideis, eguttulatis, mediocribus, 25-30 \approx 14-15; sporophoris subduplo longioribus suffultis, hyalinis.

Hab. ad folia arida putrescentia Dyckiae montevidensis in hortis La Plata, Argentina. — An *Sphaeropsis* immatura?

38. **Macrophoma Hedychii** Mariani in Atti Soc. ital. Sc. nat. L (1911) 6530 p. 169, fig. 4. — Pycnidiis dense sparsis, ellipsoideis, epidermide tectis, prominulis, vix erumpentibus, nigris, 270-300 \approx 180-200; sporulis ovato-cylindraceis vel oblongo-fusoideis vel interdum subreniformibus, hyalinis, 16-19 \approx 5,5-6, endoplasmate granuloso farctis; sporophoris rectis, crassiusculis, 5-6 μ . longis.

Hab. in petiolis foliisque Hedychii coronarii in Horto botanico conimbricensi, Lusitania (A. MOLLER). — A *Macrophoma Musæ* (Sacc. Syll. III, 163, sub *Phoma*) facile dignoscitur sporulis dimidio angustioribus.

39. **Macrophoma ? americana** Speg., Myc. Argent. V, p. 348, in An. 6531 Mus. Buenos Aires, XX (1910). — Maculis ellipticis parvulis, ferrugineis, callosis, 1-3 mm. long. 1-1,5 mm. lat.; pycnidiis numerosis, dense constipatis, non v. vix prominulis, latissime ostiolato-perforatis, atris, 75-80 μ . diam., tenuiter membranaceis, globosis, contextu indistincto, atro; sporulis maximis, ovoideo-elongatis v. sub-

ovoideis, superne crassiuscule tunicatis, hyalinis, 45-60 \approx 10-14, intus sæpe nubilosus.

Hab. ad calamos languidos *Scirpi americani* in uliginosis circa Mendoza, Argentina. — Stirps singularis, Uredinaceas in mentem revocans; forte non de pycnidiis genuinis sed de loculis agitur.

40. **Macrophoma sorghicola** Speg., Myc. Argent. V, p. 350, in An. 6532 Mus. Buenos Aires, XX (1910). — Maculis nullis v. obsoletis; pycnidiis dense gregariis, seriatis, erumpentibus, ovoideis, submembranaceis, nigris, glabris, plus minusve papillato-ostiolatis, 100-150 μ . alt., 70-100 μ . cr., contextu grosse celluloso, pellucide fuscō; sporulis subfusoideis, sæpe leniter inæquilateris, hyalinis, sursum obtusulis, deorsum acutulis, 18-20 \approx 6-7; sporophoris vix conoideis, 10-15 \approx 2, hyalinis.

Hab. in culmis languidis v. emortuis *Sorghum vulgaris* in hortis La Plata, Argentina.

41. **Macrophoma melanostigma** (Lév.) Sacc. Notæ myc. VIII, Ann. Myc. 6533 v. IV (1906) p. 491, tab. X, fig. 5, *Sphæria melanostigma* Lév. in Demid. Voyage dans la Russie mérid. II, pag. 105, t. V, f. 6 (1842). — Pycnidiis epiphyllis sed utrinque visilibus, gregariis, punctiformibus, globoso-depressis, 100-130 μ . diam., nigris, in pag. sup. leviter et obtuse prominulis, non papillatis; contextu membranaceo, parenchymatico, vinoso-fuligineo, cellulis subglobosis 8-12 μ . diam.: sporulis tereti-clavatis, utrinque præcipue apice rotundatis, rectis v. leviter curvis, subsessilibus, 28-30 \approx 5-6, strato mucoso hyalino cinctis, intus minute granulosis, hyalinis.

Hab. in foliis emortuis dealbatis Graminaceæ minoris non determinandæ pr. Sou-Dagh Tauriæ. — Cl. Léveillé, l. c. describit ascos breves apice valde inflatos, sporas 4 vel 5 globosas, hyalinæ continentes. Organa talia pluribus observationibus non vidi: revera dubius haesi an sporulæ supra a me descriptæ potius ascos immaturos sisterent, sed et quia facile secedant et quia muco cingantur et plasmate granuloso æquali farctæ sint, organa omnino matura videntur. Nihilominus species non omnino certa manet.

42. **Macrophoma guttifera** (Otth) v. Höhn., Sitzb. k. Ak. d. Wiss. 6534 Wien CXV, Abt. I (1906) p. 26. — Teste v. Höhnel ita vocanda est *Sphæropsis guttifera* Otth — Syll. XI, p. 512.

LONCHOSPERMELLA Spegazz., Fungi Paulist., Rev. Mus. La Plata t. XV, p. 37 (1908) (Etym. *lonchos* lancea et *sperma* spora). — Pycni-

dia subglobosa antice umbonato-ostiolata, anhista, postice sessilia, parenchymatica; sporulæ lanceolatæ in sporophoris subglobosis quaternatim acrogenæ continuæ v. diblastæ, hyalinæ. — Genus *Hyalodermatum* statum stylosporicum sistit.

1. **Lochnospermella tetraspora** Spegazz. l. c. — Pycnidiis atris, 100 6535 \approx 80, sparsis, in subiculo *Meliolæ* parasitantibus; sporulis antice acutissimis, 30 \approx 7-8, erectis, hyalinis in sporophoris e globoso subobovatis, 5-6 μ . diam., concoloribus acrogene insistitiis, saepius diblastis.

Hab. ad folia coriacea plantæ ignotæ cujusdam, subiculo *Meliolæ* laxæ insidens, Ipiranga Moça Brasilia (USTERI).

SCLEROPHOMA v. Höhn. Fragm. z. Mykol. VIII p. 78 (1909) (Etym. *scleros* durus et *Phoma*). — Pycnidia erumpentia v. superficialia, primum sclerotioidea, nigra, astoma, nucleus minute cellularum, plectenchymaticum continentia. Sporulæ hyalinæ, elongatae uniloculares, ex histolysi mucosa contextus parenchymatis nuclearis orientia. — Ad hoc genus cl. auctor refert: *Sclerophoma pityophila* (Corda) v. Höhn. = *Phoma pityophila* (Corda) Sacc. Syll. Fung. III p. 101; *Sclerophoma pitya* (Thüm.) v. Höhn. = *Phoma pityella* Sacc. Syll. X p. 164; *Sclerophoma Piceæ* (Fiedl.) v. Höhn. = *Phoma Piceæ* (Fiedl.) Sacc. Syll. III p. 101. — *Sclerophoma Pini* (Desm.) v. Höhn. = *Phoma Pini* (Desm.) Sacc. Syll. III. p. 191.

1. **Sclerophoma endogenospora** Laubert, Gartenflora, LX (Mart. 1911) 6536 p. 134, *Phæodiscula endogenospora* Laub., l. c. (Feb. 1911) p. 78. — Pycnidiis erumpentibus sat minutis, $\frac{1}{4}$ mm. diam., interdum usque 1 mm. diam., depresso globosis, extus nigris, intus e massa sporularum albidis, hypostromate nigro praeditis, diu clausis, demum irregulariter dehiscentibus; sporulis in massam firmam dein submucosam congestis, ovoideis v. oblongo-ovoideis, hyalinis, continuis, 4-12 \approx 2-5, ex histolysi mucosa nuclei endogenetice oriundis.

Hab. in cortice trunci emortui Piri Mali pr. Berolinum Germaniæ.

SELENOPHOMA Maire, Bull. Soc. Bot. Fr. LIII (1906) p. CLXXXVII (Etym. a *selene*). — Conceptacula immersa erumpentia v. subsuperficialia, ostiolo punctiformi plus minusve papillato, membranacea, nigra; sporulæ quasi *Vermiculariæ*, curvatae et utrinque acu-

tæ, muticæ, hyalinæ; sporophora brevissima, simplicia. — Est *Vermicularia* conceptaculis calvis, seu *Phoma* sporulis bicornibus. A. *Sclerotiopside* conceptaculis minimis, membranaceis ostiolatis erumpentibus differt.

1. **Selenophoma Catananches** Maire, l. c. p. CLXXXIVII — Con- 6537
ceptaculis minutis, 60-130 μ . diam.; sporulis levibus 11-13 \times 4.

Hab. in caulis aridis Catananches caeruleæ, Tlemcen Africæ bor. — Socia adest *Pleospora herbarum*.

RHIZOSPHÆRA Mangin et Hariot, Bull. Soc. Myc. de France t. XXIII (1907), fasc. I p. 56. (Etym. *rhiza* radix et *sphæra*). — Pycnidia superficialia, subglobosa, atra, contextu celluloso, apice perforata, deorsum in stipitem filamentosum parenchymate foliorum immersum, basi in filaments mycelii ramosa desinentem, attenuata; sporophora brevia, simplicia, monospora; sporulae hyalinæ, non septatæ, ovoidæ, leves.

1. **Rhizosphæra Abietis** Mang. et Hariot Bull. Soc. Myc. de France, 6538 t. XXIII (1907) fasc. I. p. 56, fig. 1-6. — Pycnidiiis minutis, 120 \times 90, longitudinaliter secus nervum dense seriatis, contextu e cellulis coriacellis angulosis efformato; stipite inferne in tuberculum sclerotii instar subglobosum, subhyalinum, 50 μ . circ. crassum, desinente; hyphis mycelii hyalinis crasse tunicatis; sporophoris acuminatis; sporulis numerosis, 16-20 \times 8.

Hab. in foliis subvivis Abietis pectinatae in silva La Sa-vine dicta, in regione jurassica, et prope Ambert Arverniæ, Gallia. — Teste cl. Maublanc in Bull. Soc. Mycol. Fr. XXIII (1907) p. 171 ab hac specie non differret *Coniothyrium Pini* Corda, seu *Leptothyrium Pini* (Corda) Sacc. Syll. III., p. 627, quod tamen sub. nov. gen. militare debet titulo *Rhizosphæræ Pini* (Corda) Maubl. l. c.

APOSPHÆRIA Berk. -- Syll. III p. 169, X p. 205, XI p. 497, XIV p. 893, XVI p. 884, XVIII p. 275.

1. **Aposphæria majuscula** Sacc. et Roum. in Rev. Mycol. VI. (1884) 6539 p. 39 sine diagnosi, t. 44 f. 34. — Pycnidiiis gregariis, superficialibus globoso-conoideis breviter papillatis, glabris 0,5 mm. diam., nigris, subcoriaceis; sporulis breviter tereti-oblongis, hyalinis, utrinque rotundatis, obtusis, 6 \times 2,5-3.

Hab. in ramis decorticatis emortuis putrescentibus Vitis vi-niferæ in Arduennis (LIBERT).

2. **Aposphæria minuta** (Schulz. v. Mügg.) Sacc. et Trott. *Mazzantia* 6540
minuta Schulz v. Mügg. in Verh. zool.-bot. Ges. Wien (1871) t. XIII p. 29. — Pycnidiis in ligno albo-maculato superficialibus, sparsis v. gregariis subglobosis, obscure papillatis, poro latiusculo pertusis, glabris, nigris, 180-225 μ . diam.; sporulis perexiguis oblongis, hyalinis, 3,5 μ . longis.

Hab. in ramis decorticatis emortuis et putrescentibus Cydoniæ vulgaris in Hungaria.

3. **Aposphæria Berlesii** Sacc. et Trott. — Ita dicatur *Aposph. minuta* 6541
 Berl. (1889) — Syll. X p. 207 et cfr. Syll. XIX p. 85 — non Schulz. v. Mügg. supra memorata.

4. **Aposphæria denudata** (Schulz.) Sacc. et Trav. Syll. XIX p. 84, 6542
Næmaspora denudata Schulz. v. Mügg. in Verh. zool.-bot. Ges. Wien (1871) p. 1236, t. 13, f. 14. — Pycnidiis gregariis, peridermio jam delapso, omnino superficialibus, globosis, epapillatis, nigris, glabris, poro latiusculo pertusis, 250-400 μ . diam., intus griseis; sporulis ovato-oblongis, hyalinis, minutis, 5 μ . long.; sporophoribus bacillaribus stipatis sporulâ multo longioribus.

Hab. in ramulis emortuis jamdudum decorticatis Cydoniæ vulgaris in Hungaria.

5. **Aposphæria microcarpa** (Schulz.) Sacc. et Trav. Syll. XX p. 356 6543
(Phoma) Clisosporium microcarpum Schulz. v. Mügg. in Verh. zool.-bot. Ges. Wien (1871) p. 1252, t. 13, p. 32. — Pycnidiis gregariis mox cortice jam dejecto superficialibus, globosis, minutis, levibus, epapillatis, nigris, $\frac{1}{6}$ - $\frac{1}{3}$ mm. diam., subcorneis; sporulis innumeris, perexiguis, ellipsoideis, 2,6 μ . long. hyalinis, pycnidii nucleum album formantibus.

Hab. in ramis decorticatis Cydoniæ vulgaris in Hungaria.

6. **Aposphæria major** Syd. Am. Mycol V (1907) p. 340 et in Barthol. 6544
 Fg. Columb. n. 2304. — Pycnidiis sparsis, solitariis, superficialibus, primo globosis, tandem plus minus profunde collabascentibus, ostiolo brevissimo, carbonaceis, atris, $\frac{1}{2}$ — $\frac{3}{4}$ mm. diam.; sporulis numerosissimis, oblongis, utrinque obtusis, continuis, hyalinis, eguttulatis, 7-10 \times 3-4, rectis; sporophoribus non visis.

Hab. in caulibus Rubi parviflori, Big. Cottonwood Canyon Salt Lake Co., Utah Americæ bor. (A. O. GARRETT).

7. **Aposphæria Rhois** Sacc. et Trott., Ann. Myc. X. (1912), p. 512. 6545
 — Pycnidiis minutissimis $\frac{1}{10}$ mm. circ. cr., subglobosis, nigris, glabris, contextu minute parenchymatico, brunneo; sporulis breviter bacillaribus, rectis v. curvulis utrinque obtusulis hyalinis,

3-3,5 \approx 1-1,5, eguttulatis; sporophoris distinctis parallelo fasciculatis, acicularibus, hyalinis, 7-10 \approx 15.

Hab. in ramulis decorticatis emortuis sed adhuc stantibus *Rhois Oxyacanthæ* in M. Mergheb prope Homs Tripolitania, Africa bor. — A congeneribus exiguitate sporularum, sporophoris distinctis, matrice etc. videtur diversa. In gen. *Rhus* viget tantum *A. p. fibriseda* (C. et Ellis) Sacc. imperfecte descripta sed certe diversa.

8. **Aposphæria Canavaliæ** Massee, Kew Bull. n. 7 (1906) p. 258. — 6546
Maculis arescendo-nigricantibus, irregularibus, indeterminatis; pycnidiis superficialibus, atris, glabris, ostiolo conico pertusis, contextu parenchymatico, brunneo donatis; sporulis magnis, hyalinis, utrinque obtusis, rotundatis, 24-30 \approx 8-10, sporophoris cylindraceis 13-15 \approx 4, hyalinis, insidentibus.

Hab. in leguminibus siccis *Canavaliæ* sp. Fiji Polynesiae (YEOWARD). — *Apos. macrosporæ* Sacc. affinis.

9. **Aposphæria caulinæ** Karst., Act. Soc. pro Faun. et Fl. fenn. 6547
XXVII, IV (1905) p. 15. — Pycnidiis sparsis, superficialibus, rotundatis, v. elongatis, vulgo inæqualibus, astomis, atratis, minutis; sporulis elongatis, continuis, hyalinis, circiter 4 \approx 1.

Hab. in caulis siccis *Cerefolii silvestris* prope Kuopio Fennia (HENDUNEN).

10. **Aposphæria conica** Sacc. Fungi ital. fig. 1444 (sine diagnosi). — 6548
Pycnidiis in ligno superficie denigrato laxe gregariis, superficialibus altiuscule globoso-conicis, minutis, nigris, levibus, subcarbonaceis, vertice pertusis; sporulis ellipsoideis v. oblongo-ellipsoideis, perexiguis, rectis, 2,5-3 \approx 1,7, hyalinis; sporophoris subnullis.

Hab. in ligno putri *Quercus pedunculatae* in silva Montello Ital. bor. sept. 1876.

11. **Aposphæria Henryana** Trav. in Bull. n. 8 (1912) Société Flore 6549
Valdôtaine, pag. 26 extr. — Pycnidiis dense sparsis vel hinc inde subgregariis confluentibusque, ligno denudato vel cortice duriore insidentibus, atris, opacis, globoso-depressis, 200-250 μ . diam., ostiolo papillulato, poro circulari angusto pertuso præditis, senescendo quandoque collabescentibus, excipulo indistincte pseudo-parenchymatico, castaneo-brunneo; sporulis minutis, bacillibus, rectis, utrinque rotundato-subtruncatis, grosse biguttulatis, hyalinis, coacervatis vero pallide viridi-lutescentibus, 4-5 \approx 1 $\frac{1}{2}$ -2; sporophoris distinctis nullis visis.

Hab. in ramis siccis semi-decorticatis *Salicis albæ*, Valpelline,

Valle d'Aosta, Ital. bor. alt. 950 m. — Cum speciebus in Salice inventis minute comparata, sed nullo modo convenit. Ab *A. Salicuum* Sacc. differt pycnidiis majoribus et sporulis crassioribus. *A. pezizoidea* Ell. et Ev. pycnidiis majoribus gaudet et typice valde collapsis. Species nostra *A. pulvisculæ* Sacc. magis accedit, a qua tamen differt pycnidiis majoribus, excipulo indistincte celluloso, sporulis coacervatis flavidulis et sporophoribus, ut videtur, nullis distinctis.

12. ***Aposphæria rudis*** Karst., Acta Soc. pro Fann. et Fl. XXVII, 6550 VI (1905) p. 15. — Pycnidiis erumpentibus, dein superficialibus, cæspitose aggregatis, v. solitariis, difformibus, rotundatis, elongatis v. depresso-depressis, rostratis, atris, minutis, villo incano (an proprio) tectis; sporulis ovoideis, 1-2 guttulatis, hyalinis, 3-4 \approx 1-2.

Hab. in cortice interiore *Abietis excelsæ*, Villmanstrand Fenniæ (LÖNNBOHM).

13. ***Aposphæria Musarum*** Speg., Myc. Argent. V. p. 351 in An. 6551 Mus. Buenos-Aires, XX. (1910). — Pycnidiis superficialibus laxe gregariis, atris, subglobosis, glabris, matrice subiculo tenuissimo subcanescente glabrescenti hyalino velata insidentibus, exime acutiusculeque papillato-ostiolatis, 70-80 μ . diam., contextu minutissime parenchymatico subferrugineo; sporulis ellipsoideis, eguttulatis utrinque subacutiusculis, 3-4 \approx 1-1,25, rectis curvulisve, hyalinis.

Hab. ad folia dejecta putrida Musæ sapientum, prope Orán, Valta, Argentina.

14. ***Aposphæria anomala*** Rota-Rossi, I. Contr. Mic. Bergamo, Att. R. 6552 Ist. bot. Pavia ser. II v. IX (1907) p. 13. — Pycnidiis superficialibus, sparsis, globoso-depressis, atris, majusculis $\frac{1}{2}$ — $\frac{2}{3}$ mm. diam., interdum irregulariter bilocularibus, ostiolo distincte papillæformi præditis, intus contextu parenchymatico hyalino; sporulis copiosissimis, cylindraceo-ellipsoideis, eguttulatis, hyalinis, 4-6 \approx 2-2,5; sporophoribus cylindraceis, continua, rectis, hyalinis, 8-10 \approx 2-2,5.

Hab. in caule herbaceo emortuo humi dejecto, Palazzago Bergamo Ital. bor.

15. ***Aposphæria charticola*** Sacc. in Ann. Mycol. IX (1911) p. 251. — 6553 Pycnidiis globulosis, laxe gregariis, minutissimis, 160 μ . diam., superficialibus, vertice obtusis, subastomis, nigris, contextu minute celluloso, duriusculo, atro-fuligineo; sporulis pycnidium impleti-bus, ellipsoideis, basi acutiusculis, rectis, 5,5—7 \approx 3, hyalino-farctis, coacervatis dilutissime flaveolis.

Hab. in areis dealbatis chartæ udae dejectæ, Lyndoville N. Y. Amer. bor. (C. E. FAIRMAN).

DENDROPHOMA Sacc. — Syll. III. p. 178 X. p. 209, XI. p. 498, XIV.

p. 895, XVI p. 886, XVIII p. 278.

1. **Dendrophoma Guettardæ** Patouill., Bull. Soc. Myc. Fr. XXII 6554 (1906) p. 59. — Pycnidiis erumpentibus, globosis, atris, papilliformi-ostiolatis, 0,5-0,7 mm. diam.; sporophoris hyalinis, verticillatis, acutis, 6-10 \approx 2; sporulis, hyalinis allantoideis, rectis v. curvulis 3 \approx 1.

Hab. in fructibus emortuis Guettardæ speciosæ, Makemo Polynesia.

2. **Dendrophoma Inocarpi** Patouill., Bull. Soc. Myc. Fr. XXII (1906) 6555 p. 59. — Pycnidiis erumpentibus, atris, globosis, solitariis v. gregariis, c. 250, μ . diam., poro pertusis; sporophoris linearibus 12-15 \approx 2, verticillatis; sporulis numerosissimis, hyalinis, fusoideo-ovoideis, 6 \approx 2.

Hab. in fructibus Inocarpi edulis, Roruru Polynesia.

3. **Dendrophoma vitigena** Sacc. in Sydow. Mycol. germ. n. 517 et Ann. Mycol. IV (1906) p. 485 endr. *D. pleurospora* var. *vitigena* Sacc. in Syll. fung. III p. 178. — Sporophoris bacillaribus, apice obtusatis, septatis, 25-30 \approx 4 μ . facile dilabentibus, non ramosis, sporulis acro-pleurogenis, inæqualiter ovoideis, minute biguttulatis, 3-4 \approx 1 $\frac{1}{2}$ -2 hyalinis.

Hab. in ramis Vitis viniferae et aestivalis in Germania, Gallia et Italia.

4. **Dendrophoma pruinosa** (Fr.) Sacc., Syll. III. p. 179 — var. *Ligustrum* Strasser, Verh. k. k. zool. bot. Ges. Wien Bd. LX (1900) p. 311. — A typo differt sporulis majoribus et matrice diversa.

Hab. in ramis siccis Ligustrum vulgaris, prope Ybbsitz Austria (P. LAMBERT). — Socia adest Valsa Cypri Tul.

5. **Dendrophoma ?armeriicola** Speg. Myc. Arg. V p. 350 in An. Mus. Buenos-Aires, XX (1911). — Pycnidiis, sparsis, epidermide tectis, leniter prominulis, subcarbonaceis, atris, 200-250 μ . diam., ostiolo vix papillato coronatis, contextu nigro, opaco; sporulis subcylindraceis utrinque subtruncatis, 3-5 \approx 1-1,5, rectis curvulis (an catenulatis?) pleurogenis; sporophoris bacillaribus deorsum in-crassatis, saepè irregulariter denticulatis, 30-50 \approx 2-3.

Hab. ad scapos aridos Armeriae chilensis ad ripas Rio Deseado, Patagonia.

6. **Dendrophoma casuarinicola** Spieg. Myc. Arg. V p. 350, An. Mus. 6559 Buenos Aires XX (1910). — Pycnidiis ligno insidentibus, primo tectis dein denudato-superficialibus, subhemisphæricis, carbonaceis, 100-120 μ . dein, obsolete ostiolatis, nigris; contextu indistincto; sporulis ellipsoideis utrinque subrotundatis, rectis curvulisve, perexiguis, 2 \approx 1; sporophoris deorsum subincrassatis, parum supra basin trifidis v. medio furcatis, 10 \approx 1.
Hab. ed ramulos emortuos subputrescentes Casuarinæ strictæ, Claypole, prope Buenos Aires, Argentina.
7. **Dendrophoma Gibberella** Spieg. Myc. Arg. V, p. 351 in An. Mus. 6560 Buneos Aires, XX (1910). — Pycnidiis cæspitosis erumpentibus, subglobosis, atrocyaneis, glabris, subcarnosulis, 150-200 μ . diam., eximie papillato-ostiolatis; contextu grosse perenchymatico ex atro cærulecente; sporulis ellipsoideis, nubilosis, utrinque obtusis, 20-25 \approx 12-14, non v. leniter inæquilateralibus; sporophoris dense botryoso-ramulosis, ramulis brevibus, obtusulis, monosporis.
Hab. ad ramos subputrescentes Smilacis campestris prope Fraile Pintado, Salta, Argentina. — Sporophora circa ostiolum sterilia, indivisa. Verisimiliter pycnidium *Gibberellæ* cujusdam.
8. **Dendrophoma vagans** Syd. Hedwigia XLIX (1909) p. 82. — Pycnidiis epiphyllis, maculis, vagis indeterminatis pallidis insidentibus, æqualiter denseque distributis, subglobosis, 200-250 μ . diam., atris, medio pertusis; sporulis ellipsoideis, utrinque rotundatis, hyalinis, continuis, intus nubiloso-farctis, 21-28 \approx 11-14; sporophoris filiformibus, dichotome ramosis, 30-40 \approx 2.
Hab. in foliis Philodendri, Para, Brasilia (C. F. BAKER).
9. **Dendrophoma oligoclada** Sacc., Ann. Mycol. VI (1908) p. 565 Pycnidiis superficialibus, laxe gregariis, globulosis, atris, levibus, membranaceo-carbonaceis, 100 μ . diam., ostiolo impresso partus; conidiis anguste cylindraceis, 4 \approx 0,8-1, utrinque rotundatis, leniter curvis, hyalinis; sporophoris, fasciculatis filiformibus, aliis simplicibus, aliis lateraliter parce ramulosis, 15-24 \approx 1-1,3, hyalinis.
Hab. in lignis dejectis putrescentibus, socio *Coniothecio effuso*, in silvis Lyndonville N. Y. Amer. bor. (FAIRMAN). — Ab affini *Dendrophoma Pulvere-pyrio* imprimis sporophoris parcissime ramulosis dignoscitur.

SCLEROTIOPSIS Spieg. — Syll. III p. 184, X p. 213, XVI p. 887, XVIII 279.

1. **Sclerotiopsis Rubi** Massalongo, Nuove reclute fl. mic. veronese 6563

p. 8, *Malpighia* v. XX (1906). — Maculis foliorum suborbicularibus avellaneis, dein expallentibus et zona fusca limitatis; pycnidiis nitidulis, castaneis, astomis lenticularibus, amphigenis, vulgo tamen epiphyllis, contextu obscure parenchymatico 0,5-1 mm. in diam.; basidiis densissimis filiformibus, ramosis 25-32 \approx 1-1,5; sporulis subnavicularibus (ad instar gen. *Vermiculariæ*), hyalinis utrinque acutis, 6-8 \approx 2.

Hab. Ad folia languentia Rubi cæsii prope Tregnago ex loco «Bosco Cagalati», Verona Ital. bor. — A *Scl. Potentilla* Oudm., imprimis distat: pycnidis magis depresso-lenticularibus et colore castaneo, nec ex utraque superficie fol. prominentibus, insuper forma sporularum. Forte ad hoc genus etiam spectat *Sporonema dubium* C. Massal., observante auctore.

PLENQDOMUS Preuss — Syll. III p. 184, X p. 213, XIV p. 897, XVI p. 887, XVIII p. 280. (*)

1. **Plenodomus Eucalypti** Alm. et. Cam., Revista Agronom. V (1907) 6564 · p. 339, tab. I fig. 9-10; Bol. Soc. Brot. XXV (1908-1909), Extr. p. 43. — Pycnidiis primo tectis, dein erumpentibus, sparsis, sublenticularibus, basi subapplanatis, astomis, atris, 200-251 \approx 100-120; sporulis numerosissimis, oblongis, utrinque rotundatis biguttulatisque, continuis, subchlorinis, 5-6 \approx 2,5-3; sporophoribus non visis.

Hab. in ramis Eucalypti globuli, prope Caldas da Rainha Lusitania (A. MOLLER).

MYCOGALA Rost. — Syll. III p. 185, XI p. 449, XIV p. 898, XVI p. 888, XVIII p. 280.

1. **Mycogala macrospora** Jaap, Fungi sel. exsicc. n. 346; Abh. Bot. Ver. Prov. Brandb. LII (1910) Extr. p. 17. — Pycnidiis superficialibus, flavo-grisis v. brunneo-grisis, globosis, 0,5-1 mm. diam., glabris, astomis, contextu parenchymatico flavidio; sporulis sessilibus, globosis, 18-25 μ . diam., brunneolo-flavis, contextu dilute violaceo; membrana 3,4 μ . cr. spinulis 2,4 μ . long. hyalinis, obtusis, crebris donata.

Hab. in gramine cæso putrido, prope Bergedorf Schleswig-Holstein Germaniæ.

(*) Cfr. Diedicke in Ann. Mycol. IX (1911) p. 137.

SPHÆRONÆMA Fr. Syll. III p. 185, X p. 213, XI p. 499, XIV 899, XVI p. 888, XVIII p. 281.

1. **Sphaeronæma Pæoniæ** v. Höhn. in Strasser, Verh. k. k. zool.-bot. Ges. Wien, LX (1910) p. 312 (nomen nudum).

Hab. in caulibus emortuis Pæoniæ, Sonntagberg Austriæ. —

Cl. Pat. Strasser l. c. dicit V. Höhnelium speciem descriptum esse, sed in opusculis ejus hucusque diagnosis desideratur.

2. **Sphaeronæma Alyssi** Hollós, Ann. Mus. Nat. Hungar. V (1907) 6567 p. 48. — Pycnidiiis epidemide tectis, sparsis gregariisve, globoso-conicis, ostiolo erumpente setis coronato, nigris 140-210 μ . diam., contextu parenchymatico; setis rigidis, fuscis, septatis, apice hyalinis, 80-250 \approx 4-5; sporulis cylindraceis, utrinque rotundatis, curvulis 4-5-guttulatis, nonnunquam obscure 3-4-septatis, hyalinis, 12-16 \approx 2.

Hab. in caulibus et foliis siccis Alyssi calycinæ et tortuosæ prope Kecskemet Hungariæ.

3. **Sphaeronæma Violæ** Hollós, Ann. Mus. Nat. Hung. (1908) VI p. 6568 530. — Pycnidiiis sparsis, epidemide tectis, depresso globosis, brunneis, levibus, 500-600 μ . diam., contextu parenchymatico, rostellum 100 \approx 140; sporulis ellipsoideis, continuis, eguttulatis, hyalinis, 4-6 \approx 1-5-2.

Hab. in petiolis siccis Violæ odoratæ prope Kecskemet Hungariæ.

4. **Sphaeronæma talcahuense** Speg., Fungi Chilenses (1918) p. 148. 6569 — Pycnidiiis superficialibus hinc inde cæspitosis globoso-depressis, piceo-subsuccineis, 100-150 μ . diam., ostiolo cylindraceo recto v. arcuatulo apice subpellucido armatis; sporophoris fasciculatis, ramosis, 10-15 \approx 1; sporulis cylindraceis utrinque subtruncatis, 2-3 \approx 1, hyalinis.

Hab. in schidiis truncorum Boldoæ fragrantis prope Talcahuano Chile, Amer. austr.

5. **Sphaeronæma album** Petch, Ann. Roy. Bot. Gard. Peradeniya III 6570 Pt. I (1906) p. 5. — Pycnidiiis semi-immersis, globosis, hyalinis, 140-260 μ . diam., in rostellum hyalinum, strictum productis; rostellis 250-800 μ . long. basi 80-160 μ . diam., apice 40-80 μ . diam., apice fimbriato; sporulis ovoideis, hyalinis, continuis, 7-11 \approx 4.

Hab. in fructibus dejectis Heveæ brasiliensis, Ceylon.

6. **Sphaeronæma pomorum** Shear, Bull. Torr. Bot. Cl. XXXIV (1907) 6571 p. 307. — Pycnidiiis gregariis v. sparsis, subsuperficialibus, submembranaceis, subglobosis, 125-175 μ . diam., ostiolo rostellato

75-150 μ . long.; sporulis oblongo-cylindraceis v. saepe ovoideis v. subellipsoideis, continuis, pallide viridi-flavidis, 6-7 \approx 3.

Hab. in *Vaccinio macrocarpo* prope Whitesville N. Jers. Amer. bor.

7. **Sphaeronæma spiniforme** B. R. S. in Sacc. Not. Myc. VI Ser., v. III 6572 (1905) p. 509. — Pycnidiiis verticaliter elongatis, spiniformibus, compressis, brunneis, glabris, molliusculis, siccitate rigido-fragilibus, sursum obtuse tenuatis, saepe albidis, 3-4 mm. alt. basi 1,5-2 mm. lat.; contextu partis inf. inflatæ minute globuloso-celluloso, superioris subprosenchymatico pallidiore et in fibras hyalinæ flexuosas conglutinatas abeunte; sporulis cylindraceis rectis, sed saepius curvulis, 4-5 \approx 1,5-2, hyalinis 30-45 μ . long.; sporophoris septatis, paniculato-ramosis.

Hab. ad caules emortuos *Adenostyliidis albifrontis*, Paneveggio agri Tridentini (J. BOMMER). — Ad genus *Glutinium* fece æquo jure trahi potest.

8. **Sphaeronæma hispidulum** Corda, Syll. III p. 196 - f. *Cirsii* A. Poteb. 6573 nia, Ann. Mycol. VIII (1910) p. 71. — Pycnidiiis 350-400 μ . diam., ampulliformibus, basi expansis, collo elongato, sparse piloso prædictis; sporulis 3,5-4 \approx 1,5.

Hab. in caulis hibernantibus *Cirsii* sp. Charkow Rossia.

9. **Sphaeronæma curvirostre** Saccardo, Not. Myc. VI, Ann. Myc. v. 6574 III (1905) p. 512, *Sphaeria curvirostra* De Not. in herb. Inst. bot. rom. c. icone, nec Fries. — Pycnidiiis late et laxe gregariis, subcutaneis, dein, epidermide secedente, expositis, e basi appanata globoso-conoideis, 300-400 μ . diam., membranaceo-coriacellis, nigris, in rostrum fere æquilongum cuspidatum, saepe curvulum, interdum rugulosum productis, glabris; sporulis e fronte oblongo-ellipsoideis, rectis, 4 \approx 2, e latere curvulis angustioribus, 4 \approx 1, bигuttatis, hyalinis; sporophoris bacillaribus 5 \approx 0,5, hyalinis.

Hab. in caulis emortuis herbarum majorum verisimiliter Compositæ v. Umbelliferæ cujusdam in M. Cenisio, Ital. bor. 1838 (Dom. LISA).

10. **Sphaeronæma Orobanches** Hollós, Ann. Mus. Nat. Hung. VI (1908) 6575 p. 530. — Pycnidiiis sparsis, globulosis, ostiolo erumpente, olivaceis, levibus, 180-200 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, curvulis, continuis, 3-5-guttulatis, hyalinis, 10-12 \approx 1,75-2, massa sporularum dilute ochracea.

Hab. in caulis siccis *Orobanches stigmatoidis* prope Kecskemét Hungariæ.

11. **Sphæronæma Veronicæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6576 p. 341. — Pycnidiis gregariis, superficialibus, depresso-globosis, nigris, levibus, 240-310 μ . diam., contextu parenchymatico, rostello 140-210 \approx 90-105; sporulis oblongis, continuis, biguttulatis, hyalinis, 4-5 \approx 1-1,5; massa sporularum dilute ochracea.

Hab. in caulis siccis decorticatis *Veronicae Chamædryos* prope Kecskemét Hungariæ.

12. **Sphæronæma herbarum** Hollós, Ann. Mus. Nat. Hung. V (1907) 6577 p. 458. — Pycnidiis sparsis v. gregariis, initio epidermide tectis, demum superficialibus, nudis, nigris, oblongis, 400-700 μ . long., collo crasso, elongato, rectis v. curvulis, 100-180 \approx 70-100, apice aculeis rigidis, brunneis, septatis, 70-120 \approx 4-6 coronato, contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, rectis v. curvulis, 3-5-plerunque 4-guttulatis, hyalinis, 10-14 \approx 1,5-2, in massa pallide roseis.

Hab. in caulis siccis specierum complurimarum, Kecskemét Hungariæ. — Probabiliter status pycnidicus *Ophioboli*.

13. **Sphæronæma grandisporum** v. Höhn., Stzb. K. Ak. Wiss. Wien, 6578 CXVIII Abt. I (1909) p. 402. — Pycnidiis sparsis, superficialibus, nigris, tenui-membranaceis, globosis, levibus, 200 μ . latis, collo brevi recto v. curvulo, obtuso, 100 \approx 45-50 præditis; contextu e cellulis polygoniis 5-6 μ . latis constituto; sporophoris filiformibus, sporulâ duplo v. triplo longioribus; sporulis hyalinis ellipsoideis v. elongato-cylindraceis utrinque rotundatis, tenuiter tunicatis, contentu granuloso, 12-25 \approx 13-14.

Hab. in ligno putri, Buitenzorg Java. Filamenta paraphysoidæa inter sporulas occurunt.

14. **Sphæronæma Oryzæ** I. Miyak, Pilze Reispfl. Japan (Journ College Agricul. Tokyo, II, (1910) p. 256, t. XIV, f. 43-44. — Pycnidiis in partibus foliorum decoloratis albidis insidentibus, longe rostratis, phialiformibus, 125 μ . diam., nigris, pseudoparenchymaticis; rostro 100 μ . circ. longo; sporulis ellipsoideis v. fusoideis 5-6 \approx 2,5-3, hyalinis.

Hab. in glumis et foliis *Oryzæ sativæ*, Shiga Japonia.

15. **Sphæronæma adiposum** Butl. Mem. Dept. Agric. in India, Bot. (1906) p. 40, t. X et. XI p. p. et apud Bankroft, Handb. Diseas. West Ind. Plants (1910) p. 41. — Mycelio lanuginoso nigro; hyphis fertilibus simplicibus, septatis, endoconidia efformantibus;

endoconidiis variabilibus, cylindraceis, piriformibus v. globosis, aliis hyalinis v. brunneis et levibus, aliis fuscis et verrucosis, 9-25 \approx 4,5-18; sporulis semilunatis, hyalinis, continuis, utrinque acutis, 6,5 \approx 3,5.

Hab. in culmis *Sacchari officinarum* in Bengala. — Ex icono pycnidia sunt globulosa, pilosa in rostrum sextuplo longius, aciculare producta et apice globulo coronata.

16. **Sphæronæma foliicola** (Fuck.) Lind, Vidensk-Selskab. Skrift. 6581
Math. Naturw. Kl. Christiania (1909) n. 9, Extr. p. 13. — Ita
vocandum *Ceratostoma foliicolum* Fuck. — Syll. IX p. 483,
teste Lind l. c. — *Sphæronæma quercicola* Oud. (citatum in Syll.
XX p. 845 ex erroneo nomine in tab. IX Oud. et Konig in
Arch. Néerl. 1902) est *Sphær. Fagi* Oud. in eorum textu p. 27.

SPHÆRONÆMOPSIS Speg. *Fungi Chilenses* (1910) p. 151, (Etym.
Sphæronæma et *opsis* aspectus). — Pycnidia subsuperficialia car-
bonacea, subglobulosa longe tenuiterque ostiolata; sporulæ medio-
cres clavatæ, unicellulares, hyalinæ, paraphysibus septulatis lon-
gioribus obvallatæ.

1. **Sphæronæmopsis chilensis** Speg. l. c. p 151. — Pycnidiis ligno 6582
dealbato nitente leniter insculptis, lenticularibus 250-300 μ . diam.
basi hyphis nonnullis repentibus cinctis; sporulis clavatis, 20-
25 \approx 5, antice obtusis, postice longe rostrato-attenuatis, paraphysi-
bus sporulæ triplo quadruplove longioribus, basi crassiusculis et
septulatis, sursum attenuatis, filiformibus continuis, 60-100 \approx 5
cinctis.

Hab. in partibus emortuis *Nothofagi* cujusdam, Mapil
Chile Amer. austr.

YPSILONIA Lev. — Syll. III p. 215.

1. **Ypsilonia vagans** Spegazz., *Fungi Paulist.*, Rev. Mus. La Plata I 6583
- XV (1908) p. 35. — Pycnidiis 75-90 μ . cr., hemisphærico-depressis,
nigris membranaceis, contextu minuto denso subimperspicuo, spar-
sis v. laxe gregariis (an inferne apertis ac dimidiato-scutatis) in
subiculo status ascophori insidentibus; sporulis e sporophoris mox
diffluentibus ipsas æquantibus, ternatim exurgentibus, linearibus
10-15 \approx 1-1,25, continuis hyalinis, apice, setulis tribus rectis acutis,
30-35 \approx 1, concoloribus coronatis.

Hab. in subiculo Zukaliæ vagantis ad folia arbuscularum
in Horto botanico S. Paulo Brasilia (USTERI). In foliis Spireæ

cantonensis adest forma altera (an species?) cuius sporulæ setulis duabus triplo longioribus, altera vero sporulam tantum æquante sunt coronatæ.

CICINNOBOLUS Ehrenberg — Syll. III p. 216, X p. 220, XI p. 502, XIV p. 904, XVI p. 890, XVIII p. 283.

1. **Cicinnobolus Karstenii** Sacc. et Trav. Syll. XIX p. 290, H. Karsten Bot. Untersuch. (1866) p. 336 et in Ann. and. Mag. Nat. Hist. ser. III v. 19 (1867) p. 1, extr. t. 10 p. 11-13 (sine nomine). Pycnidiis parasiticis gregariis, globosis, 100-150 μ . diam., griseo-nigricantibus, minutissime asperulis, ostiolo obtuse papillato, periphysibus bacillaribus breviter exertis coronato; sporulis ovoideis v. ellipsoideis, minutissimis, hyalinis jodo cæruleo tincti, in cirrum longum tortuosum denique expulsis.

Hab. in antheris jam apertis, *Fuchsiae splendentis* in Germania.

2. **Cicinnobolus Ulicis** Adams Irish Naturalist XVI (1907) p. 168 f. 6585 2-4 — Pycnidiis pedicellatis, fulvo-atris, 34-67 \approx 27-42; sporulis ovoideo-oblongis, continua, hyalinis, 4,5-8,5 \approx 2-2,8.

Hab. in caulis et foliis *Ulicis europæi*, Great Sugar Loaf, Co. Wicklow Hiberniæ (Ireland). Hyphæ pycnidiferæ intertextæ cum iis *Erysiphaceæ* sp. non determinatae.

3. **Cicinnobolus Artemisiæ** Vogl., Ann. R. Ac. Agric. Torino XLVIII 6585* (1905) p. 428, Atti R. Ac. Sc. Torino v. XLIII (1907-1908) p. 93 (247). — Pycnidiis sphæroideis, 80-90 μ . diam., rarissime oblongis v. piriformibus, membranaceis, ostiolatis, setis erectis, fuliginosis, in parte superiore, circa ostiolum, præditis; sporulis ellipsoideis v. amygdaliformibus, hyalinis, 4-6 \approx 2-2,5 pro more 5 \approx 2-2,5, rarius 3.

Hab. parasitice in mycelio *Oidii erysiphoidis* ad folia Artemisiæ in Pedemontio Italiæ bor.

4. **Cicinnobolus Hieracii** Bubák, Ann. Mycol IV (1906) p. 112. — 6586 Pycnidiis ellipsoideis v. ovoideis raro fere globosis, 49-62 \approx 28-35, flavidis v. brunneolis, contextu parenchymatico; sporulis ovoideis v. elongatis 6-11 \approx 3,5-4,5, apice rotundatis, hyalinis, in cirrum elongatum productis.

Hab. in foliis *Hieracii silvatici* parasitice in *Oidii* sp. (? *Sphaerothecæ Humuli*) prope Eisenstein Bohemia.

5. **Cicinnobolus Polygoni** Potebnia, Myc. St. in Ann. Myc. V (1907) p. 6587 15 et. Trav. Soc. Nat. Univ. Kharkov, XXXIII (1907). —

Pycnidiis difformibus, aliis piriformibus 70-21-26, aliis sphæroidis 50-90 μ . cr. flavo-brunneis; sporulis 7,5-8,5 \approx 2,5-3 rectis v. curvulis, hyalinis.

Hab. in Oidio et Erysiphe in foliis Polygoni avicularis prope Kharkov. — *Cicinnobolo Plantaginis* Oud. proximus sed setulis destitutus.

NEOTTIOSPORA Desm. — Syll. III p. 216, XVI p. 890.

1. **Neottiospora schizochlamys** Ferdinands. et Winge, Bot. Tidsskr. 6588 XXVIII (1908) p. 255, fig. 6. — Pycnidiis immersis, papilla erumpentibus, globosis v. subglobosis, contextu parenchymatico, circ. 250 μ . diam., nigris, seriatis; sporulis cylindraceis, v. cylindraceo-clavatis, utriusque rotundatis, plasmate irregulariter partito, nebuloso, subsessilibus, primitus gelatina indutis, dein membrana gelatinosa longitudinaliter fissis, apice (2?) - 4-ciliatis, 24-37 \approx 6-7,5, saepe curvatis hyalinis, appendicibus 1 μ . cr. sporulas subæquantibus, primum sporulis adpressis dein erectis, corniformibus, hyalinis, mox evanescentibus.

Hab. ad caules sicclos Scirpi cæspitosi prope Borris Jutlandæ, Dania.

2. **Neottiospora lycopodina** v. Höhn. Fragm. Mykol VII (1909) p. 6589 77. — Pycnidiis in ramulis nigrificatis sparsis, subepidermicis, nigris, coriaceis, globosis, supra late conoideis, ostiolo 10-12 μ . lato, 280 μ . circ. lat. 230 μ . altis, parietibus tenuibus 20-25 μ . cr., minute celluloso-plectenchymaticis; sporulis hyalinis, cylindraceo-clavatis, rectis v. curvulis, apice plerumque rotundatis basi angustato-acutatis 8-12 \approx 2-2,5, contextu homogeneo.

Hab. in ramulis adhuc vivis Lycopodi comp. planati, Sonntagsberg prope Waidhofen Austriæ (P. STRASSER).

SIROCOCCUS Preuss — Syll. III p. 217, X p. 220, XI p. 502, XIV p. 905, XVI p. 891, XVIII p. 285.

1. **Sirococcus Calycanthi** Spieg., Myc. Argent. V p. 355 in An. 6590 Mus. Buenos Aires, XX (1910). — Tumores tuberiformes, 5-20 mm. diam., rameales verrucoso-diformes subsuberosos pallide sordideque rufescentes efformans; pycnidiis in rimulis basi tumorum infossis, superne exertis semiglobosis levibus 60-90 μ . diam., minute ostiolatis (ost. 10 μ . diam.) membranaceo-coriacellis, contextu, minute densissimeque parenchymatico, olivaceo-fusco; sporulis subcylindraceis, utrinque rotundato-subtruncatis 2-4 \approx 0,75-1, rectis v.

leniter inæquilateralibus in catenulas longiusculas 25-50 μ . long. simplices v. ramulosas digestis, hyalinis, levibus, eguttulatis.

Hab. ad ramos vivos Calycanthe floridi culti in hortis Buenos-Aires Argentina, Amer. austr.

2. **Sirococcus Echii** Speg. Myc. Argent. V p. 356, in An. Mus. 6591 Nac. Buenos-Aires XX (1910). — Pycnidiis matrice denudata infuscataque immersis, subglobosis 150-180 μ . diam., tenuissime membranaceis, ostiolo minutissimo depresso præditis; sporulis cylindraceis utrinque rotundatis, 10-12 \approx 1,75, rectis v. lenissime subcurvulis, 6-10-guttulatis, hyalinis, in catenulas tri-pentameras sporophoribus concoloribus sublageniformibus 5-6 \approx 1,5-2 acrogenas digestis.

Hab. ad caules aridos putrescentesque Echii plantaginei in pratis circa La Plata Reip. Argentinæ Amer austr.

3. **Sirococcus mendozanus** Speg. Myc. Argent. V p. 356, in An. 6592 Mus. Nac. Buenos-Aires XX (1910). — Pycnidiis cortice insculptis, primo epidermide velatis dein plus minusve erumpentibus, sparsis v. laxe gregariis, globoso-subconoideis, 150-180 μ . diam. subcarbonaceis; sporulis cylindraceis utrinque obtusis 4-6 \approx 1, rectis v. curvulis in catenulas tetra-hexameras, in apice sporophororum filiformium (10-12 \approx 1) acrogenas, digestis, hyalinis, eguttulatis.

Hab. ad ramos languentes Artemisiæ mendozanæ in montuosis Cacheuta prope Mendoza Amer. austr.

4. **Sirococcus Elasticæ** Koord., Botan. Untersuch. (1907) p. 207. — 6593 Pycnidiis subglobosis, superficialibus gregariis, glabris, stromate destitutis, c. 60-100 μ . diam., nigris intus niveis, subastomis, contextu prosoplectenchymatico, fusco; sporulis continuis hyalinis 4 \approx 1,75-2 ovoideis v. late cylindraceis, e conidiophoris cylindraceis 8 μ . longis, hyalinis, catenulatim oriundis.

Hab. in foliis emortuis Fici elasticæ prope Purworedio prov. Kedu Java (KOORDERS).

5. **Sirococcus Cycadis** Speg. Myc. Argenti V p. 356 in An. Mus. 6594 Buenos-Aires XX (1910). — Maculis quandoque nullis, quandoque arecentibus (heterogeneis?) determinatis; pycnidiis amphigenis erumpenti-superficialibus subconoideis 100-120 μ . diam., obsolete papillato-ostiolatis, subcarbonaceis, nigris, glabris; sporulis breviter cylindraceis, utrinque subtruncatis 2-6 \approx 1,75-2, catenulas in sporophoribus longiusculis (15-35 \approx 1-1,5) sursum leniter incrassatulis v. bifidis acrogenas efformantibus, eguttulatis, chlorinulis.

Hab. vulgata ad folia arida Cycadis revolutæ in hortis Claypole et La Plata Reip. Argentinæ Amer. aust.

6. **Sirococcus Puyæ** Speg., Fungi Chilenses (1910) p. 151. — Pycni- 6595 diis hypodermicis amphigenis hemisphæricis, carbonaceis, minute ostiolatis, 90-100 μ . diam.; sporulis cylindraceis, utrinque truncato-rotundatis, 4-6 \approx 2,5-3,5, in catenulas simplices 40-50 μ . long., digestis, sporophoro 10-12 \approx 3,5 sustentis.

Hab. in foliis siccis emortuis Puyæ cæruleæ, Cerro de San Cristobal ad Santiago Chile Amer. austr.

7. **Sirococcus Maydis** Speg., Fungi Chilenses (1910) p. 151, cum 6596 icon. — Pycnidiis sparsis v. laxæ gregariis, primo epidermide tectis dein nudis, subsuperficialibus, hemisphærico-depressis, 120-150 μ . diam., subastomis, atris, subcarbonaceis; sporulis cylindraceis utrinque truncatis, 5-10 \approx 1,5-1,75, unilocularibus, in catenulas saepius bifidas longiusculas digestis, 50-80 μ . long., hyalinis.

Hab. in culmis siccis subputrescentibus Zeæ Maydis, San Bernardo prope Santiago Chile Amer. austr.

PYRENOCHÆTA De Not. — Syll. p. 219, X p. 220, XI p. 503, XIV p. 905, XVI p. 892, XVIII p. 286.

1. **Pyrenochæta Erysimi** Hollós, Ann. Mus. Nac. Hung. IV (1906) p. 6597 341. — Pycnidiis globoso-conoideis, ostiolo erumpente setis coronato, nigris, 190-210 μ . diam., contextu parenchymatico; setis rigidis, fuscis, septatis, apice hyalinis, 70-100 \approx 4; sporulis cylindraceis, rectis v. curvulis, utrinque rotundatis, plerumque 4-guttulatis, continuis, hyalinis, 10-12 \approx 2-2,5.

Hab. in foliis siccis Erysimi canescens prope Kecskemét Hungariæ.

2. **Pyrenochæta Heliettæ** Speg. Myc. Argent. V p. 533, in An. 6598 Mus. Buenos Aires, XX (1910) — Maculis hypophyllis obsotetis-simis subdisciformibus, 2-5 mm. diam.; pycnidiis sat numerosis, innato-subsuperficialibus, hemisphæricis, 75-100 μ . diam., astomis, superne glabris, basi hyphis paucis radiantibus, chlorinis, 30-90 \approx 3-5, flexuosis, ramulosis ornatis; sporulis subcylindraceis, utrinque rotundatis, 3-5 \approx 1, rectis curvulisve, interdum medio coarctatulis, hyalinis, eguttulatis v. minute 2-guttulatis.

Hab. ad folia languida Heliettæ cuspidatæ in silvis Puerto Leon, Misiones, Argentina. — Quoad genus dubia species.

3. **Pyrenochæta Filarszkyi** Bubák, Beitr. Pilzfl. Ung., in Növénytani 6599 Közlemények (1907) Heft. 4, Extr. p. 30. — Maculis foliicolis

utrinque visilibus, 2-5 mm. latis, rotundatis v. irregularibus, late distributis, flavo-alutaceis, striolis angustis obscure brunneis limitatis; pycnidiis subepidermicis, globosis 150-180 μ . latis, nigro-brunneis, contextu grosse parenchymatico brunneo, poro obscuriore lato depresso prominentibus; setulis ostiolaribus usque ad 12, rectis, filiformibus subhorizontalibus, obscure brunneis, septatis, 100-140 μ . longis, apice angustatis, basi usque ad 9 μ . cr.; sporulis numerosis, cylindraceis, 9-15-(raro 18) \times 3-4, rectis, raro curvulis, apice rotundatis; sporophoris hyalinis breviter cylindraceis.

Hab. in foliis vivis Tiliae parvifoliæ, Csernata prope Herculesfürdö Hungaria.

4. **Pyrenochæta robiniana** d'Alm. et de Souza da Cam. in Rev. Agron. Lisboa, (1905) p. 144, t. III f. 1-3. — Pycnidiis sparsis superficialibus, subgloboso-conicis, aterrimis, 150-200 μ . latis; setis concoloribus, divergentibus, continuis, simplicibus, rigidis, sursum attenuatis pallidisque 200-250 μ . longis; sporulis continuis, fusiformibus 8-10 \times 2-2,5 subhyalinis sporophoris basilaribus 25-30 μ , suffultis.

Hab. in cortice Robiniae Pseudacaciae prope Coinbra Lusitania. — Differt præcipue a *Pyr. Robiniae*, setis circa ostiolum haud orientibus.

5. **Pyrenochæta cereicola** Speg., Myc. Argent. V p. 353, An. Mus. Buenos Aires XX (1910). — Pycnidiis hinc inde erumpentibus, solitariis v. pauci-gregariis, subglobosis 200-250 μ . diam., eximie papillato-ostiolatis, hyphis patentiusculis, olivaceis, 1-pluri-cellularibus, gracilibus 30-120 \times 67 conspersis; sporulis subellipticis, utrinque rotundatis, 34-40 \times 14-16, rectis curvulisve, hyalinis nubilosis (an serius fuligineis?)

Hab. ad ramos languidos v. emortuos Cerei Hænkeani in silvis prope Santa Ana, Misiones Argentina.

6. **Pyrenochæta leptospora** Speg. Myc. Arg. V p. 354, in An. Mus. Buenos Aires XX (1910). — Pycnidiis hemisphericis, sparsis, superficialibus, coriacellis, atris, 100-120 μ . diam., basi ad marginem pilis 3-10 uncinatis v. arcuatis v. circinatis 20-40 \times 2-4 hyalinis ornatis, irregulariter dehiscentibus; contextu indistincto; sporulis e tereti subfusoideis, continuis, 3-7-guttulatis.

Hab. ad folia Lauraceæ cujusdam, Puerto Leon, Misiones, Argentina.

7. **Pyrenochæta Phlogis** Massee, Kew. Bull. (1907) p. 241, f. 1 et Disseas. 6603

cultiv. Plants, 1910, p. 420, f. 131:1-2. — Pycnidiis dense gregariis globosis, immerso-erumpentibus, membranaceis setulis nigris numerosis rigidulis prope ostiolum vestitis; sporulis ellipsoideis, hyalinis $5 \approx 3$, sporophoribus bacillaribus hyalinis suffultis.

Hab. in caulis Phlogis var. sp. cultarum, quibus valde noxia in hortis Kew Angliae.

8. **Pyrenochæta vexans** Syd. Hedwigia XLIX (1909) p. 82. — Ma- 6603 culis primo minutis, mox majoribus confluentibusque et saepe totum spatium inter nervos primarios occupantibus, tandem delapsis, griseis rufo-marginatis; pycnidiis amphigenis, globosis, atris, poro usque ad 20 μ . lato pertusis, circa porum setis paucis atro-brunneis apicem versus attenuatis 70-125 μ . longis. obsitis; contextu fuligineo, circa porum obscuriore; sporulis numerosis, anguste ellipsoideis, hyalinis, continuis, $4-6 \approx 2-2^1/2$.

Hab. in foliis vivis vel languidis Sancheziaæ nobilis, Para, Brasilia (C. F. BAKER).

9. **Pyrenochæta Centaureæ** Voglino, Atti R. Ac. Sc. Torino v. 6604 XLIII (1907-1908) p. 94 (248); Bull. Soc. Agric. it. XIII (1908) p. 4. — Amphigena sed plerumque hypophylla, maculis indeterminatis, latiusculis, griseis v. cinereo-fuscescentibus; pycnidiis numerosis, plerumque superficialibus inter pilos folii seu innato-erumpentibus, globoso-conoideis, piriformibus umbrinis, coriaceo-carbonaceis, ad verticem attenuatum seu circa ostiolum latiusculum, setis rigidis, septatis, plus minus copiosis, fuligineo-atris, usque ad 140 μ . longis, 4 μ . latis, hirtis, 70-100 μ . latis, sporophoribus cylindraceis, sporam æquantibus; sporulis ovoideis v. ellipsoideis, utrinque rotundatis, hyalinis, $4-5 \approx 2,5$.

Hab. in foliis vivis Centaureæ candidissimæ quæ nigrescunt et flaccidæ fiunt, in hortis Pedemontii Italiæ bor.

10. **Pyrenochæta Dichondræ** Speg., Myc. Argent. V, p. 353, in An. 6605 Mus. Buenos Aires, XX (1910). — Maculis nullis; pycnidiis hypophyllis superficialibus, sparsis, hemisphæricis, 75-100 μ . diam., nigris, astomis, setulis patentiusculis simplicibus, 25-85 $\approx 4-5$, subfuligineis, 1-2-cellularibus vestitis; sporulis subcylindraceis, egutulatis, minimis, utrinque obtuse rotundatis, $4 \approx 1,7$, hyalinis rectis curvulisve.

Hab. ad folia viva Dichondræ repentis in silvis prope Bompland, Misiones, Argentina.

11. **Pyrenochæta Aristolochiæ** Speg., Myc. Argent. V, pag. 352, in 6606 An. Mus. Buenos Aires, XX (1910). — Maculis repando-orbicu-

laribus, cinereo-albicantibus, determinatis, areola angusta purpurascente cinctis, 5-10 mm. diam.; pycnidiiis epiphyllis superficialibus paucis, hemisphæricis, astomis, 100-150 μ . diam., pilis non nullis concoloribus, flexuosis, simplicibus patentiusculis, 40-50 \approx 4-5 parum supra basim adspersis; contextu obsolete parenchymatico subopaco; sporulis ellipsoideis nubilosis, utrinque rotundatis, 8-10 \approx 3-4, hyalinis, rectis.

Hab. ad folia languida Aristolochiæ Esperanzæ in dumetis ad ripas Rio Sora, Salta, Argentina.

12. **Pyrenochæta fallax** Bres. in Strasser III Nachtr. Pilz. Sonntagb. 6607 in Verhandl. zool. bot. Gesell. Wien (1905) p. 615). — Pycnidiiis gregariis, initio epidermide velatis, dein superficialibus, nigris, carbonaceo-membranaceis, contextu subparenchymatico, subgloboso-depressis, 0,25-0,33 mm. latis, ostiolo cylindraceo, valde prominulo, plus minusve setuloso, setulis fuscis, septatis, apice cuspitatis, 80-100 \approx 5; sporulis hyalinis, elongatis, biguttulatis, 4-5 \approx 1,5-1,75.

Hab. ad caules Urticæ dioicæ, Sonntagberg Austr. inf.

13. **Pyrenochæta orchidophila** Speg., Myc. Argent. V, pag. 354, in 6608 An. Mus. Buenos Aires, XX (1910). — Maculis nullis; pycnidiiis amphigenis, erumpenti-superficialibus, astomis, coriacellis, atris, 130-180 μ . diam., setulosis, contextu opaco indistincto; setulis simplicibus acutis rectiusculis, non v. vix incrassatulis, 50-100 \approx 5-6, subcontinuis fuligineis; sporulis cylindraceis utrinque rotundatis, 18-20 \approx 5-6, hyalinis, nubilosis, rectis.

Hab. ad folia emortua adhuc pendula Isochili linearis in silvis prope Ledesma, Argentina.

14. **Pyrenochæta Oryzæ** I. Miyake, Pilze Reispfl. Japan in Journ. College Agricult. Tokyo, II (1910) pag. 255, t. XIV, fig. 36-42. — 6609 Pycnidiiis immersis vix prominulis, nigro-brunneis, ellipsoideis, 200 μ . diam., 120 μ . alt., ostiolo 6-20 setulis nigris multiseptatis plus minusve patentibus 60-140 \approx 4-5 circumdato, ostiolo extus 40 μ . intus 12 μ . circ. lato; sporulis fusoideis 4-6 \approx 1,5-2, utinque guttulatis.

Hab. in foliis glumisque decoloratis dein brunneis Oryzæ sativæ, Japonia.

15. **Pyrenochæta Hepaticarum** Sacc. et Trott. Cfr. supra p. 149. Est 6610 status pycnidicus *Stigmatoe Hepaticarum* Patouill., Bull. trim. Soc. Myc. Fr. XXI (1905) p. 121.

Hab. in thallo Lunulariæ in Algeria Afr. bor.

16. **Pyrenochæta Geasteris** Hollós, Ann. Mus. Nat. Hungar. V (1907) 6611

pag. 281. — Pycnidiis gregariis sparsisve, semiglobosis, ostiolo conico setis coronato, fuscis, 210-250 μ . diam., contextu parenchymatico; setis rigidis, flavo-brunneis, septatis, apice obtusatis, 170-250 \approx 6-8; sporulis cylindraceis, utrinque rotundatis, rectis, continuis, hyalinis, 14-20 \approx 3-3,5.

Hab. in stratu interno exoperidii *Geasteris* fornicati pr. Kecskemét Hungariæ.

Subgen. *Trichocicinnus* Sacc. — Pycnidia parasitica, cicinnoboloidea.

17. **Pyrenochæta erysiphoides** Saccardo, Not. Myc. VI, Ann. Myc. 6612

v. III (1905) pag. 512. — Biophila, hypophylla, laxe gregaria; pycnidiis omnino superficialibus, globulosis, subastomis, vertice obtusis, 150-160 μ . diam., ubique setulosis; contextu tenui-membranaceo, 1-stratoso, olivaceo-fuligineo; setulis radiantibus, simplicibus, septatis, 80-125 \approx 4, atro-fuligineis, apice obtusulis, pallidioribus; sporulis sessilibus oblongo-cylindraceis, rectis, utrinque rotundatis, obsolete 2-guttulatis, hyalinis, 3-4 \approx 2.

Hab. in pag. inf. foliorum vivorum *Cirsii arvensis*, Selva (Treviso) Ital. bor. — Fungillus eximus, habitu omnino erysiphaceo, ob vitam parasiticam a typo distinguendus. *Trichocicinnus* dixi l. c. quasi sit *Cicinnobolus* setosus.

STAUROPHOMA v. Höhnel, Ergebniß Bot. Exp. Südbras. 1901, Denk. k. Ak. d. Wiss. Wien Bd. LXXXIII (1907) Extr. p. 34 (Etym. *stauros* crux et *Phoma*). — Subiculum tenui-membranaceum, ex hyphis intricatis, formatum; pycnidia superficialia, rotundata brunnea, ostiolata, supra pilis tenuibus, cruciatim ramosis, brunneis tecta; sporidia hyalina, subglobosa v. elongata, unilocularia. — Ab affini gen. *Staurochæta* differt subiculo distincto, pycnidiis ostiolatis, cæspitosis.

1. **Staurophoma Panici** von Hönel, l. c. tab. I, fig. 7. — Pycnidiis 6613 laxe cæspitosis, numerosis, hypophyllis, in maculis 1-1,5 cm. elongatis, brunneo-nigris insidentibus, rotundatis, supra depresso, late ostiolatis, epapillatis; pilis unilocularibus, 14-18 μ . long., 3-4 cruciatim ramosis, infra obconoideo-angustatis; subiculo tenui membranaceo ex hyphis brunneolis, 1-2 μ . cr., tenuissime tunicatis, constituto; sporulis numerosissimis, hyalinis, unilocularibus, rotundatis v. ellipsoideis, 1-2 \approx 1.

Hab. in foliis Panici sulcati, Sao Paulo Brasilia, America australis.

CHÆTOPHOMA Cooke — Syll. III p. 199, X p. 216, XI p. 501, XIV p. 900, XVI p. 889, XVIII p. 282.

1. **Chætophoma Biscutellæ** C. Mass. in litt. 18, III, 1906, in Sacc., 6614 Not. Myc. VII, Ann. Myc. IV (1906) p. 273. — Foliicola, amphigena; subiculo fuligineo late effuso, ex hyphis 5-8 μ . cr. cladosporioideis, ramosis septatis et dense intertextis formato; pycnidiiis mycelio nidulantibus, vulgo obovatis v. ellipsoideis, 42-54 \times 20-28, membranaceis; sporulis ovoideis, polari-2-guttulatis, 6-9 \times 3-4, hyalinis.

Hab. ad folia viva Biscutellæ levigatae, in glareosis torrentis Progno prope Marcenigo prov. Veronensis, Ital. bor. (C. MASSALONGO). — Ob formam pycnidii et characteres sporularum inter congeneres magis affines facile distincta species.

2. **Chætophoma melanopotamica** Speg., Myc. Argent. V, p. 351, in 6615 An. Mus. Buenos Aires XX (1910). — Maculis nullis; pycnidiiis amphigenis, hinc inde coacervatis, globosis, astomis, hyphis radiantibus et intertextis e hyalino subchlorinis 50-200 \times 2-5 insidentibus, membranaceis, nigris, 75-100 μ . diam., centro per ætatem minute stellatim dehiscentibus, contextu minutissime indistincte parenchymatico, olivaceo; sporulis subcylindraceis, grosse 2-3-guttulatis, utrinque obtusulis, 6-8 \times 2, hyalinis.

Hab. ad folia viva Adenostemi nitidi in silvis Andinis, Neuquem, Argentina.

3. **Chætophoma scoriadea** Speg., Fungi Chilenses (1910) pag. 148, 6616 cum icon. — Subiculo nigro, crassissimo, pannoso-scruposo, articulis cuboideis grosse uniguttulatis (verisim. est *Antennari scoriade* Berk.); pycnidiiis subiculo absconditis, ovatis, 50-60 \times 50-80, olivaceis, glabris, membranaceis, minute eximieque papillato-ostiolatis; sporulis subcylindraceis, utrinque obtusis, 4 \times 1,5, hyalinis.

Hab. frequens in foliis vivis Boldoæ fragrantis pr. Talcahuano Chile Amer. austr. — *Chætoph. pelliculæ* Sacc. et Syd. affinis.

4. **Chætophoma Penzigi** Sacc. — Syll. III, p. 200 — var. **theicola** 6617 Speschn., Arb. Bot. Gart. Tiflis, Lief. VI, Heft III, pag. 10. — A typo præter matricem, differt sporulis 8-14 \times 2-3 (nec tantum 3-5 \times 2).

Hab. in foliis, quæ vitiantur, Theæ sinensis pr. Batum in

Caucaso. — Ob sporulas plusquam duplo longiores videtur specificē distinguenda.

5. **Chætophoma microspora** Spegazz., Fungi Paulist., Rev. Mus. La Plata t. XV, p. 35. — Pycnidiis hinc inde laxe gregariis, subiculo tenuissimo parenchymatico hyphas *Asterinæ?* cujusdam sterilis hypophyllæ incrustante suffultis, e globoso piriformibus v. sublagniformibus 30-50 μ . diam., ostiolo perforatis, pellucidis, contextu dense minuteque parenchymatico olivaceo; sporulis rectis, utrinque obtusiusculis 2-2,5 \approx 1-1,25, eguttulatis, hyalinis.

Hab. ad folia viva Spirææ cantonensis in Horto botan. Sao Paulo Brasilia (USTERI).

6. **Chætophoma ? trichothecia** Spieg., Myc. Arg. V, pag. 352, in An. Mus. Buenos Aires, XX (1910). — Pelliculoso-subcrustacea, late effusa, nigra, subiculo ex hyphis toruloso-articulatis (articulis 10-20 \approx 5-6) crebre intertextis formato; pycnidiis lanceolatis stipite 100-250 \approx 10-20 suffultis, sursum longe attenuato-ostiolatis, atris, opacis, apice minute fimbriatis, 150-250 \approx 40-50, contextu parenchymatico; sporulis ellipsoideis, utrinque rotundatis, 5-6 \approx 2,5-3, rectis curvulisve, eguttulatis v. minute 2-guttulatis, hyalinis.

Hab. ad folia ramulosque Myrsines africanae in hortis La Plata, Argentina. — Certe sistit. ceratopycnidium *Capuodii* sp.

7. **Chætophoma venturioides** Sacc. et Berl. — Descripta in Syll. IX, 6620 p. 406 ut st. pycnidicus *Dimerosporii venturioidis* Sacc. et Berl.

Hab. in pag. sup. Convolvulaceæ cujusdam, Santos Bras.

8. **Chætophoma erysiphoides** Griff. et Maubl., Bull. Soc. Myc. Fr. 6621 XXV (1909) p. 60, cum icon. — Pycnidiis hypophyllis, sparsis, superficialibus, globosis, nigris, apice poro minuto pertusis, contextu tenui celluloso 110-150 μ . diam., pilis rigidis, fuligineis, septatis, usque ad 100 μ . longis, plus minusve numerosis ornatis; mycelio superficiali, tenuissimo, fuligineo, ex hyphis effusis, ramosis, septatis composito; sporulis globulosis v. late ovatis, eguttulatis, chlorinis, 3-5 \approx 2,5-4.

Hab. in foliis adhuc vivis Quercus Ilicis jam Oidio quer-cino pervasis, Cadillac Gironde Galliae (CAPUS). — *Ckæi. setigeræ* Peck proxima.

9. **Chætophoma microsperma** (Corda) Sacc. et Trav. — Syll. XIX, 6622 p. 266 — *Pleuropyxis microsperma* Corda Icon. fung. I, p. 23, t. VI, pag. 291. — Mycelio effuso, fusco; hyphis ascendentibus, laxis longissimis, simplicibus, 3-4 μ . cr. septatis; pycnidiis sub-

ovatis, rugulosis, atro-fuscis, irregulariter ruptis; sporulis lunulatis, minutis, obtusis, hyalinis, 2,4-2,5 μ . long.

Hab. in ligno nudo betulino putri pr. Reichenberg Bohemiæ.

10. **Chætophoma glumarum** I. Miyake, Pilze Reispfl. Japan (Journ. 6623

College Agricult. Tokyo, II (1910) p. 254, t. XIV, f. 33-35. — Maculis albescensibus mycelio nigrescente præditis; pycnidiis gregariis, globosis v. ellipsoideis nigris 80-125 μ . diam.; sporulis hyalinis rotundato-ovoideis vel ellipsoideis, utrinque guttulatis, 5-7,5 \approx 2,5-3.

Hab. in glumis Oryzæ sativæ, Ochi-gun, Ehime Japonia.

11. **Chætophoma incrustans** Spegazz., Fungi Paulist., Rev. Mus. La 6624

Plata t. XV (1908) p. 34. — Pycnidiis subiculo status ascophori insidentibus, hinc inde laxe gregariis, subglobosis 50-80 μ . diam., minute ostiolato-pertusis, atris, tenuibus, membranaceis, contextu minute parenchymatico, olivaceo; sporulis rectis v. inaequilaterali- bus, 4-6 \approx 2.

Hab. in subiculo Dimerii inconstantis ad folia ignota, Ipiranga, Brasilia (USTERI).

12. **Chætophoma meliolicola** Spegazz., Fungi Paulist., Rev. Museo La 6625

Plata t. XV, p. 34. — Pycnidiis subiculo stato ascophori insiden- tibus hinc inde laxe pauci-gregariis 75-90 μ . cr., ostiolo umbonato perforatis membranaceis, contextu parenchymatico minuto fuligineo; sporulis rectis utrinque obtusissime rotundatis 8-10 \approx 3-3,5 biguttulatis hyalinis.

Hab. in subiculo Dimerosporii meliolicolæ ad folia Caseariæ cujusdam, Ipiranga até Cambucy, Brasilia (USTERI).

13. **Chætophoma paulistana** Spegazz., Fungi Paulist., Rev. Mus. La 6626

Plata t. XV, p. 35. — Pycnidiis epiphyllis sparsis v. hinc inde pauci-gregariis, globoso-depressis, 50-100 μ . diam., astomis subiculo heterogeneo?, olivaceo superficialibus, membranaceis, contextu dense minuteque parenchymatico fuligineo; sporulis ellipsoideis ovatis v. subnavicularibus utrinque obtusis 4-6 \approx 2, saepe medio leniter coarctatulis, minutis biguttulatis hyalinis.

Hab. ad folia coriacea arboris cujusdam ignotæ, Ipiranga Cambucy, Brasilia (USTERI).

ASTEROMA DC. — Syll. III p. 201, X p. 219, XI p. 501, XIV p. 901, XVI p. 889, XVIII p. 283.

1. **Asteroma deflectens** Karst., Acta Soc. pro Faun. et Fl. fenn. 6627

XXVII, IV (1905) p. 10. — Maculis amphigenis, atris, opacis, latis,

irregularibus, confluentibus, subinde paginam folii totam obtègentibus, uniformibus, absque fibrillis; pycnidiis sparsis, prominulis, astomis, mediocribus, sphæroideis, depresso; sporulis... non visis.

Hab. in foliis emortuis *Lathyri pratensis*, Tammela Fenniae. -- Forte species *Glæosporii*.

2. **Asteroma Spirææ** Kab. et Bub., Hedwigia, XLVII (1908) p. 355; 6628 Fungi imp. exsicc. fasc. XI (1909) n. 506. — Maculis amphigenis, sparsis, plus minusve rotundatis, 6-10 mm. diam., brunneis, non v. flavidо-marginatis, quandoque confluentibus; fibrillis plus minus regulariter radiantibus, nigris, copiose anastomosantibus, apice pallidioribus; pycnidiis non visis.

Hab. in foliis emortuis *Spirææ Chamædryos* prope Gross-Skal Bohemia (KABAT).

3. **Asteroma ceramoides** Sacc., Ann. mycol. VIII (1910) p. 343. — 6629 Eximie tenuissime reticulatum, nigrum nitidum; ramulis adpressis radiantibus, repetitive ramoso-anastomosantibus ex pycnidiis uniseriatis, creberrimis inter se fibrillis brevissimis cellulosis connexis formatis; pycnidiis subhemisphæricis, per exiguis, 50-60 μ . diam., adnato-superficialibus, atro-nitentibus, contextu distincte parenchymatico, fuligineo, cellulis 6-8 μ . diam., centralibus minoribus, dilutioribus, demum secedentibus et ostiolum inæquale 14-16 μ . d. relinquenteribus; nucleo . . . immaturo, guttulis oleosis sphæricis, variæ magnitudine fœto.

Hab. in caulis emortuis *Smyrnii Olusatris*, Villa Favorita, Palermo Siciliæ (J. H. MATTEI). — Pulchalla species *Ceramii* v. *Callothamnii* species quasdam æmulans.

4. **Asteroma Antholyzæ** Sacc. Ann. Mycol. VI (1908) pag. 555. — 6630 Amphigenum, maculas dense gregarias atro-olivaceas, subquadrangleas sistens; hyphis in folio transverse excurrentibus, filiformibus, 5-6,5 μ . cr. olivaceo-fuscis, septatis, breve ramosis, laxe intricatis, subinde vero in fasciculos junctis; ramulis obtusis; conidiis (propriis?) interspersis globoso-ellipsoideis, 8 \times 6-7, fuligineis; pycnidiis . . . nullis visis.

Hab. in foliis morientibus *Antholyzæ bicoloris*, Villa Favorita Palermo, Sicilia (J. H. MATTEI). — Habitus omnino *Asteromatis*.

5. **Asteroma Lloydiæ** Cruchet in Bull. Soc. Vaud. Sc. nat. XLIV (1909) p. 472. — Maculis expansis caulinis v. foliicolis, primum pallide brunneis, dein obscure brunneis, demum nigris; fibrillis tenuissimis, parce ramosis, parallelis; conceptaculis sparsis, raro

gregariis, minutulis, fere nigris; sporulis cylindraceis, unilocularibus, utrinque obtusis, bacillaribus, 3-4 \approx 0,5 hyalinis.

Hab. in caulibus foliisque Lloydiae serotinæ, in Alpibus Valesiacis Helvetiæ. — Socia *Sphaerella Burnati* (Cruch.).

VERMICULARIA Fr. — Syll. III p. 221, X p. 222, XI p. 503, XIV p. 907, XVI p. 894, XVIII p. 287.

1. **Vermicularia serbica** Bubák et Ranojevic, Ann. Mycol. VIII 6632 (1910) p. 385, fig. 1-5. — Pycnidiis in petiolis foliorum æque et crebre distributis, ex ellipsoideo elongatis, raro rotundatis, nigris, 200-350 μ . diam., conoideis, dein applanatis, setulis longis nigris, usque 500 \approx 6-8, 3-6-septatis, apice acutatis præeditis; sporulis subfalcatis, raro rectis, 20-24 \approx 2,5-4, utrinque subacutatis, hyalinis; sporophoris primum brunneis, dein pallidioribus, demum hyalinis, cylindraceis papilliformibus, 10-20 \approx 4-6, quandoque dentatis.

Hab. in petiolis vetustis foliorum Ranunculi auricom i pr. Belgrad et Cer, Serbia.

2. **Vermicularia oligotricha** Bubák et Kabát, Hedwigia XLIV (1905) 6633 p. 351. — Pycnidiis fere regulariter distributis, raro confluentibus, 60-250 μ . diam., rotundatis v. ellipsoideis, depresso-convexis, subepidermoides dein erumpentibus, primum obscure brunneis, dein fere nigris, nitidulis, setulis paucis radiantibus, cylindraceis apicem sensim angustatis, obscure brunneis, hinc inde subcurvulis, basi quandoque fortiter inflatis, 20-70 \approx 4, tectis; contextu parenchymatico, pallide brunneo supra obscuriori; sporulis ellipsoideis ex elongato cylindraceis fusoides, apice rotundatis, uno latere quandoque angustatis, rectis v. curvulis, 10-15 \approx 3,5-4, hyalinis; sporophoris fasciculatis, cylindraceis, rectis v. varie incurvatis, apice rotundatis 10-30 \approx 4-5, basi brunneolis, supra e pallido hyalinis.

Hab. in ramis siccis Rubi suberecti prope Ktová Bohemia (KABAT).

3. **Vermicularia cerasicola** Aderh. in Arb. Biol. Anstlt f. Land. u. Forstwirtschaft IV (1905) p. 462, fig. 2. — Pycnidiis amphigenis, sparsis, globosis alte prominulis, atris, 60-100 μ . diam., ubique setis 3 subinde numerosis, usque ad 140 μ . longis, basi 5-6 μ . latis, acutis continuis atris obsitis; sporulis leniter curvulis, continuis, fusoides, utrinque acutis, 23-255 \approx 2,3-3,5.

Hab. in foliis dejectis Pruni avium, Proskau Silesiae.

4. **Vermicularia Jatrophæ** Speg., Myc. Argent. V, pag. 354, in An. Mus. Buenos Aires, XX (1910). — Maculis amphigenis repando-

orbicularibus, 5-10 mm. diam., cinerescenti-fuscescentibus; pycnidii epiphyllis, paucis, sparsis v. subcircinantibus erumpenti-superficialibus subhemisphæricis 100-150 μ . diam., atris, pilis fuligineis subopacis pluricellularibus rigidulis rectiusculis acutiusculis, 50-150 \approx 5-6, dense vestitis, coriacellis, contextu indistincto olivaceo; sporulis cylindraceo-lunatis, utrinque acutatis, 24-26 \approx 3-4, hyalinis, nubilosis.

Hab. ad folia languida Jatrophæ macrocarpæ in dumetis montanis prope Tucumán Argentina, Amer. austr. — *Vermicul.* (*Chætomellæ*) *Stevensonii* Ell. valde affinis sed certe distincta.

5. **Vermicularia varians** Ducomet, Ann: Ecole nat. Agricul. Rennes 6636 t. II (1908) pag. 47, fig. 14-24. — Pycnidii initio erumpentibus dein superficialibus 75-150 μ . cr., astomis, pilis nigris 100-130 \approx 3,5-4, biseptatis, basi parum inflatis, apice pallidis attenuatisque donatis; sporulis curvulis, acuminatis, hyalinis, guttulatis 18-22 \approx 2,5-3; sporophoris incoloribus v. basi brunneis, 20-30 \approx 3-3,5.

Hab. parasitica in partibus aereis v. subterraneis Solani tuberosi nec non Physalidis peruvianæ, Rennes, Gallia. — Species quam maxime variabilis, et ad gen. *Phomam*, *Colletotrichum* et *Glæosporium* simul vergens.

6. **Vermicularia atricha** Ell. et Ev. in Millsp. Field Columb. Mus. 6637 II 4° 1 (1900) p. 16, t. LIII. — Maculis orbicularibus, rubiginosis, 2-4 mm. diam., centro saturationibus; pycnidii amphigenis, innatis, minutis, 75-100 μ . diam., apice pertusis, setulis obsoletis; sporulis lunatis, acutis, 3-4-nucleatis, 15-20 \approx 3.

Hab. in foliis Petiveriæ alliaceæ, Caguas Portorico Tabula non adest in meo exempl.

7. **Vermicularia Dematum** (Pers.) Fr. — Syll. III, p. 255 — var. 6638 **macrospora** Speg., Myc. Argent. V, p. 354, in An. Mus. Buenos Aires, XX (1910). — A typo differt sporulis dimidio longioribus, nempe 28-31 \approx 5, hyalinis, multiguttulatis.

Hab. ad caules aridos Medicaginis orbicularis in hortis La Plata Argentina. — Var. **Juglandis** Hollós, Ann. Mus. Nac. Hung. IV (1906) p. 341. — Pycnidii erumpenti-superficialibus, nigris, depressis, 140-180 μ . diam., setulis rigidis, nigris, septulatis, 250-320 \approx 7-8; sporulis cylindraceis, utrinque acutis, granulosis, hyalinis, 24-25 \approx 3-3,5. — In epicarpo putrido Juglandis regiæ, Kecskemét Hungariæ. — Var. **Lycoctoni** Potebnia, Myc. Stud., in Ann. Myc. V (1907) p. 15 et Trav. Soc. Nat. Univ. Khar-kov, XXXXIII (1907). — Pycnidii 150-200 μ ., setulis 170-200 \approx

5-6, obscure brunneis apice pallidioribus; sporulis fusoideis, curvulis, $23 \vee 3,5$, intus nucleatis, quandoque septo inconspicuo præditis. — In foliis et petiolis Aconiti Lycoctoni pr. Kursk.

8. **Vermicularia Cataseti** v. Höhnel, Ergebni. Bot. Exp. Südbras. 1901, 6639 Denk. k. Ak. 4. Wiss, Wien Bd. LXXXIII (1907) Extr. p. 34. — Pycnidiis superficialibus amphigenis, greges rotundatos usque ad 1 cm. latos efformantibus, punctiformibus, nigris, depresse conoideo-hemisphæricis, basi late insidentibus, $80-160 \mu$. latis, setulis numerosis unicellularibus, obscure brunneis apice pallidioribus, acutis, curvatis, $40-80 \vee 5-6$ tectis; membrana pycnidiorum tenui, grosse parenchymatica; sporulis unilocularibus, rectis, hyalinis, cylindraceis, utrinque rotundatis, $14-18 \vee 5-6$.

Hab. in foliis Cataseti fimbriati, prope Salto Grande d. Rio Paranapamena Sao Paulo Brasilia, Amer. austr.

9. **Vermicularia affinis** Sacc. et Br. — Syll. X, p. 227 — var. **Calamagrostidis** Karst., Acta Soc. pro Fauna et Fl. fenn. XXVII, 4 (1905) p. 15. — Pycnidiis innatis, sparsis, sphæroideis, $40-50 \mu$. diam., setulis parcis, rigidis, brunneis, sursum attenuatis dilutioribusque, longitudine pycnidiorum; sporulis elongato-fusoideis, guttulatis, rectis v. leniter curvulis, $16-23 \vee 2-4$.

Hab. in foliis siccis Calamagrostidis Epigeios in regione Kuopioënsi Fenniæ (LÖNNBOHM).

Species omnino dubiæ.

10. **Vermicularia Pseudosphæria** Tode Fungi Meckl. I, p. 31, t. VI, 6641 fig. 46 (1790).

11. **Vermicularia pubescens** Tode Fungi Meckl. I, p. 31, t. VI, f. 47 6642 (1790).

DOTHIORELLA Sacc. — Syll. III p. 235, X p. 229, XI p. 504, XIV p. 910, XVI p. 895, XVIII p. 288.

1. **Dothiorella aberrans** Peck, Bull. Torr. Bot. Cl. XXXIV (1907) 6643 p. 103. — Pycnidiis cæspitosis, paucis v. multis congregatis, raro solitariis, globosis v. subglobosis, erumpentibus, nigris; sporulis numerosis, late ellipsoideis v. subglobosis, e hyalino ætate leniter coloratis, $5-8 \vee 4-5$.

Hab. in ramis siccis Asiminæ trilobæ, Oberlin Ohio Amer. bor. (F. O. GROVER). — A *Dothiorella Asiminæ* pycnidiis nigris et sporulis latioribus imprimis diversa.

2. **Dothiorella Celastri** Peck, Bull. Torr. Bot. Club, XXXVI (1909) 6644
pag. 337. — Pycnidii cæspitosis, vulgo confertis, erumpentibus,
inæqualibus, subcoriaceis, subastomis, atris, intus albidis; cæspi-
tibus 0,5-1 mm. latis; sporulis late ellipsoideis v. subglobosis, hya-
linis v. subhyalinis, 5-8 \times 4-5.

Hab. in ramis emortuis *Celastri scandentis*, Riverside
Illinois Amer. bor. (E. T. et S. A. HARPER).

3. **Dothiorella Tiliæ** Sacc., Annal. Mycol. VIII, (1910) p. 344. — Stro- 6645
matibus gregariis, elevato-pulvinatis, erumpentibus epidermide ar-
recta cinctis, fusco-nigricantibus 1-2 mm. diam., intus fuscis; py-
cnidiis in quoque stromate 6-10 globulosis, plus minus prominulis,
non papillatis; sporulis oblongis, curvulis, utrinque rotundatis,
11-15 \times 4-4,2, hyalinis; sporophoris brevissimis, 4-6 \times 2, parum di-
stinctis.

Hab. in ramis corticatis subemortuis *Tiliæ americanæ*,
Lyndonville, New York, Amer. bor. (C. E. FAIRMAN). — A *Rabenhorstiæ* et *Dothiorellæ* speciebus bene distincta. — Sporulæ eru-
ctatæ massulas albidas formant.

4. **Dothiorella Caseariæ** Speg., Mycet. Argent. V p. 359, in An. 6646
Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; stromati-
bus tuberculiformibus, verruculosis, innato-erumpentibus epiphyllis
atris, subcarbonaceis, 400-600 μ . diam.; loculis subimmersis sub-
globosis albo-farctis, astomis, 150-200 μ . diam.; sporulis ellipsoideis
utrinque obtusissime rotundatis 28-32 \times 14-18, primo sporophoro
15-20 \times 5-8, e cylindraceo subconoideo concolore appendiculatis
dein ecaudatis, levibus, hyalinis.

Hab. ad folia viva *Caseariæ silvestris* in silvis prope
Puerto Leon, Misiones Amer. austr.

5. **Dothiorella tubericola** Speg., Myc. Argent. V, p. 359, in An. 6647
Mus. Nac. Buenos Aires XX (1910). — Stromatibus irregulariter
lenticularibus primo tectis dein nudis, fusco-cinerescentibus, 2-10
mm. diam., superne convexulis, sordide cinereis, rugulosis, dense
minuteque loculigeris; loculis 150-200 μ . diam., hyalino farctis;
sporophoris rectis v. leniter flexuosis, 20-25 \times 5-6, apice quan-
doque sporula ellipsoidea utrinque rotundata 34-35 \times 18, nubilosofarcta
coronatis, quandoque paraphyse geminatas simplices v.
bifidas sustinentibus.

Hab. ad tubera emorta *Corytholoma* cujusdam ad truncos
arborum in silvis Misiones Reip. Argent. America austr.

6. **Dothiorella Daniellæ** Pat. et Har., Bull. Soc. Myc. Fr. XXIV (1908) 6648

pag. 15. — Erumpens; stromate transversim disposito, 5-10 mm. long., 1-2 mm. lato, ruguloso; pycnidiis immersis, ovatis, apice perforatis, subglobosis, intus albidis, 250-800 μ . circ. diam., farctis; sporulis numerosissimis, ovoideis, utrinque rotundatis, hyalinis, simplicibus, 16-20 \times 10-12; sporulis linearibus suffultis.

Hab. in cortice Daniellæ sp., Casamance, Bignonia-Fogny (A. CHEVALIER).

7. **Dothiorella divergens** Peck, New York St. Mus. Bull. n. 139 (1909) 6649
p. 22. — Cæspitibus pycnidiorum 1-3 mm. latis, stromate nigro insidentibus, suborbicularibus v. ellipsoideis, erumpentibus, epidermide rupta circumdatis; peritheciis irregularibus, inæqualibus, submembranaceis, atris, intus pallidis; sporulis oblongis, obtusis, rectis v. leviter curvulis, aliquando uninucleatis, hyalinis, raro viridescentibus seu flavescentibus, 20-30 \times 8-10.

Hab. in ramis emortuis Piri Mali, Menandes Albany co. Amer. bor. — A *Doth. Mali* et *D. pyrenophora* sporulis latioribus diversa.

8. **Dothiorella Piri** Aderh. in Arb. Biol. Anstalt f. Land. u. Forstwirtschaft IV (1905) p. 462, fig. — 3. Stromatibus binis trinis aggregatis et pustulam discoideam epidermide tectam erumpentem formantibus; sporophoris subulatis rectis, 10 \times 2-3; sporulis continua, hyalinis, ellipticis v. ovatis, leniter attenuatis, guttulis 1 v. pluribus præditis, 11-15 \times 7-8 $\frac{1}{2}$, in cirros sordide albidos in sicco ceraceos expulsis.

Hab. ad ramum Piri communis, Proskau Silesiæ.

9. **Dothiorella Betulæ** (Preuss) Saccardo, Not. Myc. VI, Ann. Myc. v. III (1905) p. 512 — Syll. fung. III, p. 236 — *Sphaeria conglobata* Sanguinetti in Herb. Instituti bot. romani, nec Fr. — Stromatibus transverse erumpentibus, oblongo-lanceolatis, peridermio laciniato cinctis, 2 mm. long., vix 1 mm. lat., superficie, ob ostiola prominula, colliculosis, nigris; pycnidiis immersis, globoso-ovoideis, monostichis, 150 μ . diam., intus albis; sporulis oblongo-fusoideis, utrinque acutulis, rectis, 20 \times 6, intus nubilosis, hyalinis; sporophoris bacillaribus, 16-22 \times 1,5, hyalinis.

Hab. in cortice Betulæ albæ in Horto botanico romano (P. SANGUINETTI). — *Sphaerocista Betulæ* Preuss, etsi breviter descripta, eadem species mihi videtur.

10. **Dothiorella Oxycedri** Maire, Bull. Soc. Bot. Fr. LIV (1907) 6652
p. CLXXXVIII. — Conceptaculis botryose congestis, in stromate nigro insidentibus, atro-brunneis, epidermide lacerata cinctis, ostio-

lo epapillato pertusis, 120-150 μ . diam.; sporulis numerosissimis minutis, hyalinis, levibus, oblongis v. cylindraceis, 2-3 \approx 1.

Hab. in galbulis putrescentibus *Juniperi Oxycedri* inter Terni et Sebdou Africæ bor. — Ob sporulas minutas a ceteris speciebus præcipue dignositur.

11. **Dothiorella Pirottiana** Sacc. et Trav. in Saccardo, Not. Myc., Ann. 6653 Myc. v. III (1905) p. 513. — *D. pityophila* Bres. et Sacc. in Malp., (1897) p. 310 (in *Junipero*), nec Sacc. et Penz. in Mich. et in Sacc. Syll. III, pag. 238 (in *Pino*). — *Melanomma obtusum* stat. pycn. Comes Reliq. micol. Notarisiæ, no. 126 (1883). — Stomatibus dense sparsis, mox erumpentibus et subsuperficialibus, depresso-depressis, disciformibus, demum subcupuliformibus, basi leviter coarctatis, nigris, opacis, rugosis, $1/2$ -1 mm. diam., intus dilute olivaceis vel albicantibus; loculis in quoque stromate sat copiosis (12-16), irregularibus, saepe angulosis, 100-200 μ . diam., e stromatis superficie non v. parum emergentibus; sporophoris stipatis, breviusculis, 10-12 \approx 2-3, hyalinis; sporulis cylindraceis, utrinque attenuatis, rectiusculis, obscure biguttulatis, hyalinis (coacervatis dilutissime olivaceis) 7-10 \approx 2- $2\frac{1}{2}$.

Hab. ad ramulos corticatos *Juniperi nanæ*, Riva Valsesia Ital. bor. (CARESTIA in herb. DE NOTARIS et SACCARDO). — Species a *D. Juniperi* (Fr.) Sacc. plurimis notis distincta. A *D. pityophila* typica, cui affinis, mox distinguitur stomatibus minoribus, disciformibus, saepe leviter cupulatis, basi plerumque nonnihil coarctatis; loculis multo minus prominentibus. Certe ad *Melanomma obtusum* minime pertinet; potius videtur status pycnidicus Discomycetis cujusdam.

12. **Dothiorella pseudodiblasta** Ferdin. et Winge, Videnssk. Meddel. 6654 fra den naturh. Foren. Kiobenhavn (1908) p. 144, tab. IV, fig. 4. — Stomatibus caulinis, numerosis, 1-2 (raro 3) mm. long., 0.5-1 mm. lat. oblongis, pulvinatis, structura pseudoparenchymatica nec non sclerotioidea, coriaceis, circum fasciculos vasculares orientibus, epidermidem versus crescentibus, eamque postremo longitrorum rumpentibus, pustulas brunneas formantibus; pycnidii in summo stromate insidentibus, nunc semiimmersis, nunc basi modo insculptis et botryoideo-coacervatis, inter fasciculos fibrosos epidermicos seriatim ordinatis, 100-150 μ . diam., forma varia, subglobosis v. ellipsoideo-ovoideis, ostiolo subconice protracto instructis; sporulis oblongo-fusoideis, utrinque acutiusculæ

rotundatis, plasmate constanter bipartito pseudodiblastis, saepius vacuolatis, $14-16 \approx 3-3\frac{3}{4}$ hyalinis; sporophoris tenuibus curtis.

Hab. ad caules vivos *Scleria* sp. in insula St. Jan Indiæ occid. (F. BOERGESEN) — Species prima *Dothiorellæ* in planta monocotyledonea observata, matricem valde infestans.

13. **Dothiorella parasitica** Bubák, Ann. Mycol. VII. (1909) p. 61. 6655

— Pycnidiis in stromatibus vetustis *Cytosporæ* parasiticis, globoso-ovoideis ellipsoideis v. elongatis, quandoque irregularibus, nigris, $100-250 \mu$. cr. saepe confluendo e latere compressis, contextu extus atro-brunneo intus pallidiori parenchymatico instrutis; sporulis $2-3 \approx 1$ bacillaribus, rectis v. curvulis hyalinis, coacer-vatis fumoso-chlorinatis, guttulis binis polaribus oleosis praeditis; sporophoris filiformibus, $10-15 \mu$. long. hyalinis.

Hab. in pycnidiis vetustis *Cytosporæ* sp. in cortice Piri Malh « Hoie Wark » prope Wien, Austria.

14. **Dothiorella inversa** (Fr.) v. Höhn. Sibzb. k Ak. d. Wiss. Wien 6656

CXV, Abt. 1 (1906) p. 28. Ita vocanda *Sphaeria inversa* Fr. S. M. II p. 414. — Pycnidiis ternis v. paucis, globoso-ovoideis, nigris, apice leviter umbilicatis, satis firmis sed madore molliusculis, cæspitulos erumpentes formantibus; sporulis breviter baculiformibus, rectis, $2-4 \approx 1$, hyalinis, sporophoris ramulosis, fasciculatis, $30-50 \mu$. longis suffultis.

Hab. in ramis *Alni incanæ* etc. in Suecia, Britannia, Germania, socia *Tymanide alnea*, cuius est pycnidium.

PLACOSPHÆRIA Sacc. — Syll. III p. 244, X p. 234, XI p. 506, XIV p. 911, XVI p. 898, XVIII p. 291. (*)

1. **Placosphaeria Tiliæ** Bubák, Beitr. Pilzfl. Ung. in Növénytani Közlemények (1907) fasc. 4, Extr. p. 30. — Maculis utrinque visilibus rotundato-sinuatis v. subellipticis, brunneis, medio are-scendo flavo-coriaceis, margine ex obscure brunneo fere nigro 3-6 mm. lato; pycnidiis epiphyllis, subepidermicis, depressis saepe sub-trigonis, $100-160 \mu$ latis, unilocularibus v. indistincte plurilocularibus, contextu parenchymatico obscure brunneo, ostiolo lato rotundo; sporulis elongatis v. fusoideis, $4-7$ (raro usque ad 9) $\approx 2-2,5$, rectis v. quandoque curvulis v. inæquilateris, hyalinis, in massa

(*) *Placosphaeria Pampaninii* Bacc. in N. Giorn. Bot. ital. nuova ser. XI (1904) p. 420, t. IV, f. 4-5 est *Strigula elegans* (Fée) Müll. Arg. (lichen).

roseolis; sporophoris e conoideo subpiriformibus, 5-10 μ . long., hyalinis.

Hab. in foliis vivis Tiliæ parvifoliae, Csernata, prope Herculesfürdö Hungariæ. — *Habitus Phyllostictæ* ob stroma sæpe uniloculare.

2. **Placosphaeria pustuliformis** R. Maire ad interim, Ann. Mycol. VI 6658 (1908) p. 151, fig. 7. — Amphigena; stromatibus orbicularibus, 0,5-1 mm. diam., in maculis flavescentibus solitariis vel gregariis, sæpius totam folii crassitudinem occupantibus, paucilocularibus, ad ostiola tantum nigris; sporophoris cylindraceis, simplicibus, circ. 20-25 \times 3 μ ; sporulis fusiformibus, hyalinis, levibus, 1-pluriguttulatis, 30-42 \times 5-6, utrinque obtusis vel acutatis.

Hab. in foliis Lauraceæ cujusdam (Ocoteæ?) prope San Paulo Brasiliæ.

3. **Placosphaeria? Tiglii** P. Henn., Hedwigia XLVII (1908) p. 263. 6659 — Maculis amphidymis rotundatis, bullatis, fuscis, stromatibus fuscis rotundatis, rugulosis, sporulis bacillaribus, hyalinis, 4-5 \times 0,5.

Hab. in foliis Crotonis Tiglii, in ins. Balabac Philippin. (MANGUBAT).

4. **Placosphaeria Merrilli** P. Henn., Hedwigia XLVII (1908), p. 263. 6660 — Maculis rotundatis v. effusis, flavo-fuscidulis; stromatibus amphidymis, gregariis sæpe confluentibus angulato-rotundatis, planiusculis, atris, loculis immersis; sporulis bacillaribus, hyalinis 5-6 \times 0,5.

Hab. in foliis Derridis in insula Palmas ex Philippin. (MERRILL).

5. **Placosphaeria Derridis** P. Henn., in Fl. du Bas- et Moy. Congo, Ann. Mus. du Congo, v. II, fasc. II (1907) p. 101. 6661 — Maculis rotundatis, amphigenis, pallidis, exaridis, margine brunneo cinctis; stromatibus hypophyllis sparsis v. aggregatis, rotundatis, planis, atris, 150-180 μ . cr. loculis immersis rotundatis; sporulis ellipsoideis v. ovoideis, 2-guttulatis, hyalinis, 10-12 \times 4-4,5.

Hab. in foliis Leguminosæ arboreæ verisimiliter Derridis sp., Sonso, Congo (VANDERYST).

6. **Placosphaeria Missionum** Spieg., Myc. Argent. V p. 325, in An. Mus. Nac. Buenos Aires XX (1910). 6662 — Stromatibus innatis suborbicularibus, 1-2 mm. diam., tenuibus planiusculis, utrinque manifestis, determinatis, atris, centro minute bullosis; loculis innatis lenticularibus irregulariter dehiscentibus albo-farctis; sporulis an-

guste ellipsoideis v. lenissime clavulatis cum sporophoro deciduis 16-18 \approx 6, per ætantem ecaudatis.

Hab. ad folia viva Lauraceæ cujusdam, Puerto Leon Misiones Argentina Aîner. austr.

7. **Placosphæria Epilobii** Bres. apud Jaap, Ann. Myc. III (1905) 6663 p. 400. — Sporulis ovoideo-elongatis, 6-9 \approx 3-4, biguttulatis.

Hab. in caulis emortuis putrescentibus Epilobii angustifolii prope Warnemünde Mecklenburg Germania.

8. **Placosphæria Rhododendri** P. Henn. Engl. Jahrb. XXXVII (1905) 6664 p. 163. — Stromatibus epiphyllis, sparsis, innato-superficialibus, rotundatis, atris, verrucoso-rugulosis, usque ad 5 mm. diam.; loculis immersis; sporophoris filiformibus, hyalinis, continuis, 2-2,5 \approx 1-1,5.

Hab. in foliis vivis Rhododendri, Mt. Juare prov. Tosa Japoniæ (YOSHINAGA).

9. **Placosphæria Valerianæ-montanæ** Magn. in Vestergr. Microm. sel. 6665 n. 674 (1903) et Pilze Tirols, p. 586 (1905) (sine diagnosi).

Hab. in foliis Valerianæ montanæ in Tiroli austriaco et pr. San Martino di Castrozza Agr. Tridentini (MAGNUS). — Ab affini *Pl. rhytismae* Allesch. dignoscitur imprimis stromatibus magis oblongatis.

10. **Placosphæria Viburni** P. Henn. Engl. Jahrb. XXXVII (1905) p. 6666 163. — Stromatibus innato-superficialibus epiphyllis, explanatis, rotundatis, atris, subcarbonaceis, usque ad 1,5 cm. diam., verrucoso-rugulosis, loculis immersis, globulosis; sporophoris filiformibus, hyalinis, 15-30 \approx 1,5-2; sporulis subfalcatis, acutiusculis, hyalinis, continuis, 20-30 \approx 2-3.

Hab. in foliis vivis Viburni dilatati, Mt. Pakao prov. Musashi Japoniæ (MIYAKE).

11. **Placosphæria Ulmi** P. Henn. Engl. Jahrb. XXXVII (1905) p. 6667 163. — Maculis flavido-fuscidulis, rotundato-angulatis v. effusis; stromatibus epiphyllis, innato-superficialibus, rotundato-angulatis v. radiantibus, atro-crustaceis, verrucoso-rugulosis, 2-5 mm. diam. sæpe confluentibus; sporophoris hyalinis breve filiformibus; sporulis oblonge ellipsoideis v. fusoides, hyalinis, 3,5-5 \approx 1-1,5.

Hab. in foliis Ulmi parvifoliæ, Tokyo, prov. Tosa, Wakayama Japonia (NAMBU YOSHINAGA, NAKANISHIKI). — Verisimiliter status pycnidicus *Phyllachoræ Ulmi*.

12. **Placosphæria Junci** Bubák, Ann. Mycol. IV (1906) p. 113, cum 6668 icon. — Stromatibus sparsis, ø rotundato elongatis, $\frac{1}{4}$ -1 mm. long.

$\frac{1}{4}$ - $\frac{1}{2}$ mm. latis, immersis, epidermide tectis, nigris, loculis numerosis indistinctis præditis, convexis, contextu parenchymatico, brunneo-fuligineo; sporulis globosis v. globoso-ovoideis, 2-2,5 μ . cr. hyalinis; sporophoris rectis v. curvulis, basim versus subin-crassatis, quandoque obclavatis, 15-25 μ . long. infra 2,4 circ. cr., hyalinis.

Hab. parasitice in caulis bracteisque *Junci filiformis* inter Borkovic et Veseli Bohemia.

13. **Placosphæria Isachnes** P. Henn., Engl. Jahrb. XXXVII (1905) 6669 p. 163. — Stromatibus innato-superficialibus, sparsis v. gregariis, rotundatis v. oblongis, angulatis, interdum confluentibus, atris, usque ad 1 mm. longis, 0,5 mm. latis; loculis immersis, oblonge rotundatis; sporulis fusoideis, rectis v. curvulis, continuis, 20-25 \approx 3,5-4, hyalinis.

Hab. in foliis *Isachnes australis*, Wakayama Japoniæ (NA-KANISHIKI). — A *Pl. graminis* sporulis angustioribus diversa.

14. **Placosphæria Massariæ** Sacc., Ann. Myc. III (1905) p. 506. — 6670 Stomatibus pulvinatis, vix 1 mm. latis, nigris, subcoriaceis, intus inæqualiter plurilocularibus, loculis parciорibus majoribus et forma irregularibus; sporulis oblongis, curvulis, utrinque obtusulis, hyalinis, 12-15 \approx 4-5; sporophoris fasciculatis acicularibus, 25 \approx 1,5-2, hyalinis.

Hab. in ostiolis *Massariæ Curreyi* ad ramos *Tiliae* in viridario publico, Parma Ital.bor. — Species eximia et vere peculiaris ob parasitismum in *Pyrenomyctes*. Status ascophorus est *Plowrightia Massariæ* (Pass.) Sacc.

15. **Placosphæria Beckeræ** P. Henn., in Fl. du Bas- et Moy. Congo, 6671 Ann. Mus. du Congo v. II, fasc. II, (1907) p. 101. — Maculis oblongis confluentibus, flavo-fuscis; stromatibus hypophyllis oblongo-striiformibus confluentibusque, atris plurilocularibus; sporulis cylindraceis v. oblongis, obtusis, hyalinis, 2-2,5 \approx 0,5.

Hab. in foliis Beckeræ sp., Kisantu Congo Africa.

16. **Placosphæria punctiformis** (Fuck.) C. Mass. et Sacc., Annales 6672 Myc. VI (1908) p. 555. — Ita vocanda *Phyllachora punctiformis* Fuck. — Syll. II, p. 615.

METHYSTEROSTOMELLA Spæg., Myc. Argent. V, p. 396, in Ann. Mus. Nac. Buenos Aires XX (1910) (Etym. metà post et *Hysterostromella*, cuius est pycnidium) — Stromata scutato-dimidiata, atra, centro ostiolis rimosis undique versis dehiscentia; sporulæ

subellipsoideæ continuæ hyalinæ. — Est *Hysterostomellæ* status pycnidicus.

1. **Methysterostomella argentinensis** Spieg., l. c. p. 396. — Maculis 6673 nullis; stromatibus saepius epiphyllis, tenuissimis, orbicularibus, 1-3 mm. diam., arcte matrici adnatis, centro subpapillulosis minute denseque rimulosis, ambitu levibus integris, margine vix repandulis, subopace parenchymaticis; sporulis ovatis v. ellipsoideis saepius grosse biguttulatis, hyalinis, 5-7 \times 4-5, substantia mucosa immersis.

Hab. ad folia viva Lauraceæ cujusdam in silvis prope Puerto Leon Misiones Argentina, Amer. austr.

CYCLODOMUS v. Höhn. Fragm. z. Mykol. IX (1909) p. 67 (Etym. *cyclos* circulus et *doma* domus seu loculus). — Stromata coriaceo-carbonacea, parva, rotundata, epidermide innata, disco tantum prominentia, unilocularia, loculo anuliformi circum columellam centralem disposito, disco erumpenti aperta; sporophora brevia monospora; sporulae cylindraceæ, uniloculares, hyalinæ; contextu parenchymatico.

1. **Cyclodomus Umbellulariæ** v. Höhn. l. c. p. 68 — Stromatibus 6674 præcipue epiphyllis, sine maculis, dense gregariis, nigris, nitidulis siccis rugulosis, epidermide innatis, plerumque subhemisphærico-discoideis, infra applanatis, 100-250 μ . diam., 90-100 μ . cr., disco 60 μ . circ. lato; loculo 65-70 \times 48, columella 50-80 μ . cr. sporulis 14-24 \times 2-3.

Hab. in foliis præcipue emortuis Umbellulariæ californicæ (Lauraceæ) prope Clairmont California (C. F. BAKER).

BOTHRODISCUS Shear, Bull. Torr. Bot. Cl. XXXIV (1907) p. 312. (Etym. *bothros* cavitas et *discus*). — Stroma nigrum, discoideum, coriaceum v. subcorneum, substipitatum, primo membrana coriacea tectum, pluriloculare; sporulae elongatae, hyalinæ v. pallide citrinæ, continuæ. — Genus *Fuckeliae* affine sed stromate tunicato differt.

1. **Bothrodiscus pinicola** Shear l. c. p. 313. — Stromate obscuro, obconico, substipitato, disco nigro, areolato, 0,5-1 mm. diam., primum membrana (peridio?) coriacea tenui tecto, dein dilacerato; pycnidiis regularibus, plurimis, 100 \times 75; sporulis hyalinis v. in massa pallide viridi-flavidis, clavato-cylindraceis, plus v. minus curvulis, multiguttulatis, continuis, 32-42 \times 5-6.

Hab. in ramis Pini virginianæ, Takoma Park Amer. bor.

EPHELIOPSIS P. Henn., Hedwigia XLVII (1908) p. 270. (Etym.

Ephelis, quam in memoriam revocat.). — Stromata crustacea, atra, effusa; pycnidia subcarbonacea atra, subconoidea, pertusa, stromate inserta; sporulæ cylindracea curvulae, continuæ, hyalino-fuscidulae.

1. **Epheliopsis Turneræ** P. Henn., l. c. p. 270. — Stromatibus longe 6676 effusis ramulos circumdantibus, atro-crustaceis, rugulosis, rimosis; pycnidiis gregariis v. sparsis, subcarbonaceis v. coriaceis, atris, pulvinatis v. subconoideis, rugulosis, 200 μ . c. cr., perforatis; sporulis, cylindraceis, utrinque obtusis, curvulis, hyalino-fuscidulis 5-11 \times 2-3.

Hab. in ramulis vivis Piriquetæ Duarteanae, Turneræ surinamensis et T. leptospermæ, Remanso, Bahia, Brasilia (ULE).

ASCOCHYTOPSIS P. Henn., Engl. Jahrb. XXXVIII (1905) p. 117.

(Etym. *Ascochyta*, cuius est analogum genus). — Stromata superficialia. subcarbonacea, atra, 1-paucilocularia; sporulæ falcatae, pluriguttulatae, hyalinæ. — Generibus *Ascochytæ*, *Septorellæ*, *Septodothideopsidi* et *Septosporiellæ* affinis, sed videtur satis distincta.

1. **Ascochytopsis Vignæ** P. Henn., Engl. Jahrb. XXXVIII (1905) p. 6677 117. — Maculis fuscidulis v. obsoletis; stromatibus epiphyllis superficialibus, gregariis, saepè nervos sequentibus, punctiformibus, subglobosis, subcarbonaceis, rugulosis, atris, 1-paucilocularibus, c. 170-180 μ . diam.; sporulis falcatis, utrinque acutis, pluriguttulatis, hyalinis, 12-22 \times 2,5-3.

Hab. in foliis Vignæ (? vexillatae), Usambara orient. Afr. (ZIMMERMANN).

FUSICOCCUM Corda. — Syll. III p. 247, X p. 329, XI p. 507, XIV p. 913, XVI p. 899, XVIII p. 293.

1. **Fusicoccum Pseudacaciæ** Ranojevic et Bubák, Ann. Mycol. VIII, 6678 (1910) p. 385, fig. 24-26. — Stromatibus crebre distributis, in periderma immersis et erumpentibus, rotundatis, applanatis, elongatis, prominentibus, nigris, usque ad 1,25 mm. diam., plerumque confluentibus; pycnidii in stromate immersis, supra liberis, globoso-applanatis, rotundatis, plurilocularibus, ostiolo papilliformi apertis, usque ad 500 μ . diam., contextu flavo-brunneo crasso præditis; sporulis unilocularibus elongatis, ovoideis, piriformibus, ellipsoideis, utrinque rotundatis, rectis, inaequilateris, leniter con-

tortis, contentu granuloso, plerumque 1-2-guttulatis, 23-32 vel usque ad 38 \approx 11,5-17, hyalinis; sporophoris cylindraceis, subfuscoides, 1-3-cellularibus, 9-24 μ . long.

Hab. in ramis siccis Robiniae Pseudacaciæ prope Belgrado, Serbia.

2. **Fusicoccum microsporum** Potebnia, Myc. Stud. in Ann. Myc. V, 6679 (1907) p. 15, Trav. Soc. Nat. Univ. Kharkov XXXIII, (1907). — Stromate ut in *Fus. complanato*; sporulis in loculis dense confertis, 5-7 \approx 2,5, hyalinis.

Hab. in ramis siccis Piri Mali prope Kursk. — *Fus. complanato* proximum; an ejus status immaturus?

3. **Fusicoccum Pruni** Potebnia, Myc. St., in Ann. Myc. V (1907) 6680 p. 15, fig. 29 et Trav. Soc. Nat. Univ. Kharhov XXXIII (1907). — Stromate nigro usque ad 1 mm. cr.; sporulis 23-29 \approx 5-9, irregularibus, variabilibus, hyalinis, grosse nucleatis, sporophoris 20-25 μ . long.

Hab. in ramis siccis Pruni domesticæ pr. Kursk Rossiae.

4. **Fusicoccum Amygdali** Delacroix Bull. trim. Soc. Myc. de France 6681 vol. XXI (1905) p. 280, fig. IV. — Maculis albidis, irregularibus, mox depressis, saepius longitudinaliter sed interdum pariter transverse rimosis; stromate variabili; pycnidiiis subepidermicis et epidermide erupta saepe superficialibus, uni- vel saepius plurilocellatis, dimensione variantibus, transverse compressis latioribusque, usque ad 275 μ . lat. et 50 μ . alt. poro unico latiore, irregulari; sporulis irregularibus, ovatis v. subpiriformibus, interdum ad basim acutatis, hyalinis, protoplasmate granulis guttulisve carente, 5-7,25 \approx 2,5-3; sporophoris brevioribus, 5 μ . cir. long. acicularibus.

Hab. in ramis adhuc vivis Amygdali communis, prope Berre Bouches-du-Rhône Gallia.

5. **Fusicoccum viticola** Reddik, Cornell Univ. Agric. Exp. Sta. Bull. 6682 263, (1909) p. 323 c. icon. (Diagnosis desideratur).

Hab. in ramis Vitis, cui necrosim affert, in America bor.

6. **Fusicoccum Macarangæ** v. Höhnel Fragm. z. Mykol., Sitzb. K. 6683 Ak. d. Wiss. Wien. Bd. CXVI Abt. I (1907) p. 144. — Stromatibus erumpenti-superficialibus, nigris, supra rugulosis, depressionis, 400-500 μ . alt. $\frac{1}{4}$ -1 mm. latis, subglobosis v. elongatis, quandoque irregulariter linearibus et usque ad 3. mm. long.; contextu extus carbonaceo, intus carnoso e cellulis 10-16 μ . cr. tenuiter tunicatis constituto; habitu dothideaceo, loculis numerosis, plerumque stratum simplicem efformantibus, elongato-ovoideis, parietibus

tenuibus indefinitis inter se divisis, 60-100 μ . latis; sporulis hyalinis, rotundato-ovoideis, crasse tunicatis, unilocularibus 10-22 \approx 10-14, contentu granuloso; sporophoris simplicibus hyalinis, 12-14 \approx 2-3.

Hab. in cortice Macarangæ Reinecke i ex Euphorbiaceis, Upolu prope Apia in Ins. Samoa (RECHINGER).

7. **Fusicoccum Kesslerianum** Rick Ann. Mycol. VI (1908) p. 107. — 6684
Stromate nigro 2-3 mm. lato, erumpente, coacervato, parasitico in pustulis hemisphaericis matricis; pycnidiiis 2-4 mm. latis uni vel plurilocularibus, polystiche ligno immersis; sporulis ellipsoideis v. subirregularibus, hyalinis, continuis, 20-30 \approx 13, sporophoris suffultis.

Hab. in ramis Compositæ arborescentis intumescentiam producens et in formam candelabri contrahens. Rami infecti resinam abundantissime segregant, pr. Novam Petropolin Brasiliæ.

8. **Fusicoccum Elasticæ** Koord., Bot. Untersuch. Java (1907) p. 208 6685
f. 27. — Stromatibus pulvinatis, sparsis v. laxè gregariis, subcutaneis vix erumpentibus, atris, intus plurilocellatis, pallidioribus; sporulis fusoideis, utrinque obtusis v. rotundatis, continuis, hyalinis, rectis v. subrectis, 25-35 \approx 5-6; sporophoris cylindraceis, hyalinis 7-12 μ . longis; paraphysibus destitutis.

Hab. in cortice Fici elasticæ prope Loano prov. Kedu Java, majo 1906 (KOORDERS).

9. **Fusicoccum perniciosum** Briosi et Farneti, Atti R. Ist. bot. Pavia 6686
ser. II, v. XIII (1909), vol. XIV, pag. 50; Riv. Pat. veg. III.
(1911) p. 341. — Stromatibus sparsis, majusculis, innato-erumpentibus, depresso-pulvinatis, verruculosis, fuligineis, plurilocularibus; sporulis oblongo-fusoideis, hyalinis, continuis, utrinque obtusiusculis, intus granuloso-multiguttulatis, 56-66 \approx 11-13; sporophoris acicularibus, dimidio brevioribus.

Hab. in cortice Castaneæ parasiticum, morbum «Moria dei Castagni» vel «Male dell'Inchiostro» test. auctoribus, provocans in Etruria, Liguria, Pedemontio. — Socia sunt: *Coryneum perniciosum* et *Melanconis perniciosa*.

10. **Fusicoccum betulinum** Laubert, Arb. K. biol. Anst. f. Land- u. Forstwirtsch. V (1906) p. 208, fig. 3. — Stromate pulvinato 0,4-0,8 mm. lato 0,3-0,4 mm. alto, ehyalino, griseo-viridi, subepidermico-erumpenti, primum grosse et depresso uniloculari dein biloculari; sporophoris filiformibus, hyalinis apice clavulatis, 20-30 \approx 0,5-1,5; sporulis unilocularibus, elongatis, hyalinis uni- v. biguttulatis, 7-11 \approx 2,5-3,5.

Hab. in ramo corticato languido Betulæ, Kreis Jerichow, prov. Saxonia Germaniæ. — Verisimiliter pathogenum et morbum dictum «Einschnürungskrankheit» efficiens.

11. **Fusicoccum operculatum** Bubák, Ann. Mycol. IV (1906) p. 114. 6688

— Stromate epiphylo, depresso subconoideo, nigro, pluriloculari, pustuliformi erumpenti, contextu brunneo-olivaceo, 150–200 μ . cr.; sporulis ovoideis v. ellipsoideis 6-7,5 μ . long. apice rotundato-angustatis, pluriguttulatis; sporophoris brevibus, crassis, hyalinis.

Hab. in foliis emortuis Abietis pectinatae prope Tábor Bohemia.

12. **Fusicoccum Mac-Alpini** Sacc. Annal Mycol. VIII (1910) p. 344. 6689

— Stromatibus minutis phyllogenis, hypophyllis, laxe gregariis, brunneo-rufescentibus in areis leviter dealbatis nascentibus, globoso-depressis, subcutaneo-erumpentibus, 180-230 μ . diam., hyphulis filiformibus, hyalinis, variis, 1 μ . cr. cinctis, intus minute plurilocellatis, locellis subrotundis; sporulis oblongis, curvulis, apice rotundatis, basi vix acutatis, 10-12 \approx 3, hyalinis, coacer-vatis chlorinis; sporophoris paliformibus, 10 \approx 3, stipatis.

Hab. in foliis adhuc vivis Quercus coccinea in Australia merid. (MAC ALPINE). — Habitu folii-maculicola et minutie a typo generis recedit et cum *Fusicocco coronato* Karst. genus distinctum (*Leptococcum*) constituere posset.

CYTOSPORELLA Sacc. — Syll. III p. 251, X p. 242, XI p. 507, XIV p. 913, XVI p. 900, XVIII p. 294.

1. **Cytosporella Tiliæ** Bubák, Ann. Mycol. IV (1906) p. 115. — 6690
Pycnidiis irregularibus, nigris, epidermide lacerata cinctis, 1-8-lo-cularibus, levibus nitidulis; loculis singulis 90-250 μ . cr., plerumque globosis, sæpe confluentibus, contextu crasso, brunneo, parenchymatico; sporulis minutis, bacilliformibus, 3-4 \approx 1,5, rectis, apice rotundatis, minute biguttulatis, hyalinis; sporophoris cylindraceis, rectis, 6-10 μ . long., tenuibus, numerosis.

Hab. in ramis emortuis Tiliæ parvifoliae prope Tábor Bohemia. — Socia *Rabenhorstia Tiliæ*.

2. **Cytosporella Cinnamomi** Turconi in Atti R. Ist. bot. Pavia, (1905) 6691
XI p. 314-318, tab. XXII fig. 1-3. — Maculis arescendo dealbatis, fusco-marginatis, rotundis v. irregularibus, sinuosus, marginalibus, 5-15 mm. latis; stromatibus innatis, demum innato-erumpentibus, intus inæqualiter plurilocularibus, loculis globosis, 100-200 μ . diam.; sporulis ovoideo-ellipsoideis, guttulatis, hyalinis,

4-6,5 \approx 2-2,5; sporophoris cylindraceis, dense stipatis, 15-17 \approx 1,5-2, hyalinis suffultis.

Hab. in foliis *Cinnamomi Burmanni* culti in horto botanico, Pavia Italiæ borealis.

3. ***Cytospora laurea*** Roll., Bull. Soc. Myc. Fr. XXI, (1905) pag. 6692
 31. — Pustulis irregularibus, subseriatis, nigris, corticolis, epidermidem inflatam rima longitudinali plerumque lacerantibus; stromatibus griseis, numerosos loculos stipatos, ovoideos, minimos foveantibus; sporulis copiosissimis, ellipsoideis, 3-4 \approx 1-2, hyalinis, sporophoris longissimis, usque ad 30 \approx 2, totam superficiem internam pycnidiorum vestientibus.

Hab. in ramis *Lauri nobilis*, San Salles, in Ins. Balearibus.

4. ***Cytospora Kermesi*** Speg., Myc. Argent., V, p. 357, in Anal. Mus. Nac. Buenos Aires XX (1910). — Stromatibus hinc inde laxe gregariis ambitu difformibus 2-5 mm. diam., atris, carbonaceis per corticem erumpentibus monostichis, plurilocularibus; sporulis ellipsoideis crasse tunicatis nubilosus, 30 \approx 18, sporophoris ovoideis (10-15 \approx 10), apice rostro longiusculo simplici v. saepius bifido (5-10 \approx 1,5-2) monosporo donatis.

Hab. ad ramos dejectos putrescentes *Tecomæ?* cujusdam in silvis pr. Formosa, Chaco, in Rep. Argent. Amer. aust. (E. KERMES).

5. ***Cytospora damnosa*** Petri, Ann. Myc. V. (1907) p. 329, tab. 6694 VIII. — Stromatibus irregularibus, parce evolutis, diu immersis nigris, minutissimis, 0,3-0,4 mm. diam., irregulariter locellatis; loculis distinctis, plus minus stipatis, ovatis vel subangulatis, 50-70 \approx 75-125; sporulis globosis vel ovatis, initio hyalinis, demum pallide fuligineis, 1,5-2,5 diam. vel 2,5 \approx 1,5-2; sporophoris pallide fuligineis, cylindraceis, apice truncatis, rarius furcatis, 6,5-9 μ . longis.

Hab. in cortice ramorum *Pini* prope Gaeta Ital. austr. — A *Cytospora alpina* stromatibus immersis, sporulis majoribus omnino distincta.

CYTOSPORA Ehrenb. — Syll. III p. 252, X p. 243, XI p. 508, XIV p. 914, XVI p. 902, XVIII p. 297.

1. ***Cytospora Cydoniæ*** Schulzer. v. Mügg. in Verh. zool-bot. Ges. Wien, (1871) p. 1239, t. XIII, fig. 19. — Stromatibus tenuibus pustulatis, subcutaneis, nunc minutis, nunc latius extensis irregulariter multilocellatis, infra luteolis, extus nigricantibus; nucleo subglaucō; sporophoris dense stipatis, bacillaribus, subinde fur-

catis, sporulâ multo longioribus; sporulis breviter tereti-oblongis, rectiusculis copiosissimis, 6 μ . long.

Hab. in ramis corticatis emortuis *Cydoniae vulgaris* in Hungaria.

2. **Cytospora Tulipiferae** Diedicke, Ann. Mycol. IV (1906) p. 414. — 6696
Stromatibus in cortice pustulatim elevato insidentibus, conoideis, plurilocularibus, 1 mm. circ. diam. et ultra; loculis infra circa nucleus centralem nigrum dispositis et versus ostium confluentibus; sporophoris plures furcatis v. subverticillatis, 20-26 \approx 1-2; sporulis curvulis, 5-6 \approx 1.

Hab. in ramis emortuis *Liriodendri Tulipiferae* prope Halle, Germania (A. SCHROETER).

3. **Cytospora Actinidiæ** Syd., Mycoth. germ. n. 519, Ann. Mycol. IV (1906) p. 485. — 6697
Stromatibus sparsis, minutis, epidermide elevata arcte tectis et tantum disco minutissimo tandem erumpentibus, atris, plurilocularibus, intus griseo-olivaceis; sporulis allantoideis, rectis vel curvulis, hyalinis, 4-5 \approx 1- $1\frac{1}{2}$.

Hab. in ramis *Actinidiæ argutæ*, Rixdorf pr. Berlinum (SYDOW).

4. **Cytospora Pteleæ** Hollós, Növényt. Közlemén. VI (1907) Extr. p. 6698
4. — Stromatibus conico-truncatis, disco ex albido cinereo et papilla minutissima, atra, centrali, pertusa instructis, multilocularibus; sporulis cylindraceis, curvulis, hyalinis, 5-6 \approx 1-1,5; sporophoris filiformibus, tenuissimis, simplicibus, 14-16 μ . longis.

Hab. in ramis siccis *Pteleæ trifoliatae*, Nagy-Körös Hungariæ.

5. **Cytospora candida** Speg., Myc. Argent. V, p. 357, cum icon., in An. Mus. Nac. Buenos Aires XX (1910). — 6699
Stromatibus per peridermum transverse fissum vix protrudentibus, 1-2 mm. long. 0,3-0,5 mm. lat. superne applanatulis margine obtusulis pruinuloso-puberulis, ostiolis impressis fuscidulis notatis, subcarnosulis, loculis subglobosis ostiolatis 100-150 μ . diam.; sporophoris bacilaribus, 15 \approx 1, constipatis, monosporis; sporulis cylindraceis utrinque rotundatis, 4-6 \approx 1, leniter curvulis, eguttulatis hyalinis.

Hab. ad corticem truncorum ramorumque emortuorum *Persicæ vulgaris* in hortis, Escobar prope Buenos Aires Riep. Argentinæ, Amer. austr.

6. **Cytospora eutypelloides** Sacc., Ann. Myc. VIII (1909) p. 344. 6700
— Stromatibus laxe gregariis, subcutaneo-erumpentibus, prominulosis, eutypelliformibus, atris, pulvinatis, 1-2 mm. latis, 20-30-

locularibus, loculis globoso-angulosis, variis, intus atro-griseolis, ostiolis prominulis, obtusulis, confertis, integris, nitidulis, discum planiusculum formantibus; sporulis minimis, allantoideis, $4 \approx 0,5$ hyalinis; sporophoris bacillaribus, simplicibus v. furcatis, $11-14 \approx 1,5-2$, hyalinis.

Hab. in ramis corticatis emortuis Pruni Armeniacæ in hortis cultæ, Lyndonville, N. Y., Amer bor., (C. E. FAIRMAN). — *Habitus Eutypellæ*, hinc diversa a *Cyt. rubescente*. Prob. *Eutypellæ* speciei st. pycnidicus.

7. **Cytospora Beaufortiæ** Da Camara, Bol. Soc. Broteriana XXV, 6701 (1910) Extr. p. 15. — Epiphylla; stromatibus innato-erumpentibus, 3-4-loculatis; loculis convergentibus, compressis, subconoideis, nucleo pallide fuligineo, ostiolo minuto; sporulis allantoideis, hyalinis, continuis, utrinque rotundatis, biguttulatis, $5-6 \approx 2$; sporophoris subcylindraceis, hyalinis, plus minusve rectis, simplicibus, usque ad 12μ . long.

Hab. in foliis Beaufortiæ sparsæ, in horto botanico Coimbra Lusitaniæ (A. MOLLER).

8. **Cytospora Seselis** Moesz, Gomb. Budap. I, (1909) p. 20 (Bot. 6702 Közlem.) — Stromatibus laxe gregariis, depressis, 1 mm. c. long., 0,5 mm. latis, erumpentibus disco nigro, cinereo, plurilocularibus, loculis irregulariter dispositis; sporulis allantoideis, $6-7 \approx 1,5$, hyalinis; sporophoris ramosis, 22μ . long.

Hab. in caulis siccis Seselis glauci prope Budaspet Hungariæ.

9. **Cytospora Peylii** Rabenhorst in Peyl, Lotos VII, (1857) p. 28, 6703 fig. 6. — Stromatibus subcutaneis, gregariis, subinde confluentibus, molliusculis, nigricantibus, conicis, dein vix erumpentibus, intus irregulariter 1-pluriloculatis pallidioribus; sporulis allantoideis, curvulis, in cirros filiformes, tortuosos, flavidos exeuntibus.

Hab. in cortice languido Lagenariae vulgaris, Kacin Bohemiae — An potius *Gloeosporii* species?

10. **Cytospora Dahliæ** Peyl, Lotos VII, (1857) p. 67, t. II, fig. 11. 6704 — Stromatibus laxe gregariis, subcutaneis, conicis, prominulis, nigricantibus, intus inæqualiter pluriloculatis; loculis quinis v. pluribus albidis, sæpe angulosis; sporulis anguste fusoideis, curvatis, utrinque acutissimis, hyalinis, in cirros filiformes pallide flavos, varie curvatos exeuntibus.

Hab. in caulis Dahliæ sp. in calidario cultæ, hieme, Kacin Bohemiae (PEYL).

11. **Cytospora Sambuci** Diedicke, Ann. Mycol IV, (1906) p. 414. — 6705
 Stromatibus gregariis in maculis dealbatis elongatis insidentibus, depressis, ore late conoideo prominentibus, usque ad 1 mm. diam.; loculis in parte inferiori circa nucleum centralem nigrum insidentibus; sporophoris filiformibus, simplicibus, usque ad 25 μ . long., sporulis botuliformibus, 5-6,5 \approx 1,5-2.
Hab. in ramis emortuis Sambuci nigræ, Delitzsch Thuringia.
12. **Cytospora Smithiæ** Sacc. et Trott. — *Cytospora Sambuci* A. L. 6706
 Smith., Trans. Brit. Mycol. Soc. III (1910) p. 222, non Diedicke. — Stromatibus minutis immersis basi planis in ostiolum conicum singulum sursum convergentibus, 1-plurilocularibus, parietibus loculorum sporophoris 25 μ . long. simplicibus tenuibus dense tectis; sporulis copiosis, minutis, hyalinis, continuis, cylindricis, 5 \approx 1.
Hab. in cortice ramorum Sambuci nigræ, tumores minutos rotundos atros generans, Derbyshire, Britaniæ. — An diversa a præcedente? —
13. **Cytospora exigua** Saccardo, Not. Myc. VI in Ann. Mycol. III 6707
 (1905) p. 513. — Amphigena, pusilla; stromatibus subglobosis, immersis, subunilocularibus, 150 μ . diam., disco punctiformi initio albido, dein nigricanti, epidermide arcte cincto; sporulis allantoideis, minutis, curvulis, hyalinis, 4-5 \approx 1; sporophoris fasciculatis bacillaribus, 30-40 \approx 1, simplicibus v. arrecto-furcatis, hyalinis.
Hab. in foliis languidis Oleæ europææ cultæ, Montello (Treviso) Ital. bor. — A ceteris speciebus oleicolis satis diversa.
14. **Cytospora Syringæ** Sacc. — Syll. III, p. 272 — var. **brevipes** Potebnia, Myc. Stud., Ann. Myc. v. V, (1907) p. 15, Trav. Soc. Nat. Univ. Kharkov XXXIII (1907). — A typo differt sporophoris brevioribus, 10 μ . long., et loculis radiatim dispositis.
Hab. in ramis siccis Syringæ vulgaris pr. Kharkov Rossiæ.
15. **Cytospora Forsythiæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6709
 p. 342. — Stromatibus epidermide fissa tectis, globosis, nigris, magnis, pluricellularibus; sporulis cylindraceis, curvulis, allantoideis, continuis, hyalinis, 7-8 \approx 1,5; sporophoris filiformibus, 20-25 μ . long.
Hab. in ramis siccis Forsythiæ suspensæ, Nagy-Körös Hungariæ.
16. **Cytospora caracolensis** Spég., Fungi Chilenses (1910) p. 153, 6710

cum icon. — Pycnidiis hypodermicis in caulis nigrefactis orientibus, circinantibus, pellucidis e carneo succineis, piriformibus, 300-600 \approx 250-300 ostiolis conniventibus fuscidulis; sporulis botuliformibus, utrinque obtusatis, plus minusve incurvatis, 5-6 \approx 1-1,25, hyalinis.

Hab. in caulis siccis subputrescentibus *Verbasci virgati*, Cerro Caracol de Concepción, Chile Amer austr.

17. **Cytospora Lycii** Diedicke, Ann. Mycol. IV (1906) p. 414. — 6711
 Stromatibus sparsis circa ramulum dispositis, epidermide tectis
 dein ostiolo prominentibus; loculis numerosis proportione angustis,
 parietibus crassiusculis obscure brunneis limitatis, supra in
 ostiolum unicum irregulariter confluentibus; sporophoris filiformi-
 bus, indivisis v. ramosis, circ. 25 μ . long.; sporulis minutis, rec-
 tis v. curvulis, 2-3 \approx 1.

Hab. in ramis emortuis *Lycii barbary*, Wendelstein a. U.
 Thüringia.

18. **Cytospora Myricæ-Gales** Bres., in Jaap, Verh. Bot. Ver. Prov. Brand L (1908) p. 46. — 6712
 Stromatibus gregariis, corticolis, obtuse conoideis, basi circ. 1 mm. diam., intus pallidis, disco applanato albo; sporulis allantoideis, curvulis, hyalinis, 4-5 \approx 1,2-1,5; sporophoris ramosis, 2 μ . circ. cr.

Hab. in ramulis siccis Myricæ Gales, prope Hamburg Germania. — Socia est *Cytospora sororia* Bres.

19. **Cytospora sororia** Bres. in Jaap, Verh. Bot., Ver. Prov. Brand L (1908) p. 46. — 6713
Cytospora Myricæ Jaap, Ann. Mycol., (1905) p. 400, non P. Henn. (1902). — Pycnidiis prominentibus indistincte multilocularibus; sporophoris usque ad 25 μ . long.; sporulis allantoideis, 4-7 \approx 1,5.

Hab. in ramis siccis Myricæ Gales, Rostocker Heide Mecklenburg, Germania. — Socia adest *Diaporthe valida*.

20. **Cytospora Oudemansii** Bres., Ann. Mycol. III (1905) p. 400. Ita 6714
 vocanda *C. fraxinicola* Oudem. — Syll. XVI, p. 904 — nec P. Brun. Syll. XIV, p. 916.

21. **Cytospora Loranthi** Moesz, Gomb. Budap. I, (1909) p. 20, t. II, 6715
 f. 11 a-d (Bot. Közlem.). — Stromatibus gregariis, subcutaneis, epidermidem granulato-inflantibus dein erumpentibus, e basi orbiculari, compresso-conoideis, atris, basi 0,7-0,9 mm. diam., poro in disculo unico, multicularibus, loculis plus minusve radia-
 tim ordinatis v. sine ordine stipatis, intus viridulis; sporulis al-

lantoideis, 6-8 \approx 1,5-2, hyalinis; sporophoris simplicibus, filiformibus, tenuissimis, 14-18 μ . long.

Hab. in ramis corticatis *Loranthi europæi* prope Budapest Hungariæ.

22. **Cytospora loranthicola** Sacc. et Trott. — *Cytospora Loranthi* 6716 Bres. in Strasser Verh. k. k. zool-bot. Ges. Wien LX, (1910) p. 313, non Moesz. (1909). — Stromatibus parvis, 0,25 mm., conico-truncatis, papilla in disco pallido, demum obscurato centrali singula, atra pertusis, spurie plurilocularibus, v. loculis vix distinctis; sporulis hyalinis, cylindraceo-curvulis, 6-8 \approx 1-1,5; sporophoris ramosis, 2 μ . cr. suffultis.

Hab. in ramis emortuis *Loranthi europæi*, Sonntagberg Austriæ. — An diversa a præcedente?

23. **Cytospora Broussonetiæ** Moesz, Gomb. Budap., (1909) p. 20, t. 6717 II, f. 10 a-c (Bot. Kózlem). — Stromatibus gregariis, subcutaneis, dein erumpentibus, peridermio laciniis irregulariter fissis cinctis, 0,8-1,7 mm. diam., e basi orbiculari compresso-conoideis, atris, poro in disculo unico, multicularibus, loculis radiatim ordinatis; sporulis cylindraceis, allantoideis, 4,5-7,5 \approx 1-2, plerumque 5-6 \approx 1,5 hyalinis; sporophoris ramosis, 14-22 μ . long.

Hab. in ramis corticatis *Broussonetiæ papyriferae* prope Budapest Hungariæ.

24. **Cytospora quernea** Sacc. Ann. Mycol. VI, (1908) pag. 561. — 6718 Stromatibus late gregariis, subcutaneis, discoque minuto griseo erumpentibus, 1 mm. diam. intus 4-6-loocularibus atro-cinereis; sporulis anguste allantoideis, distincte arcuatis, utrinque obtusulis, 8,5-9 \approx 1, hyalinis, eguttulatis; sporophoris dense fasciculatis, bacillaribus, 20-25 \approx 1, hyalinis.

Hab. in ramis emortuis *Quercus pedunculatae*, Biesenthal pr. Bernau Germaniæ (H. Sydow).

25. **Cytospora nigro-cincta** Trav. in Bull. n. 8 Société Flore Valdostaine, pag. 25 extr. (1912). — Pseudostromatibus in areis pallidioribus, variae magnitudinis, subcircularibus vel irregulariter ellipticis, linea nigrescente plus minusve distincta et saepe elevatula cinctis singulatim vel paucis insidentibus, subcorticalibus, pustulato-prominulis, primo tectis dein disco minuto, fuligineo-atro, centro perforato erumpentibus, conoideo-truncatis vel depresso hemisphæricis, olivaceo-fuscis, basi discoidea $\frac{1}{2}$ -2 mm. lata, 500-800 paltis, varie locellatis, plerumque vero loculo centrali uno majusculo, periphericis copiosis, multo minoribus et irregularibus;

sporophoris dense stipatis, filiformi-bacillaribus, simplicibus, furcatis vel varie verticillato-ramosis, prope basim lutescentibus, 25-35 $\approx 1 \frac{1}{2}$; sporulis copiosissimis, minutis, allantoideis, distincte curvatis, hyalinis, 4 $\frac{1}{2}$ -5 $\approx 0,7-1$.

Hab. in ramulis corticatis emortuis Alni, prope Valpelline, Valle d'Aosta, Ital. bor., alt. 950 m. — Pulcherrima species, ob pseudostromata nigro-cincta facillime dignoscenda, habitum *Diatrypellæ nigro-annulatæ* simulans. Fructificatio ascophora adhuc ignota.

26. **Cytospora melanodiscus** (Otth) v. Höhn., Sitzb. K. Ak d. Wiss. Wien CXV, Abt. I, (1906) p. 12. — Dimidiata, scutata, depressa plurilocularis, 1-1 $\frac{1}{2}$ mm. diam., disco distincto polystomo prædicta; sporophoris numerosis simplicibus, 6-12 μ . long.; sporulis hyalinis, minutis, plerumque rectis, cylindraceis, 2-3 $\approx 0,5$.

Hab. in ramis Alni, prope Steffisburg. Helvetia (OTTH). — Socia adest *Valsa melanodiscus* (Otth) ad quam verisimiliter pertinet.

27. **Cytospora Celtidis** Ell. et Ev. — Syll. XI, p. 509. — Voglino 6721 in Ann. R. Acc. d'Agricolt. Torino LI (1908) Extr. p. 25. — Stomatibus nigris lenticularibus, valsoideis, immersis, dein erumpentibus 0,5-1,5 mm. latis, multilocularibus; sporulis cylindraceis, allantoideis, hyalinis, 6-8 ≈ 2 ; sporophoris simplicibus raro ramosis 10-12 $\approx 2-3$.

Hab. in truncis *Celtidis australis*, cui valde nocet, in Amer. bor. et Nole Canavese Ital. bor.

28. **Cytospora Ostryæ** Syd., Ann. Mycol (1910) p. 492, Myc. Germ. n. 6722 920. — Stromatibus sparsis v. gregariis peridermio leniter pustulatim elevato tectis, disco minuto, nigro erumpentibus, intus atro-olivaceis, 0,5-1 mm. latis, 4-8-locularibus; sporulis allantoideis, 5-7 $\approx 1-1,5$ rectis v. leniter curvulis, hyalinis.

Hab. in ramis *Ostryæ virginianæ*, Tamsel Germaniae (P. VOGEL).

29. **Cytospora chætospora** Bres. in Strasser, III Nachtr. Pilz. Sonntagb. in Verhandl. zool. bot. Gesell. Wien, (1905) p. 616. — Stromatibus immersis verruciformibus v. conico-truncatis et erumpentibus, 0,5-0,66 mm. basi latis, plurilocularibus, loculi sine ordine dispositis, sæpe subobsoletis, pluriostiolatis, ostiolis sæpe prominulis nigris, cirro hyalino; sporulis hyalinis cylindraceis, curvulis, utrinque obtusatis, 12-14 ≈ 3 , in apice setulis filiformibus præditis, 10-15 ≈ 1 ; sporophoris 20-24 ≈ 1 .

Hab. in cortice Abietis pectinatae, Sonntagberg Austriæ inf. — Ob sporulas ciliatas potius nov. gen. et tunc spec. dicenda *Chætospora Bresadolæ* Sacc.

30. **Cytospora Curreyi** Lind, Ann. Mycol. V (1907) p. 275. — Stro- 6724 matibus crebre sparsis in cortice nidulantibus et peridermum sub- inflantibus, hemisphaericis, intus 10-12 loculis radiantibus præditis, ore papilliformi unico centrali apertis; sporophoris ramosis 14-30 μ . long.; sporulis cylindraceis, curvulis, hyalinis, 4-6 \times 1,5, in cirrum purpuraceum projectis.

Hab. ad truncos et ramos emortuos Pini Strobi, Silkeborg Jütlandia Daniæ. — Virisimiliter ad *Valsam Curreyi* spectans. Cfr. Nitschke, Pyrenomyc. germ. p. 201.

31. **Cytospora Yatay** Speg., Myc. Argent. V, p. 357, in An. Mus. 6725 Nac. Buenos Aires XX (1910). — Maculis nullis sed matrix tota sordide subnigrescens; stromatibus lenticularibus matrici immersis parum prominulis v. vix exertis, valsoideis, 0,5-1 mm. diam., atris, ostiolo communi papillato; loculis cinereis ellipticis dense constipatis, farctis; sporulis cylindraceis utrinque obtusissime rotundatis 4-5 \times 1-1,25, rectis v. curvulis, eguttulatis, hyalinis.

Hab. ad superficiem internam spathæ putrescentis Cocoës Yatay in hortis La Plata Reip. Amer. austr.

32. **Cytospora Calami** Syd. Ann. Mycol. VIII (1910) p. 41. — Stro- 6726 matibus gregariis, epidermidem pustulatim elevantibus eamque tandem rima longitudinali vel fere stellatim disrumpentibus, subglobosis vel ellipticis, $1\frac{1}{2}$ -1 mm. longis, intus atris, loculos numerosos minutos continentibus; sporulis bacillaribus, rectis vel lenissime curvulis, continuis, hyalinis, $3\frac{1}{2}$ -4 \times $3\frac{3}{4}$ -1; sporophoris dense stipatis, 10-15 μ . longis.

Hab. ad stipites Calami spec., Mont. Mariveles, prov. Bataan, Luzon, ins. Philipp. (E. D. MERRILL).

33. **Cytospora Sacchari** Butl., Mem. Dept. Agric. in India, Bot. Ser. I, (1906) p. 31, t. VIII. — Stromatibus verruciformibus, seriatim ordinatis, subcutaneo-erumpentibus, plurilocularibus, nigris, ostiolo elongato singulo rarius duobus præditis; sporulis minutissimis, cylindraceis, curvulis, utrinque obtusis, hyalinis, 3,5 \times 1-1,5; sporophoris ramosis, septatis, 12-18 μ . long.

Hab. in culmis vaginisque Sacchari officinarum, Madras, Central Provinces Indiæ orient.

34. **Cytospora lirella** Syd. Ann. Mycol. VIII (1910) p. 41. — Stro- 6728 matibus elongatis 1-6 mm. longis, $1\frac{1}{2}$ -1 mm. latis, dense seria-

tim et parallele dispositis, valde confertis et plagas atras haud interruptas plura cm. longas latasque efformantibus, carbonaceis; pycnidiis immersis, ovatis, optime secus series duas juxtapositas ordinatis; ostiolis prominulis, atris, glabris; sporulis allantoideis, leniter curvulis, $5-8 \vee 1\frac{1}{2}-2$ subhyalinis vel dilutissime brunneolis.

Hab. ad culmos emortuos Bambusæ in silva, Dumaguete Mont. Cuernos, Province of Negros oriental, Bulucaowi, in. Philipp. leg. E. D. E. ELMER. — Probabiliter ad *Eutypæ* spec. pertinet.

PLAGIORHABDUS Shear, Bull. Torr. Bot. Club XXXIV, (1907) p.

310. (Etym. *plagios* obliquus et *rhabdos* virga, sporophorum).

— Pycnidia irregulariter plurilocularia late ostiolata, stromate tenui, effuso, nigro, subcoriaceo tecta; sporulæ hyalinæ, continuæ, basi ex sporophoris oblique adhærentibus appendiculatæ.

1. **Plagiorhabdus Cratægi** Shear, l. c. p. 310. — Stromate tenui, 6729 nigro, effuso, epidermide circumdato, superficie leniter ruguloso; pycnidie parietibus crassis præditis, forma magnitudine variabilibus, immersis et crusta stromaticæ tectis; sporulis allantoideis plerumque biguttulatis, $9-12 \vee 3-4$, appendice 12-20 \vee 1.

Hab. in fructibus vetustis Cratægi punctatæ, Washington Amer. bor.

2. **Plagiorhabdus Oxycocci** Shear l. c. p. 311. — Pycnidiis sparsis, 6730 plerumque hypophyllis, irregulariter depresso globosis, immersis, 125-190 μ . diam., leniter erumpentibus; contextu pycnidii subtenui, ostiolis subprominentibus; sporulis hyalinis v. in massa tenuiter viridi-flavidis, curvulis v. allantoideis, 8-10 \vee 3, appendice basilari 10-15 \vee 0,75.

Hab. in foliis Vaccinii macrocarpi, Carver Mass. Amer. bor. (H. J. FRANKLIN).

CEUTHOSPORA Fr. — Syll. III, p. 277, X p. 250, XI p. 510, XIV p. 918, XVI p. 905, XVIII p. 301.

1. **Ceuthospora Punicæ** Bubák, Bull. Herb. Boiss. 2 ser. IV (1906) p. 6731 475. — Pycnidiis parce gregariis, globosis, nigris, subcarbonaceis, basi depressis, v. immersis, demum superficialibus; contextu parenchymatico firmo, extus nigro intus pallidiore, loculis plus vel minus distinctis; sporulis cylindraceis, 4-6 \vee 0,75-1, rectis, raro curvulis, apice rotundatis, guttulatis, hyalinis; sporophoris 6-10 \vee 1,5-2, apice angustatis, hyalinis, ramosis.

Hab. in superficie interna corticis fructuum Puniceæ Granati prope Ulcinj Montenegro.

2. **Ceuthospora? Cocculi** Spieg., Myc. Argent. V, p. 358, in An. 6732 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis v. obsoletissimis, ægre perspicuis, pallescentibus indeterminatis, 3-7 mm. diam., stromatibus epiphyllis, parenchymate innatis, epidermidem per ætatem irregulariter disrupta tectis, repando-orbicularibus, 150-250 μ . diam., tenuissimis, contextu parenchymatico olivaceo; loculis 2-4 in quoque stromate, sublenticularibus, 50-75 μ . diam.; sporulis bacillari-subfusoideis, utrinque acutato-subrotundatis, 10-20 \times 1-1,25, rectis v. leniter curvulis, hyalinis, eguttulatis.

Hab. ad folia dejecta putrescentia Cocculi laurifoliae in hortis La Plata Reip. Argentinæ Amer. austr.

3. **Ceuthospora Feurichii** Bubák, Ann. Mycol. IV (1906) p. 115. — 6733
C. foliicola Krieg. Fungi saxon. n. 1887. — Stromatibus amphigenis regulariter distributis v. sparsis, nigris, profunde immersis v. epidermide pustuliformi albicante tectis, demum poro erumpentibus, plurilocularibus; loculis singulis globosis v. irregulariter ellipsoideis, usque ad 200 μ . alt. et 150 μ . latis, contextu parenchymatico, supra castaneo-brunneo, v. flavo-brunneo; sporulis cylindraceis v. cylindraceo-fusoideis, 9-13 \times 2, basim versus plerumque angustatulis supra rotundatis; sporophoris filiformibus, dendroideo-ramosis, sporulas subæquantibus v. longioribus.

Hab. in foliis emortuis Vincæ minoris, prope Göda, Saxonia (H. G. FEURICH).

4. **Ceuthospora Phlomidis** Bubák, Bull. Herb. Boiss. 2 ser. VI (1906) 6734 p. 476. — Stromatibus sparsis depresso conoideis, usque ad 0,5 mm. latis, nigris, plurilocularibus, saepe indistincte, 200-300 μ . altis, supra depresso; contextu nigro-brunneo, parenchymatico; sporulis ex elongato breviter fusoideis, 4,5-9 \times 1,5-2,5, rectis, utrinque rotundatis v. ibique saepe v. uno apice tantum angustatis, guttulatis, hyalinis.

Hab. in caulinis siccis Phlomidis tuberosæ, prope Ulcinj Montenegro,

5. **Ceuthospora lunata** Shear, Bull. Torr. Bot. Club XXXIV (1907) 6735 p. 312. — Pyenidiis sparsis, amphigenis, discoideis, subpulvinatis, immersis, leniter erumpentibus, tectis, 200-375 μ . diam., subcoriaceis, crasse tunicatis, intus irregulariter plurilocularibus, ostiolis prominentibus præditis; sporophoris subramosis, ramulis bre-

vibus; sporulis subhyalinis v. in massa pallide viridi-flavidis, inæquilateralibus v. sublunatis, 7-9 \approx 3-3,5.

Hab. in foliis dejectis Vaccinii macrocarpi, N. Jers. et Mass. Amer. bor. — Sporulae illis *Phomæ cytosporeæ* similes. — A typo generis satis recedit.

6. **Ceuthospora atra** Lind, Ann. Mycol. V (1907) p. 276. — Stro- 6736 matibus sparsis, lenticularibus, immersis, nigro-piceis, irregularibus, 15-20-locularibus, et totidem ostiolis præditis; contextu parenchymatico brunneo 75 μ . cr., parietibus loculorum 15 μ . cr. subhyalinis; sporophoris ramosis, hyalinis, 25 \approx 2; sporulis rectis, utrinque obtusis, 15-16 \approx 2-3, hyalinis.

Hab. in foliis siccis Fagi silvaticæ, Silkeborg Jütlandia Daniæ.

7. **Ceuthospora melaleuca** Ferdinand. et Winge, Bot. Tidsskr. XXVIII, 6737 (1907) p. 254, fig. 4. — Stromatibus epiphyllis, subepidermalibus, cubico-conicis, 2-6 locularibus, poro singulo, 300-375 μ . diam., substrato innatis, pustulas inferne atras, superne albidas formantibus; sporulis bacillaribus, hyalinis, 11-15 \approx 3.

Hab. in foliis dejectis Gingkonis bilobæ, in horto bot. Hafniensi Daniæ.

8. **Ceuthospora Lycopodii** Lind, Ann. Myc. v. III (1905) p. 429, 6738 cum icon. — Stromatibus epiphyllis, plurilocularibus, obtuse conoides, nigris, ostiolo concolori subprominentibus; sporulis cylindraceis, rectis, stipitatis, hyalinis, unilocularibus, utrinque obtusis, 20 \approx 3.

Hab. in foliis emortuis Lycopodii annotini, Wiborg Jütland Sueciæ.

9. **Ceuthospora Ellisii** Sacc. et Trott. — Ita dicetur *Ceuthospora abietina* Ellis (1904). — Syll. XVIII, p. 302 - quæ videtur satis diversa ab homonyma et anteriore *Ceuth. abietina* Delacroix - Syll. X, p. 250.

ENDOTHIELLA Sacc. Not. Myc. VII, Ann. Myc. IV (1906) p. 273.

(Etym. ab *Endothia*, cuius est pycnidium et quam habitu imitatur). — Stroma corticale innato-superficiale, pulvinatum, nunc discretum, nunc statui ascophoro impositum, læte coloratum (aurantiacum v. rubrum) tenuè suberosum, friabile (nec carnosum) intus inæqualiter pluri-loellatum, ostiola (ubi manifesta) obtusa et interdum umbilicata. Sporulae oblongæ, minutissimæ, continuæ, hyalinæ, sporophoris filiformibus ramoso-dendroideis suffultæ. —

Adest quandoque forma epixyla stromatibus deminutis, immo saepius in pycnidia discreta, globoso-conica, subrostellata solutis.

1. **Endothiella gyrosa** Sacc. l. c. p. 273. — Stromatibus corticolis 6740 dense gregariis, subconfluentibus, rubris v. rubro-aurantiis, intus flavis, pulvinatis; lignicolis omnino superficialibus deminutis et saepius in pycnidia solitaria v. parce connata solutis; pycnidiis globulosis, 0,2-0,3 mm. diam., modo obtusis, modo conico-subrostellatis, poro latiuscule aperto; sporulis oblongis, curvulis, hyalinis, eguttatis, 3 ~ 1; sporophoris filiformibus, irregulariter denodoideo-ramosis, 40-55 ~ 1, intermixtis nonnullis subindivisis.

Hab. in cortice et ligno nondum putrescentibus *Quercus*, *Carpini*, *Castaneæ*, *Æsculi* etc. plerumque socio statu ascophoro (*Endothia gyrosa* *) in Europa et America bor. Formam epixylam pulcre rostellatam, *Sphaeronæmellæ* æmulam, in *Quercu* ex Alba Pedemontii communicavit cl. prof. T. FERRARIS.

Sect. 2. Phæosporæ.

CONIOTHYRIUM Corda — Syll. III p. 305, X p. 261, XI p. 514, XIV p. 922, XVI p. 909, 1155, XVIII p. 302.

1. **Coniothyrium Hellebori** Cooke et Mass., Sacc. Syll. X (1908) p. 6741 261. — var. **Hellebori-viridis** C. Mass., Osserv. fitol. in Madonna Verona v. II, (1908) Extr. p. 10. — Maculis subovalibus 2-3 cent. latis, fuliginosis, dein pallescentibus, concentrice rugulosis; pycnidiis epiphyllis punctiformibus nigris, prominulis; sporulis e subgloboso ovoideis 5-6 ~ 3-4.

Hab. in foliis *Hellebori viridis*, prope Cogolo, Verona Italæ bor.

*) Præeuntibus ill. TULASNE et FUCKEL, nomen *Endothiæ gyrosæ* in Sylloge recepi, sed ex autopsia speciminum originalium Schweinitzii (testibus auctor. americanis) evincitur speciem nostram cum *Sphaeria radicali* Schw. perfecte collidere, non vero cum *Sphaeria gyrosa* Schw., quæ heterogenea v. dubia manet. Qua de re nostra rectius *Endothia radicalis* (Schw.) De Not. dicenda est. — Quod ad *Diaporthem parasiticam* Murr. (= *Endothia parasitica* (Murr.) Anders.) attinet, hæc quam maxime accedit ad *End. radicalem*, sed quia vere parasitica (et pathogena!) et quia omnibus partibus nonnihil (etsi per paullulo) sit major, distinguenda videtur. Diceretur forma ob parasitismum exaltata *Endothiæ radicalis!* Cfr. supra p. 890 et E. PANTANELLI in *Rend. Acc. Linc.* 1912 p. 869, ubi vexata quæstioclare exponitur.

2. **Coniothyrium Magnoliæ** (West.) Sacc. et Trav. Syll. XIX p. 400. 6742
 — *Monoplodia Magnoliæ* West, in Bull. Acad. roy. Belg., ser. 2,
 VII (1859) p. 21, tab. f. 19 (extr.) — Pycnidiis sparsis, nigris,
 immersis, prominulis, papillatis; sporulis globulosis, 6,6 μ . diam.,
 copiosissimis demum exeuntibus et matricem nigro-inquinantibus.
Hab. in foliis Magnoliæ grandifloræ in Belgio (CL. DUMONT). — Genus *Monoplodia* West. (1859) revera ab auctore non
 definitum, congruit cum *Coniothyrio* Corda (1840) anteriore.
3. **Coniothyrium Lesquerellæ** J. Lind, Micromycetes from North-East 6743
 Groenlandia, Kiobenhavn (1910) p. 161. — Pycnidiis sparsis, e
 globoso lenticularibus, subcutaneis, vix erumpentibus, tenuibus,
 membranaceis, atris, majusculis, c. 350 μ . diam., ostiolo vix pro-
 minente pertusis; sporulis ut plurimum perfecte globosis, atro-
 fuscis, eguttulatis, 7-10 μ . diam.
Hab. in ramis emortuis Lesquerellæ (Vesicariæ) arctice,
 Harefjeld Groenlandia.
4. **Coniothyrium Hyperici** P. Henn., Verh. Bot. Ver. Prov. Brandb. 6744
 XLVII (1905) p. 221. — Peritheciis erumpentibus atris, lenti-
 culari-rotundatis, perforatis, cellulosis, 100-150 μ . cr.; sporulis
 ellipsoideis v. subglobosis, fuligineis, continuis, 3-3,5 \approx 2-2,5.
Hab. in caulis siccis Hyperici perforati, Hellmühle
 Germaniæ. — Socia adsunt *Diploceras hypericinum* (Ces.) et *Pho-*
ma Hyperici-perforati P. Henn.
5. **Coniothyrium melanconieum** Sacc. Ann. Mycol. III (1909) p. 436. 6745
 — Pycnidiis gregariis v. subsparsis, epidermide velatis, lenticulari-
 depressis, 200 μ . diam., nigricantibus, ostiolo circulari impresso
 pertusis; contextu tenuissimo, pallide olivaceo, obsolete celluloso;
 sporulis obovatis, 6-8 \approx 4, apice obtusioribus, minute pluriguttu-
 latis, olivaceo-fuligineis; sporophoribus inconspicuis.
Hab. in ramulis languidis v. emortuis Ribis Grossulariæ
 pr. Tamsel Germaniæ (P. VOGEL). — Tam ob pycnidia nigra
 trans epidermidem conspicua, quam ob sporulas atras species ha-
 bitum Melanconii ostendit. A *Conioth.* *Ribis* prasertim pycnidiis
 valde applanatis dignoscitur.
6. **Coniothyrium Tamaricis** P. Henn. in Kabát et Bubák Fungi imp. 6746
 exs. n. 458 (1907). — Pycnidiis sparse vel gregarie erumpenti-
 bus, subglobosis vel sublenticularibus, atris, 90-120 μ . diam.;
 sporulis ellipticis vel ovoideis, 5-8 \approx 3 $\frac{1}{2}$ -4 $\frac{1}{2}$ μ ., hyalino-flave-
 scensibus, continuis.

Hab. in ramis *Tamaricis gallicæ* in horto bot. Dahlem Germaniæ.

7. **Coniothyrium Silenes** Bondarzew, Acta Horti Petropol. XXVI, 6747 (1906) p. 43 (extr.). — Maculis rotundatis, pallidis, marginatis; pycnidiis epiphyllis globoso-lenticularibus, sparsis, innatis, brunneolis v. atris; sporulis piriformibus, 12-15 \times 4-5,5, continuis, hyalinis, 1-2-guttulatis; sporophoris breviter cylindraceis.

Hab. in foliis vivis *Silenes nutantis* in ditione Kursk Rossiae.

8. **Coniothyrium tumefaciens** Güssow, Journ. Roy. Hort. Soc. XXIV, 6748 (1908) p. 229. — Masse Dis. cult. Plants, (1910) p. 417. — Pycnidiis nigricanti-brunneis, sparsis; sporulis subolivaceis, ellipsoideis, 5-7 \times 3-4; sporophoris longis, simpliicibus v. ramosis.

Hab. in caulis vivis Rubi fruticosi, quibus excrescentias a pisi ad nucis magnitudinem efficit, in Britannia.

9. **Coniothyrium piricola** Potebnia, Myc. St. in Ann. Myc. v. V 6749 (1907) p. 16 et Trav. Soc. Nat. Univ. Kharkov, XXXIII (1907). — Pycnidiis epiphyllis, pallide brunneis, atro-nucleatis, globulosis, 70-140 μ . cr. apice ostiolatis; sporulis 5-6 \times 2,5-3, pallide brunneis in cirrum expulsis.

Hab. in foliis vivis Piri Mali, socia *Phyllosticta Briardi* Kursk Rossiae

10. **Coniothyrium Armeniacæ** Hollós, Ann. Mus. Nat. Hung. IV, 6750 (1906) p. 355, tab. VIII, fig. 7. — Pycnidiis gregariis, superficialibus, depresso-globosis, brunneis, opacis, 140-160 μ . diam.; sporulis ellipsoideis, continuis, flavidobrunneis, plerumque in uno latere applanatis, centralibus crasse guttatis, 8-10 \times 5,5.

Hab. in putamine putrescente *Armeniacæ vulgaris*, socio *Perisporio funiculato* cuius videtur status pycnidicus, Kecskemét Hungariæ.

11. **Coniothyrium Persicæ** Sacc. et Cub. in Sacc. Ann. Mycol. X 6751 (1912) p. 318. — Pycnidiis sparsis minutissimis, subsuperficialibus, nigris, 90-100 μ . diam., poro exiguo pertusis; contextu minute celluloso, fuligineo; sporulis subsessilibus, ellipsoideis, 9-10 \times 5, e latere leviter depressis, dilute brunneis.

Hab. in superficie interiore putaminum dejectorum *Persicæ vulgaris*, Conegliano, Ital. bor. (G. CUBONI). — E subgenere *Epithyrium*.

12. **Coniothyrium microporoides** (Schulz.) Sacc. et Trav. Syll. XIX p. 6752 400. — *Phoma microporoides* Schulz. v. Mügg. in Verh. zool.-bot.

Ges. Wien (1871) p. 1218, t. 13, f. 1. — Pycnidiis subcutaneis, prominentibus, demum ostiolo subpapillato erumpentibus, globulosis, nigris, 300-1000 μ . diam.; sporulis atro-brunneis, ovato-oblongis, 6-8 μ . longis, nucleatis; sporophoribus bacillaribus subinde ramulosis, sporulâ multo longioribus.

Hab. in ramis corticatis *Cydoniæ vulgaris* in Hungaria.

13. **Coniothyrium proteus** (Schuz.) Sacc. et Trav. Syll. XIX, p. 400. 6753
— *Myxosporium proteus* Schulz. v. Mügg. in Verh. zool-bot. Ges. Wien (1871) p. 1222, t. 13, f. 3 a-e (non f-g). — Pycnidiis gregariis, subinde paucis contiguis, subcutaneo-erumpentibus, globoso-conoideis, atris, 270-600 μ . diam., intus albidis; sporulis brunneis ovoideis v. ovato-oblongis, 3-5 μ . longis, sporophoribus (?) filiformibus multo longioribus suffultis.

Hab. in ramis corticatis *Cydoniæ vulgaris* in Hungaria.

— In fig. f-g habetur forma pycnidio carens, quæ certe heterogenea.

14. **Coniothyrium Cystotricha** (Schulz.) Sacc. et Trav. — Syll. XIX, 6754
p. 398. — *Sacidium Cystotricha* Schulz. v. Mügg., in Verhandl. zool.-bot. Ges. Wien (1871) p. 254, t. 13, f. 35. — Pycnidiis e basi applanata conoideis, papillatis, superficialibus, nigris, 500-600 μ . diam., subcarbonaceis, intus albido-griseis, basi hyphulis brunneis ramulosis, septatis cinctis; sporulis ovato-oblongis, 5-6 μ . longis, brunneis.

Hab. in ramis decorticatis emortuis *Cydoniæ vulgaris* in Hungaria. — Ob pycnidia superficialia subgeneri *Epithyrio* adscribendum.

15. **Coniothyrium papillatum** (Schulz.) Sacc. et Trav. — Syll. XIX, 6755
pag. 400 — *Clisosporium papillatum* Schulz. v. Mügg., in Verh. zool.-bot. Ges. Wien (1871) p. 1225, t. 13, f. 5. — Pycnidiis gregariis, superficialibus, globosis v. centro parum depresso, eximie obtuse papillatis, 450-600 μ . diam., rugulosis, atro-brunneis; contextu crassiusculo intus albo-celluloso; sporulis subsessilibus, ovato-oblongis, nucleatis, 6-7 μ . longis.

Hab. in ramis jam statu viventi decorticatis in Hungaria. —

Ob pycnidia superficialia ad subg. *Epithyrium* referenda species.

16. **Coniothyrium Lathyri** Potebnia, Myc. St. in Annal. Myc. X (1907) 6756
p. 16, Trav. Soc. Nat. Univ. Kharkov XXXIII (1907). — Pycnidiis 70-85 μ . long.; sporulis 5-5,5 \approx 3,5.

Hab. in stipulis *Lathyri pisiformis* prope Kursk Rossiæ.

17. **Coniothyrium olivaceum** Bon. — Syll. III, p. 305 — var. Gy- 6757

mnocladi Hollós, Növényt., Közlemén. (1907) VI, Extr. p. 6. — — Sporulis ovoideis, continuis, fuscis, eguttulatis, 6-7 \approx 4-5.

Hab. in ramis siccis, dejectis *Gymnocladi canadensis*, Nagy-Körös Hungariæ. — var. **Kœlreuteriæ** Hollós, l. c. — Sporulis ovoideis, continuis, brunneo-olivaceis, eguttulatis, 6-8 \approx 3-4. — In ramis siccis *Kœlreuteriæ paniculatæ*, Nagy-Körös Hungariæ. — var. **Pteleæ** Hollós l. c. — Sporulis oblongo-ellipsoideis, continuis, brunneo-olivaceis, eguttulatis, 6-7 \approx 2,5-3. — In ramis siccis *Pteleæ trifoliatae*, Nagy-Körös Hungariæ.

18. **Coniothyrium fructicola** Hollós, Növényt. Közlemén. (1907) VI, 6758

Extr. p. 6. — Pycnidii epidermide tectis, gregariis, globoso-depressis, nigris, poro pertusis, 350-400 μ . diam., contextu parenchymatico; sporulis ovoideis, continuis, fuscis, uniguttulatis, plerumque biguttulatis, 6-8 \approx 5-6; massa sporularum nigra.

Hab. in fructibus dejectis *Gymnocladi canadensis*, Kecskemét Hungariæ.

19. **Coniothyrium Yerbæ** Speg., An. Mus. Nac. B. Aires t. XVII (1908) 6759

p. 135. — Matrice tota pallide cinerescente, circa pycnidia saepius pallidiore; pycnidii punctulatim prominulis 100-150 μ . diam., fuscis, epidermide velatis, circa ostiolum rotundum latiusculum parenchymaticis, nigris coriacellis, ceterum tenuissimis ægre perspicuis (an incompletis?); sporulis ellipsoideo-globosis, utrinque obtusis, 4-5 \approx 3-4, non v. grosse uniguttulatis, fusco-fumosis.

Hab. ad ramulos languidos v. arescentes *Ilicis paraguariensis* in dumetis prope Fracran Misiones in Rep. Argentina.

20. **Coniothyrium maticola** Spegazz., An. Mus. Nac. Buenos Aires 6760

t. XVII (1908) p. 135. — Maculis nullis; pycnidii laxè gregariis epidermide velatis, membranaceis, lenticularibus, 80-100 μ . diam., ostiolo minuto rotundo impresso perforatis; sporulis ellipsoideo-cylindraceis, utrinque rotundato-subtruncatis, 6-8 \approx 3-3,5, eguttulatis, levibus, olivaceis.

Hab. ad ramulos languidos *Ilicis paraguariensis* in dumetis circa San Pedro Reip. Argentinæ.

21. **Coniothyrium Mate** Speg., An. Mus. Nac. Buenos Aires t. XVII 6761

(1908) p. 135. — Matrice saepius dealbata; pycnidii subsparsis e matrice semiexertis, nigris, subconoideis, 150-200 μ . diam., carbonaceis, glabris, ostiolo valide papillato coronatis, contextu opaco indistincto; sporulis ellipsoideis, utrinque obtusiusculis, non v. grosse 1-guttulatis, 5-6 \approx 2,5-3, fuligineis.

Hab. ad truncos cariosos Ilicis paraguariensis in silvis circa San Pedro Reip. Argentinæ.

22. **Coniothyrium euphorbicola** Hollós, Ann. Mus. Nat. Hung. V (1907) 6762 pag. 464. — Pycnidiis superficialibus, dense gregariis, brunneis, demum nigris, globulosis, 300-350 μ . d., contextu parenchymatico; sporulis oblongo-ellipsoideis vel piriformibus, inferne papillatis, olivaceis, biguttulatis, 11-12 \times 6-7; sporophoris filiformibus 20-24 μ . longis.

Hab. in caulis siccis Euphorbiæ palustris prope Kecskemét Hungariæ. — A *Con. Euphorbiæ* (Roum.) et *C. silvatico* Sacc. et Malbr. satis diversa.

23. **Coniothyrium rhamnigenum** (Sacc.) Bubák, Hedwigia XLVII 6763 (1908) p. 361. Ita vocanda esset *Phyllosticta rhamnigena* — Syll. III, p. 14. — Sporulis globosis, ellipsoideis, ovoideis v. breviter cylindraceis, 4-9 \times 3-4,5, rectis v. curvulis, demum reniformibus, utrinque rotundatis, unilocularibus, brunneo-olivaceis.

Hab. in foliis emortuis Rhamni catharticae inter Jungbunzlau et Josefstal, Bohemia (KABAT).

24. **Coniothyrium Duméei** Br. et Cav., Funghi parass. n. 392 (1905), 6764 cum icon. — Pycnidiis epiphyllis, sparsis, 120 μ . diam., in mesophyllo insidentibus, ostiolis latis præditis, maculas marginales sat irregulares, brunneas efformantibus; sporulis brunneo-castaneis, continuis, ellipsoideis, utrinque obtusis, uni-biguttulatis, 6-6,5 \times 4-5,5; sporophoris nullis v. obsoletis.

Hab. in foliis vivis Rhamni Frangulae, Meaux Gallia (P. DUMÉE).

25. **Coniothyrium Saxifragæ** Rostr., Rep. second Norweg. arctic 6765 Exped. Fram (1906) p. 8. — Pycnidiis gregariis, epiphyllis, atrofuscis, hemisphæricis, opacis; sporulis oblongis, saepè medio subconstrictis, fuscis, pariete crasso, 9-10 \times 5.

Hab. in foliis Saxifragæ tricuspidatæ, Ellesmere Land, Cape Rutherford Norvegiæ.

26. **Coniothyrium Boldoæ** Speg., Fungi Chilenses (1910) p. 154. — 6766 Pycnidiis hypodermicis sparsis, sublenticularibus, 100-120 μ . diam., atris, coriacellis, minute ostiolatis; sporulis ellipsoideis v. subcylindraceis, utrinque rotundatis, 6-8 \times 2,5-4, non v. 1-2-guttulatis, fuligineis.

Hab. in ramulis siccis Boldoæ fragrantis, prope Talcahuano Chile Amer. austr.

27. **Coniothyrium Sambuci** Earle, Bull. of the New York Bot. Gard. 6767

(1904) p. 295. — Pycnidiis sparsis v. subgregariis, immersis, demum plus minusve erumpentibus, nigris, globosis, non collabescientibus, 300-350 μ . diam., contextu firmo parenchymatico, cellululis regularibus 7-10 μ . diam., ostiolo papillato; sporulis obscure fuscis, subglobosis, circ. 8 \times 7; sporophoris nullis v. inconspicuis.

Hab. in ramis emortuis decorticatis Sambuci, Snow Valley Peak, Ormsby Co. Nevada Amer. bor. (BAKER).

28. **Coniothyrium Campanulæ** Hollós, Ann. Mus. Nat. Hungar. VIII 6768 (1910) p. 7. — Pycnidiis sparsis, erumpentibus, globosis, atris, papillatis, 400-450 μ . diam.; sporulis ellipsoideis v. obovatis, continuis, olivaceis, biguttulatis, 5,5-6 \times 3-4.

Hab. in caulis siccis Campanulæ glomeratae prope Kecskemét Hungariæ.

29. **Coniothyrium valdivianum** Speg., Fungi Chilenses (1910) p. 154. 6769 — Pycnidiis laxe gregariis, primo epidermide tectis dein nudis, lenticularibus, 200-250 μ . diam., minute ostiolato-papillatis, atris, membranaceis; sporulis pusillis, ellipsoideis, ovoideis v. subglobosis, utrinque obtusis, 3-4 \times 2-2,5, pallide olivaceis.

Hab. in caulis siccis putrescentibus Digitalis purpureæ prope Ciudad de Valdivia Chile Amer. austr.

30. **Coniothyrium Viburni** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6770 p. 356. — Pycnidiis initio epidermide tectis, dein superficialibus, dense gregariis, globosis, apice brevissime papillatis, rufo-brunneis, 0,5 mm. diam.; sporulis oblongo-ellipsoideis, continuis, initio hyalinis, dein flavidulis, demum olivaceo-brunneis, eguttulatis, 6-7 \times 3-3,5 massa sporularum carbonacea.

Hab. in ramis siccis Viburni Opuli, Kecskemét Hungariæ.

31. **Coniothyrium Coptospermæ** P. Henn., in Völitzkow, Reise Ostafrika III (1908) p. 32. — Maculis effusis, pallidis, exaridis; pycnidiis erumpentibus, gregarie sparsis, epiphyllis, lenticulari-hemisphæricis, atris, perforatis, 40-60 μ ; sporulis ellipsoideis v. ovoides, 1-2-guttulatis, 5-7 \times 3-3,5, brunneo-fuscis.

Hab. in foliis Coptospermæ nigrescentis, Nossi-Bé Madagascar (J. M. HILDEBRANDT).

32. **Coniothyrium Coffeæ** P. Henn., Hedwigia XLVII (1908) p. 263. 6772 — Pycnidiis gregariis innato-erumpentibus, minutis, atris, globulosis, perforatis, c. 120-150 μ ; sporulis oblongis, utrinque obtusis, 1-2-guttulatis, brunneo-fuscis, 5-6 \times 2-2,5.

Hab. in ramulis siccis Coffeæ arabicæ, Luzon, Prov. Benguet, Kabayan ins. Philippin. (MERRILL).

33. **Coniothyrium Amphistelmæ** P. Henn., Hedwigia XLVII (1908) 6773
 p. 270. — Pycnidiis sparse gregariis, erumpentibus, minutis, punctiformibus, atris, pulvinatis, poro pertusis; sporulis ellipsoideis, utrinque obtusis, castaneis, 8-10 \approx 4-5.
Hab. in caulis siccis Amphistelmæ sp., Maracás Bahia in Brasilia.
34. **Coniothyrium baccharidicola** Speg., Myc. Argent. V p. 359, in Ann. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis vel obsoletis pallescentibusque; pycnidiis saepius epiphyllis numerosis, innato-prominulis, 80-100 μ . diam., contextu indistincto opaco, nigris, coriaceis, minute ostiolatis; sporophoris bacillaribus laxe constipatis, 5-15 \approx 1, hyalinis, monospermis, paraphysibus triplo longioribus non v. vix crassioribus parce commixtis; sporulis oblongatis, rarius ellipsoideis v. subpiriformibus, 12-13 \approx 6-7, fuligineis, levibus.
Hab. ad folia languida Baccharidis pingreæ in collinis Valcheta Patagonia Amer. austr.
35. **Coniothyrium Gmelinæ** P. Henn., Hedwigia XLVII (1908) p. 263. 6775
 — Pycnidiis subepidermico-erumpentibus, subglobosis, atris; sporulis ellipsoideis, atro-castaneis, 4-5 \approx 4.
Hab. in ramis siccis Gmelinæ villosæ in societate *Diplodiae Gmelinæ*, Mindanao, Davao ins. Philipp. (COPELAND).
36. **Coniothyrium Oroxyli** P. Henn., Hedwigia XLVII (1908) p. 263. 6776
 — Maculis effusis, pallidis v. fuscis; pycnidiis sparse gregariis, innato-erumpentibus, ellipsoideis v. globulosis, atris, cellulosis, c. 160-180 \approx 130-150; sporulis ellipsoideis v. subglobosis, 1-guttulatis, atro-fuscis, 4 \approx 2.
Hab. in capsulis putridis Oroxyli indici, Mindanao, Davao ins. Philipp. (COPELAND).
37. **Coniothyrium olivaceum** Bon. apud Fuck. — Syll. III, p. 305 — 6777
 var. **Tecomæ** Sacc., Not. Myc. VII, Ann. Myc. IV (1906) p. 276.
 — Pycnidiis innato-emergentibus globulosis, atro-nitidulis, 200 μ . diam.; sporulis ellipsoideis, dilute olivaceo-fuscis 6,5-7 \approx 4.
Hab. in ramis morientibus Tecomæ redicantis, Lyndonville New York Amer. bor. (C. E. FAIRMAN).
38. **Coniothyrium phyllogenum** Sacc. in Ann. Mycol. X (1912) p. 318 6778
 — Syll. X, p. 265 (ut var.). — Maculis epiphyllis orbiculari-angulosis, minutis, vix 2 mm. latis, non v. obscure zonatis; pycnidiis punctiformibus, epidermide diu velatis; sporulis ellipsoideis, 7-9 \approx 4-5, olivaceis, subsessilibus.

Hab. in foliis languidis Rhododendri sp. in calidariis, Romæ (D. SACCARDO).

39. **Coniothyrium Phytolaccæ** Hollós, Ann. Mus. Nat. Hungar. VII 6779 (1909) pag. 55. — Pycnidiis gregariis, erumpentibus, globulosis, nigris, nitidis, poro pertusis, 280-320 μ . diam.; sporulis numerosissimis, ellipsoideis, continuis, fuligineis, semipellucidis, biguttatis, 5-7 \approx 3-4.

Hab. in caulis siccis decorticatis Phytolaccæ decandrae prope Kecskemét Hungariæ.

40. **Coniothyrium Polygoni** Hollós, Novényt. Közlemén. IV (1907) 6780 Extr. p. 6. — Pycnidiis epidermide tectis, sparsis, sordide albo-marginatis, lenticularibus, nigris, poro pertusis, 210-280 μ . diam.; sporulis sphæricis v. ovoideis, olivaceo-brunneis 12-14 \approx 9-14.

Hab. in caulis siccis Polygoni lanigeri, Kecskemét Hungariæ.

41. **Coniothyrium Obionis** Jaap, Weit. Beitr. Pilzfl. nordfr. Ins., Schr. Naturw. Ver. f. Schlesw.-Holst. Bd. XIV, Heft 1, p. 29 (1907). — Pycnidiis gregariis, punctiformibus, nigris, primum subcorticolis, dein erumpentibus, depresso globosis, breviter ostiolato-papillatis, 150-200 μ . latis, membranaceis, contextu indistincte parenchymatico, flavidio, ostiolo rotundato obscuriore, 30 μ . circ. lato; sporulis ovoideis, ellipsoideis v. subglobosis, pallide olivaceis, 5-8 \approx 3,5-5, unilocularibus, non guttulatis.

Hab. in ramulis siccis Obionis portulcoidis prope Norddorf in ins. Amrum Frisia.

42. **Coniothyrium Humuli** Hollós, Ann. Mus. Nat. Hungar. V (1907) 6782 p. 53. — Pycnidiis epidermide tectis, gregariis, globosis, nigris, ostiolo conico perforato erumpente, 240-280 μ . diam., contextu parenchymatico; sporulis subglobosis v. ovoideis, fuscis, 8-10 \approx 5-6.

Hab. in sarmentis Humuli Lupuli prope Kecskemét Hungariæ. — A *Conioth. lupulino* Bres. differt sporulis majoribus.

43. **Coniothyrium epiphyllum** Cooke, in Rav. Fungi Amer. exsicc. 6783 n. 244 (1879) (sine diagnosi). — Pycnidiis epiphyllis sparsis, globoso-depressis innato-erumpentibus, nigris, 300 μ . diam. intus farctis, contextu fusco-fulvescente parum distincto; sporulis globosis e hyalino fuscellis 3-4 μ . diam.

Hab. in foliis languidis non maculatis Quercus Catesbeysi, Aiken, S. Carolina, in America boreali.

44. **Coniothyrium Betulæ** Laubert, Arb. k. biol. Anst. f. Land- u. Forstwirtsch. V (1906) p. 208, fig. 2. — Pycnidiis gregariis, ple-

rumque subepidermidici, erumpentibus v. superficialibus, sphæroideis, parietibus nigricantibus præditis, 0,16-0,4 mm. lat., 0,12-0,24 mm. altis, plerumque minute papillato-ostiolatis; sporophoris brevissimis subnullis; sporulis ovoideis unilocularibus, e griseo-brunneolo flavo-brunneolis, quandoque etiam subhyalinis, plerumque grosse 1-2-guttulatis, 4-5,5 \times 3-4.

Hab. in ramulis languidis Betulae, Kreis Jerichow prov. Sachsen Germania. — Verisimiliter pathogenum et morbum dictum « Einschnürungskrankheit » efficiens.

45. **Coniothyrium salicicola** Rota-Rossi G., in Atti R. Ist. bot. Parma XI (1905) pag. 307-308 e Primo Contrib. Micolog. Bergamo l. c. — Maculis parvis, irregularibus, primo fusco-ferrugineis et interdum nigro-marginatis, arescendo albis v. albo-griseis; pycnidii epiphyllis, globosis, nigris, pertusis, parvis, 90-120 μ . diam.; sporulis copiosis, ovoideis, fuligineis, continuis, 5-6,5 \times 3-3,5.

Hab. in foliis Salicis vitellinæ, Palazzago, Bergamo Italiæ borealis. — A *Con. eurotioide* colore pycnidiorum sporularumque mensuris et loco (in foliis) vere differt.

46. **Coniothyrium Hariotianum** Speg., Fungi Paulist., Rev. Mus. La Plata t. XV (1908) p. 36. — Maculis sparsis orbicularibus 5-10 mm. diam. centro cinerescentibus v. albescientibus, margine fuscis; pycnidii epidermide velata vix prominulis dense gregariis, circinatis, 60-80 μ . diam., coriacellis, contextu indistincto atro, obsolete puberulis et ostiolatis; sporulis non v. vix inaequilateralibus utrinque obtusis, 6-8 \times 4, minute biguttulatis, olivaceo-fuligineis.

Hab. ad folia languida Oncidii cujusdam, Ipiranga Moça Brasilia (USTERI).

47. **Coniothyrium bulbicola** Hollós, Ann. Mus. Nat. Hung. V (1907) pag. 464. — Pycnidii dense gregariis v. sparsis, erumpentibus, globulosis, nigris, ostiolo brevi cylindraceo, 170-210 μ . diam.; sporulis sphæroideis, nigris, 8-9,5 μ . diam.

Hab. in bulbis Muscari comosi prope Kecskemét Hungar.

48. **Coniothyrium japonicum** I. Miyake, Pilze Reispfl. Japan in Journ. College Agricult. Tokyo II (1910) pag. 256, t. XIV f. 45-46. — Pycnidii in maculis pallidis præcipue ad apicem v. marginem foliorum gregarie insidentibus, immersis, brunneis, ostiolo obscurioribus, 130-150 μ . diam.; sporulis brunneis, cylindraceis v. ellipsoideis, rectis v. curvulis, utrinque guttulatis, 6-9 \times 2-3.

Hab. in foliis Oryzae sativæ, Kagoshima Japoniæ (M. SHIRAI).

49. **Coniothyrium anomalum** I. Miyake, Pilze Reispfl. Japan in Journ. 6789

College Agricult. Tokyo, II (1910) p. 257, t. XIV, f. 49-50. — Pycnidiis ellipsoideis 100-190 μ . diam., 60-110 μ . alt., obscure brunneis, in foliis immersis, papillato-prominulis, in maculis pallidis margine nigrescentibus insidentibus; sporophoris filiformibus æquilongis 7,5-10 \times 1; sporulis viridi-brunneis, ellipsoideis, ovoideis v. fusoideis, apice obtusiusculis 6-7,5 \times 2-3, grosse uniguttulatis.

Hab. in foliis *Oryzæ sativæ*, Awaji Japonia.

50. **Coniothyrium brevisporum** I. Miyake, Pilze Reispfl. Japan in Journ. 6790

College Agricult. Tokyo II (1910) p. 256, t. XIV, f. 47-48. — Pycnidiis in foliis congregatis, immersis sed papilliformi-prominulis, maculis pallescentibus insidentibus, pseudoparenchymaticis, obscuris, ellipsoideis, 100-130 μ . diam., 90-100 μ . alt., sporophoris parvis; sporulis ellipsoideis v. ovoideis, obscuris 4-5 \times 2,3-3.

Hab. in foliis *Oryzæ sativæ*, in Japonia et China.

51. **Coniothyrium arenarium** B. R. S. in Saccardo, Not. Myc. VI, Ann. 6791

Myc. v. III (1905) p. 509. — Pycnidiis sparsis, depresso-globulosis, 300 μ . ddiam., epidermide denigrata denique irregulariter fissa velatis, emergentibusque, contextu pseudo-parenchymatico præditis, nigris, nitidulis, non v. vix papillatis; sporulis ovoideis, pallide brunneis, obsolete guttulatis, 9-12 \times 5-6; sporophoris validis sed confusis.

Hab. in culmis emortuis Ammophilæ arenariæ, Knocke pr. Heyst, Belgii (MARIA ROUSSEAU).

52. **Coniothyrium graminum** Hollós, Ann. Mus. Nat. Hung. V (1907) 6792

pag. 53. — Pycnidiis epidermide tectis, sparsis, depresso-globosis, fuscis, poro pertusis, 120-140 μ . diam., contextu parenchymatico; sporulis oblongo-ovoideis, initio hyalinis, dein flavidulis, demum fuscis, continuis, 10-14 \times 5-7.

Hab. in culmis Phlei phleoidis prope Kecskemét Hungariae. — A *Con. Oryzæ* Cav. diversum.

53. **Coniothyrium Bambusæ** Miyake et Hara, in Bot. Mag. Tokyo 6793 (1910) p. (353) [japonice].

Hab. in Bambusæ sp. in Japonia.

54. **Coniothyrium Cargillianum** (Linds.) Sacc. et Trott., *Microthelia* 6794 *Cargilliana* Linds., Lich. and Fungi Otago, p. 439, t. 31-34 (1867).

— Pycnidiis laxe gregariis, nigris, globoso-conicis papillatis, semi-immersis, ascis nullis; sporulis? subglobosis, minutis, copiosis, 3,7-6 μ . diam. continuis, brunneis.

Hab. parasitice in apotheciis Parmeliæ perforatæ prope Otago in Nova Zelandia.

55. **Coniothyrium lichenicola** Karst. — Syll. X, p. 268. — var. **Buel-** 6795
liæ von Keissler, Centralbl. f. Bakter. etc. II Abt., Bd. 27 (1910)
p. 209. — A typo differt pycnidiiis in thallo non nigrificato vi-
gentibus et sporulis angustioribus bacillaribus (non elongato-ovo-
deis v. clavatis, nec basi angustatis), 15 \approx 2,5.

Hab. in thallo Buelliæ disciformis in silva Thüringer
Wald dicta, Austria (G. LETTAU).

CONIOTHYRIOPSIS Speg., Myc. Argent. V, p. 361, in Anal. Mus. Nac.
Buenos Aires XX (1910) (Etym. *Coniothyrium*, cui affine genus).
— Pycnidia villosa, cetera *Coniothyrii*.

1. **Coniothyriopsis Hualaniæ** Speg., l. c. p. 361, cum icon. — Pycni- 6796
diis primo tectis dein erumpentibus v. denudatis subhemisphæricis
100-150 μ . diam. vix papillulatis coriacellis, subiculo parco olivaceo
vestitis, hyphis confertiusculis radiantibus et intertextis tenuiu-
sculis ramulosis septulatis olivaceis, 50-150 \approx 4 vestitis; sporulis
globosis crassiuscule tunicatis, 5-6 μ . diam., eguttulatis, levibus,
olivaceis.

Hab. ad ramulos emortuos Hualaniæ colletioidis in præ-
ruptis montanis Potrerillos prope Mendoza Reip. Argent. Amer-
icæ australis.

CONIOTHYRINA Syd., in Ann. Mycol. X (1912) p. 233, *Coniothyriella*
Speg., Myc. Arg. V, p. 361, An. Mus. Nac. Buenos Aires (1910),
non *Coniothyriella* Speg., F. Puigg. (1889) n. 439 (Etym. *Conio-
thyrium*, cui est affine genus). — Pycnidia superficialia, membra-
nacea, astoma, irregulariter dehiscentia; sporulæ globosæ fuligineæ
leves.

1. **Coniothyrina agavecola** (Speg.) Syd., l. c., *Coniothyrella agavecola* 6797
Speg., l. c. p. 360, cum icon. — Foliis infectis plagulas orbicula-
res, 3-5 mm. diam., atro-olivaceas granulosas confertas sœpeque
confluentes ostendentibus sed maculis destitutis, non v. vix palle-
scentibus; pycnidiiis cuticula insidentibus, 200 μ . diam., glabris,
atris, superne centro carbonaceis, laciniatim disruptis, ambitu mem-
branaceis grosse breviterque subprosenchymaticis, inferne tenuis-
simis, subanhistis, chlorinis; sporulis globosis, 6-8 μ . diam. cras-
siuscule tunicatis eguttulatis.

Hab. ad folia languida Agaves Salmianæ cultæ in hortis
La Plata in Rep. Argentina, Amer. austr.

FAIRMANIA Sacc., Not. Myc. VII, Ann. Myc. IV (1906) pag. 276
 (Etym. a cl. Doct. Ch. E. FAIRMAN, mycolo boreali-americano, generis inventore). — Pycnidia superficialia, globoso-papillata, membranaceo-subcarbonacea, nigra, glabra. Sporulæ semilunato-reniformes, continuæ, fuligineæ; sporophora parum evoluta. — Præcipue forma peculiari sporulæ, soleæ calcaneum exacte imitantis, ab *Epithyrio* subgenere *Coniothyrii* dignoscitur.

1. **Fairmania singularis** Sacc., l. c. p. 276. — Pycnidiis gregariis v. 6798 subsparsis, basi adnata superficialibus, globosis, nigris, nitidulis, glabris, 250-300 μ . diam., ostiolo acutiuscule papillato; contextu membranaceo-subcarbonaceo minute celluloso, fuligineo, cellulis 4-5 μ . diam.; sporulis semilunato-reniformibus, seu convexo-concavis, 5-7 μ . diam., e latere leniter compressis, 5 μ . cr., hyalinis, mox dilute fuligineis, nucleo crasso, dilutiore, rotundo, e latere compresso; sporophoris tenerrimis, 3-5 \times 1, hyalinis.

Hab. in ligno putrescente Fagi americanæ, Lyndonville New York, Amer. bor. (Ch. E. FAIRMAN).

HARKNESSIA Cooke — Syll. III p. 320, X p. 269, XI p. 515, XVIII p. 311.

1. **Harknessia aggregata** Syd., Ann. Mycol. IV (1906) pag. 344. — 6799 Pycnidiis hypophyllis, plerumque dense aggregatis, rotundatis, atris, medio irregulariter apertis, 175-225 μ . diam., pariete, ut videtur, incompleta; sporulis globosis vel ellipsoideo-globosis, continuis, fuscis, $7-10\frac{1}{2}$ μ . diam.

Hab. in foliis languidis Ceanothi velutini, Salt Lake Co. in Utah Americæ bor. (A. O. GARRETT).

SPHÆROPSIS Lév. — Syll. III p. 291, X p. 251, XI p. 511; XIV p. 919, XVI p. 905, XVIII p. 311.

1. **Sphaeropsis citricola** Mc. Alpine, Fung. Dis. Citrus p. 82, t. 18, 6800 f. 41-42 (1899). — Pycnidiis sparsis v. subgregariis, minutis, nigris, semi-erumpentibus, subglobosis, circ. 130 μ . diam.; contextu minute celluloso, pallide brunneo; sporulis ellipsoideis, 5,5-7,5 \times 4-4,5, brunneis, coacervatis atro-brunneis, tunica crassiuscula.

Hab. in foliis ramulisque Citri Limonis, Victoria, N. S. Wales, Queensland Australiæ. — Ob minutiem pycnidiorum et sporularum potius *Coniothyrium*.

2. **Sphaeropsis Dearnellii** Sacc et Trott. *Sphaeropsis Magnoliae* Ell. et 6801 Dearn. Fungi Columb. (1905) n. 2087, non Magnaghi (1902) —

Syll. XVIII, p. 313. — Pycnidiis numerosis, inæqualiter conferte seriatis, cortice nidulantibus, dein prominulo-erumpentibus, intus albidis, basi nigricantibus, 175-200 μ . diam., excipulo 16 μ . cr., apice poro 15-18 μ . diam. apertis; sporulis oblongo-ellipsoideis, 23-26 \times 9-10, brunneis; sporophoris variæ longitudinis, plerumque vero sporulam dimidiam æquantibus.

Hab. in ramis Magnoliæ acuminatæ, socia *Valsaria Magnolie*, Ontario Canada in America boreali.

3. **Sphaeropsis hippocastanea** L. Gaja, Flora micol. prov. Padova, 6802 p. 23 (1911) (sunto litogr.). — Pycnidiis sub cortice ramorum sparsis 2-3 proximatis, nigris, erumpentibus, sphæroideis, vix papillatis, poro circulari pertusis, 200-360 μ . diam.; excipulo indistincte et minute pseudoparenchymatico, atro; sporulis oblongo-ellipsoideis, levibus, intus granulosis, fuligineis, 19-22 \times 11-13; sporophoris hyalinis, cylindraceis, sporulas subæquantibus.

Hab. in ramis emortuis dejectis Æsculi Hippocastani in Horto Botanico Patavino, Ital. bor.

4. **Sphaeropsis simillima** Peck, Bull. Torr. Bot. Cl. XXXVI (1909) 6803 p. 337. — Pycnidiis minutis, 0,25-0,33 mm. latis, dense gregariis, raro cæspitosis, erumpentibus, atris; sporulis ellipsoideis v. oblongis, obtusis, 20-25 \times 10-12.

Hab. in ramis Aceris saccharini, River Forest Illinois Amer. bor. (E. T. et S. A. HARPER). — *Sph. fertili* valde affinis.

5. **Sphaeropsis Sarmientoi** Speg., Myc. Argent. V, p. 363, in Anal. 6804 Mus. Nac. Buenos Aires XX (1910). — Matrice tota cinerascente-albescente; pycnidiis parenchymate innatis epidermide velatis saepius hinc inde laxe gregariis, lenticularibus, 150-200 μ . diam., ostiolo impresso pertusis, contextu parenchymatico subindistincto fuligineo; sporophoris bacillaribus, 10 \times 2, constipatis, hyalinis, monocarpis; sporulis ellipsoideis v. obovatis utrinque obtusis 15-22 \times 8-10, subopace fuligineis non v. leniter inæquilateralibus.

Hab. ad pericarpium fructuum Bulnesiae Sarmientoi, Sierra Santa Barbara Chaco, in Rep. Argentina Amer. austr.

6. **Sphaeropsis americana** Saccardo, New Fungi New York, Journ. 6805 of Myc. v. XIII (1907) p. 47. — Pycnidiis laxe gregariis, globo-depressiusculis, peridermio pustulatim elevato tectis et denique ostiolo breviter papillato erumpentibus, 500-700 μ . diam., excipulo crassiusculo, 90-100 μ . cr., minute celluloso, atro-fuligineo, nucleo farcto subolivaceo; sporulis oblongo-ellipsoideis, 28-30 \times 9-11, rectis v. leviter inæquilateris ex ochraceo olivaceo-fuligineis, initio gra-

nulosis, dein 2-nucleatis, demum farctis, tunica hyalina crassiuscula obductis; sporophoris paliformibus, 10-15 \approx 4-5, hyalinis.

Hab. in ramis Tiliæ americanæ, Lyndonville, New York, Amer. bor. (Doc. C. E. FAIRMAN). — E subgenere *Macroploidioë*.

7. **Sphaeropsis Lyndonvillæ** Sacc., Not. Myc. VII, Ann. Myc. IV (1906) 6806 p. 275. — Pycnidiis dense gregariis, innato-erumpentibus et conspicue prominentibus, globosis, obtusis, subastomis, 0,7-0,9 mm. diam., glabris, nigris; contextu parenchymatico, rufo-fuligineo; sporulis ellipsoideo-oblongis, utrinque rotundatis, saepius curvulis, interdum ad medium lenissime constrictis, 18-20 \approx 7-9, late fuligineis, farctis, jugiter continuis (etiam in perfecta maturitate!); sporophoris bacillaribus, tenuibus, 11-13 \approx 1,5-2, facile secedentibus, hyalinis, intermixtis paraphysibus filiformibus, flexuosis, 30-35 \approx 1,5-2, hyalinis, facile evanidis.

Hab. in ramulis Hibisci syriaci culti in hortis Lyndonville, Amer. bor. (C. E. FAIRMAN). — Pulchra species; omnino distincta a *Sph. Hibisci* ob sporulas multo longiores, pycnidia non papillata etc.

8. **Sphaeropsis evonymella** Trav. et Migliardi, Flora micol. prov. Venezia, p. 13 (1911). — Pycnidiis densiuscule sparsis, prominulis, epidermide lacerata cinctis, globulosis, 200-250 μ . d., atris, poro circulare pertusis; contextu crasso, compacto, nigricante; sporulis ovoideis vel subellipsoideis, haud raro inaequilateris, fulvo-fuligineis, intus granuloso-guttulatis, 20-30 \approx 9-12; sporophoris hyalinis, cylindraceis, 18-22 \approx 4-5 fultis.

Hab. in ramulis exaridis Evonymi japonicæ, «S. Elisabetta di Lido», Venetiis, Ital. bor. — A *Sphaeropsi Evonymi* Gabotto, sporulis multo majoribus perfecte distincta species.

9. **Sphaeropsis cereicola** Speg., Myc. Argent. V, pag. 361, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; pycnidiis lenticularibus, 150-180 μ . diam., laxe gregariis, atris, coriacellis, contextu indistincto, ostiolo rotundo parvo impresso perforatis; sporophoris cylindraceis brevissimis, 10-15 \approx 2-3, dense constipatis, paraphysibus nullis; sporulis ellipsoideo-subobovatis, 24-36 \approx 11-12, levibus, eguttulatis v. obsolete biguttulatis.

Hab. ad cladodia arida Cerei triangularis, La Plata in Rep. Argentina Amer. austr.

10. **Sphaeropsis Eriobotryæ** Speg., Myc. Argent. V, p. 362, in An. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; pycnidiis amphigenis sparsis v. laxe hinc inde gregariis, primo epidermide

velatis, dein plus minusve erumpenti-exertis, globoso-depressis, 120-180 μ . diam., ostiolo imperspicuo, atris, glabris, contextu indistincto; sporulis ellipsoideis utrinque obtuse rotundatis, 18-22 \approx 12, fuligineis, levibus, eguttulatis.

Hab. ad folia putrescentia dejecta *Eriobotryæ japonicæ* in hortis Santa Catalina prope Buenos Aires in Rep. Argentina Amer. austr.

11. **Sphaeropsis Mespili** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 6810
p. 7. — Pycnidiis gregariis, erumpentibus, globulosis, atris, obtuse papillatis, c. 0,5 mm. diam.; sporulis ellipsoideis v. ovoideis, continuis, atro-olivaceis, intus granulosis et 1-2-guttatis, 24-30 \approx 12-14; sporophoribus bacillaribus, continuis, hyalinis, 16-20 μ . long.

Hab. in fructibus præmature exsiccatis sed adhuc pendulis *Mespili germanicæ*, Nagy-Körös Hungariæ.

12. **Sphaeropsis Photiniæ** Trav. et Migliardi, Fl. micol. prov. Venezia 6811
p. 13 (1911). — Pycnidiis per totam foliorum superf. dense sparsis, nunc epiphyllis, nunc hypophyllis, saepe vero amphigenis, epidemidem pustulatim sublevantibus, vix erumpentibus, globulosis, atris, 150-250 μ . diam., plerumque late pertusis, excipulo compacto, fuligineo-atro; sporulis ellipsoideo-oblongis, utrinque rotundatis, fuligineo-umbrinis, 18-24 \approx 8-12, intus minute granulosis; sporophoribus distinctis, crassiuscule cylindraceis, hyalinis, 8-10 \approx 4-5.

Hab. in foliis siccis et putrescentibus *Photiniæ serrulatæ*, Dolo, prope Venetias, Ital. bor. — Sporulæ semper continuæ, ergo species a statu juvenili *Diplodiæ Photiniae* Speg. sine dubio distincta et genuina *Sphaeropsis*.

13. **Sphaeropsis Astragali** v. Höhn., Ann. Naturhist. Hofmus. Wien, 6812
XX, Heft 4 (1905) Extr. pag. 5. — Pycnidiis erumpentibus, nigris, globosis, minute parenchymaticis et parietibus crassiusculis constitutis, opacis, 250-300 μ . cr., ostiolo indistincto; sporophoribus brevibus; sporulis cylindraceis, utrinque rotundatis, hyalinis, demum pallide griseo-brunneis, 22-28 \approx 8-10.

Hab. in foliis et spinis *Astragali* sp., in Mt. Erdschias-Dagh, 2700-2900 m. alt., Anatolia.

14. **Sphaeropsis Spartii** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 6813
p. 480. — Pycnidiis late gregariis, globosis, 200-220 μ . latis, nigris, subepidermicis, demum breviter papilliformi-erumpentibus, contextu grosse parenchymatico, obscure olivaceo-brunneo; sporulis ellipsoideis v. oblongis, 18-22 \approx 10-12, utrinque rotundatis,

castaneo-brunneis; sporophoris 4-6 μ . cr., cylindraceis; sporulas subæquantibus v. brevioribus, hyalinis.

Hab. in ramis siccis Sartii juncæi prope Ulcinj Montenegro.

15. **Sphaeropsis mimosicola** Speg., Myc. Argent. V, p. 362, in Anal. 6814

Mus. Nac. Buenos Aires XX (1910). — Matrice tota sordide infuscata; pycnidiiis cortice innatis epidermide tectis plus minusve dense gregariis sed non confluentibus, sublenticularibus, 150-180 μ . diam., minute obsoleteque papillato-ostiolatis, contextu opaco indistincto; sporulis ellipsoideo-cylindraceis, 20-24 \times 8-10, rectis v. leniter inæquilateralibus, subopacis, fuligineis, levibus, eguttulatis.

Hab. ad ramos emortuos Mimosæ polycarpæ, La Plata Argent. Amer. austr.

16. **Sphaeropsis mulinicola** Speg., Myc. Argent. V, p. 362, in Anal. 6815

Mus. Nac. Buenos Aires XX (1910). — Maculis nullis sed matrice tota albescenti-subcinerescente; pycnidiiis sparsis innatis erumpentibus subhemisphæricis minute ostiolatis, 80-100 μ . diam., atris, contextu parenchymatico olivaceo; sporulis ex ellipsoideo cylindraceis 20 \times 6, chlorinis (in speciminibus patagonicis), 14-15 \times 7-8, subopace fuligineis (in speciminibus mendozanis).

Hab. ad ramos et folia Mulini proliferi, Cracker-bay, Patagonia et Mulini spinosi pr. Mendoza, Argentina, in America australi.

17. **Sphaeropsis Salviæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6816

p. 355, tab. IX, fig. 28. — Pycnidiiis semi-immersis, globosis, nigris, apice ostiolo papillato, c. 0,5 mm. diam.; sporulis ellipsoideis, continuis, initio hyalinis, dein flavidulis, demum fuscis, olivaceis, 1-guttatis, 20-26 \times 10-12.

Hab. in caulis siccis Salviæ officinalis, Nagy-Körös Hungariæ.

18. **Sphaeropsis rumicicola** Saccardo, New Fungi New York, Journ. 6817

of Myc. v. XIII (1907) p. 47. — Pycnidiiis densiusculæ gregariis, subcutaneo-erumpentibus et dein subsuperficialibus, globoso-conoides, atris, membranaceis, 1-3 mm. diam., glabris; sporulis ellipsoideis, utrinque rotundatis, 22-27 \times 11-14, inæqualiter 2-3-guttulatis, fuligineis; sporophoris paliformibus v. sursum leviter inflatis, hyalinis.

Hab. in caulis emortuis Rumicis sp., Lyndonville, New York, Amer. bor. (Dr. C. E. FAIRMAN). — Sporulæ jugiter continuæ hinc typica *Sphaeropsidis* species nec *Diplodia*.

19. **Sphaeropsis elæagnina** Fairm. Ann. Mycol. VIII (1910) p. 326. — 6818

Pycnidiis epidermidem pustulatim elevantibus eamque tandem disrumpentibus, minutis, globosis, ut plurimum applanatis, atris; sporophoris clavatis, hyalinis; sporulis primo hyalinis et granulosis, dein rotundatis, ellipsoideis v. obovatis, utrinque rotundatis, continuis, granulosis, nucleolatis, brunneis olivaceisve 12-23 \times 10-12.

Hab. in ramis emortuis Elæagni longipedis cultæ, Lyndonville New York Amer. bor.

20. **Sphaeropsis pinicola** Speg., Myc. Argent. V, pag. 362, in Anal. 6819 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; pycnidiis innatis, obsolete ostiolatis, globosis 250-300 μ . diam., subcarbonaceis, per ætatem totaliter deciduis atque folium foveolatum reliquenibus; sporophoris conoideis vel sublageniformibus, 15 \times 6, monocarpis, hyalinis, constipatis, immediate e strato prolifero exsurgentibus; sporulis e cylindraceo subellipsoideis, 35-38 \times 16-18, non v. leniter inæquilateralibus, fuligineis.

Hab. ad acus dejectas subputrescentes Pini insignis in horto Villa Elisa Argentina Amer. austr.

21. **Sphaeropsis cocoina** Patouill., Bull. Soc. Myc. Fr. XXII (1906) 6820 p. 59. — Pycnidiis numerosis, sparsis v. longitudinaliter seriatis, atris, nitidulis, erumpentibus, globosis, 400-600 μ . diam., coriaceo-carbonaceis; sporulis fusco-atris, ovoideis, continuis, levibus, 18-21 \times 8-10.

Hab. in rhachidibus dealbatis foliorum Cocoës nuciferæ, in ins. Hao Polynesia.

22. **Sphaeropsis Phœnicis** Alm. et Cam., Revista Agron. IV (1906) 6821 pag. 80, tab. I, fig. 8-9; Bol. Soc. Brot. XXV (1908-1909), Extr. pag. 45. — Pycnidiis subglobosis v. globoso-depressis, aterrimis, initio epidermide tectis, demum erumpentibus, minutis, punctiformibus, sparsis, saepe gregariis, 150-250 μ . diam.; sporulis ellipsoideis, atro-brunneis, continuis, utrinque rotundatis, medio uninucleatis, 14-20 \times 5-6.

Hab. in foliis Phœnicis dactyliferæ, in horto bot. Coimbra, Lusitania (A. MOLLER).

23. **Sphaeropsis Pandani** P. Henn., Hedwigia XLVII (1908) p. 263. 6822 — Pycnidiis innato-erumpentibus, sparse gregariis, rotundato-hemisphæricis v. lenticularibus, atro-nitentibus, apice papillato-perforatis, usque ad 1 mm. diam.; sporulis oblonge ellipsoideis, utrinque obtusis, luteo-brunneis, 20-26 \times 8-11.

Hab. in foliis siccis Pandani levis, Mindanao, Davao, ins. Philippin. (COPELAND).

24. **Sphæropsis japonica** I. Miyake, Pilze Reispfl. in Journ. College 6823
Agricul. Tokyo, II (1910) p. 257, t. XIV, f. 51-52. — Pycnidiis
epidermide tectis, ostiolo verruciformi conspicuo præditis, nigris,
parietibus crassis præditis, globosis v. ellipsoideis, 175-200 μ . d.;
sporophoris parvis; sporulis unilocularibus granuloso-farctis, ellipsoideis,
ovoideis, cylindraceis v. irregularibus, maturis obscuris,
12-17 \approx 4-6.

Hab. in glumis *Oryzæ sativæ*, Ika Japoniæ. — A *Sph. vaginarum* ostiolo majori et sporulis magis elongatis distincta, a *Sph. Oryzæ* forma sporarum etiam diversa.

PHÆODOMUS v. Höhn., Fragm. Mykol. IX (1909), pag. 69, in Stzsb.
k. Akad. Wiss. Wien, Bd. CXVIII, Abt. I (Etym. *phaios* obscurus et *domus*). — Stromata globosa, primo immersa dein erumpenti-superficialia, carbonacea, subparenchymatica, verrucoso-rugosa, sclerotioidea, unilocularia, astoma, loculo rotundato; sporophora brevissima crassa; sporulæ uniloculares, coloratæ, elongatæ.

1. **Phæodomus Lauracearum** v. Höhn., l. c. pag. 69. — Stromatibus 6824
strato 130 μ . cr., hyalino-parenchymatico suffultis, 1 mm. lat.,
plerumque epiphyllis, in areis 3-10 mm. lat. vix decoloratis insidentibus,
erumpentibus, nigris; loculo 800 \approx 80-120, subhemisphærico;
sporulis fumoso-brunneis, ellipsoideis, basi subcuneatis, 20-25 \approx
10-12.

Hab. in foliis vivis *Nectandræ* sp. in Brasilia merid. (von
HÖHNEL, THEISSEN).

CAPNODIASTRUM Speg. — Syll. X p. 272, XI p. 516, XIV p. 925,
XVI p. 912.

1. **Capnodiastrum atratum** v. Höhnel, Ergebni. Bot. Exp. Südbras. 6825
1901, Denk. k. Ak. d. Wiss. Wien, Bd. LXXXIII (1907) p. 34.
— Maculis nullis; subiculo opace nigro, tenuissimo, ex hyphis intricatis brunneis, 3-5 μ . cr., sine hyphopodiis constituto, irregulariter rotundato, saepe evanido, margine irregulariter minute radiante, 5-8 mm. lato, epiphylo; pycnidiis crebris, grosse parenchymaticis, irregulariter rotundatis, tenuiter tunicatis, demum supra late lacinulato-apertis, 50-70 μ . cr.; sporulis in sporophoris crebris hyalinis brevibus insidentibus, paucis, unilocularibus, brunneis, elongato-ellipsoideis v. ovoideis, saepe subglobosis, infra subangustatis, 12-20 \approx 6-8,5.

Hab. in foliis coriaceis, Ilha de S. Amaro prope Santos Sao Paulo Brasilia, Amer. bor.

NÆMOSPHÆRA Sacc. — Syll. III p. 198, X p. 259, XI p. 514, XVIII p. 315.

1. **Næmosphæra Fairmani** Sacc., Not. Myc. VII, Ann. Myc. IV (1906) 6826 p. 276. — Pycnidii laxe gregarii, nunc cortice immersis, nunc subsuperficialibus, globoso-depressis, atris, glabriusculis, 500 μ . d., in ostium cylindraceum subæquilongum hirtellum abrupte tenuatis, hinc rostratis, rostri setulis fuligineis septatis breviusculis 2-3 μ . cr.; pycnidii contextu firmulo, parenchymatico, fuligineo; sporulis ellipsoideo-oblongis, rectis, 16-17 \times 8-8.5, perfecte maturis usque ad 19 μ . longis, diu hyalinis 1-pauciguttatis, maturis læte fuligineis, minute et dense pluri-guttulatis; sporophoris bacillaribus, hyalinis, 14 \times 2, facile evanidis, intermixtis paraphysibus filiformibus tortuosis guttulatis, facile mucoso-fluxilibus.

Hab. in areis dealbatis trunci Aceris sp. Lyndonville, N. Y., Amer. bor. (C. E. FAIRMAN). — Subaffinis *N. rudi*, a qua mox distinguitur pycnidii multo majoribus, sporulis oblongis etc.

LEVIEUXIA Fr. — Syll. III p. 321, X p. 271.

1. **Levieuxia Equiseti** Hollós, Ann. Mus. Nat. Hung. VI (1908) p. 536. 6827 — Pycnidii globulosi, 140-240 μ . diam., longe stipitatis (210-350 \times 35-50), atris, virescenti-olivaceis, astomis, superne rimose deciduis; sporulis cylindraceo-fusoideis, continuis, 2-4-guttulatis, olivaceis, 12-16 \times 3-3.5; sporophoris filiformibus, hyalinis, 50-120 \times 0.5-1.

Hab. in caulis siccis Equiseti ramosissimi prope Kecskemét Hungariæ.

SIROTHECIUM Karst. — Syll. X, p. 270, XVIII p. 315.

1. **Sirothecium lichenicola** (Lindsay) v. Keissler, Österr. Bot. Ztschr. 6828 Bd. 60 (1910) p. 61 — Syll. X, p. 574 (*Torula*) — var. **bisporum** von Keissler, Centralbl. f. Bakter. etc. II Abt. Bd. 27 (1910), p. 210. — A typo differt sporulis constanter bicellularibus, 6-8 \times 3.

Hab. in apotheciis Lecanoræ Hagenii, inter Arnstadt et Eikfeld Austriæ (G. LETTAU).

CHÆTOMELLA Karst. — Syll. III p. 321, X p. 271, XI p. 516, XIV p. 925, XVI p. 912, XVIII p. 316.

1. **Chætomella Gasteriæ** Trinchieri, Rend. R. Acc. Sc. Napoli (1909) 6829 fasc. 8-12, Extr. p. 5. — Pycnidiiis superficialibus, punctiformibus, gregariis, valde depresso, rarius umbilicatis, astomis, sparse setosis, aterrimis, 257-343 μ . diam., 147-245 μ . altis; excipulo indistincte celluloso, subcarbonaceo, firmulo præditis; setis rectis rigidisque, septatis, apice acutatis, olivaceis, 73-122 μ . longis, 4,5-7 μ . latis; sporophoris filiformibus, flexuosis, irregulariter guttulatis, apice rotundatis, hyalinis, 53-61 μ . longis, 2 μ . latis; sporulis copiosissimis, bacillaribus, utrinque rotundatis vel subfusiformibus, rectis, continuis, 2-3-4-guttulatis, olivaceis, quandoque hyalinis, 9,5-19 \approx 2.

Hab. in scapo exsiccato Gasteriæ fusco-punctatæ in Horto botanico neapolitano Ital. austr. (TRINCHIERI). — Accedit ad *Ch. atram* Fuck., a qua tamen satis distinguitur pycnidiorum forma, colore et contextu, setarum basidiorumque mensuris, sporularum forma, magnitudine et sæpe etiam colore.

CLADOCHÆTE Sacc. in Ann. Mycol. X (1912) p. 318 (Etym. *clados* ramus et *chæte* seta), *Chætomium* Wint. ex p., *Chætomella* Cooke, Oudem. etc. ex p. — Pycnidia superficialia globulosa, membranacea, subastoma (chætomioidea!) setosa; setis pluries divergenti- v. arcuato-ramosis, brunneis, intermixtis saepius aliis indivisis, cuspidatis, nigricantibus. Sporulæ globoso-ovoideæ, continuæ, brunneæ, sessiles v. subsessiles, substrato tenuissime celluloso, hyalino insertæ. — Genus habitu prorsus *Chætomii*, cuius verisimiliter efficit status pycnidicos.

1. **Cladochæte setosa** (Wint.) Sacc., *Chætomium setosum* Wint. — 6830 Syll. IX, p. 484 — *Chætomella Cavallii* Mattiolo in Duca degli Abruzzi, Il Ruvenzori I, p. 3, t. III, f. 1-3 (extr.). — An huc spectat *Trichothecium clavatum* Letell. Fig. Champ. Suppl. à Bulliard, t. 685?

Hab. in foliis dejectis udis Fagi silvaticæ, Conegliano Ital. bor. (G. CUBONI), in charta uda in silva Nakitava, Ruvenzori, 2652 m. alt. Afr. (Doct. CAVALLI). — Perfecte congruit cum diagnosi Wint. l. c. et iconе Mattioli l. c. et æque ascos nulos ostendit. Sporulæ copiosissimæ ovato-ellipsoideæ, brunneæ, leves, 4,5-6 \approx 2,5-3; setæ biformes: simplices rigidæ, cuspidatæ, divergentes, 250-300 \approx 4 (basi), obscure septatae subinde demum asperulæ; ramosæ simplicibus dimidio breviores et copiosiores, ramis iterato furcatis et eximie incurvis, ubique asperulis præditæ; hyphæ myceliales (rhi-

zinæ) copiosæ flexuoso-ramosæ, 2,5 μ . cr., brunneolæ, interdum coalescentes. Area speciei distributionis latissima: Patagonia, Africa centr., Italia! — Ad hoc genus quoque referendæ sunt: **Cladochæte furcata** (Cooke et M.) Sacc. — *Chætomella furcata* C. et M. — Syll. X, p. 271 — et **Cladochæte horrida** (Oud.) Sacc. — *Chætomella horrida* Oud. — Syll. XVIII, p. 316.

HAPLOSPORELLA Spieg. — Syll. III p. 323, X p. 273, XI p. 516, XIV p. 925, XVI p. 912, XVIII p. 316.

1. **Haplosporella ruscigena** Bubák, Bull. Herb. Boiss., 2 sér., VI 6831 (1906) p. 481. — Pycnidiis in greges circa 300 μ . diam. stromatiformiter confertis, globosis, sæpe lateraliter confertis, 90–150 μ . latis, nigris, contextu firmo 20 μ . circ. crasso, flavo-brunneo, supra obscure castaneo-brunneo; sporulis ex elongato fusoideis, 9-13 \times 3,5-4,5, rectis v. curvulis, apice rotundatis, 2-3-guttulatis, olivaceo-brunneis; sporophoribus cylindraceis 6-8 \times 2, hyalinis.
Hab. in cladodiis emortuis Rusci aculeati prope Ulcinj Montenegro.
2. **Haplosporella rubicola** Maire, Bull. Soc. Bot. Franc. LIV (1907) 6832 p. CLXXXIX. — Pycnidiis supra stroma nigrum·botryose congestis, nigris, nitidis, apice ostiolo papillato pertusis, 150–300 μ . diam.; sporulis ovoideis v. subglobosis, levibus, dilute brunneolis, 3-3,5 \times 2,5-3; sporophoribus brevissimis.
Hab. in caulis emortuis Rubi sp., inter Tlemcen et Hafir Africæ bor.
3. **Haplosporella missouriensis** Bubák, Journ. of Mycol. XII (1906) 6833 p. 54. — Stromatibus caulinis late gregariis, primum subepidermoideis dein prominentibus, depresso-pulvinatis, $1\frac{1}{3}$ - $2\frac{1}{3}$ mm. latis, nigris, plus v. minus nitidis, contextu parenchymatico, intus flavidulo extus obscure brunneo; loculis paucis uniseriatis, evolutis, quandoque etiam in evolutis irregularibus; sporulis elongatis v. cylindraceis, sæpe subcurvulis v. medio biscoctiformi-constrictis, 13-18 \times 4,5-7, castaneo-brunneis, medio guttula elongata præditis; sporophoribus filiformibus, hinc inde curvulis, 76-80 \times 2, apice plerumque expansis, hyalinis.

Hab. in ramis emortuis Persicæ vulgaris, Emma Salina Co. Missouri, Amer. bor. (C. H. DEMETRIO).

4. **Haplosporella Calycanthi** Fairm. Ann. Mycol. VIII (1910) p. 322. 6834 — Pycnidiis minutis, atris, erumpentibus, approximatis; sporulis

oblongo-cylindraceis, utrinque rotundatis, granulosis, guttulatis, brunneis, 15-30 \times 10-12.

Hab. in ramis emortuis *Calycanthe floridi* culti, Lyndonville New York Amer. bor.

5. **Haplosporella commixta** Peck in Barth. Fgi. Columb. 1905, n. 2031, 6835 et in Bull. Torr. Bot. Cl. XXXIII (1906) pag. 219. — Pycnidiis singulis v. confertis, numerosis, tenuibus, globosis, erumpentibus, nigris; sporulis late ellipsoideis v. obovatis, primum hyalinis dein maturis luce transmissa obscure brunneis, 24-32 \times 16-20.

Hab. in ligno et ramis emortuis *Ulmus fulvae*, Stockton Kansas Amer. bor. (BARTHOLOMEW).

6. **Haplosporella camerunensis** P. Henn. in Engl. Jahrb. XXXVIII 6836 (1905) pag. 128. — Stromatibus sparse v. gregarie erumpentibus saepe confluentibus, rotundato-pulvinatis v. lenticularibus, discoideo-applanatis, 1-1,5 mm. diam., gyroso-rugulosis, subcarbonaceo-atris, intus subhyalinis; pycnidiis immersis; sporophoris subulatis v. filiformibus 6-12 \times 2,5-3, hyalinis; sporulis ovoideis v. ellipsoideis, diutius hyalinis, dein castaneo-atris, continuis, 12-18 \times 7-11.

Hab. in ramis corticatis arboris cujusdam, Kamerun Africæ (ZENKER).

CYTOPLEA Bizz. et Sacc. — Syll. III p. 325, XI p. 516.

1. **Cytoplea badia** Miyake et Hara in Bot. Mag. Tokyo (1910) p. (352) 6837 [japonice].

Hab. in *Bambusa* sp. in Japonia.

2. **Cytoplea propullulans** (Peck) Starb. Stud. Fr. Herb. p. 82. — Ita 6838 vocanda *Sphaeropsis propullulans* Peck — Syll. III, p. 294.

READERIELLA Syd., An. Myc. VI (1908) p. 484 (Etym. a cl. F.

M. READER, fungi detectore). — Stromata minuta, phyllachoroidæa, epidermide tecta, atra, intus minute plurilocularia; sporulæ ambitu trigonæ, continuæ, fuscae. — Ob sporularum formam singularem et stromatum anularem dispositionem predistinctum genus.

1. **Readeriella mirabilis** Syd., l. c. — Stromatibus amphigenis, maculis orbicularibus $\frac{1}{2}$ -1 cm., diam., obscure brunneis insidentibus, in circulos amœne formatos et concentricæ ordinatos dispositis, minutis, ca. $\frac{1}{4}$ - $\frac{1}{3}$ mm. diam., intus minute plurilocularibus, atris, epidermide elevata diu (vel semper?) tectis, phyllachoroidæis; sporulis ambitu trigonis, continuis, fuscis, 9-11 μ . diam. 6839

Hab. in foliis *Eucalypti capitellatae*, County of Follett, Victoria (READER).

Sect. 3. Phæodidymæ

DIPLODIA Fr. — Syll. III p. 329, X p. 275, XI p. 518, XIV p. 927, XVI p. 915, XVIII p. 319.

1. **Diplodia hortensis** Saccardo New Fungi New York, Journ. of Myc. v. 6840 XIII (1907) p. 47. — Pycnidiis gregariis, subcutaneo-erumpentibus, globosis, breve papillatis, nigris, 300-400 μ . diam.; sporulis ellipsoideis, utrinque rotundatis, medio septatis, non constrictis, 19-20 \times 11 fuligineis; sporophoribus fasciculatis, paliformibus, 8-10 \times 5, hyalinis.

Hab. in caulis Clematidis paniculatae cultæ, Lyndonville, N. Y., Amer. bor. (Dr. C. E. FAIRMAN). — A *Dipl. herbarum* dignoscitur pycnidiis regularibus, papillatis, sporulis brevioribus, haud constrictis.

2. **Diplodia berberidina** Sacc., *Diplodia Berberidis* Sacc., Ann. Mycol. VI (1908) p. 566, non Rota-Rossi (cfr. sp. seq.). — Pycnidiis gregariis, subcutaneo-erumpentibus, globosis, 300 μ . diam., apice obtusis, nigris; sporulis obovato ellipsoideis, 22-24 \times 8,5, diu continuis, demum 1-septatis, non constrictis, fuligineis; sporophoribus filiformibus, sporula paullo brevioribus, hyalinis.

Hab. in ramulis corticatis emortuis Berberidis sp. cultæ, Lyndonville, N. Y., Amer. bor. (FAIRMAN). — A *Dipl. Berberidis* Rota-Rossi, paullo anteriore, differt pycnidiis globosis, nec depresso, sporulis paullo longioribus, septo non constrictu etc.

3. **Diplodia Berberidis** Rota-Rossi, III Contr. Mic. Bergamo, Atti R. Ist. Bot. Pavia ser. II v. XIII (1907) p. 202. — Pycnidiis gregariis, epidermide tectis dein semi-erumpentibus, globoso-depressis, minutis, 100-180 μ . diam.; sporulis oblongis, fuscis, 1-septatis, vix constrictis, biguttulatis, 18-22 \times 8-10.

Hab. in ramulis corticatis Berberidis vulgaris, Parve Bergamo, Ital. bor.

4. **Diplodia Tulipiferæ** Diedicke, Ann. Mycol. IV (1906) p. 414. — 6843 Pycnidiis irregulariter sparsis v. in series elongatas ramum late obtectibus, cortice immersis, peridermio arcte adnatis, rotundatis v. subellipsoideis, nigris, leniter e cortice erumpentibus; sporophoribus brevibus, hyalinis, apice tenuioribus; sporidiis, primum

hyalinis, dein pallide demum obscure-brunneis, bilocularibus, medio plus v. minus constrictis, elongatis, apice rotundatis, 20-24 \times 8-10, quandoque etiam profunde constrictis et loculis tunc subrotundatis.

Hab. in ramis siccis Liriodendri tulipiferae, prope Halle Germania (A. SCHROETER).

5. **Diplodia zebrina** Petch, Ann. Roy. Bot. Gard. Peradeniya III, Pt. I (1906) p. 6. — Pycnidiis nigris, confertis, erumpentibus, 0,25 mm. diam.; sporulis olivaceis, ellipsoideis, 25-30 \times 13-15, tæniolis pallidis angustis longitudinaliter striatis.

Hab. in fructibus emortuis Heveæ brasiliensis et in ramulis emortuis Theæ viridis Ceylon.

6. **Diplodia rapax** Massee, Kew Bull. (1910) pag. 3, f. 13-14 et ap. Bancroft Handb. Diseas. West Ind. Plants (1901) p. 40, Ridley, Bull. of the Straits and Federates Malay States VII, (1909) p. 310. — Pycnidiis gregaris, 3-7, globosis, nigris demum erumpentibus, glabris, 160-180 μ . diam., minute ostiolatis; sporulis ellipsoideis, utrinque obtusis, medio uniseptatis, non constrictis, fuligineis, 32-35 \times 15-16.

Hab. in ramis Heveæ brasiliensis, in America et Africa trop.

7. **Diplodia Boldoæ** Speg., Fungi Chilenses (1910) p. 158. cum icon. 6846 — Maculis nullis; pycnidiis amphigenis, parenchymate innatis, epidermide tectis, subglobosis, 150-180 μ . diam., atris, subcarbonaceis, minute ostiolato-perforatis; sporulis ex ellipsoideo obovatis, 24-26 \times 10-12, opace fuligineis, medio 1-septatis, non constrictis; sporophoris conoideis, hyalinis, 10-14 \times 3-4.

Hab. in foliis dejectis putrescentibus Boldoæ fragrantis, prope Talcahuano, Chile Amer. austr.

8. **Diplodia perseana** Delacroix in Bull. trim. Soc. Myc. de France, 6847 vol. XXI (1905) p. 201, fig. XIII. — Forma conidica e genere *Stilbum*: (*Stilbum perseanum* S. et T.): synnematibus erectis, rubro-coccineis, summo albido rotundato vixque dilatato v. ovoideo-capitato; hyphis septatis, parallelis, stricte connexis; conidiis hyalinis, rotundatis, 3 μ . diam., summo sterigmatum hyalinorum cylindraceorum 10-15 \times 3-4 solitariis. — Forma pycnidica e gen. *Diplodia*: pycnidiis brunneis, immersis, ostiolo prominente, 140 \times 112; sporulis hyalinis, dein brunneolis, demum brunneo-atris uniseptatis, 18 \times 9, ovalibus; sporophoris brevibus 3 \times 2.

Hab. in cotyledonibus *Perseæ* gratissimæ, Congo Africæ (DYBOWSKI).

9. **Diplodia samararum** Sacc. Mycoh. Ven. Cent. XIV, n. 1396 (1879). 6848

— Pycnidiis innato-emergentibus, globoso-conicis, $\frac{1}{4}$ mm. diam., nigris, contextu crasse parenchymatico, fuligineo-violaceo; sporulis oblongis, 1-septatis, non constrictis, 25 \times 15, fuligineis; pedicello hyalino.

Hab. in samaris dejectis *Aceris platanoidis* in horto botanico Patavino.

10. **Diplodia Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires t. XVII, 6849

(1908) p. 135. — Pycnidiis primo cortice tectis eaque dein secedente denudatis atque in ligno superficialibus, sparsis v. hinc inde glomerulatis, subglobosis v. depressis, 150-180 μ . diam., nigris, glabris, valide papillulato-ostiolatis, contextu opaco indistincto; sporophoris sublanceolatis 15 \times 5, paraphysibus filiformibus elongatis simplicibus concoloribus 40-60 \times 1-2 commixtis; sporulis acrogenis utrinque obtusis 24-30 \times 10-15, quandoque ellipsoideis quandoque leniter subobovatis, rectis v. modice inaequilateralibus, continuis v. saepius uniseptatis, ad septum non v. lenissime constrictis, subopacis, fuligineis, eguttulatis.

Hab. vulgata ubique ad ramulos emortuos subputrescentes *Ilicis paraguariensis*, Misiones Reip. Argentinæ.

11. **Diplodia Trevoæ** Speg., Fungi Chilenses (1910) p. 158. — Pyc-

nidiis sparsis v. laxe gregariis, primo cortice tectis, eaque secedente plus minusve denudato-superficialibus, e lenticulari hemisphaericis, 150-250 μ . diam., atris, glabris, carbonaceis, 30-32 \times 12-20, 1-septato-constrictulis, sporophoris cylindraceis hyalinis, 10 \times 3-4, fultis.

Hab. in ramis emortuis siccis *Trevoæ trinervis* in collibus Batuco et San Bernardo, prope Santiago Chile Amer austr.

12. **Diplodia Mangiferæ** Koord., Botan. Untersuch. Java (1907) p. 210. 6851

— Pycnidiis sparsis, globoso-depressis, 200-300 μ . diam. et 70-100 μ . altis, atris, tectis, dein epidermide fissa suberumpentibus, obtuse papillatis; sporulis oblongis, initio continuis hyalinis, tandem medio 1-septatis, fuscis 26-28 \times 12-14; sporophoris 7-13 \times 3-4 cylindraceis, hyalinis; paraphysibus hyalinis 35 \times 2 intermixtis.

Hab. in cortice *Mangiferæ indicæ* in Purworedjo prov. Kedu in insula Java (KOORDERS).

13. **Diplodia Hibisci** P. Henn., Hedwigia XLVII (1908) p. 263. — 6852

Pycnidiis gregarie suberumpentibus, subglobulosis, atro-castaneis;

sporulis ellipsoideis v. ovoideis, utrinque obtusis, atris, 1-septatis haud constrictis, 16-22 \approx 8-10.

Hab. in ramis emortuis *Hibisci rosæ-sinensis* L. in societate *Megalonectriæ pseudotrichiæ*, Manila Ins. Philipp. (MERRILL).

14. **Diplodia natalensis** Pole Evans in Transvaal Dept. of Agricult. 6853

Sc. Bull. n. 4 (1910) p. 15, c. ic. — Pycnidiis sparsis, primo epidermide tectis, dein erumpentibus, atris, membranaceis, subglobosis, papillatis, 150-180 μ . diam.; sporulis ellipticis, 1-septatis, non constrictis, obscure coloratis, 24 \approx 15, exosporio striato.

Hab. in fructibus *Citri* qui nigro-maculantur et vitiantur, Natal Africæ.

15. **Diplodia Phellodendri** H. Zimmermann in Verhandl. naturf. Ve- 6854

rein, Brünn XLVII (1908-1909) p. 40 (extr.). — Pycnidiis sparsis, corticolis, emergentibus et erumpentibus, subglobosis; sporulis ab initio cylindraceis, decoloribus, in ætate proiecta cylindraceis v. ovoideis, fusco-brunneis, subopacis, 24-36 \approx 8; sporophoris 10 \approx 1, decoloribus.

Hab. in ramulis siccis *Phellodendri amurensis* in horto Eisgrubensi Austriæ.

16. **Diplodia Cerei-triangularis** Speg., Myc. Argent. V, p. 370, in 6855

An. Mus. Nac. Buenos Aires XX (1910). — Matrice tota albo-cinerescente; pycnidiis densiuscula gregariis sed omnino discretis, epidermide tectis eaque adnatis, lenticularibus, 100-120 μ . diam., obsolete ostiolatis, atris, subcarbonaceis, contextu opaco indistincto; sporulis ellipsoideis v. lenissime obovatis. 22-24 \approx 12-13, prope medium uniseptatis, ad septum non v. vix constrictis, fuligineis.

Hab. ad ramos emortuos putrescentesque *Cerei triangularis*, in hortis La Plata Reip. Argentinæ Amer. Austr. .

17. **Diplodia Pteleæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 6856

359. — Pycnidiis epidermide tectis, sparsis, globosis, ostiolo papillato conico erumpentibus, atris, carbonaceis, 350-450 μ . diam.; sporulis ellipsoideis, initio continuis, hyalinis, dein medio 1-septatis, constrictis, flavis, demum fuscis, 20-24 \approx 10-12.

Hab. in ramis siccis *Pteleæ trifoliatae*, Kecskemét et Nagy-Körös Hungariæ.

18. **Diplodia platanicola** Sacc. in Ann. Mycol. VI (1908) p. 562. — 6857

Pycnidiis late dense gregariis, rima peridermii plerumque longitudinali erumpentibus, globulosis, nigris, $\frac{1}{2}$ mm. diam., obsolete

papillatis; sporulis ellipsoideis, 1-septatis, leniter constrictis, 16-20 \approx 8-11, nitide fuligineis, 2-guttatis.

Hab. in ramis emortuis *Platani orientalis* pr. Tamsel Germaniæ (P. VOGEL).

19. **Diplodia Hamamelidis** Fairm. in Peck New York St. Mus. Bull. 6858 139 (1909) p. 22. — Peritheciis gregariis, minutis, depresso-globosis, nigris, primum epidermide tectis, dein erumpentibus; sporulis primum hyalinis dein coloratis, diu continuis, denique uniseptatis, 20-28 \approx 10-12.

Hab. in ramis emortuis *Hamamelidis virginianæ*, Lyndonville Amer. bor. (C. E. FAIRMAN).

20. **Diplodia Diospyri** (Schw.) Sacc. et Trav. Syll. XIX p. 610. — 6859 *Sphaeria Diospyri* Schw. ap. Currey, Trans. Linn. Soc. XXII, (1858) p. 273, t. 47, f. 103. — Pycnidiis; sporulis ova-to-oblongis, utrinque rotundatis, atro-brunneis, 1-septatis, leviter constrictis, 16-18 μ . long.

Hab. in ramis *Diospyri* sp. in America bor. — Cl. Currey refert ascos non invenisse; tamen *Sphaeria Diospyri* Schw. Syn. Car. n. 57 saltem pro parte, teste ill. Notarisio ad *Valsaria* spectat. Cfr. Syll. II, p. 743.

21. **Diplodia Phlæospora** Sacc. et Trav. Syll. XIX p. 613. — *Phlæo-* 6860 *spora Diplodia* Schulz. v. Mügg. in Verh. zool-bot. Ges. Wien, (1871) p. 1231, t. 13, f. 10. — Pycnidiis subcutaneis et vix erumpentibus, prominulis, globoso-conoideis, nigris, 300-600 μ . diam.; sporulis ovato-ellipsoideis, utrinque rotundatis, constricto-didymis, 17-22 \approx 6-12, loculo inferiore sæpe paullo minore, fuligineis; sporophoris paliformibus, brevissimis.

Hab. in ramis corticatis *Cydoniæ vulgaris* in Hungaria. Ex fig. b videtur pycnidii contextus extus niger, intus albo-cellulosus, crassiusculus.

22. **Diplodia Mespili** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 6861 p. 7. — Pycnidiis sparsis, epidermide tectis, erumpentibus, globulosis, nigris, c. 0.5 mm. diam.; sporulis oblongo-ellipsoideis, medio 1-septatis, non v. vix constrictis, fuligineis, 22-26 \approx 10-12; sporophoris clavatis, hyalinis, 10-12 μ . long.

Hab. in ramulis emortuis *Mespili germanicæ*, Nagy-Körös Hungariæ.

23. **Diplodia mespilina** L. Gaja, Flora Micol. provinc. Padova (1911) p. 6862 24 (sunto litogr.) — Pycnidiis gregariis vel solitariis, atris, lenticularibus, breviter papillatis, erumpentibus, 250-300 μ . diam.; *Syll. Fung.* XXII (IV-1913)

sporulis 1-septatis, subcylindraceis, ad apicem rotundatis, et ad septa constrictis, aureo-fulvis, intus granulosis, 23-24 \times 7-8; sporophoris hyalinis, cylindraceis brevibus.

Hab. in ramis corticatis *Mespili germanicae* in viridario Convictus Universitariorum Patavii Ital. bor.

24. **Diplodia Griffoni** Sacc. et Trav. — Syll. XX p. 1228 — *Diplo- 6863
diæ* sp. Griffon et Maublanc in Bull. Soc. Mycol. France (1910) p. 314. t. XV et t. XVI, f. 1-4, 7, 8, 10. — Pycnidiis parasiticas majusculis, solitariis v. aggregatis, simplicibus v. in loculos divisis; sporulis diu hyalinis crasse tunicatis, elliptico-oblongis, subirregularibus, intus granulosis 20-30 \times 10-13, dein ovoido-ellipsoideis, 1-septatis 22-25 \times 10-13, perfecte levibus, fuligineis.

Hab. ad ramos corticatos *Piri communis* et *P. Mali* (quibus noxia) in Gallia. — A *Sphaeropside Malorum* et *Sph. Pseudo-Diplo-
dia* sporulis denique 1-septatis, levibus, a *Diplodia maura* sporulis ellipsoideis non elongatis, levibus non granulosis, a *Botryodiplodia Mali* sporulis non piriformibus et paullo majoribus imprimis dignoscitur.

25. **Diplodia Rhodotypi** Hollós, Növényt. Közlemén. VI (1907) Extr. 6864 p. 7. — Pycnidiis epidermide tectis, dense gregariis, erumpentibus, globoso-depressis, apice ostiolo minuto præditis, nigris, c. 0,5 mm. diam.; sporulis oblongo-ellipsoideis, medio 1-septatis, leviter constrictis, fuscis, 20-24 \times 10-14.

Hab. in ramis siccis *Rhodotypi kerrioidis*, Kecskemét Hungariæ.

26. **Diplodia Arachidis** Petch, Ann. Roy. Bot. Gard. Pevadenya III, 6865 Pt. I (1906) p. 6. — Pycnidiis globosis, primum immersis, prominentibus, deinde erumpentibus, nigris, gregariis, 0,25 mm. diam.; sporulis ellipsoideis, uniseptatis, atro-brunneis, 17-25 \times 10-12, pariete et septo crasso.

Hab. in caulibus *Arachidis hypogaeæ*, ins. Ceylon.

27. **Diplodia Siliquastri** West. — Sacc. Syll. III, p. 336 — var. *legu- 6866
minum* Hollós, Ann. Mus. Nat. Hung. V (1907) p. 53. — Pycnidiis epidermide tectis, sparsis, erumpentibus, depresso-globosis, nigris, poro pertusis, 280-350 μ . diam.; sporulis ellipsoideis, initio continuis, hyalinis, dein flavidulis, medio 1-septatis, non v. vix constrictis, demum fuscis, biguttulatis, 16-24 \times 8-12.

Hab. in leguminibus *Cercidis Siliquastri*, Kecskemét Hungariæ.

28. **Diplodia Onobrychidis** Hollós, Növényt. Közlemén VI (1907) 6867

Extr. p. 7. — Pycnidiis epidermide tectis, dense gregariis, erumpentibus, globoso-depressis, nigris, 350-400 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, initio continuis et hyalinis, dein flavidulis, demum fuscis, medio 1-septatis, constrictis, 24-26 \times 10-12.

Hab. in caulis siccis *Onobrychidis sativæ*, prope Kecskemét Hungariæ.

29. **Diplodia Vignæ** Saccardo, Fungi aliquot africani, Bol. Soc. Boteriana v. XXI (1904-1905) p. 7. — Pycnidiis gregariis, erumpentibus, e globoso hemisphæricis, glabris, nitidulis, duriusculis, breve papillatis; contextu grosse celluloso, fuligineo; sporulis ova-to-ellipsoideis, utrinque obtusulis, 22-25 \times 10-11,5, diu hyalinis, farctis; sporophoris bacillaribus, 12-15 \times 2,5-3,5, hyalinis.

Hab. in caulis emortuis *Vignæ sinensis*, Lourenço Marques Africae orient. (A. MOLLER). — Sporulæ nondum septatae et coloratæ visæ quia adhuc immaturæ.

30. **Diplodia Coffeæ** P. Henn., Mission E. Laurent, fasc. III (1907) p. 317. 6869
— Pycnidiis subcutaneo-erumpentibus, sparsis v. subgregariis atro-carbonaceis, subpapillatis c. 200 μ . diam., sporulis ellipsoideis utrinque rotundatis, atro-castaneis, medio 1-septatis, haud constrictis, 17-23 \times 10-14.

Hab. in ramis corticatis emortuis Coffeæ, prope Bolombo Africæ. — *D. coffeicolæ* Zimm. affinis sed sporulis distincta.

31. **Diplodia Cinchonæ** Koord., Botan. Untersuch. Java (1907) p. 209. 6870
— Pycnidiis gregariis, globoso-depressis, obtusis, subcutaneis, ostiolo vix erumpente, $\frac{1}{3}$ mm. diam.; sporulis oblongis, medio uniseptatis, haud constrictis, 28-33 \times 12-14,5, utrinque rotundatis, fuscis, sporophoris sporulâ fere duplo brevioribus, paraphysibus filiformibus intermixtis.

Hab. in ramis Cinchonæ succirubræ in M. Sendoro prope Auggronggondok prov. Kedu Java (KOORDERS).

32. **Diplodia Celottiana** Sacc. in Ann. Mycol. X (1912) p. 319. — 6871
Pycnidiis subcutaneo-erumpentibus, depresso globosis, obsolete pertusis, papillatis, 300 μ . diam., nigris, contextu grosse celluloso, fuligineo; sporulis brevissime stipitatis, oblongo-ellipsoideis, utrinque rotundatis, fuligineis, 2-guttulatis, 20-22 \times 8-9.

Hab. in caulis emortuis *Vincæ minoris*, Conegliano, It. bor. (CELOTTI). — A *Dipl. vincicola* Brun. (in *Vinca majore*) videtur distincta ostiolo non papillato, pycnidiis depresso, sporulis angustioribus (non 22-35 \times 12-15).

33. **Diplodia hungarica** Bubák, Beitr. Pilzfl. Ung., in Növénytani Közlemenek (1907) Heft. 4, Extr. p. 37. — Maculis rotundatis v. ellipsoideis, coriaceis, definitis, brunneo-marginatis, 4-6 mm. latis, sparsis; pycnidiis epiphyllis, globosis, 180-220 μ . latis, subepidermicis, rostello cylindraceo 45 \approx 50 erumpentibus; sporophoris cylindraceis, 18-26 \approx 9-11, brunneo-nigris, utrinque rotundatis, medio transverse uniseptatis, non v. leniter constrictis; sporophoris 6-12 μ . long., supra expansis, hyalinis, multiguttulatis.

Hab. in foliis vivis Fraxini Orni in M. Domugled, prope Herkulesfürdö Hungariæ.

34. **Diplodia jasminicola** Sacc. in Ann. Mycol. IX (1911) p. 251. — 6873 Pycnidiis subcutaneo-erumpentibus, gregariis, atris, minutis, 250-300 μ . diam., obtuse papillatis; sporulis oblongo-ellipsoideis, utrinque rotundatis, initio hyalinis continuis, demum constricto-1-septatis, 20-22 \approx 9-11; sporophoris brevibus, crassiusculis, 5-6 \approx 4, hyalinis.

Hab. in ramulis morientibus Jasmini officinalis, Ville-sur-Ante Galliæ (P. HARIOT). — A *Dipl. Jasmini* differt imprimis pycnidiis dimidio minoribus, sed speciem quam edidi ut *D. Jasmini* in Myc. Ven. n. 337 in Jasmino fruticante, Patavii et in eadem matrice ex Conegliano communicavit 1876 cl. Spegazzini ad hanc *D. jasminicola* spectant. E contra specimina lecta Parmæ a prof. Passerini et edita in Rabenh. F. Eur. n. 2247 ex parte ad veram *D. Jasmini* West. pertinent.

35. **Diplodia Forsythiæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6874 p. 359. — Pycnidiis epidermide tectis, erumpentibus, depresso-globosis, nigris, apice ostiolo papillato perforatis, 210-280 μ . diam., contextu parenchymatico; sporulis ellipsoideis, medio 1-septatis, leniter constrictis, olivaceo-brunneis, 22-26 \approx 9-11.

Hab. in ramulis siccis Forsythiæ suspensæ, Nagy-Körös Hungariæ.

36. **Diplodia Leptodactyli** Earle, Bull. of the New York Bot. Gard. (1904) p. 295. — 6875 Pycnidiis sparsis, immersis, dein erumpentibus, nigris, subglobosis, non collabascentibus, 200-225 μ ., contextu molli membranaceo, cellulis regularibus, 8-10 μ . diam., ostiolo inconspicuo; sporulis brunneis, ellipsoideis, uniseptatis, subconstrictis, apice obtuse rotundatis, circ. 14 \approx 8.

Hab. in ramis emortuis Leptodactyli squarroxi, Clear Creek Canon, prope Carson, Nevada Amer. bor. (BAKER).

37. **Diplodia Gmelinæ** P. Henn., Hedwigia XLVII (1908) p. 263. 6876

— Pycnidiis erumpentibus, globulosis, atris; sporulis ellipsoideis v. ovoideis, obtusis, intus granulatis, atro-castaneis, 1-septatis, haud constrictis, 18-24 \approx 10-13.

Hab. in ramulis Gmelinæ villosæ in societate *Coniothyrii Gmelinæ*, Mindanao, Davao Ins. Philippin. (COPELAND).

38. **Diplodia Weigeliæ** Sacc. Ann. Mycol. VI (1908) p. 565. — Py- 6877
nidiis gregariis, subcutaneo-erumpentibus, globoso-conoideis, pro-
minulis, nigris, vix $\frac{1}{3}$ mm. diam.; sporulis ellipsoideis, 1-septatis,
non v. vix constrictis, 23-27 \approx 10, fuligineis.

Hab. in ramulis emortuis Weigeliæ roseæ cultæ, Lyndon-
ville N. Y. Amer. bor. (FAIRMAN). — A *Dipl. Lonicerae* et *Dipl.*
Symporicarpi satis diversa.

39. **Diplodia Baccharidis** Hollós, Növényt. Közlemén VI (1907) Extr. 6878
p. 7. — Pycnidiis epidermide tectis, dense gregariis, seriatim di-
gestis, erumpentibus, globoso-depressis, apice ostiolo minuto præ-
ditis, carbonaceis, c. 700 μ . diam.; sporulis oblongo-ellipsoideis,
initio continuis et hyalinis, dein medio 1-septatis, non v. con-
strictis, flavis, demum fuscis, 18-22 \approx 9-10.

Hab. in ramis siccis Baccharidis halimifoliæ, Kecskemét
Hungariæ.

40. **Diplodia polygonicola** Hollós, Növényt. Közlemén. VI (1907) 6879
Extr. p. 7. — Pycnidiis epidermide tectis, dense gregariis, erum-
pentibus, demum superficialibus, globoso-depressis, apice ostiolo
minuto præditis, carbonaceis, c. 600 μ . diam.; sporulis oblongo-
ellipsoideis, initio continuis et hyalinis dein flavidulis, demum fu-
scis, medio 1-septatis, valde v. non constrictis, 20-26 \approx 10-12.

Hab. in caulis siccis Polygoni lanigeri, Kecskemét
Hungariæ. — A *Diplodia Polygoni* Ruhl. sporulis majoribus
diversa.

41. **Diplodia Betæ** A. Potebnia Ann. Mycol. VIII (1910) p. 62. 6880
— Pycnidiis 160-200 μ . diam., subimmersis, obscure brunneis,
poro usque ad 30 μ . lato præditis; sporulis pallide brunneis v. hya-
linis, 13-16 \approx 4-7, septatis, ibique non constrictis, quando bisepta-
tis et tunc usque ad 20 μ . long.

Hab. in foliis hibernantibus Betæ vulgaris cultæ a *Cerco-
spora beticola* infestis, Gouv. Kursk, Rossiæ. — Verisimiliter non
diversa a *Dipl. beticola* Prill. et Delacr.

42. **Diplodia Loranthi** Bres. in Strasser, Verh. k. k. zool-bot. Ges. 6881
Wien LX (1910) p. 319. — Pycnidiis majusculis, simplicibus v.
sæpius cæspitosis, obovatis, corticolis, ostiolis prominulis; sporu-

lis fuscis, subellipticis, 1-septatis, ad septum valde constrictis, 20-27 \approx 9-12, pedicello hyalino, 10 \approx 3 suffultis.

Hab. ad ramulos sicclos Loranthi europæi, Sonntagberg Austriæ. — Teste Cl. Bresadola potius generi *Botryodiplodiæ* adscribenda videtur.

43. **Diplodia Wurthii** Koord., Botan. Untersuch. Java (1907) p. 153, f. 6882

4. — Pycnidiis sparsis v. gregariis, hinc inde confluentibus, subcutaneis, amphigenis, dein erumpentibus, subglobosis, circiter 150-250 μ . diam., atris, contextu plectenchymatico fuligineo; sporulis ovato-oblongis, oblongis v. ovatis, utrinque rotundatis, diu continuis, hyalino-farctis (macrophomoideis), tandem medio 1-septatis ad septum non constrictis, atro-fuligineis 22-30 \approx 12-18; sporophoris brevissimis, 4-10 μ . longis, paraphysibus subclavato-filiformibus, 50-60 μ . longis.

Hab. in foliis ramulisque Fici elasticæ quam valde lädit, Loano, Purworedjo etc. prov. Kedu Java, (KOORDERS).

44. **Diplodia Ostryæ** Syd., Ann. Mycol. (1910) p. 493, Myc. Germ. 6883

n. 922. — Pycnidiis gregariis, subcutaneo-erumpentibus, subglobosis, atris, c. 250-300 μ , diam.; sporulis oblongis, utrinque rotundatis, medio 1-septatis non v. vix constrictis, fusco-brunneis, 20-23 \approx 8-10; sporophoris brevibus, hyalinis.

Hab. in ramis Ostryæ virginicæ, Tamsel Germaniæ (P. VOGEL).

45. **Diplodia phœnicicola** Speg., Myc. Argent. V, p. 370, in Anal. 6884

Mus. Nac. Buenos, Aires XX (1910). — Pycnidiis plus v. minus gregariis, lenticularibus, 150-180 μ . diam., primo epidermide tectis dein erumpentibus v. denudatis, atris, carbonaceis, glabris, minute ostiolato-papillatis; sporulis subellipsoideis, obtuse rotundatis, 20-23 \approx 11-13, rarissime inæquilateralibus, ad septum non constrictis, loculis æquilongis eguttulatis, subopace fuligineis.

Hab. ad petiolos dejectos putrescentes Phœnicis canariensis in horto Santa Catalina, prope Buenos Aires Argentina Amer. austr.

46. **Diplodia Stangeriæ** H. Zimmermann in Verhandl. naturf. Ver. 6885

Brünn, XLVII (1908-1909) p. 40, t. I, f. 3 (Extr.) — Maculis maximis, pallescentibus, margine dilutis; pycnidiis, amphigenis, sparsis, 250-300 μ . diam., tectis dein erumpentibus, nigris; sporulis ovoideis, 26-30 \approx 14, initio hyalinis, granulosis, ovoideis v. ellipsoideis, uniseptatis, fuscis, granulosis, guttulis oleosis; sporophoris tenuibus, 10-30 \approx 1, hyalinis, continuis.

Hab. in foliis vivis *Stangeriae paradoxæ* in tepidario cultæ, Eisgrub Austriæ.

47. **Diplodia depazeoides** Dur. et Mont. — Syll. III, 372 — f. **Arecæ** 6886
Giuditta Mariani in Atti Soc. Ital. Sc. Nat. L (1911) p. 168. —
Sporulis 8,5-11 \approx 3-4.

Hab. in foliis *Arecaæ sapidæ* in horto botanico Coimbra,
Lusitaniæ (A. MOLLER).

48. **Diplodia cocoina** Syd. Hedwigia, XLIX (1909) p. 82. — Pyc- 6887
nidii sparsis vel seriatim dispositis, erumpentibus, minutis, lenticularibus, 150-175 μ .
diam.; sporulis ovato-oblongis, utrinque rotundatis, primo hyalinis
continuis, dein medio septatis et castaneo-brunneis, parum
vel leniter constrictis, 11-18 \approx 7-9; sporophoros hyalinis, brevibus.

Hab. ad truncos *Cocoës nuciferæ*, Para, Brasilia (C. F.
BAKER).

49. **Diplodia Euterpes** Syd. Hedwigia XLIX (1909) p. 82. — Pyc- 6888
nidii sparsis vel seriatim dispositis, erumpentibus, subglobosis,
atris, subcarbonaceis, 150-200 μ . diam., poro pertusis; sporulis
ellipsoideis, utrinque rotundatis, primo continuis hyalinis, dein
medio 1-septatis brunneis, vix constrictis, 18-26 \approx 9-12; sporo-
phoros brevibus, c. 10-15 μ . longis.

Hab. in vaginis emortuis *Euterpes edulis*, Para Americæ
austr. (C. F. BAKER).

50. **Diplodia Henriquesiana** Trav. et Spessa, Bol. Soc. Brot. XXV 6889
(1910) p. 181, t. III, f. 18. — Pycnidii sparsis, erumpenti-
bus, majusculis, atris, globosis, $\frac{1}{3}$ - $\frac{1}{2}$ mm. diam., subastomis, ex-
cipulo crasso irregulari præditis; sporulis late ellipsoideis, utrin-
que rotundatis, medio uniseptatis et ad septum non constrictis,
loculis æqualibus, fulvo-fuligineis, 25-28 \approx 14-16.

Hab. in pseudobulbis adhuc vivis *Cattleyæ labiatæ* in
horto botanico conimbricensi Lusitaniæ (A. MOLLER).

51. **Diplodia Veratri** Earle, Bull. of the New York Bot. Gard. 6890
(1904) p. 296. — Pycnidii sparsis, immersis, denique sæpe
erumpentibus, nigris, subglobosis, non collabescensibus, 300-400
 μ . diam., contextu crasso, opaco, cellulis 8-12 μ . cr. ostiolo minute
papillato; sporulis subcylindraceis, demum fuscis, uniseptatis, non
vel leniter constrictis, circ. 14 \approx 2; sporophoros non visis.

Hab. in caulis emortuis *Veratri*, King's Cañon, prope
Carson Nevada Amer. bor. (C. F. BAKER).

52. **Diplodia macrospora** (Poll.) G. Mariani — *D. Rusci* Sacc. et Th. 6891
var. *macrospora* Pollacci — Syll. XIV, 938-39 - var. *caulicola*, G.

Mariani in Atti Soc. Ital. Sc. Nat. L (1911) p. 168: sporulis 19-22 \approx 8-10.

Hab. in caulibus siccis *Rusci Hypoglossi* in horto bot. Coimbra Lusitaniæ (A MOLLER). — Teste cl. Mariani a typo *D. Rusci* ob sporulas multo majores certe distinguenda est species.

53. **Diplodia ulcinjensis** Bubák, Bull. Herb. Boiss., 2 ser. VI (1906) 6892 p. 482. — Pycnidiis sparsis, subcorticis sclerenchymate nidulantibus, globosis, collo crasso prominentibus, 200-220 μ . latis, nigris, contextu nigro præditis; sporulis ex ellipsoideo ovoideis, 22-26 \approx 12-14, utrinque rotundatis, diu unilocularibus, demum trasverse uniseptatis, obscure castaneo-brunneis; sporophoris cylindraceis, 10-22 \approx 2,5, rectis, hyalinis.

Hab. in ramis emortuis *Asphodeli microcarpi*, prope Ulcinj Montenegro.

54. **Diplodia Pappiana** Bacc., Funghi Eritr., Ann. Bot. v. IV (1906) 6893 p. 276. — Pycnidiis gregariis in maculis aridis et latis, sub epidermide demum lacerata nidulantibus, atris, 300-400 μ . diam., globosis, ostiolo minime prominulo; sporulis ellipticis, castaneo-fuscis, 6-8 \approx 3,5-4,5, ad septum non constrictis.

Hab. in foliis *Sansevieræ* sp. in Montibus Arbarobu et Mohdet, Colonia Eritræa, 2200 m. alt. (PAPPI).

55. **Diplodia fructus-Pandani** P. Henn., Hedwigia XLVII (1908) p. 6894 264. — Pycnidiis gregariis cæspitosis, globulosis, atris; sporulis ellipsoideis v. ovoideis utrinque obtusis, medio 1-septatis, haud constrictis, atris 20-26 \approx 10-12; sporophoris hyalinis 6 \approx 3.

Hab. in squamis fructus Pandani *luzonensis*, Luzon, Prov. Bataan, Lamao, Ins. Philippin (MERRILL).

56. **Diplodia Simmonsii** Rostr., Rep. second, Norweg. arctic Exped. 6895 Fram, (1906) p. 8. — Pycnidiis minutissimis, dense gregariis, globosis, atris, 0,1-0,2 mm. cr., foliicolis, innatis, contextu, parenchymatico, fusco; sporulis oblongis v. ellipsoideis, 1-septatis, fuligineis, 12-19 \approx 6-9.

Hab. in foliis *Luzulæ arenatae*, E. Fram's Haven Norvegiae.

57. **Diplodia Oryzæ** I. Miyake, Pilze Reispfl. Japan in Journal Colleg. 6896 Agricult. Tokyo, II (1910) p. 258, t. XIV, f. 53-54. — Pycnidiis nigris, globosis, subepidermicis, ostiolo papilliformi apertis, 90 μ . diam.; sporophoris parvis, 3-6 \approx 1, hyalinis; sporulis ellipsoideis, fusoideis v. cylindraceis, apice rotundatis, fuligineis, medio septatis ibique non v. parum constrictis, 7,5-9 \approx 2,5-3.

Hab. in foliis glumisque *Oryzæ sativæ*, in Japonia.

58. **Diplodia Agrostidis** Saccardo, Not. Myc. VI, Ann. Myc. III (1905) 6897

p. 513. — Pycnidiis hinc inde dense gregariis, sub culmi vaginis præsertim nidulantibus dein expositis et globoso-conoideis, $\frac{1}{4}$ mm. diam., nigris, glabris, ostiolo papillato; sporulis ellipsoideo-oblongis, 1-septatis, non constrictis, utrinque obtuse tenuatis, 22-25 \times 6,5-7, diu hyalinis, dein fuligineis; sporophoribus bacillariis 25-30 \times 2.

Hab. in culmis, præsertim ad nodos, *Agrostidis albæ*, Monello (Treviso) Ital. bor. — Affinis *Diplodiæ Maydis*.

59. **Diplodia maculans** Miyake et Hara in Bot. Mag. Tokyo (1910) 6898
p. (353) [japonice].

Hab. in *Bambusæ* sp. in Japonia.

60. **Diplodia? maydicola** Speg., Myc. Argent. V p. 370 in Annales 6899
Mus. Nac. Buenos Aires XX (1910). — Pycnidiis prope nodos præcipue confertis, erumpenti-subsuperficialibus, sublenticularibus, 150-180 μ . diam., glabris, carbonaceis, minute ostiolato-papillatis, contextu opaco indistincto; sporulis subcylindraceis utrinque leniter attenuatis subacutiuscule rotundatis, 24-26 \times 5-7, ad medium uniseptatis, non v. leniter coarctatulis, saepe nonnihil inæquilateralibus, loculis æquilongis non v. minute biguttulatis, fusco-fumosis.

Hab. ad culmos dejectos putrescentesque *Zeæ Maydis* in arvis Villa Elisa, prope La Plata Argentinæ, Amer. austr. — Species sporularum fabrica a typo nonnihil desciscens.

61. **Diplodia Zeæ** (Schw.) Lév. Ann. Sc. Nat., Bot. (1848) p. 258. — 6900
Sphaeriæ Zeæ Schw. Syn. Fung. Car. p. 207 (1822), ex Curr. Simpl. Sphaer. n. 358. — Ita vocanda *Diplodia Maydis* (Berk.) Sacc. Syll. III p. 326 = *Sphaeria Maydis* Berk. in Lond. Journ. Bot. (1847) p. 326. — Exempl. *Sphaeriæ Zeæ* Berk. herb. (non Schw.) *Diaporthes* speciem sistunt; sed verisimiliter species commixtae occurunt. Cfr. Wilcox et Pool in XXII Ann. Rep. Nebraska Agric. Exp. St. (1909) t. I-X. — Huc quoque spectat *Hendersonia Zeæ* (Schw.) Hazsl. Math. Termész Közlem. X (1872) p. 48, tab. II, fig. 7.

DIDYMOSEPIELLA Trav. et Migliardi, Flora Micol. prov. Venezia, p. 14 (1911) (Etym. a *Didymosporio* cuius est analogum genus). — Pycnidia sub epidermide nidulatia, vix erumpentia, depressa, astoma; excipulum membranaceum, multo tenuius in parte infe-

riore, ubi pycnidia subincompleta videntur. Sporulæ didymæ, fuscae, ad septum constrictæ, apicibus plerumque angustatæ. Sporophora nulla distincta. — Generi *Didymosporio* inter Melanconiaeas affinis, sed excipulum etsi tenue adest; a *Diplodia* quoque statim dignoscitur fabrica pycnidii et sporulis subsessilibus.

1. **Didymosporiella Æluropodis** Trav. et Migliardi l. c. p. 14 tab. 6901 1, fig. 1. — Pycnidiis sparsis, epidermide initio tectis deinceps erumpentibus, lenticularibus, atris, subastomis, 180-220 \times 80-100; excipulo tenui, in parte inferiore fere indistincto et dilute melleo, in parte superiore crassiusculo sed spurio, fuligineo-atro, astomo; sporulis ellipsoideis, utrinque distincte attenuatis, ad septum valde constrictis, fuligineis, 22-25 \times 10-12, episporio levi vel interdum leviter verruculoso; sporophoris nullis distinctis.

Hab. ad basim culmorum putrescentium Æluropodis litoralis, prope Mestre ad litus venetæ Lacunæ, Ital. bor.

MICRODIPLODIA Allesch. — Syll. XVIII p. 323.

1. **Microdiplodia ascochytula** (Sacc.) Allesch. Deut. Krypt Fl. VII 6902 p. 88, Potebnia in Ann. Myc. V (1907) p. 17, t. 3, f. 31. — *Diplodia ascochytula* Sacc. — Syll. III p. 345.

Hab. in ramis Lonicerae sp. quoque in Rossia.

2. **Microdiplodia Thalictri** Sacc., Ann. Mycol. VI (1908) p. 566. — 6903 Pycnidiis laxe gregariis, erumpentibus, globulosis, obtusis, nigris, 200 μ . diam.; sporulis tereti-oblongis, rectiusculis, utrinque rotundatis, 1-septatis, non constrictis, 4-guttatis, dilute olivaceis, 12-14 \times 4, subsessilibus, nempe sporophoris vix 1 μ . alt. suffultis.

Hab. in caulis emortuis Thalictri sp. in silvis Lyndonville N. Y. (FAIRMAN). — Socia adest *Didymosphaeria Thalictri* (cfr.) quæ verisimiliter est st. ascophorus.

3. **Microdiplodia Spirææ** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 358. 6904 — Pycnidiis epidermide tectis, sparsis, erumpentibus, sphæricis, apice ostiolo minuto papillatis, nigris; sporulis initio hyalinis et continuis, dein flavis, demum brunneis, medio 1-septatis, ad septa non v. leviter constrictis, 10-12 \times 4-5.

Hab. in ramulis emortuis Spirææ crenatae, Kecskemét Hungariæ.

4. **Microdiplodia Alpataci** Speg., Myc. Argent. V, p. 369, in An. Mus. 6905 Nac. Buenos Aires XX (1910). — Pycnidiis primo epidermide tectis eaque delapsa cortice infuscato minute squamuloso insidentibus, sparsis v. hinc inde laxe gregariis, subglobosis, 120-150 μ .

diam., glabris, subcarbonaceis, contextu atro indistincto; ostiolo impresso minuto perforatis; sporulis ellipsoideo-cylindraceis, utrinque rotundatis, 8-12 \approx 3,5-5, ad septum non v. vix constrictis, levibus, fuligineis.

Hab. ad ramulos emortuos et aridos Prosopidis Alpataci in montanis Potrerillos prope Mendoza Argentina, Amer. austr.

5. **Microdiplodia valvuli** Fairm., Ann. Mycol. VIII (1910) p. 325. — 6906
Pycnidiis minutis, globosis v. sub-applanatis, erumpentibus, tandem superficialibus, sparsis, atris; sporulis piriformibus v. obovatis, plerumque ellipsoideis, utrinque rotundatis, primo continuis, tandem uniseptatis, ad sepimentum vix constrictis, brunneis, 6-9 \approx 4-6.

Hab. in leguminibus vetustis Robiniae Pseudacaciæ, Lyndonville N. Y. Amer. bor.

6. **Microdiplodia Larreæ** Speg., Myc. Argent. V, p. 369, in An. Mus. 6907
Nac. Buenos Aires XX (1910). — Pycnidiis plus minusve dense gregariis, cortice epidermide vestitis, primo tectis dein nudis, eaque cinerescenteque insidentibus, lenticularibus, 130-150 μ . diam., glabris, subcarbonaceis, minutissime papillato-ostiolatis; sporulis ellipsoideis, utrinque subacutiuscule rotundatis, 10-12 \approx 5-6, crassiuscule tunicatis, ad medium uniseptatis, non v. vix constrictulis, loculis æqualibus eguttulatis fuligineis.

Hab. vulgata ad ramos Larreæ nitidæ in præruptis montanis Cacheuta prope Mendoza, Argentina Amer. austr.

7. **Microdiplodia Xanthoceratis** Hollós, Ann. Mus. Nat. Hung. IV 6908
(1906) p. 358. — Pycnidiis epidermide tectis, erumpentibus, depresso-globosis, nigris, poro pertusis, 300-400 μ . diam., contextu parenchymatico; sporulis ellipsoideis, initio continuis et hyalinis, dein medio 1-septatis, ad septa non v. leniter constrictis, dilute umbrinis, 10-14 \approx 4-6, massa sporularum nigra.

Hab. in ramulis emortuis Xanthoceratis sorbifolii culti, Kecskemét Hungariæ.

8. **Microdiplodia Enotheræ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6909
p. 357, t. VIII, fig. 8. — Pycnidiis epidermide tectis, sparsis, depresso-globosis, fuscis, 400-500 μ . diam., contextu parenchymatico; sporulis initio hyalinis, dein flavidulis, medio 1-septatis, ad septa non v. vix constrictis, demum castaneo-umbrinis, 11-13 \approx 4,5-6.

Hab. in caulis siccis Enotheræ biennis prope Nagy-Körös Hungariæ.

9. **Microdiplodia Elæagni** Potebnia, Myc. Stud., in Ann. Myc. v. V 6910

(1907) p. 16, fig. 30 et Trav. Soc. Nat. Univ. Kharkow XXXIII (1907). — Pycnidiis immersis, epidermide initio tectis deinde erumpentibus, 250-350 \approx 200, flavo-brunneis, nucleo nigro præditis; sporulis subcylindricis, utrinque rotundatis, non truncatis v. paulo biscotiformibus, flavo-brunneis, 9-10,5 \approx 4-5; sporophoris brevisimis.

Hab. in ramis *Elæagni angustifolii*, Kharkov Rossia.

10. **Microdiplodia Piperorum** Bubák, Bull. Herb. Boiss., 2 sér., VI 6911 (1906) p. 482. — Pycnidiis sparsis, fortiter depresso-depressis, rotundatis, 200-220 μ . latis, 150-160 μ . altis, crassiusculis, nigris, contextu nigro, in cortice nidulantibus, demum collo brevi erumpentibus; sporulis ex ovoideo elongatis, 6,5-9 \approx 2,5-4, utrinque rotundatis v. raro basi angustatis, medio transverse uniseptatis, constrictis, obscure castaneo-brunneis.

Hab. in caulis siccis *Scrophulariæ heterophyllæ* in Piperska Lukavica Montenegro.

11. **Microdiplodia Visci** (DC.) A. Pot. Ann. Mycol. VIII (1910) p. 63. 6912 — Ita vocanda *Diplodia Visci* (DC.) Fries — Syll. X, p. 282. — Sporulæ 9-10 \approx 3,5-4. — Nascitur quoque in Rossia.

12. **Microdiplodia Alkannæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 6913 p. 356; tab. VIII, fig. 9. — Pycnidiis epidermide tectis, sparsis, erumpentibus, globosis, nigris, apice ostiolo minuto papillato, 120-170 μ . diam., contextu parenchymatico; sporulis ellipsoideis, medio 1-septatis, ad septum non constrictis, rarius biguttulatis, flavidobrunneis, 8-11 \approx 3,5-4.

Hab. in caulis siccis *Alkannæ tinctoriae* prope Nagy-Körös et Izsók Hungariæ.

13. **Microdiplodia Bryoniæ** (H. Zimm.) Sacc. et Trott., *Diplodia Bryoniæ* H. Zimmerm. in Verhandl. naturf. Ver. Brünn, XLVII (1908-1909) p. 39, t. I, f. 10 (extr.). — Pycnidiis 50-150 μ . diam., lenticularibus, nigris, pertusis, in maculis pallidis caulinis insidentibus; sporulis cylindraceo-fusoideis, brunneis, 11-13 \approx 4.

Hab. in caulis vivis *Bryoniæ dioicae*, Eisgrub Austriæ.

14. **Microdiplodia Phillyreæ** Bubák, Bull. Herb. Boiss., 2 sér., VI 6915 (1906) p. 481. — Pycnidiis amphigenis sparsis, globosis, 150-250 μ . latis, nigris, subepidermicis demum erumpentibus, contextu brunneo-nigro; sporulis elongato-ovoideis 6,5-9 \approx 4,5-5,5, utrinque rotundatis, medio transverse uniseptatis ibique non v. parum constrictis, obscure castaneo-brunneis.

Hab. ad gallas leneiculares foliorum *Phillyreae* mediæ pr.

Ulcinj Montenegro.

15. **Microdiplodia mafilensis** Speg., *Fungi Chilenses* (1910) p. 156, 6916 cum icon. — Pycnidiis plus minusve dense gregariis, superficialibus subglobosis, minutis, 90-120 μ . diam., atris, glabris, nitidulis, obsolete ostiolatis; sporulis ellipsoideis, medio 1-septatis, non v. leniter constrictulis, obscure fumosis, 8-12 \approx 4-6.

Hab. in ligno *Nothofagi* cujusdam, Mafil Chile Amer. austr.

16. **Microdiplodia betulina** P. Henn. *Hedw.* XLV (1905), p. 32. — 6917 Pycnidiis subcorticalibus, tectis, c. 1 mm. diam., atris, dein apice erumpentibus; sporophoris hyalinis, subulatis, 15-35 \approx 2,5-3; sporulis ellipsoideis, 2-guttulatis, medio crasse septatis, paullo constrictis, atris, 8-10 \approx 5-6.

Hab. in ramis siccis *Betulae albæ*, Michailowskoe Rossiæ.

17. **Microdiplodia Juglandis** Diedicke, *Ann. Mycol.* IV (1906) p. 415. 6918 — Pycnidiis circa ramum annulatim dispositis et peridermum coniformiter elevantibus, demum longitudinaliter erumpentibus, lenticularibus, ostiolo conoideo præditis; sporophoris indistinctis, minutis; sporulis fere cylindraceis, apice rotundatis, bilocularibus, non constrictis, brunneis, 10-13 \approx 4.

Hab. in ramo *Juglandis regiae*, Schwellenburg Thuringia.

18. **Microdiplodia Ephedræ** Hollós, *Ann. Mus. Nat. Hung.* IV (1906) 6919 p. 357. — Pycnidiis epidermide tectis, sparsis, depresso-globosis, nigris, apice perforatis, 90-140 μ . diam., contextu parenchymatico; sporulis ellipsoideis, medio 1-septatis, ad septa non v. vix constrictis, fuscis, 10-12 \approx 5-6.

Hab. in ramis emortuis *Ephedrae distachyæ*, prope Kecskemét Hungariæ.

19. **Microdiplodia Anthurii** Trinchieri, *Rend. R. Ac. Sc. Fis. Matem.* 6920 Napoli (1909) fasc. 3-4, marzo-aprile p. 91. — Pycnidiis amphigenis, dense gregariis, primum epidermide velatis, demum suberumpentibus, globulosis, pertusis, nigris, 110-147 μ . diam., 110-122 μ . altis; excipulo valido, parenchymatico, brunneo præditis; sporophoris nunquam visis; sporulis oblongis, utrinque obtusis v. rarius leniter acutis, quandoque curvulis deformatisve, 1-septatis, non vel vix constrictis, brunneis, 9-14,5 \approx 2-4,5.

Hab. in maculis magnis aridisque *Phyllostictæ Cavaræ* Trinch., ad folia viva *Anthurii crassinervii*, culti in calidario Horti regii botanici neapolitani, Ital. austr.

20. **Microdiplodia Tofieldiæ** Diedicke, *Ann. Mycol.* IV (1906) p. 415. 6921

— Pycnidiis in maculis amphigenis pallescentibus insidentibus, epidermide inflata tectis dein erumpentibus, subglobosis, contextu parenchymatico, cellulis circa ostium obscurioribus; sporophoris inconspicuis; sporulis ex ellipsoideo ovoideis, flavo-brunneis, bilocularibus, medio non v. parum constrictis, 8-10 \approx 4-5.

Hab. in foliis emortuis *Tofieldiæ calyculatæ*, Delitzsch Thuringia.

21. **Microdiplodia melaspora** (Berk.) Griff. et Maubl., Bull. Soc. Myc. 6922

Fr. XXV (1909) pag. 55. — Ita vocanda est *Darluca melaspora* Berk. (*Coniothyrium* Sacc. Syll. III, p. 319). Ejus diagn. emendata hæc est: — Pycnidiis minutis, sparsis, nigris, immersis, depresso-depressis, 250-300 μ . diam., ostiolo minuto prominulo; sporulis ovoideis, obscure fuligineis, 1-septatis, haud constrictis, 6-10 \approx 5-6.

Hab. in culmis *Sacchari officinarum*, Porto Rico.

22. **Microdiplodia valdiviensis** Speg., Fungi Chilenses (1910) p. 157. 6923

— Maculis infuscatis linearibus 0,5-1 mm. long., 250-500 μ . lat.; pycnidiis ligno immersis, subglobosis, 100-120 μ . diam., epidermide infuscata tectis, seriatim gregariis, atris, carbonaceis minute papillulato-ostiolatis; sporulis subcylindraceis, medio 1-septatis, non constrictis, parvis, olivaceis, 10-12 \approx 3; sporophoris hyalinis, conoides, 5-6 \approx 2-5.

Hab. in caulis siccis *Chusqueæ valdiviensis* prope Bahia de Corral, Chile Amer. austr.

DIPLODIELLA Karst. — Syll. III p. 375, XI p. 521, XIV p. 940, XVII p. 923, XVIII p. 328.

1. **Diplodiella Silenes** Hollós, Ann. Mus. Nat. Hungar. VII (1909) 6924

p. 55. — Pycnidiis crustaceo-aggregatis, superficialibus, globoso-depressis, atris, glabris, nitidis, papillatis, 180-240 μ . diam., contextu celluloso; sporulis ellipsoideis, utrinque apice obtusis, medio 1-septatis, non v. vix constrictis, biguttulatis, brunneis, 10-12 \approx 3,5-4.

Hab. in caulis siccis decorticatis *Silenes Otitis* prope Kecskemét Hungariæ.

2. **Diplodiella Tamaricis** Maubl. Bull. Soc. Mycol. de France XXII 6925

(1906) p. 66. — Pycnidiis gregariis, nigris, superficialibus, 200-250 μ . diam.; sporulis oblongis medio septatis, non v. vix constrictis, saepe inaequilateralibus, utrinque obtusis, eguttulatis, fuligineis, 10-12 \approx 5; sporophoris rectis, brevibus.

Hab. in ramis decorticatis *Tamaricis*, Pornic Galliae.

3. **Diplodiella Cocculi** S. Da Camara, Bol. Soc. Broteriana, XXV (1910) 6926

Extr. p. 17. — Pycnidiis subglobosis, atris, sparsis, immersis, primo tectis demumque erumpentibus, papillatis, 150-200 μ . diam.; sporulis cylindraceis v. ovoideis, dilute melleis, uniseptatis, non v. vix constrictis, utrinque rotundatis, saepe basi truncatis, biguttulatis, 7-10 \times 3-4.

Hab. in ramulis Cocculi laurifolii in horto botanico Coimbra Lusitaniæ (A. MOLLER).

4. **Diplodiella Actinonema** (Schulz.) Sacc. et Trav. Syll. XIX p. 608 6927

(*Diplodia*), *Sacidium Actinonema* Schulz. v. Mügg. in Verh. zool.-bot. Ges. Wien (1871) p. 1252, t. 13, f. 33. — Pycnidiis hinc inde dense gregariis hemisphærico-conoideis, superficialibus, 250-350 μ . diam., basi hyphulis brevibus brunneis cinctis, apice poro pertusis, nigris; sporulis irregularibus, ellipsoideis v. ellipsoideo-oblongis, rectis v. curvulis, 1-septatis, non constrictis, fuligineis, 15-26 \times 7-11.

Hab. in ramis decorticatis Cydoniæ vulgaris in Hungaria.

5. **Diplodiella Fruticosæ** A. Zimmermann in Verhandl. naturf. Ver. 6928

Brünn, XLVII (1909) p. 41, t. I, f. 8 (extr.). — Pycnidiis 110-150 μ . diam., lenticularibus v. hemisphæricis, apice impresso pertusis, ostiolo 20 μ . lato, contextu parenchymatico, fusco-nigris; sporulis 10-14 \times 4-5, cylindraceis v. piriformibus, subfuscis.

Hab. ad ramos inflorescentiæ, mortuos decorticatos, Amorphæ fruticosæ prope Eisgrub Austriæ.

6. **Diplodiella Pseudo-sphæropsis** R. Maire, Not. Myc., Ann. Myc. v. 6929

IV (1906) p. 330. — Pycnidiis nigris lignicolis, superficialibus, subglobosis, apice obsolete papillatis et pertusis, circ. 0,1-0,2 mm. diam.; sporulis oblongis vel oblongo-cylindraceis, 26-40 \times 12-18, episporio levi, brunneo, plasmate parietali granuloso, sero in medio septatis; sporophoris brevibus cylindraceis, tandem brunneis.

Hab. in ligno putrescente Pini silvestris, Prosnes, Marne Galliæ (E. BERLAND).

7. **Diplodiella Ampelodesmi** (R. Maire) Sacc. — *Diplodia Ampelodesmi* 6930

R. Maire, Bull. Soc. Mycol. Fr. t. XXI (1905) p. 214, f. 1. — Pycnidiis immersis, 100-300 μ . diam., ostiolo nigro, papilliformi exerto, plus minusve irregulari; sporulis flavo-brunneis, ovoideis v. fusoideis, ad septum haud constrictis, levibus, 8-13 \times 3-6, sporophoris brevibus, simplicibus, hyalinis suffultis.

Hab. in calamis emortuis Ampelodesmi tenacis, Chateau de Bellvez in ins. Balearibus.

8. **Diplodiella Oryzæ** I. Miyake, Pilze Reispfl. Japan Journal College Agricult. Tokyo, II (1910) p. 259, t. XIV, f. 55-56. — Pycnidiis superficialibus, parietibus pseudoparenchymaticis tenuibus constitutis, globosis, v. ellipsoideis, 120-220 μ . diam., 120-180 μ . altis, obscure brunneis; sporophoris parvis; sporulis brunneis, fuscoideis, uniseptatis, 9-13 \approx 2,5-3.

Hab. in foliis et glumis Oryzæ sativæ, Gotenba Nara Japoniæ.

CHÆTODIPLODIA Karst. — Syll. III p. 374, X p. 292, XI p. 521, XIV p. 940, XVIII p. 330.

1. **Chætodiplodia grisea** Petch, Ann. Roy. Bot. Gard. Peradeniya III Pt. I (1906) p. 6. — Pycnidiis minutis, nigris discretis, prominentibus, epidermide tectis, deinde erumpentibus, 250-400 μ . diam., in maculis brunneis insidentibus, pilis erectis, olivaceis, septatis, 70-180 μ . long. ornatis; ostiolis circ. 40 μ . diam.; sporulis primum continuis, hyalinis, cirro albido ejectis, deinde ellipsoideis, uniseptatis, 24-28 \approx 13-14, fusco-griseis, pariete circ. 8 μ . cr.; sporophoris circ. 10 μ . long.; paraphysibus internis 30-50 μ . long., linearibus.

Hab. in fructibus emortuis Theobromæ Cacao et in plantulis Heveæ brasiliensis, Ceylon.

2. **Chætodiplodia velata** Rota-Rossi, III Contr. Mic. Bergamo, Atti R. Ist. bot. Pavia ser. II. v. XIII p. 203 Extr. (1907). — Pycnidiis gregariis peridermio fisso erumpentibus, majusculis, 330-400 μ . diam., atris, globoso-conoideis sed aliquando plane truncatis, simplicibus v. spurie plurilocularibus, pilis primo prælongis numerosisque et quasi comam albidulam simulantibus, dein fuscidulis et tamquam setulis rigidulis præditis, contextu distinete parenchymatico; sporulis ellipsoideis, obtusis, fuligineis, medio 1-septatis, non v. parum constrictis, 18-24 \approx 7-9; sporophoris distinctis, bacillaribus 12-16 μ . long.

Hab. in ramulis corticatis emortuis Mori albae prope Cisano Bergamo Ital. bor.

BOTRYODIPLODIA Sacc. — Syll. III p. 377, X p. 294, XI p. 522, XIV p. 941, XV p. 924, XVIII p. 331.

1. **Botryodiplodia aromatica** Spæg., Fungi Chilenses (1910) p. 159. 6934

— Pycnidiis hinc inde parce gregariis (3-8), per corticem erumpentibus, subglobosis, 120-150 μ . diam., subcarbonaceis, minute obsoleteque ostiolatis; sporulis ellipsoideis v. obovatis, utrinque obtusis, 20-26 \times 12-14, subopace fuligineis, 1-septatis, saepius constrictulis.

Hab. in ramis emortuis siccis arbusti cuiusdam aromatici (? *Laureliae* sp.) in silvaticis Cerro Caracol de Concepcion Chile Amer. austr.

2. **Botryodiplodia Lithrææ** Speg., *Fungi Chilenses* (1910) p. 159. — 6935
Pycnidiis hinc inde pauci-cæspitosis (5-8), per corticem pustulatim erumpentibus, subglobosis, 150-180 μ . diam., atris, subcarbonaceis, minute papillato-ostiolatis; sporulis mediocribus opace fuligineis, 1-septatis, ellipsoideis v. obovatis, 28-32 \times 13-15, non v. vix constrictulis.

Hab. in ramis emortuis siccis *Lithrææ causticæ* in silvaticis Cerro Caracol de Concepcion Chile Amer. austr.

3. **Botryodiplodia Ingæ** Syd., *Hedwigia* XLIX (1909) p. 83. — Stro- 6936
matibus valsiformibus peridermio pustulatim elevato tectis, plerumque confertis, forma magnitudineque variabilibus, rotundatis v. elongatis, minutis v. majoribus, 0,5-2 mm. longis; pycnidiis v. loculis numerosis (10-20) in quoque stromate, globosis v. subglobosis, 120-200 μ . diam., intus pallidis; sporulis ellipsoideis, utrinque rotundatis, primo continuis, hyalinis, dein medio 1-septatis brunneis, non v. vix constrictis, tandem emissis et matricem atro-inquinantibus, 20-28 \times 10-16; sporophoris fasciculatis, hyalinis, 15-30 \times 1-2.

Hab. in leguminibus emortuis *Ingæ cinnamomeæ*, Para America austr. (C. F. BAKER).

4. **Botryodiplodia insitiva** Ranojevic, *Ann. Mycol.* VIII (1910) p. 6937
387. — Pycnidiis globosis, e stromate subcorticali orientibus, dein erumpentibus, supra liberis v. congestis, brunneo-nigris, contextu pseudoparenchymatico, flavo-brunneo, uni- v. plurilocularibus, usque ad 600 μ . lat.; sporulis elongatis, ellipsoideis, utrinque rotundatis, rectis, raro subincurvatis, bilocularibus, raro constrictulis, in quoque loculo uniguttulatis, flavo-brunneis, massam nigrescentem in pycnidio efficientibus, 8-15 \times 4-6; sporophoris numerosis, sporulis brevioribus, apice attenuatis, hyalinis.

Hab. in ramis siccis *Gleditschia* *Triacanthi* prope Belgrad, Serbia. — A *Botr. Gleditschia*, sporis minoribus diverse coloratis, etc. distincta.

5. **Botryodiplodia valdiviana** Spieg., Fungi Chilenses (1910) p. 160 6938 cum. icon. — Pycnidiis cæspitosis, pauci-gregariis, constipatis, substantia stromatica parca connexis, epidermide primo integra subllevata nigrificata tectis, dein erumpentibus, plus minusve exertis, atris, subcarbonaceis, subglobosis, 150-200 μ . diam., papillato-ostiolatis; sporulis cylindraceis, ellipsoideis v. obovatis, utrinque rotundatis, 25-30 \times 12-16, opace fuligineis, medio uniseptatis, plus minusve constrictulis.

Hab. in sarmenis emortuis Rubi sancti prope Ciudad de Valdivia, Chile Amer. austr.

6. **Botryodiplodia Elasticæ** Petch, Ann. Roy. Bot. Gard. Peradeniya III (1906) p. I, p. 7. — Per corticem in acervulos lineares v. rotundatos 1,5-2 mm. diam. erumpens; pycnidiis 0,25-0,4 mm. diam., polygoniis; sporulis 25-30 \times 14-15, ovoideis, uniseptatis, violaceo-brunneis, pariete et septo crasso; paraphysibus numerosis, linearibus, 40-80 μ . long.

Hab. in radicibus plantularum Heveæ brasiliensis nec nou in cortice vulnerato Castilloæ elasticæ, Ceylon.

7. **Botryodiplodia Batatæ** P. Henn., Engl. Jahrb. XXXVIII (1905) 6940 p. 116. — Pycnidiis tubericolis, cæspitose erumpentibus confluentibusque, atro-carbonaceis; cæspitulis pulvinatis usque ad 5 mm. diam.; sporophoris hyalinis, filiformibus, 10-16 \times 3; sporulis ellipsoideis, interdum ovoideis, primo hyalinis, continuis, intus granulatis, dein medio 1-septatis, vix constrictis, atris, 18-24 \times 10-14.

Hab. in tuberibus Batatæ edulis, Usambara Africæ (STUHLMANN).

8. **Botryodiplodia Marantæ** Spieg., Myc. Argent. V p. 371, in An. 6941 Mus. Nac. Buenos Aires XX (1910). — Pycnidiis hinc inde botryose aggregatis, cæspitulis 2-7 mm. diam., 1 mm. cr. stromate parco conjunctis, subglobosis, 120-150 μ . diam., carbonaceis, ?astomis; sporophoris bacillaribus, 7-11 \times 1.5-2, hyalinis, monosporis, constipatis, paraphysibus filiformibus, triplo-quadruplove longioribus commixtis; sporulis ellipsoideis v. obovatis, 18-22 \times 10, primo continuis hyalinis dein 1-septatis non constrictis, loculis æquilongis, plus minusve intense fuligineis

Hab. ad rhizomata putrescentia Marantæ arundinaceaæ cultæ, Santa Ana Misiones Argentina Amer.-austr.

9. **Botryodiplodia Ribis** (Sacc.) Namysl. — Teste Namyslowski in 6942 Kosmos XXXIII (1908) p. 328, ita vocanda est *Haplosporella Ribis* Sacc. — Syll. III p. 324.

LASIODIPLODIA Ell. et Ev. — Syll. XIV p. 939, XVI p. 924.

1. **Lasiodiplodia Theobromæ** (Pat.) Griff. et Maub., Bull. Soc. Myc. 6943

Fr. XXV (1909) p. 57, *Botryodiplodia Theobr.* Pat., *Macrophoma vestita* Prill. et Del., *Diplodia cacaoicola* Henn., *Lasiodiplodia nigra* Appel et Laub. Griffon et Maublanc (l. c.) hanc diagn. præbent. — Stromatibus nigris, contextu celluloso, primum immersis, erumpentibus, magnitudine variabilibus, intus loculis plus minusve numerosis (rarius loculo unico) globulosis v. piriformibus, poro pertusis, superficie pilis septatis 5 μ . cr., rectis v. flexuosis vestita; sporulis ovoideis, primum hyalinis, granulosis, demum brunneis, 1-septatis, non constrictis, 20-30 \times 11-15; sporophoris brevibus, rectis, crassis; paraphysibus numerosis, elongatis, hyalinis, apice paullulum incrassatis, usque ad 70 μ . long.

Hab. in fructibus ramis radicibusque *Theobromæ Cacao*, in radicibus *Albizziæ Moluccanæ*, in culmis *Sacchari officinarum* (HOWARD), in fructibus *Mangiferæ indicæ* (CHARLES), in ramis *Caricæ* (APPEL et LAUBERT) etc. in regionibus tropicibus.

2. **Lasiodiplodia nigra** Appel et Laubert, Arb. K. Biol. Anst. f. Landw. 6944

Forstwirtschaft, V, Heft III (1905) p. 147 cum icon. — Mycelio breviter articulato, brunneo; pycnidiiis plerumque numerosis in parte exteriori stromatis verruciformi efformatis; sporulis 28-33 \times 18-21; sporophoris simplicibus; paraphysibus numerosis immixtis 25 \times 4-5.

Hab. in ramis languidis *Theobromæ Cacao* et *Caricæ* in ins. Samoa. — Test. Griffon et Maublanc species non differt.

Lasiodipl. Theobromæ (Pat.) Griff. et Maubl.

3. **Lasiodiplodia Fiorii** Baccarini, N. Giorn. bot. it. (1910) p. 165. — 6945

Pseudostromate atro, crustaceo, subcutaneo-erumpente, late effuso, ramos ambiente, scabro; pycnidiiis monostichis, pseudostromate insidentibus vel subimmersis, plerumque densissime stipatis, rugulosis subrotundis vel mutua pressione irregularibus, lanosis, dein calvis, 200-300 μ . latis, ostiolis breviter papillatis; sporulis initio unicellularibus atque hyalinis, dein atro-brunneis ac didymis, utrinque rotundatis, ad septum non constrictis, 24-26 \times 12-15; paraphysibus filiformibus simplicibus longe superantibus.

Hab. in truncis *Modeccæ abyssinicae* Hochst. in Erythræa.

4. **Lasiodiplodia Thomasiana** Sacc. in Ann. Mycol. VI (1908) p. 586 — 6946

Pycnidiiis amphigenis subcutaneo-erumpentibus, prominulis, globo-

sis, obtuse papillatis, 300-400 μ . diam., modo solitariis, modo paucis coacervatis, fusco-nigricantibus, pilis longi mollibus, septatis, simplicibus v. parce ramosis, 150-200 \approx 4-5, dilute fuligineis; contextu denso atro-fuligineo; sporulis elliptico-oblongis v. leviter clavulatis, initio continuis, hyalinis et valde refringentibus dein 1-septatis, non v. vix constrictis, 28-30 \approx 11-12; sporophoribus bacillaribus, hyalinis, 15-20 \approx 2; paraphysibus intermixtis prælongis, 80-90 \approx 1,5 apice paullo crassioribus.

Hab. in foliis Heptapleurii Barteri (Aral.). Roca Sandade, S. Thomé, altit. 700 m., Africa (Ad. MOLLER). — A *L. tubericola* præter habitationem, diagnoscitur paraphysibus duplo longioribus, sporulis longioribus et pseudostromate minus manifesto.

5. **Lasiodiplodia abnormis** Trav. et Spessa in litteris. — Pycnidiiis 6947 aterrimis hinc inde gregariis, primum, ut videtur, epidermide tectis, sed mox nudatis superficialibusque, globosis, atris, minutis, 160-200 μ . diam. subiculo crustoso ex hyphis ramosis, intricatis, parce septatis, umbrino-isabellinis, 4-5 μ . diam. constituto insidentibus, contextu atro-fuligineo, subcarbonaceo; sporulis ellipsoideo-ovoideis, initio et diu hyalinis, continuis, granuloso-farctis, dein septatis, ad septum non vel leniter constrictis, fulvo-fuligineis, 25-28 \approx 13-15; sporophoribus brevibus cylindraceis.

Hab. in fructibus dejectis et marcescentibus Pandani thomensis, Rodia in insul. S. Thomé, alt. 550 m. — A *L. tubericola* plurimis notis valde differt et præcipue ob pycnidia stromate nullo inclusa et ob defectum paraphysium distinctarum. Ad hoc genus tamen pertinere videtur. Certe a *Diplodia Pandani* valde diversa, nec cum ea comparanda.

Sect. 4. Hyalodidymæ.

ASCOCHYTA Lib. — Syll. III p. 384, X p. 295, XI p. 522, XIV p. 942, XVI p. 925, XVIII p. 335.

I. *Eu-Ascochyta*. Sporulæ hyalinæ.

1. **Ascochyta carinthiaca** Jaap, Ann. Mycol. VI (1908) p. 219. — Maculis magnis, paucis, amphigenis, rotundatis v. subellipticis, 0,5-1,5 cm. latis, brunneis deinde medio cinerescentibus, aureola brunnea

circumdati, zonati; pycnidii epiphyllis, indistincti, paullo prominentibus, globosis, brunneis; sporulis cylindraceis, rotundatis, 2-cellularibus, non v. modice constrictis, guttulis numerosis, plerumque 2-6 præditis, hyalinis $14-20 \approx 3,5-5$.

Hab. in foliis Ranunculi Thoræ Jovansteig prope Eisenkappel in Karawanken, Carinthia.

2. **Ascochyta Vodákii** Bubák, Beitr. Pilzfl. Ung., in Növénytani Közlemények (1907) Heft 4, Extr. p. 32. — Maculis epiphyllis utrinque visilibus, sparsis, saepe confluentibus, rotundatis v. rotundato-sinuatis, brunneis, dein brunneo-nigris, concentrice zonatis, anguste pallideque marginatis, areola flavo-viridi v. macula irregulari brunnea saepe magna circumdati; pycnidii epiphyllis subepidermicis, globosis v. depresso-punctatis, pallide brunneis, subpellucidis, 120-180 μ . diam., contextu flavidio indistincte parenchymatico, ostiolo brevi distincto erumpenti; sporulis cylindraceis $14-22 \approx 4-4,5$, rectis, utrinque rotundatis, medio transverse uniseptatis, non constrictis, minute et grosse guttulatis, hyalinis; sporophoris brunneolis, conoideo-papilliformibus.

Hab. in foliis vivis Hepaticæ trilobæ in M. Domugled prope Herculesfurdö Hungariæ et prope Stadt Opocno Bohemia.

3. **Ascochyta Aquilegiæ** (Roum. et Pat.) Sacc. — Syll. III, p. 306 — 6950 Quoad ejus synonymiam cfr. v. Höhn. Ann. Mycol. 1905 p. 406. — Sporulæ 8-17 \approx 3-5, oblongæ, singulatim visæ hyalinæ, interdum continuæ, typice 1-septatae, rarius 2-septatae.

Hab. in foliis Aquilegiæ vulgaris, in Germania et Gallia.

4. **Ascochyta Lepidii** Hollós, Ann. Mus. Nat. Hung. VI (1908) p. 531. 6951 Pycnidii amphigenis, gregariis, epidermide velatis, lenticularibus, brunneis, poro pertusis, 70-100 μ . diam., contextu celluloso; sporulis oblongo-ellipsoideis, medio 1-septatis, non constrictis, biguttulatis, hyalinis, $12-14 \approx 3,5-4$.

Hab. in foliis languidis Lepidii ruderis prope Kecske-mét Hungariæ.

5. **Ascochyta rusticana** Kab. et Bub. in Hedw. L (1909) p. 41. — Maculis amphigenis, variæ magnitudinis, rotundo-ellipticis, raro oblongis, 0,5-2 cm. lat., ochraceis v. brunneis, centro expallentibus et rimosis, saepe obscurius limbatis, saepe confluentibus et magnam folii partem v. totum folium occupantibus; pycnidii copiosis, sparsis, rarius gregariis v. confertis, lenticularibus, 150-270 μ . d., brunneis, contextu tenui laxè celluloso, brunneo; sporulis copiosis, cylindricis, $16-18 \approx 3,5-4,5$, rectis curvulivis, utrinque rotun-

datis, initio continuis, granulosis, mox 1-septatis, non constrictis, hyalinis, pluriguttulatis; sporophoris papilliformibus.

Hab. in foliis *Armoraciæ rusticæ*, Turnau Bohemiæ.

— Ab *A. Armoraciæ* Fuck. certe diversa.

6. **Ascochyta Chelidonii** Kab. et Bub., Myc. Beitr., Hedwigia Bd. 6953 XLVI (1907) p. 290. — Maculis epiphyllis, majusculis, irreguläribus, arescendo brunneis v. nigricantibus; pycnidiiis epiphyllis, sparsis, immersis, epidermide tectis, e succineo brunneis, apice poro minuto apertis, contextu tenui parenchymatico; sporulis cylindraceis 10-22 \approx 4-6, rectis v. curvis, apice rotundatis, medio uniseptatis, ibique non v. modice constrictis, loculis quandoque inæqualibus, biguttulatis, hyalinis; sporophoris hyalinis v. flavidis, papilliformibus.

Hab. in foliis vivis *Chelidonii majoris*, Bohemia (KABAT).

— Socia sæpe adest *Septoria Chelidonii*.

7. **Ascochyta Fumariæ** Hollós, Ann. Mus. Nat. Hung. VI (1908) 6954 p. 530. — Maculis indeterminatis; pycnidiiis epiphyllis, sparsis, epidermide velatis, lenticularibus, brunneis, poro pertusis, 140-180 μ . diam., contextu celluloso; sporulis elliptico-fusoideis, subcylindraceis, utrinque rotundatis, rectis v. curvulis, 1-septatis, non constrictis, pluriguttulatis, hyalinis, 14-18 \approx 4-5,5, cellulis inæqualibus.

Hab. in foliis languidis *Fumariæ Schleicheri* prope Nagy-Körös Hungariæ.

8. **Ascochyta Cookei** Messee, Kew Bull. (1907) p. 241, fig. 5-6. — 6955 Pycnidiiis dense gregariis, inordinatis, in maculis elongatis lutescentibus nidulantibus, subepidermicis, globosis, ostiolo erumpentibus, 70-80 μ . diam., basi hyphis mycelialibus septatis, fuligineis præditis; sporulis hyalinis, medio septatis, non constrictis, cylindraceo-clavatis, 40 \approx 4-5, utrinque obtusis.

Hab. in foliis vivis *Dianthi barbati* culti in hortis Kew Angliæ (COOKE). — Ad gen. *Septoriam* vergit.

9. **Ascochyta pallida** Kab. et Bub., Hedwigia, XLVII (1908) pag. 6956 357; Fungi imp. exs. fasc. XI (1909) n. 572. — Maculis amphigenis, rotundatis v. irregularibus, pallide ochraceis v. pallide brunneis, non limitatis, magnitudine variabilibus, sæpe late confluentibus; pycnidiiis epiphyllis plerumque sparsis, quandoque gregariis v. confertis, epidermide tectis, ostioto minuto papilliformi erumpentibus, globoso-applanatis, pallide brunneolis, 100-190 μ . diam., contextu tenui parenchymatico, pallide brunneos; sporulis ex elongato cylindraceis, 6-9 \approx 3-4, utrinque rotundatis, rectis,

raro curvulis, medio transverse uniseptatis, ibique non v. leniter constrictis, hyalinis; sporophoris hyalinis, conoideo-papilliformibus.

Hab. in foliis vivis Aceris platanoidis fm. bicoloris prope Turnau Bohemia (KABAT).

10. **Ascochyta velata** Kab. et Bub., Myc. Beitr. Hedw. Bd. XLVI 6957 (1907) p. 293. — Pycnidiis epiphyllis in maculis sparsis v. gregariis confluentibusque immersis, epidermide pustuliformi tectis, demum poro papilliformi erumpentibus, lenticularibus, 120-220 μ . diam., e brunneo obscure brunneis, contextu parenchymatico, infra pallide brunneo supra brunneo; sporulis ellipsoideis v. elongatis, utrinque rotundatis, rectis v. curvulis, medio uniseptatis, non v. parum constrictis, 12-16 \approx 5-6,5, loculis quandoque inæqualibus, hyalinis, pluriguttulatis; sporophoris crassis, papilliformibus, supra late subhemisphæricis.

Hab. in foliis Aceris platanoidis et varietatum ejusdem prope Turnau Bohemia (KABAT).

11. **Ascochyta Tragiæ** Speg., Myc. Argent. V, p. 365, in An. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis suborbicularibus, 3-5 mm. diam., subindeterminatis, sordide fuscescentibus, centro per ætatem saepius arescenti-cinereis; pycnidiis centralibus paucis parenchymate innatis, epidermide velatis, lenticularibus, 75-80 μ . diam., tenuissime membranaceis, contextu indistincto olivaceo; sporulis ellipsoideo-subcylindraceis, utriusque rotundatis, 8-12 \approx 3-4, didymis, loculis saepius aequilongis, hyalinis.

Hab. ad folia viva Tragiæ geranifoliæ in pratis circa La Plata Argentina, Amer. austr.

12. **Ascochyta Mercurialis** Bres. - Syll. XVI p. 933 - var **autumnalis** Bub. et Kab. Hedw. L (1909) p. 40. — A typo differt tantum maculis diversis, nempe non eumorphis sed folia ab apice ad margines decolorantur et ex alutaceo læte brunnea fiunt et mox tota folia arescunt et cinerescunt, cetera eadem.

Hab. in foliis Mercurialis perennis pr. Turnau Bohemia.

13. **Ascochyta Evonymi** Kab. et Bub., Myc. Beitr. Hedwigia Bd. XLVI (1907) p. 290. — Maculis epiphyllis, usque ad 5 mm. latis, siccis, sordide albis, rotundatis, saepe tenuiter brunneo-marginatis; pycnidiis epiphyllis, sparsis v. gregariis, innatis, epidermide prominente tectis, demum poro papilliformi erumpentibus, lenticularibus, 80-100 μ . lat., pallide brunneis, contextu minute parenchymatico pallide flavo-brunneo; sporulis ellipsoideis v. breviter cylindraceis,

6-8 \approx 3-4, utrinque rotundatis, primum unilocularibus dein medio uniseptatis, non constrictis, hyalinis; sporophoris papilliformibus.

Hab. in foliis vivis *Evonymi vulgaris* prope Turnau Bohemia (KABAT). — Forsam huc ducenda est *Phyllosticta de-structiva* Desm.

14. **Ascochyta Æsculi** Kab. et Bub. *Hedwigia* XLVII (1908) pag. 6961 356; *Fungi imp. exsicc. fasc. XI* (1909) n. 509. — Maculis epiphyllis, irregularibus, magnis, late confluentibus, flavidis dein brunneis, saepe flavo-marginatis; pycnidiis epiphyllis, solitariis v. gregariis, quandoque circinantibus, subglobosis, e brunneo obscure brunneis, 80-120 μ . diam., immersis, epidermide tectis, ostio lo cylindraceo brevi erumpentibus, contextu parenchymatico pallide brunneo; sporulis numerosis, ellipsoideis v. cylindraceis, 12-22 \approx 6-8,5, utrinque rotundatis, rectis v. raro curvulis, transverse uniseptatis, ibique non v. parum constrictis, loculis saepe inæqualibus; sporophoris conoideo-papilliformibus, latis, sporulas subæquantibus, brunneis.

Hab. in foliis vivis *Æsculi Hippocastani* fm. bicoloris prope Turnau Bohemia (KABAT).

15. **Ascochyta grandimaculans** Kab. et Bub., *Myc. Beitr.*, *Hedwigia* 6962 Bd. XLVI (1907) p. 291. — Maculis epiphyllis, atro-flavidis v. alutaceis, infra pallide brunneis, magnis, irregularibus, rubro-purpureo marginatis; pycnidiis epiphyllis, sparsis, immersis, globosis, parum depresso, 70-120 μ . diam., brunneis v. nigro-brunneis, apice poro rotundo apertis, contextu parenchymatico, tenui, infra flavo-brunneo, supra obscure brunneo; sporulis ovoideis, ellipsoideis, plerumque vero cylindraceis, 4-7 \approx 2,5-3, hyalinis, utrinque rotundatis, primum unilocularibus, demum transverse uniseptatis; sporophoris brevibus hyalinis.

Hab. in foliis *Æsculi Hippocastani*, prope Turnau Bohemia (KABAT).

16. **Ascochyta Phellodendri** Kab. et Bub., *Myc. Beitr.*, *Hedwigia* Bd. 6963 XLVI (1907) p. 292. — Maculis epiphyllis, magnitudine variabilibus, rotundatis v. plus minus irregularibus, brunneis, saepe indistincte zonatis, centro arescentibus, frequenter anguste brunneo-marginatis, saepe late confluentibus et totum folium occupantibus; pycnidiis epiphyllis, sparsis, raro gregariis, immersis, epidermide tectis, poro minuto rotundato papilliformi erumpentibus, brunneis, globosis, 70-120 μ . diam., contextu tenui pseudoparenchymatico, pallide brunneolo; sporulis breviter cylindraceis, 6-

10 ~ 3,5, rectis v. curvulis, diu unilocularibus dein transverse uniseptatis, ibique non v. leniter constrictis, utrinque rotundatis, in quoque loculo 1-v. biguttulatis, hyalinis; sporophoris papilliformibus hyalinis.

Hab. in foliis vivis *Phellodendri amurensis* prope Turnau Bohemia (KABAT).

17. **Ascochyta Orobi** Sacc. — Syll. III p. 398 - var. **Onobrychidis** 6964 Prill. et Delacr. in Bull. Soc. Mycol. Fr. IX (1893) p. 272, t. 13, f. 5 5a. — Pycnidiis lenticularibus, brunneo-fulvis, 120-150 µ. diam., poro 40-45 µ. lato; sporulis hyalinis, 1-septatis, tenuiter guttulatis, 16 ~ 5-6, leviter constrictis, utrinque rotundatis, subinde curvulis.

Hab. in foliis *Onobrychidis sativæ*, socia *Ramularia Onobrychidis* in Gallia.

18. **Ascochyta Galegæ** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 6965 459. — Maculis irregularibus, fuscis; pycnidiis sparsis, epidermide velatis, brunneis, ellipsoideis, 200-250 ~ 120-180, poro pertusis, contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, medio 1-septatis, leviter constrictis, hyalinis, 14-16 ~ 4.

Hab. in foliis vivis *Galegæ officinalis* prope Kecskemet Hungariæ.

19. **Ascochyta Trigonellæ** Trav. et Spessa, Bol. Soc. Brot. XXV (1909) p. 180, t. III f. 21. — Pycnidiis in areolis subdecoloratis gregariis, punctiformibus, vix prominulis, globoso-depressis, $\frac{1}{6}$ - $\frac{1}{5}$ mm. diam., poro distincto circulari pertusis, contextu tenui melleo; sporulis cylindraceo-bacillaribus, medio septatis et non constrictis, rectis vel subcurvulis, hyalinis, sæpe varie guttulatis, 12-15 ~ 2 $\frac{1}{2}$ -3.

Hab. in caulibus exsiccatis *Trigonellæ (Meliloti)* cæruleæ in horto botanico conimbricensi Lusitaniæ (A. MOLLER).

20. **Ascochyta Rubi** Sacc. Ann. Mycol. VII (1909) p. 434. — Maculis suborbicularibus, minutis, 1-2 mm. diam., fusco-sanguineis, epiphyllis, non marginatis; pycnidiis paucis lenticularibus, poro pertusis, 70-80 µ. diam.; sporulis breve fusoideis, utrinque obtusulis, 10-11 ~ 2,5 3, medio septatis, non constrictis, hyalinis v. subhyalinis.

Hab. in foliis languidis *Rubi fruticosi* var. *discoloris* in Horto botanico Neapolitano, Ital. austr. (L. CUFINO).

21. **Ascochyta Pruni** Kabát et Bubák, Hedwigia XLVII (1908) p. 6968 358. — Maculis epiphyllis, rotundatis, rotundato-subpolygonis

v. indeterminatis, sæpe indistinctis, brunneis dein griseo-cinereis, siccis, sæpe latis, plerumque indistincte purpureo-brunneo marginatis; pycnidiis epiphyllis sparsis, confertis, v. etiam confluentibus, immersis, epidermide tectis, globoso-applanatis, 120-180 μ . diam., pallide brunneis, poro minuto papilliformi erumpentibus, contextu parenchymatico firmo, pallide brunneo v. flavidus; sporulis cylindraceis, 7-11 \times 3,5-4, utrinque rotundatis, raro curvulis, transverse uniseptatis, non v. leniter constrictis, hyalinis, biguttulatis; sporophoris latis, conoideo-papilliformibus, flavidis.

Hab. in foliis Pruni Padi, Turnau et prope Pelesan Bohemia (KABAT).

22. **Ascochyta Spirææ** Kab. et Bub. Hedwigia XLII (1908) p. 359; 6969

Fungi imp. exs. fasc. XI (1909) n. 515. — Maculis amphigenis rotundatis v. irregularibus, magnitudine variabilibus, singulis v. gregariis confluentibusque, obscure brunneis, sæpe plus v. minus distincte zonatis, plerumque immarginatis, raro purpureo-brunneo circumdatis; pycnidiis plerumque hypophyllis, raro epiphyllis, sparsis v. gregariis, quandoque subcircinantibus, immersis, epidermide diu tectis, erumpentibus, poro irregulari apertis, globoso-lenticularibus, 100-120 μ . diam., brunneis, contextu tenui parenchymatico; sporulis breviter cylindraceis, sæpe constricto-didymis 5-11 \times 3-4,5, rectis raro curvulis, transverse uniseptatis ibique non constrictis, utrinque rotundatis, hyalinis.

Hab. in foliis emortuis dejectis Spirææ chamaedryfoliæ prope Turnau Bohemia (KABAT).

23. **Ascochyta Malvæ** H. Zimmermann, in Verhandl. naturf. Ver. 6970

Brünn, XLVII (1908-1909) p. 37, t. I, f. 7 (extr.). — Maculis subrotundis, dilute ochraceis, postremo albidis, anguste saturatius marginatis; pycnidiis epiphyllis, sparsis, subvelatis, 150-200 μ . d., contextu brunneo, ostiolo 30 μ . lato, nigro-marginato; sporulis initio cylindraceis v. ovoideis, 6-9 \times 3-4, postea cylindraceis v. in medio coarctatis, 8-9 \times 3,5, uniseptatis.

Hab. in foliis vivis Malvæ neglectæ, Eisgrub Austriae.

24. **Ascochyta Abutilonis** Hollós, Ann. Mus. Nat. Hungar. VII (1909) 6971

p. 53. — Maculis utrinque conspicuis, subrotundis v. irregularibus, alutaceis, rubescenti-marginatis, 5-10 mm. diam.; pycnidiis epiphyllis, globoso-depressis, ochraceis, poro pertusis, 140-190 μ . d., contextu celluloso; sporulis elliptico-fusoideis, subinde curvulis, diu continuis, demum medio 1-septatis, non constrictis, hyalinis, 8-9 \times 3-4.

Hab. in foliis vivis *Abutilonis Avicennæ* prope Kecskemét Hungariæ.

25. **Ascochyta grandispora** Kab. et Bub., *Hedwigia XLVII* (1908) 6972 pag. 356; *Fungi imperf. exs. fasc. XI* (1909) n. 510. — Maculis epiphyllis, rotundatis v. subrotundato-incurvatis, 2-5 mm. diam., singulis v. paucis, sparsis, raro confluentibus, rubro-brunneis, ochraceis v. brunneis, parum distincte limitatis, anguste flavidо-marginalis; pycnidiis epiphyllis, sparsis, punctiformibus, immersis, poro minuto rotundato erumpentibus, globosis, 80-150 μ . diam., brunneis, contextu tenui parenchymatico, pallide brunneo; sporulis elongatis v. cylindraceis, 18-28 \times 6-10, rectis, utrinque rotundatis, transverse uniseptatis, ibique non v. leniter constrictis.

Hab. in foliis vivis *Symporicarpi orbiculati* prope Turnau, Bohemia (KABAT).

26. **Ascochyta Symphoriæ** Kabát et Bubák, *Hedwigia XLII* (1908) 6973 p. 359; *Fungi imp. exs. fasc. XI* (1909) n. 516. — Maculis epiphyllis, rotundatis v. irregularibus, magnitudine variabilibus, quandoque late confluentibus, e nigro-brunneis nigro-griseis, arescentibus, plerumque immarginatis; pycnidiis sparsis, immersis, epidermide tectis, poro minuto rotundato v. irregulariter erumpentibus, brunneis, globosis 65 μ . diam. v. lenticularibus 120-165 μ . latis, contextu parenchymatico pallide ochraceo; sporulis numerosis, cylindraceis, 8-13 \times 3-4, utrinque rotundatis, rectis v. raro curvulis, diu unilocularibus, demum transverse uniseptatis, non constrictis v. constricto-didymis, hyalinis, contextu granuloso.

Hab. in foliis vivis languentibus *Symporicarpi racemosæ* Turnau, Bohemia (KABAT).

27. **Ascochyta symphoricarpophila** Fairm. *Ann. Mycol.* (1910) p. 323. 6974 — Maculis brunneis, irregularibus plerumque marginalibus; pycnidiis minutis, epiphyllis, atris; sporulis ellipsoideis, utrinque rotundatis, uniseptatis, hyalinis, 6-9 \times 3-4.

Hab. in foliis vivis *Symporicarpi racemosæ*, Lyndonville N. Y. Amer. bor. — An eadem ac *A. Symphoriæ* K. et B.?

28. **Ascochyta Diervillæ** Kab. et Bub., *Myc. Beitr.*, *Hedwigia Bd. XLVI* (1907) p. 290. — Maculis epiphyllis, solitariis v. sparsis, rotundatis, ellipsoideis v. irregulariter incurvatis, plerumque minutis confluentibus, varie rugulosis v. variolosis, brunneis, purpureo-brunneo cinctis; pycnidiis epiphyllis, punctiformibus, solitariis v. parce gregariis, globosis v. subdepressis, 80-150 μ . diam., brunneis, apice poro apertis, contextu firmo parenchymatico brunneo;

sporulis ellipsoideis v. breviter cylindraceis, 9-15 \approx 4-5,5, rectis v. raro curvulis, primum unilocularibus (6-8 μ . long.) raro transverse uniseptatis ibique non vel parum constrictis, utrinque rotundatis, hyalinis; sporophoris papilliformibus, flavidis.

Hab. in foliis vivis *Diervillæ canadensis* prope Turnau Bohemia (KABAT). — Ab *Asc. Weigeliae* Sacc. et Sp. forma macularum et sporularum distincta.

29. **Ascochyta Ferdinandi** Bubák et Malkoff, Ann. Myc. VI (1908) 6976 p. 24. — Maculis rotundatis v. sinuosis, amphigenis, infra brunneis, supra griseis, brunneo-marginatis, obsolete zonatis, usque ad 1 cm lat.; pycnidii epiphyllis, sparsis, ochraceis, epidermide velatis, prominulis, e globoso depresso poro vix papillato erumpentibus, 80-120 μ . diam.; contextu flavo-brunneo v. subhyalino, tenuiter parenchymatico; sporulis cylindraceis, 15-22 \approx 4,5-5, rectis, 1-septatis, rarissime constrictis, biguttulatis, hyalinis.

Hab. in foliis adhuc vivis *Sambuci Eboli* pr. Ferdinand Bulgariæ (MALKOFF). — Ab *A. Sambuci* rite distincta.

30. **Ascochyta Rubiæ** Bubák, Bull. Herb. Boiss. 2 sér., VI (1906) 6977 p. 476. — Maculis foliicolis utrinque visilibus, griseis, arescentibus, rotundatis, 2-4 mm. latis, tenuiter limitatis, areola purpureo-brunnea limitatis; pycnidii epiphyllis sparsis, epidermide tectis, globosis. parum depresso, 70-120 μ . latis, nigris, contextu castaneo-brunneo, medio poro rotundato praeditis; sporulis ovoides vel elongatis, 6,5-9 \approx 2,5-3,5 medio transverse uniseptatis, non constrictis, apice rotundatis, guttulatis.

Hab. in foliis vivis senioribus *Rubiæ* peregrinæ prope Ulcinj Montenegro.

31. **Ascochyta orientalis** Bondarzew, Acta Horti Petropol. XXVI (1906) p. 43 (extr.). — Maculis griseis atro-brunneo-marginatis, confluentibus; pycnidii epiphyllis, brunneis, poro rotundo pertusis, 100-200 μ . diam.; sporulis 1-septatis, medio paullum constrictis, 2-4-guttulatis, 16-20 \approx 6, hyalinis.

Hab. in foliis vivis *Syringæ vulgaris* in ditione Kursk Rossiæ.

32. **Ascochyta Phlogis** Voglino, Ann. R. Acc. Agric. Torino v. LI (1908) Extract. p. 20, Nota 1. — Maculis griseis, dealbatis, oblongis, seu irregulariter effusis; pycnidii plerumque gregariis, prominulis, conicis, nigris; sporulis hyalinis, ellipsoideis, diu continuis, inde uniseptatis, ad septum leniter constrictis, 10 \approx 3; sporophoris brevissimis, incrassatis.

Hab. in foliis languidis caulisque siccis *Phlogis Drumondi*, Lucento et Torino Italiæ bor. — * **A. phlogina** Fairm. Ann. Mycol. (1910) p. 323. — Maculis albidis, rotundatis v. indeterminatis, brunneo-cinctis; pycnidiis minutis, atris; sporulis uniseptatis, hyalinis, 10-14 \approx 3. — In foliis vivis *Phlogis Drumondi* cultæ, Lyndonville N. Y. Amer. bor.

33. **Ascochyta Scrophulariæ** Kab. et Bub., Hedwigia XLII (1908) 6980 p. 359. — Maculis epiphyllis, rotundatis v. irregularibus, sæpe concentrica zonatis, alutaceis v. brunneolis, e medio arescentibus, immarginatis, quandoque confluentibus; pycnidiis epiphyllis, sparsis, punctiformibus, nigris, primum epidermide tectis, demum eam dilacerantibus et tunc superficialibus, globosis v. parum applatatis, 120-180 μ . diam., poro minuto rotundato apertis, contextu parenchymatico, obscure brunneo; sporulis cylindraceis, utrinque rotundatis, rectis 8-12 \approx 3,5-4, medio transverse uniseptatis, ibique non constrictis, hyalinis, in quoque loculo biguttulatis; sporophoris latis, conoideo-papilliformibus.

Hab. in foliis vivis *Scrophulariæ nodosæ*, prope Turnau Bohemia (KABAT).

34. **Ascochyta Dulcamaræ** Bubák, Beitr. Pilzfl. Ung., in Növénitani Közlemények, Heft 4 (1907) Extr. p. 31. — Maculis epiphyllis rotundatis, primum sordide viridibus, dein fere nigris, leniter concentrica sulcatis, 2-5 mm. latis, 1-3 in quoque folio; pycnidiis in mesophyllo immersis, globosis v. depresso, 100-150 μ . latis, trans lucem flavo-ochraceis, contextu minute parenchymatico pallide flavo; sporulis cylindraceis 7-9 \approx 2-4, rectis v. raro curvulis, apice rotundatis v. subtruncatis, diu unilocularibus dein plerumque medio transverse uniseptatis, hyalinis.

Hab. in foliis emortuis Solani Dulcamaræ, Csernatal prope Herkulesfürdö. — Ab *Asc. Lycopersici* Br. pycnidiis flavo-ochraceis, sporulis medio non constrictis, ab *A. socia* Pass. maculis foliicolis distinctis, pycnidiis pallidioribus, sporulis, cylindraceis diversa. Etiam ab *Asc. solanicola* Oud. et ab *Asc. Solani-nigri* Died. compluribus notis distincta.

35. **Ascochyta Kleinii** Bubák, Beitr. Pilz. Ung., in Növénitani Közlemények (1907) Heft. 4 Extr. p. 31. — Maculis epiphyllis sparsis, e rotnndato elongatis, ochraceo-brunneis, concentrica sulcatis, indistincte limitatis, areola rubro-brunnea præeditis, 3-5 mm. diam.; pycnidiis globoso-depressis, in mesophyllo immersis, trans lucem flavo-ochraceis, 100-200 μ . latis, contextu indistincte parenchy-

matico pallidiori, ostiolo subnigro breviter papilliformi erumpentibus; sporulis cylindraceis, 13-18 \approx 2,5-3, rectis, utrinque rotundatis, hyalinis, medio transverse uniseptatis.

Hab. in foliis vivis *Calystegiae* sè pium in M. Allion prope Orsova. — Ab *Asc. Calystegiae* Sacc. et *A. Convolvuli* Fautr. distincta.

36. **Ascochyta citrullina** C. O. Smith, Delaw. Experim. Station, 6983 Bull. 70 (1905), *Diplodina citrullina* (C. O. Sm.) Grossenbäcker, Techn. Bull. New York Agric. Exp. Station n. 9 (1909) p. 226. — Areis albicantibus; pycnidiiis depresso globosis poro minuto apicali pertusis, contextu tenuiter parenchymatico, pallide brunneo, 90-150 μ . diam., confertis; sporulis oblongis, v. obovatis utrinque rotundatis, 1-septatis, pro more constrictis, 14 \approx 4-5, hyalinis.

Hab. in caulis Cucumeris Citrulli, quem maxime vexat in America bor., socia *Sphaerella citrullina* de qua cfr. suo loco. — Similis *Ascochytae* species occurrit in Lycopersico in Britannia. Cfr. Massee Diseases. of cultiv. plants (1910) p. 218.

37. **Ascochyta Melonis** A. Potebnia, Ann. Mycol. (1910) p. 63, f. 6984 5:5. — Pycnidiiis 170-200 μ . diam., pallide flavo-brunneis, subimmersis, ostiolo centralis præditis; sporulis primum unilocularibus, dein medio septatis, constrictis, utrinque rotundatis, quandoque contortis, hyalinis, 15-17 \approx 5.

Hab. in fructibus, foliis, petiolis caulisque Cucumeris Melonis quem valde vexat, socia *Didymella Melonis*, Gouv. Kursk Rossia. — Ab *A. Cucumis* sporulis fere duplo majoribus diversa. *Ascochyta citrullina* C. O. Smith inter duas *Ascochytas* forma intermedia videtur.

38. **Ascochyta aristolochicola** Hollós, Ann. Mus. Nat. Hung. V (1907) 6985 p. 459. — Pycnidiiis epidermide velatis, gregariis, lenticularibus, nigris, poro pertusis, 100-150 μ . diam., contextu parenchymatico; sporulis cylindraceis utrinque leniter attenuatis et rotundatis, rectis, medio 1-septatis, non constrictis, hyalinis, 10-13 \approx 2-2,5.

Hab. in fructibus dejectis Aristolochiae Clematitidis prope Kecskemét Hungariæ. — *Asc. Aristolochiae* Sacc. est pycnidiiis et sporulis minoribus distincta.

39. **Ascochyta Periplocæ** Kab. et Bub., Myc. Beitr., Hedwigia Bd. 6986 XLVI (1907) p. 292. — Maculis epiphyllis, rotundatis v. irregularibus, magnis usque ad 1 cm. latis, e brunneo nigro-brunneis, concentrice zonatis, quandoque confluentibus, sordide cinerescen-

tibus, brunneo-purpureo cinctis; pycnidiis epiphyllis, sparsis, sæpe gregariis v. raro etam confluentibus, immersis, epidermide tectis, poro minuto rotundato prominentibus, e brunneo obscure bruneis, globosis, 80-120 μ . diam., contextu brunneo parenchymatico; sporulis cylindraceis, 6-10 \times 3-4, rectis v. raro subcurvulis, diu unilocularibus et biguttulatis, demum medio transverse uniseptatis, non constrictis utrinque rotundatis, in quoque loculo biguttulatis, hyalinis; sporophoris papilliformibus, brevibus, hyalinis.

Hab. in foliis Periplocæ græcæ prope Turnau Bohemia (KABAT). — Sequens species homonyma et posterior videtur eadem: **Ascochyta Periplocæ** Hollós, Ann. Mus. Nat. Hung. VII (1909) p. 53. — Maculis irregularibus, bruneis, 1-2 cm. diam.; pycnidiis epiphyllis, gregariis, globulosis, bruneis, poro pertusis, 180-210 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque rotundatis, rectis curvulisve, medio 1-septatis, non v. vix constrictis, 2-4-guttulatis, hyalinis, 8-10 \times 3-3,5.

Hab. in foliis languidis Periplocæ græcæ ad Nagy-Körös Hungariae.

40. **Ascochyta tripolitana** Sacc. et Trott. in Ann. Mycol. X (1912) 6987 p. 512. — Maculis amphigenis, rotundatis, regularibus, 1-2 cm. diam., albescensibus, determinatis, zona rufescenti marginatis, rugulis minutis subconcentricis peripherice zonatis; pycnidiis in epiphylo frequentioribus, laxe gregariis, minutis, nigris; 200-250 μ . circ. diam., poro minuto pertusis; sporulis subcylindraceis utrinque obtusis, sæpius curvulis, plerumque 1-septatis, non raro 2-septatis, quandoque continuis et subellipsoideis, plerunque 16-22 \times 6,5-7,5, medio constrictis, loculis pro more subinæqualibus, minute 1-guttulatis.

Hab. in foliis vivis Calotropidis proceræ in sabulosis prope El Mallaha inter Tripolin et Tagiura Afr. bor. — Ob sporulas quandoque 2-septatas ad subgen. *Staganosporellam* (Tassi) nutat.

41. **Ascochyta Asclepiadearum** Trav. — Syll. XVIII p. 342. — 6988
 Var. **macrospora** Massalongo, Nuove reclute flora micol. veronesse p. 9 in Malpighia v. XX (1906). — Maculis folicoliis amphigenis pallide fulvis v. isabellinis, subrotundis et zona rufa limitatis; pycnidiis punctiformibus epiphyllis, crebre dispositis, parietibus membranaceis rubiginosis; sporulis oblongis, hyalinis, utrinque rotundatis, vulgo polari-biguttulatis, demum in medio 1-septatis, 8-12 \times 3-3,5.

Hab. ad folia *Vincetoxicum officinale* circum Tregnago Verona Ital. bor.

42. **Ascochyta bohemica** Kab. et Bub., Hedwigia XLIV (1905) p. 6989 352. — Maculis epiphyllis utrinque visilibus, circularibus v. rotundato-angulatis, parvis, ochraceis v. brunneis, purpureo-brunneo-marginatis, saepe confluentibus v. forma indeterminatis; pycnidiis epiphyllis, plus v. minus sparsis, subconfluentibus, lenticularibus, 100-190 μ . latis, immersis, epidermide tectis, poro rotundato papilliformi præditis, pallide ochraceis v. brunneolis, contextu tenui parenchymatico, flavo-brunneolo; sporulis cylindraceis 10-22 \times 4-5, utrinque rotundatis, rectis v. curvulis, primum unilocularibus dein transverse uniseptatis, non v. vix. constrictis, loculis quandoque inæqualibus, hyalinis, multiguttulatis; sporulis 3-4-locularibus quandoque occurrentibus; sporophoris papilliformibus, brevibus, crassiusculis.

Hab. in foliis vivis Campanulæ Trachelii prope Turnau Bohemia (KABAT).

43. **Ascochyta Dipsaci** Bubák in Handel-Mazzetti Bot. Reise Pont. 6990 Randgeb. in Ann. Naturhist. Hofmus. Wien XXIII (1909) p. 104. — Maculis irregularibus rotundatis, c. 5 mm. latis, ochraceis, obscure brunneo marginatis, centro arescentibus; pycnidiis epiphyllis, etiam infra visilibus, sparsis, globosis, parum depresso-sis, pallide ochraceis, 100-150 μ . diam., poro minuto, rotundato pertusis, contextu luteolo, parenchymatico; sporulis oblongis v. cylindraceis, 6-9 \times 3-4, uniseptatis, rarius continuis, ad septum constrictis, utrinque rotundatis, hyalinis; sporophoris brevibus, papilliformibus.

Hab. in foliis *Dipsaci pilosi*, in montibus ponticis Anatoliæ. — *Phyll. Dipsaci* proxima v. forte identica (prima ætate).

44. **Ascochyta Adenostyli** Kab. et Bub., Fünft. Beitr. Pilzfl. Tir. in Ber. naturw.-med. Ver. Innsbruck XXX Jahrg. (1905-1906) Extr. p. 9. — Maculis epiphyllis irregularibus, magnis, primum sordide griseis, dein obscure brunneis, non marginatis, quandoque confluentibus; pycnidiis paucis in maculis sparsis, subepidermicis, 100-150 μ . latis, globosis, brunneis, poro minuto apertis, contextu tenui parenchymatico, pallide brunneo; sporulis cylindraceis, saepe leniter biscoctiformibus, 6-13 \times 2-3,5, utrinque rotundatis, rectis v. raro curvulis, primum unilocularibus, dein medio septatis.

Hab. in foliis vivis *Adenostyli albifrontis*, Zillertal

Tiroliæ. — *Phyllosticta Adenostylis* Allesch. sporulis bilocularibus distincta certe huc pertinet.

45. **Ascochyta Cynaræ** Maffei, II Contr. Mic. Ligust., Atti R. Ist. 6992 bat. Pavia ser. II, v. XII, Extr. p. 10, tav. fig. 6-8 (1907). — Maculis orbicularibus ochraceis v. albo-griseis; pycnidiis epiphyllis 110-150 μ ; sporulis immersis cylindraceo-ellipsoideis, medio 1-septatis, non v. parum constrictis, hyalinis, guttulatis, granulosis, 8-11 \times 3-4.

Hab. in foliis languentibus Cynaræ Scolymi prope Ceriale Albenga, Italiae bor.

46. **Ascochyta Lappæ** Kab. et Bub., Hedwigia XLVII (1908) p. 6993 357, Fungi imp. exs. fasc. XI (1909) n. 511. — Maculis epiphyllis, sparsis, rotundatis v. incurvatis, quandoque subpolygoniis, brunneis v. nigris, 2-10 mm. latis e medio sordide albis v. arescendo griseo-cinereis dirumpentibus, saepe late confluentibus, quandoque concentrice sulcatis; pycnidiis epiphyllis sparsis v. gregariis immersis, lenticularibus, pallide brunneis, 100-150 μ . diam., poro minuto rotundato papilliformi erumpentibus, contextu parenchymatico pallide brunneo; sporulis cylindraceis 5-10 \times 3-4, rectis, apice rotundatis, diu unilocularibus demum medio trasverse uniseptatis, ibique non vel parum constrictis, loculis saepe inaequilibus, hyalinis, contentu saepe granuloso; sporophoris papilliformibus.

Hab. in foliis vivis Lappæ minoris prope Jungbunzlau Bohemia (KABAT). — A *Ph. Lappæ* certe diversa.

47. **Ascochyta Tragopogonis** Bondarzew, Acta Horti Petropol. XXVI 6994 (1906) p. 43 (extr.). — Pycnidiis rotundatis v. globoso-lenticularibus, sparsis v. gregariis, subinnatis, poro rotundo pertusis, membranaceis, atris, 100-200 μ . diam.; sporulis 1-septatis v. 1-2-guttulatis, ovoideis v. ellipsoideis, 8 \times 3,5, hyalinis.

Hab. in caulis foliisque vivis Tragopogonis majoris in ditione Kursk Rossiæ.

48. **Ascochyta polygonicola** Kab. et Bub., Myc. Beitr. Hedwigia Bd. 6995 XLVI (1907) p. 292. — Maculis epiphyllis, rotundatis v. irregularibus, brunneolis v. alutaceis, quandoque concentrice zonatis, plerumque irregulariter flavo-marginatis, saepe confluentibus; pycnidiis epiphyllis, sparsis v. gregariis, immersis, epidermide tectis, globosis 60-140 μ . diam., pallide brunneis v. obscure brunneis, apice poro papilliformi rotundato praeditis, contextu tenui parenchymatico flavo-brunneo; sporulis cylindraceis utrinque rotunda-

tis, rectis v. curvulis, diu unilocularibus; contextu subgranuloso, demum transverse uniseptatis, non constrictis, $6-12 \approx 3-4,5$, hyalinis, bi-v. pluriguttulatis; sporophoris brevibus.

Hab. in foliis vivis *Polygoni lapathifolii* prope Turnau Bohemia (KABAT).

49. **Ascochyta Ficus** Trav. et Spessa, Bolet. Soc. Brot. XXV (1910) 6996 p. 180, t. III, f. 17. — Pycnidiis in maculis vagis cinereis dense gregariis, vix prominulis, subglobosis, $110-130 \approx 85-100$, atris, contextu spurie pseudoparenchymatico, fuligineo-atro; sporulis cylindraceo-bacillaribus, rectis, medio 1-septatis, ad septum non constrictis, hyalinis, plerumque intus minute granulosis et biguttulatis, $11-14 \approx 2-2\frac{1}{2}$.

Hab. in pagina inferiore foliorum *Ficus macrophyllæ* in horto botanico conimbricensi Lusitaniæ (A. MOLLER).

50. **Ascochyta populicola** Kab. et Bub. Hedwigia XLVII (1908) p. 6997 358; Fungi imp. exsicc. fasc. XI (1909) n. 514. — Maculis epiphyllis, singulis v. sparsis, rotundatis, brunneis v. fuligineis, arescendo sordide griseo-cinereis, plus v. minus distincte zonatis, 2-10 mm. latis, obscure brunneo-marginatis, saepe confluentibus; pycnidiis epiphyllis, sparsis v. gregariis, saepe confertis confluentibusque, brunneis, globosis, lateraliter compressis, $80-150 \mu$. diam., immersis, poro minuto erumpentibus, contextu parenchymatico obscure brunneo crassiusculo; sporulis cylindraceis, $6-11 \approx 3-4$, rectis v. curvulis, diu unilocularibus, dein medio transverse uniseptatis, ibique non v. leniter constrictis, utrinque rotundatis, hyalinis, 2-4-guttulatis; sporophoris, late papilliformibus, flavidis.

Hab. in foliis emortuis dejectis *Populi albæ* prope Turnau Bohemia (KABAT).

51. **Ascochyta translucens** Kab. et Bub., Hedwigia XLIV (1905) p. 6998 353. — Maculis utrinque visilibus, rotundatis, rotundato-angulosis v. incurvatis, saepe confluentibus, latis, griseis, medio flavo-alutaceis ibique aresentibus dilacerantibusque; pycnidiis epiphyllis, sparsis v. gregariis, subpellucidis, epidermide diu tectis poro obscuro rotundato erumpentibus, globosi, crassis, $70-130 \mu$. diam.; contextu parenchymatico tenuis, basi hyalino infra flavo-brunneolo; sporulis elongatis, utrinque rotundatis, plerumque rectis, raro curvulis, $6-11 \approx 2-3$, primum unilocularibus, dein medio transverse uniseptatis, non constrictis, hyalinis; sporophoris brevibus, papilliformibus.

Hab. in foliis vivis Salicis Capreæ prope Turnau Bohemia (KABAT). — Ab *A. salicicola* Pass. certe diversa.

52. **Ascochyta Juelii** Bubák, Ann. Mycol. VII (1909) p. 61. — Ma. 6999 culis rotundatis v. subellipticis, utrinque conspicuis, alutaceis, 2-4 mm. lat., brunneo-cinctisi pycnidiis amphigenis, globosis, leviter complanatis, subepidermicis, ostiolo parvo, obscuriori, papilliformi instructis, 90-120 μ . cr., contextu parenchymatico pallide brunneo; sporulis ellipsoideis v. raro cylindraceis, 8-16 \approx 2-3,5, sensim utrinque acutatis, medio septatis; sporophoris brevibus, papilliformibus, hyalinis.

Hab. in foliis vivis Colchici autumnalis prope Purkerdsdorf Austria inf.

53. **Ascochyta hortensis** Kab. et Bub., Hedwigia XLIV (1905) p. 7000 353. — Maculis utrinque visilibus, rotundatis v. rotundato-angulatis, ex alutaceo brunneolis, purpureo-brunneo-marginatis v. non, e medio arescendo sordide albis se disrumpentibus, magnis confluentibus; pycnidiis amphigenis, sparsis v. concentrica dispositis, immersis, epidermide tectis, globosis, 70-120 μ . diam., ostiolo rotundato papilliformi erumpentibus, primum pallidis, demum brunneis subinde obscure brunneis, contextu parenchymatico, tenui, brunneo; sporulis elongatis v. breviter subcylindraceis, 5-9 \approx 3-3,5, apice rotundatis, diu unilocularibus, demum medio nniseptatis, non constrictis, hyalinis.

Hab. in foliis Funkiae albomarginatae prope Turnau Bohemia (KABAT). — Socium adest *Fusarium Funkiae*.

54. **Ascochyta Gladioli** Trav. et Spessa, Bolet. Soc. Brot. XXV (1910) 7001 p. 180, t. III, f. 20. — Pycnidiis in areolis dealbatis gregariis, epidemidem minute pustulatim sublevantibus, punctiformibus, globoso-depressis, 140-170 μ . diam., poro latiusculo pertusis, fusco-atris, excipulo minute pseudoparenchymatico melleo-fuligineo; sporulis cylindraceo-bacillaribus, medio septatis, non constrictis, rectis vel leniter curvulis, 12-15 \approx 2 $\frac{1}{2}$ -3, intus quandoque minute pluriguttulatis, hyalinis.

Hab. in scapis exsiccatis Gladioli cardinalis in horto botanico conimbricensi Lusitaniae (A. MOLLER).

55. **Ascochyta Aspidistræ** Massee, Diseases. cult. Plants (1910) p. 431, 7002 f. 133. — Pycnidiis in maculis latis gregarie horizontaliterque dispositis; sporulis subfusoideis, 1-septatis, 12-17 \approx 2-2,5.

Hab. in foliis Aspidistræ luridæ cultæ, Amer. bor.

56. **Ascochyta pellucida** Bubák, Ann. Mycol. IV (1906) p. 112. — 7003

Maculis virescentibus in foliis jam dealbatis, magnis, irregularibus; pycnidiis epiphyllis, globosis, 100-180 μ . diam., rubro-brunneis, subpellucidis, contextu tenui indistincto, ostiolo rotundato irregulariter aperto; sporulis cylindraceis 6-11 (raro usque ad 13 μ) \approx 2,5-3,5, rectis v. curvulis, uniseptatis, utrinque rotundatis, hyalinis; sporophoris hyalinis brevibus.

Hab. in foliis emortuis Callæ palustris prope Tabor Bohemia.

57. **Ascochyta arophila** Bubák, Bull. Herb. Boiss., II ser., VI (1906) 6704 p. 476. — Maculis rotundatis v. subellipticis, utrinque visilibus, usque ad 8 mm. latis, subbrunneis, medio arescendo albidis, linea angusta, brunneo-rubra limitatis, contextu obscure brunneo, late irregulariterque erumpenti; sporulis fusoideis, 9-18 \approx 2-2,5, medio uniseptatis, apice angustatis, rectis v. curvis, hyalinis; sporophoris papilliformibus præditis.

Hab. in foliis vivis Ari italicici prope Ulcinj Montenegro.

58. **Ascochyta quadriguttulata** Kab. et Bub. Hedw. L (1909) p. 40. 6705 — Maculis amphigenis lineatis, irregularibus, confluentibus, magnam folii partem occupantibus, alutaceo-brunneis, sæpe obscurius limbatis, tandem arescendo griseis; pycnidiis sæpius amphigenis, mesophyllo innatis, epidermide diu tectis et eam leviter elevatibus, lenticularibus, ochraceo-brunneis, 120-180 μ . diam., poro rotundo latiusculo, contextu tenui laxe celluloso; sporulis copiosis, cylindraceis 12-26 \approx 4,5-6, utrinque v. uno apice tenuatus, medio 1-septatis, sæpe constrictulis, 4-guttulatis, cellula altera, sæpe crassiore; sporophoris cylindraceis, 12 μ . long.

Hab. in foliis Sparganii ramosi prope Turnau Bohemia.

59. **Ascochyta Tragi** Cruchet in Bull. Soc. Vaud. Sc. Nat. XLIV 6706 (1909) p. 475. — Maculis nullis; pycnidiis punctiformibus, parvis, vix 0,1 mm. diam., apice ostiolatis, immersis, dein fere prominentibus; sporulis uniseptatis, minute guttulatis, 4-5 gutt. in quaque cellula, ovoideo-oblongis, non constrictis, utrinque obtusis, hyalinis, 17-18 \approx 4-5.

Hab. in foliis radicalibus siccis Tragi racemosi, prope Sion Vallesia Helvetiæ.

60. **Ascochyta kerguelensis** P. Henn., Deutsche Süd polar-Exped. 6707 Bd. VIII (1906) Extr. p. 14, t. II, f. 19. — Pycnidiis innato-erumpentibus, minutissimis, atris, plerumque gregariis, subglobosis, membranaceis, poro pertusis, 50-60 μ . diam.; sporulis obtu-

siusculis, rectis v. curvulis, 2-guttulatis, medio 1-septatis, haud constrictis, hyalinis, 12-15 \approx 3,5-4,5.

Hab. in foliis Poæ kerguelensis, Kerguelen (WERTH).

61. **Ascochyta antarctica** P. Henn., Deutsche Südpolar-Exped. Bd. 6708 VIII (1906) Extr. p. 13, t. II, f. 17. — Pycnidiis sparsis, innato-erumpentibus, hemisphærico-sublenticularibus, poro pertusis, membranaceis, brunneo-fuscidulis, 150-180 μ . diam.; sporulis oblongo-ellipsoideis, utrinque obtusis, 4-guttulatis, medio 1-septatis, haud constrictis, hyalinis, 15-22 \approx 6-8.

Hab. in foliis siccis Poæ Cookii, Insulæ Possessionis (WERTH).

II. *Ascochytella* Tassi (ut gen.) Sporulæ dilute coloratæ

62. **Ascochyta prosopidicola** Speg., Myc. Argent. V, p. 368, in Annal. 6709 Mus. Nac. Buenos Aires XX (1910) sub *Ascochytella*. — Maculis arescentibus dimidium superum totum foliorum occupantibus, linea callosa, saepe in areolam pururascentem transeunte, a parte infera adhuc viva separatis; pycnidiis amphigenis epidermide tectis dein suberumpentibus, lenticularibus, 100 μ . diam., ostiolo obsoleto, atris, membranaceis; sporulis elongato-ellipsoideis, utrinque subacutiuscule rotundatis, 10-12 \approx 3, ad septum non constrictis, loculis æquilongis chlorinis.

Hab. ad folia languida Prosopidis cujusdam Orán, Jujuy, Argentina Amer. austr.

63. **Ascochyta clematidina** Thüm. — Syll. III p. 396 — var *Thalictri* Davis, Trans. Wisconsin Ac. of Sc. v. XVI p. II (1909) p. 757. — Differt pycnidiis minoribus; sporulis 8-10 \approx 2-3.

Hab. in Thalictro dioico, Madison, Wisconsin Amer. bor.

64. **Ascochyta Cotyledonis** H. Zimmermann in Verhandl. naturforsch. Ver. Brünn XLVII (1908-1909) p. 36, t. III et t. I, f. 9 (extr.) — Maculis usque ad 5 cm. cr., griseis, nigro-purpureo-marginalis; pycnidiis plerumque epiphyllis, concentrice dispositis, prominentibus, brunneis, globosis, 200-250 μ . diam., sporulis cylindricis, 6-10 \approx 3-3,5, 2-4-guttulatis, in cirro subflavis.

Hab. in foliis vivis Cotyledonis gibbifloræ, in calidario cultæ, Eisgrub Austriæ. — *Ascoch.* *Telephii* affinis sed præcipue maculis et pycnidiis majoribus satis diversa.

65. **Ascochyta Tiliæ** Kab. et Bub., Myc. Beitr., Hedwigia Bd. 6712 XLVI (1907) p. 293. — Maculis epiphyllis, irregularibus v. subrotundatis usque ad 1 cm. latis, saepe confluentibus, sordide aluta-

ceis, demum arescendo griseo-cinereis, purpureo-brunneo-marginatis v. non; pycnidiis epiphyllis, conspicuis, confluentibus, immersis, epidermide tectis, poro minuto rotundato erumpentibus, globosis, 100-140 μ . diam., primum flavo-brunneis, dein brunneis, contextu parenchymatico flavo-brunneo; sporulis ovoideis, ellipsoideis v. breviter cylindraceis, utrinque rotundatis, rectis, v. raro curvulis, diu unilocularibus, demum transverse uniseptatis, non constrictis, 6-10 \times 3-4, hyalinis v. viridulis; sporophoris brevibus, papilliformibus.

Hab. in foliis vivis Tiliæ dasystylæ prope Turnau, Bohemia (KABAT).

66. **Ascochyta Camphoræ** Turconi in Atti R. Ist. bot. Pavia (1905) 7013 XI, p. 314-318, tab. XXII, fig. 7-9. — Maculis amphigenis arescendo dealbatis, in pagina superiore fusco-marginatis, in inferiore zona purpurea evanescente limitatis, circularibus v. rotundato-sinuosus; pycnidiis numerosis, plerumque epiphyllis, in macula sine ordine dispositis, minutis, 150-200 μ . diam.; sporulis fusioideis, utrinque subacutatis, medio uniseptatis, ad septum non constrictis, dilute olivaceis, 10-12 \times 3-4.5.

Hab. in foliis Camphoræ glanduliferae cultæ in horto botanico, Pavia Italiæ borealis.

67. **Ascochyta robinicola** Hollós, Ann. Mus. Nat. Hung. V (1907) 7014 p. 459. — Pycnidiis sparsis gregariis vè, epidermide velatis, lenticularibus, brunneis, poro pertusis, 140-160 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, medio 1-septatis, non v. vix constrictis, dilute ochraceis, 8-10 \times 3.

Hab. in leguminibus dejectis Robiniae Pseudacaciæ prope Kecskemét Hungariæ. — *Asc. Robiniae* Sacc. pycnidiis et sporulis majoribus distincta.

68. **Ascochyta Eriobotryæ** Voglino, Ann. R. Acc. Agric. Torino vol. LI (1908) Extr. p. 22. — Maculis epiphyllis, initio punctiformibus, castaneo-fuliginosis, dein orbicularibus, oblongis, exarido-griseis, albicantibus, zona castanea cinctis, plerumque confluentibus et fere totum marginem folii occupantibus; pycnidiis epiphyllis, numerosis, subgregariis, sphæroideis, initio epidermide velatis dein erumpentibus, pertusis, 80-100-120 μ . latis; sporulis oblongo-ellipsoideis, leniter curvulis et ad septum vix constrictis, chlorinis 12 \times 3; sporophoris brevissimis 4-6 \times 2.

Hab. in foliis Eriobotryæ japonicæ in hortis Druent et Torino, Ital. bor.

69. **Ascochyta syringicola** Bubák et Kabát, Hedwigia XLII (1908) 7016 p. 360. — Maculis epiphyllis, sparsis, quandoque confluentibus, parvis, rotundato-angulosis, alutaceis, obscurius v. purpureo-brunneo-marginatis; pycnidiis epiphyllis, punctiformibus, sparsis, immersis, diu epidermide tectis, ostiolo minuto rotundato erumpentibus, globosis, subdepressis $110-180 \mu.$ diam., e brunneo obscureo brunneis, contextu tenui pallide brunneo, parenchymatico; sporulis ellipsoideis v. cylindraceis, $18-26 \times 6-9$, rectis v. curvulis, transverse uniseptatis, ibique plus v. minus constrictis, fumoso-griseolis; sporophoris papilliformibus, flavidis.

Hab. in foliis vivis Syringæ vulgaris prope Turnau Bohemia (KABAT). — Ab *Asc. Syringæ* Bres. maculis, pycnidiis, sporulis diversa.

70. **Ascochyta mabiana** Sacc. Ann. Mycol. VIII (1910) p. 338. — 7017 Maculis sordide fusco-griseis, vage atro-marginatis *Aecidio rhytismaideo* var. *Mabæ* contrapositis; pycnidiis laxe gregariis, erumpentibus, diu tectis, globoso-lenticularibus, $140-160 \mu.$ diam., poro obsolete apertis; sporulis ellipsoideis utrinque acutiuscule rotundatis, $5,5-6 \times 2,8$, diblastis obsoleteque 1-septatis, non constrictis, ochraceo-flavidulis.

Hab. in foliis languidis Mabæ abyssinicae, Ghinda al Don-gollo, alt. 960 m., Hamasen Erythræa (HADR. FIORI).

71. **Ascochyta Chrysanthemi** Stevens, Botan. Gazette XLIV (1907) 7018 p. 246, cum icon. — Pycnidiis minutis, immersis, erumpentibus, gregariis v. sparsis, hemisphæricis, flavidis, $100-200 \mu.$ diam., plerumque $150 \mu.$; ostiolo centrali, parvo, saturatius marginato saepè breviter rostellato; superficie reticulatae; mycelio copioso, adnato, superficiali, floccoso, septato; sporulis oblongis, irregularibus, $3-6,2 \times 10-20$, plerumque $10 \times 6,2$, apice obtusis v. acutis; plasmate vacuolato, hyalino v. in massa roseolo.

Hab. in floribus, petiolis caulibusque Chrysanthemi indici, North Carolina Amer. bor.

72. **Ascochyta Cyani** Cruchet in Bull. Soc. Vaud. Sc. Nat. XLIV (1909) 7019 p. 474. — Maculis nullis v. parum manifestis; pycnidiis punctiformibus, parvis, $180-100 \mu.$ diam., globulosis, dein depresso, apice pertusis, irregulariter dispositis, primum immersis dein fere prominentibus; sporulis ellipsoideo-oblongis, utrinque rotundatis, uniseptatis, in quoque loculo biguttulatis, ad septum leniter constrictis, leniter virescentibus, $15 \times 4-5$.

Hab. in foliis siccis fere putridis *Centaureæ Cyani*, prope Sion, Valais Helvetiæ.

73. **Ascochyta Haworthiæ** Trinchieri, Rnd. R. Ac. Sc. Napoli (1909) 7020
fasc. 8-12, Extr. p. 4. — Pycnidiis minutis, sparsis vel subgregariis, innato-erumpentibus, depresso-subglobosis, pertusis, atris, 171-257 μ . diam., 98-196 μ . altis, excipulo valido, parenchymatico, flavescente-brunneo donatis; sporophoris nullis visis; sporulis ellipsoideis vel ovoideis, utrinque obtusis, quandoque uno apice acutiusculis, primo continuis, hyalinis, demum 1-septatis, non constrictis, loculis 1-guttulatis, chlorinis, 12-17 \approx 4,5.

Hab. in scapis siccis *Haworthiæ tortuosæ*, in horto botanico neapolitano Ital. austr. (TRINCHIERI).

74. **Ascochyta Semeles** Sacc. Ann. Mycol. VI (1908) p. 555. — 7021
Maculis amplis oblongis, 2-3 cm. diam., amphigenis, rufo-marginatis, candidantibus; pycnidiis amphigenis, sed supra copiosioribus, gregariis, nigris, globoso-lenticularibus, 150-180 μ . diam., pertusis, minute cellulosis; sporulis breviter fusoides, 8-9 \approx 3, dilute olivaceis, medio septatis, non constrictis.

Hab. in foliis languidis *Semeles androgynæ* (Smilacac.) in Horto botanico Panormitano, Sicilia (J. H. MATTEI).

75. **Ascochyta Festucæ-erectæ** P. Henn., Deutsche Südpolar-Exped. 7022
Bd. VIII (1907) Extr. p. 14, tab. II, fig. 18. — Pycnidiis sparse gregariis, punctiformibus, atris, innato-erumpentibus, sublenticularibus, membranaceis, atro-brunneis, poro pertusis, 60-70 μ . diam.; sporulis fusoides, acutiusculis, medio 1-septatis, haud constrictis, eguttulatis, hyalino-cyanescensibus, 6-9 \approx 2,5-3.

Hab. in foliis siccis *Festucæ erectæ*, Kerguelen (WERTH).

Ascochytae species sequentes, ex Kl. Herb. viv. mycol., in Sylloge nec non in Allescherii Deutsch. Pilze omissæ sunt quia nullibi descriptæ. Hic memorantur ut ex exempl. orig. possint revideri.

1. **Ascochyta Orchidis** Rabenh., in Kl. Herb. viv. mycol. n. 988 7023
(1846) [nomen nudum].

Hab. in foliis *Orchidis* sp. pr. Dresden in Germania.

2. **Ascochyta Humuli** Lasch in Kl., Herb. viv. mycol. n. 680, Bot. 7024
Zeit. (1845), p. 68. — Macula pallide fusca; pycnidiis subrotundis nigrescentibus; cirris tenuissimis albis.

Hab. in foliis *Humuli Lupuli* pr. Driesen Germaniae. —
Est ne eadem ac *Asc. Humuli* Bubák?

3. **Ascochyta Atriplicis** Lasch in Kl. Herb. viv. mycol. n. 861 (1846) 7025
[nomen nudum].
Hab. in foliis *Atriplicis* sp. in agro Driesen Germaniæ.
4. **Ascochyta acerina** Lév. in Demid. Voy. p. 115, t. V, f. 7 (1842). — 7026
Ita vocanda *A. arenaria* Lév. — Syll. X, p. 296 — sic dicta ex
err. typogr. pro «acerina». — Verisimiliter est *Septoriæ* spec.
sed non congruit cum *Sept. acerina* Peck.
5. **Ascochyta Galii** Lasch in Kl. Herb. viv. mycol. n. 1254 (1849) 7027
[nomen nudum].
Hab. in foliis *Galii* sp. in agro Driesen Germaniæ.
6. **Ascochyta Epilobii** Rabenh. in Kl. Herb. viv. mycol. n. 1656 (1852) 7028
[nomen nudum].
Hab. in foliis *Epilobii* sp. in agro Dresdeni Germaniæ.
7. **Ascochyta Dulcamaræ** Lasch in Kl. Herb. viv. mycol. n. 858 (1846) 7029
[nomen nudum].
Hab. in foliis *Solani Dulcamaræ* in agro Driesen Germaniæ.
8. **Ascochyta Lychnidis** Lasch in Kl. Herb. viv. mycol. n. 857 (1846) 7030
[nomen nudum].
Hab. in foliis *Lychnidis* in agro Driesen Germaniæ.
9. **Ascochyta Graminum** Lasch in Kl. Herb. viv. mycol. n. 1155, 7031
Bot. Zeit. (1848) p. 293. — Maculis fuscis medio pallescentibus;
cirris albo-incarnatis.
Hab. in foliis *Agropyri* pr. Driesen Germaniæ.
10. **Ascochyta Geranii** Rabenh. in Kl. Herb. viv. mycol. n. 1655 7032
(1852) [nomen nudum].
Hab. in foliis *Geranii* sp. in agro Dresdeni Germaniæ.
11. **Ascochyta Teucræ** Lasch in Kl. Herb. mycol. n. 1455, Bot. Zeit. 7033
(1850) p. 439. — Cirris albis; ascis (sporulis?) elongatis.
Hab. in foliis *Teucræ Scordii* in agro Driesen Germaniæ.
12. **Ascochyta Hieracii** Lasch in Kl. Herb. viv. mycol. n. 1156, Bot. 7034
Zeit. (1848) p. 294. — Cirris tenuissimis albis.
Hab. in foliis *Hieracii Pilosellæ* pr. Driesen.
13. **Ascochyta Hyoscyami** Lasch in Kl. Herb. viv. mycol. n. 864, 7035
Bot. Zeit. (1846) p. 46. — Ascis? (= sporulis) leviter arcuatis.
Hab. in foliis *Hyoscyami* in agro Driesen Germaniæ.
14. **Ascochyta Silenes** Lasch in Kl. Herb. viv. mycol. n. 1256 (1849) 7036
[nomen nudum].
Hab. in foliis *Silenes* sp. in agro Driesen Germaniæ.
15. **Ascochyta Rubi** Lasch in Kl. Herb. viv. mycol. n. 1157, Bot. Zeit. 7037

(1848) p. 294. — Maculis pallidis; pycnidiiis subrotundis ex fusco nigricantibus; cirris albis.

Hab. in foliis Rubi saxatilis in agro Driesen.

16. **Aschochyta Polygoni** Rab. in Kl. Herb. viv. mycol. n. 990 (1846) 7038 [nomen nudum].

Hab. in foliis Polygoni in Germania (KRETZSCHMAR).

APIOSPORELLA Speg., Myc. Argent. V p. 364, in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. ab *Apiospora*, ob sporularum similitudinem). — Notæ externæ *Ascochytæ*; sporulæ excentrice septatae, loculo supero maximo, infero minuto appendiculiformi, hyalinæ.

1. **Apiosporella macrospora** Speg., l. c. p. 364, cum icon. — Maculis 7039 nullis; pycnidiiis sparsis, parenchymate innatis epidermide tectis, non v. vix prominulis, lenticularibus, 150 μ . diam., ostiolo impresso pertusis, atris, contextu grosse parenchymatico pellucido olivaceo; sporulis ellipsoideo-elongatis, ad septum non constrictis, utrinque subacutiusculis, 28-30 \times 7-8, loculo supero (18-20 μ) quam infero duplo longiore, hyalinis, levibus.

Hab. ad vaginas et folia arida Hordei jubati, Rio Grande Tierra del Fuego Argentina Amer. austr.

CERATOPYCNIDIUM Maublanc, Bull. Soc. Mycol. Fr. XXIII (1907) p. 148 (Etym. *ceras* cornu et *pycnidium*). — Foliicola; pycnidia superficialia, nigra, subcorniculata v. in collum plus minus incurvatum producta; contextu tenui; sporulæ biloculares, hyalinæ. — Inter Sphaerioideas et Excipulaceas medium genus.

1. **Ceratopycnidium citricola** Maubl., l. c. p. 148, cum icon. — Py- 7040 cnidiis 0,50-0,75 mm. alt. 0,30 mm. cr.; sporophoris plus v. minus nodulosis, 10 \times 3; sporulis solitariis oblongis, apice rotundatis, basi subangustatis, medio uniseptatis, subconstrictis, 7,5-10,5 \times 3-3,5.

Hab. parasitice in exrementis insecti cujusdam in foliis Citri deliciosaæ, Brazzaville Congo Africæ.

DIPLODINA West. — Syll. III p. 411, X p. 311, XI p. 526, XIV p. 949, XVI p. 936, XVIII p. 351.

1. **Diplodina albanica** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 7041 p. 476. — Pycnidiiis sparsis, subepidermicis, rotundatis v. ellipsoideis, depressis, 250-350 μ . diam. v. usque ad 0,5 mm. long., quandoque binis longitudinaliter confluentibus, contextu obscure casta-

neo-brunneo, breviter erumpenti-papillato; sporulis fusoideis, 11-15 \times 2, rectis v. curvulis, medio transverse uniseptatis, in quoque loculo biguttulatis.

Hab. in caulis siccis *Ranunculi Villarsii*, prope Andrijevica Montenegro.

2. **Diplodina Paeoniæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 344. 7042

— Pycnidiis epidermide tectis, gregariis, brunneis, poro pertusis, ellipsoideis, 210-280 \times 120-210, contextu parenchymatico; sporulis oblongis, medio 1-septatis, non v. vix constrictis, dilute flavidulis, 10-13 \times 2,5-3.

Hab. in ramis siccis *Paeoniæ arboreæ*, Kecskemét Hungariæ.

3. **Diplodina Sophiæ** Bubák, Ann. Mycol. IV (1906) p. 112. — Py- 7043

cniis subepidermicis, sparsis v. gregariis, globosis v. parum de- pressis, 120-220 μ . latis, nigris, poro rotundato, centrali præditis, contextu flavo-brunneo, tenui parenchymatico; sporulis fusoideis, 9-15 \times 2-3, utrinque angustatis, rectis, raro curvulis, flavidobrunneolis; sporophoris brevibus, cylindraceis, hyalinis.

Hab. in caulis *Sisymbrii Sophiæ* prope Tábor Bohemia. 7044

4. **Diplodina Lepidii** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 461.

— Pycnidiis epidermide velatis, gregariis, lenticularibus, fuscis, poro pertusis, 200-230 μ . diam., contextu parenchymatico; spo- rulis ellipsoideis v. plerumque cylindraceis, utrinque rotundatis, medio 1-septatis, non constrictis, flavidulis, 8-11 \times 2-3.

Hab. in caulis siccis *Lepidii crassifolii* prope Kecskemét Hungariæ.

5. **Diplodina Mahoniæ** Hollós, Ann. Mus. Nat. Hungar. VII (1909) 7045

pag. 53. — Pycnidiis gregariis, epidermide velatis, lenticularibus, atris, poro pertusis, 170-210 μ . diam., contextu celluloso; sporulis ellipsoideis, medio 1-septatis, non constrictis, dilute ochraceis, 8-10 \times 3-3,5.

Hab. in ramulis siccis *Mahoniæ Aquifolii* ad Kecskemét Hungariæ.

6. **Diplodina Pteleæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 346. 7046

— Pycnidiis epidermide tectis, globoso-depressis, brunneis, poro pertusis, 100-150 μ . diam.; sporulis oblongis, utrinque rotundatis, medio 1-septatis, leviter constrictis, dilute ochraceis, 8-12 \times 3-3,5.

Hab. in ramulis emortuis *Pteleæ trifoliatae*, Nagy-Körös Hungariæ.

7. **Diplodina pteleicola** Hollós, Növénnyt. Közlemén. VI (1907) Extr. 7047

p. 4. — Pycnidiis dense gregariis, superficialibus, fuscis, poro pertusis, ellipsoideis, 180-200 \approx 100-120, contextu parenchymatico; sporulis cylindraceis, utrinque attenuatis, rectis v. curvulis, medio 1-septatis, non constrictis, dilute flavidulis, 10-12 \approx 2-2,5.

Hab. in ramulis siccis decorticatis *Pteleæ trifoliatae*, Kecskemét Hungariæ.

8. **Diplodina anomala** Sacc., Not. Myc. VII, Ann. Myc. IV (1906) 7048

p. 277. — Pycnidiis densiuscule gregariis, erumpenti-emergentibus, majusculis, globosis, obtusis, 500 μ . diam., peridermio lacerato cinctis, subcarbonaceis, opacæ nigris, glabris, vertice demum irregulariter dehiscentibus; contextu firmo, grosse parenchymatico, fuligineo; nucleo farcto, subceraceo, albido; sporulis fusiformibus, utrinque acutis, rectis v. curvulis, 16-17 \approx 4-4,3, hyalinis, plasmate bipartito, demum tenuiter 1-septatis, non constrictis; sporophoribus acicularibus sæpe flexuosulis, variis, 10-26 \approx 2, ex hyalino viridulis, e strato proligero crassiusculo virescenti oriundis.

Hab. in cortice atrato *Aceris* sp. Lyndonville N. Y. Amer. bor. (C. E. FAIRMAN). — Pycnidiis ceraceo-farctis, sporulis angustis, ostiolo obsoleto species in genere aliquid anomala.

9. **Diplodina fusispora** Peck, Bull. Torr. Bot. Club XXXVI (1909) 7049

p. 337. — Pycnidiis 0,5-1 mm. latis, dense gregariis, aliquando leviter cæspitosis, irregularibus v. subglobosis, erumpentibus, atris; sporulis breve fusoideis, utrinque acutis, hyalinis, primo simplicibus, deinde uniseptatis, 16-20 \approx 4-5.

Hab. in ramis *Aceris saccharini*, River Forest Illinois Amer. bor. (E. T. et S. A. HARPER).

10. **Diplodina atra** (Potebnia) Sacc. et Trav. — Syll. XIX, p. 615 — 7050

Ascochyta atra Potebnia, Quelq. Champ. de la Russie mérid. Charchov (1900) p. 9, tab. IV, f. 10-11. — Pycnidiis sparsis, punctiformibus, globosis, subtectis, prominulis, atris, membranaceis, contextu parenchymatico, 200-250 μ . diam., ostiolo imperspicuo; sporulis oblongis, utrinque rotundatis, constricto-1-septatis, minute pluriguttulatis, hyalinis, 11-12 \approx 1,7-2; sporophoribus linearibus, 15-20 μ . longis.

Hab. in ramis vivis *Vitis viniferae* gummosi bacillari (?) affectis, socia *Pyrenopeziza Vitis* in districto Melitopoli Rossiae meridionalis.

11. **Diplodina Althææ** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 342. 7051

— Pycnidiis epidermide tectis, sparsis, globoso-depressis, fuscis,

poro pertusis, 150-180 μ . diam., contextu parenchymatico; sporulis ellipsoideis, medio 1-septatis, hyalinis, 8-10 \approx 3.

Hab. in caulis siccis *Altheæ officinalis*, prope Kecskemét Hungariæ.

12. **Diplodina Hibisci** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 344. 7052
 — Pycnidiis epidermide tectis, ostiolo minuto erumpentibus, globosis, nigris 280-320 μ . diam.; sporulis cylindraceis, rectis v. leviter curvulis, utrinque attenuatis, rotundatis, medio 1-septatis, non v. vix constrictis, hyalinis, 10-14 \approx 3,5-4.

Hab. in ramis emortuis *Hibisci syriaci*, Kecskemét Hungariæ.

13. **Diplodina rhoina** Hollós, Ann. Mus. Nat. Hung. (1907) V p. 461. 7053
 — Pycnidiis semiimmersis, gregariis, depresso-globosis, nigris, poro pertusis, 120-140 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, medio 1-septatis, non v. vix constrictis, flavidulis, 10-12 \approx 3,5-4.

Hab. in ramis decorticatis *Rhois glabrae*, Nagy-Körös Hungariæ.

14. **Diplodina Ampelopsidis** Hollós, Ann. Mus. Nat. Hung. V (1907) 7054
 p. 460. — Pycnidiis erumpentibus, dense gregariis, confluentibus, depresso-globosis, fuscis, poro pertusis, 160-210 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis v. cylindraceis, utrinque attenuatis et rotundatis, medio 1-septatis, non constrictis, dilute flavidulis, 8-13 \approx 3-4.

Hab. in ramulis emortuis *Ampelopsis quinquefolia*, Kecskemét Hungariæ.

15. **Diplodina Gypsophilæ** Hollós, Ann. Mus. Nat. Hung. V (1907) 7055
 p. 50. — Pycnidiis epidermide tectis, dense gregariis, erumpentibus, depresso-globosis, nigris, ostiolo papillato, 300-350 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, medio 1-septatis, non constrictis, biguttulatis vel granulosis, hyalinis, 16-18 \approx 2-3,5.

Hab. in caulis siccis *Gypsophila fastigiata* pr. Kecskemét Hungariæ.

16. **Diplodina Polygalæ** Hollós, Ann. Mus. Nat. Hung., IV (1906) 7056
 p. 345. — Pycnidiis epidermide tectis, gregariis, globoso-depressis, nigris, poro pertusis, c. 140 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, medio 1-septatis, non v. vix constrictis, dilute ochraceis, 10-12 \approx 4-5,5.

Hab. in caulibus siccis *Polygalæ* comosæ prope Izsák Hungariæ.

17. **Diplodina Deutziæ** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 49. 7057

— Pycnidiis epidermide tectis, dense gregariis, lenticularibus, nigris, poro pertusis, 180-280 μ . diam., contextu parenchymatico; sporulis oblongis, utrinque attenuatis, medio 1-septatis, non constrictis, flavidulis, 9-11 \approx 3,5 4.

Hab. in ramulis siccis *Deutziæ* crenatæ, Kecskemét Hungariæ.

18. **Diplodina Cydoniæ** (Schulz. v. Mügg.) Sacc. et Trott., *Micropora* 7058

Cydoniæ Schulz. v. Mügg., Verh. zool.-bot. Ges. Wien (1871) p. 1238, tab. XIII, fig. 16. — Pycnidiis subglobosis, subcutaneoerumpentibus, cæspitulosis, astomis, nigricantibus, intus flavo-pallidis, cæspitulis 600-1000 μ . d.; sporulis late fusoideis, utrinque obtusulis, 8 \approx 3,5, medio 1-septatis, non constrictis, madore cirrose exslientibus; sporophoris non observatis.

Hab. in ramis corticatis *Cydoniæ vulgaris* in Hungaria.

19. **Diplodina Rhodotypi** Hollós, Növenyt. Közlemén VI (1907) Extr. 7059

p. 40. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, umbrinis, poro pertusis, 100-120 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, medio 1-septatis, non constrictis, 2-4-guttulatis, hyalinis, 8-12 \approx 3-3,5.

Hab. in ramis emortuis *Rhodotypi kerrioidis*, Kecskemét Hungariæ.

20. **Diplodina Gleditschiæ** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7060

p. 531. — Pycnidiis superficialibus, dense gregariis, nigris, poro pertusis, ellipsoideis, 240-350 \approx 160-240, contextu celluloso; sporulis oblongo-ellipsoideis, diu continuis et hyalinis, demum medio 1-septatis, non v. vix constrictis, dilute ochraceis, 9-10 \approx 3-3,5.

Hab. in ramis siccis decorticatis *Gleditschiæ Triacanthi*, Kecskemét Hungariæ.

21. **Diplodina Coluteæ** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 7061

p. 4. — Pycnidiis sparsis, epidermide velatis, lenticularibus, umbrinis, poro pertusis, 210-240 μ . diam., contextu celluloso; sporulis ellipsoideis, medio 1-septatis, non constrictis, biguttulatis, dilute olivaceis, 8-10 \approx 3-3,5.

Hab. in ramulis emortuis *Coluteæ arborescentis*, Nagy-Körös Hungariæ.

22. **Diplodina Robiniæ** Peck, N. Y. St. Mus. Bull. n. 131 (1909) p. 21. 7062

Pycnidiis minutis, in ligno insculptis, sparsis v. aggregatis, erum-

pentibus, aliquando linea nigra circumscriptis, pallidis v. nigricantibus; sporulis oblongo-fusiformibus, rectis, uniseptatis, hyalinis, 10-12 \approx 4-5.

Hab. ad ramos emortuos *Robiniae Pseudacaciae*, Barry-Town, Dutchess Co. Amer. bor.

23. **Diplodina Genistæ** Hollós, Ann. Mus. Nat. Hungar. IV (1906) 7063 p. 343. — Pycnidiis epidermide tectis, sparsis, globoso-depressis, fuscis, poro pertusis, 140-180 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, utrinque rotundatis, medio 1-septatis, non v. vix constrictis, dilute ochraceis, 8-10 \approx 3-3,5.

Hab. in ramis emortuis *Genistæ tinctoriae* prope Kecskemét Hungariæ.

24. **Diplodina Glycyrrhizæ** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7064 pag. 460. — Pycnidiis dense gregariis, superficialibus, globulosis, nigris, poro pertusis, 160-210 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque leniter attenuatis et rotundatis, medio 1-septatis, non constrictis, flavidulis, 10-12 \approx 2.

Hab. in caulis siccis *Glycyrrhizæ echinatae* pr. Kecskemét Hungariæ.

25. **Diplodina Wistariæ** Hollós, Növényt. Közlemén. VI (1907) Extr. 7065 p. 5. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, fuscis, poro pertusis, 140-210 μ . diam., contextu parenchymatico; sporulis ellipsoideis, medio 1-septatis, non constrictis, flavidulis, 8-10 \approx 3,5-4.

Hab. in ramis siccis *Wistariæ sinensis* prope Kecskemét Hungariæ.

26. **Diplodina Pimpinellæ** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7066 pag. 531. — Pycnidiis dense gregariis, superficialibus, globulosis, nigris, 170-210 μ . diam., ostiolo prominulo, contextu parenchymatico; sporulis ellipsoideis, initio continuis et hyalinis, demum medio 1-septatis, non v. vix constrictis, deorsum attenuatis, dilute brunneis, 8-10 \approx 3,5-4,5.

Hab. in caulis siccis *Pimpinellæ Saxifragæ* pr. Kecskemét Hungariæ.

27. **Diplodina fœniculina** Speg., Fungi Chilenses (1910) pag. 157. — 7067 Pycnidiis numerosis confertis, epidermide velatis, lenticularibus, parvis, 150-180 μ . diam., olivaceis, tenui-membranaceis, parenchymaticis, ostiolo latiusculo impresso perforatis; sporulis e cylindraceo subclavulatis, medio uniseptatis, non v. vix constrictulis, fumosis, 14-18 \approx 5-6.

Hab. in caulis siccis *Polygalæ* comosæ prope Izsák Hungariæ.

17. **Diplodina Deutziæ** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 49. 7057
 — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, nigris, poro pertusis, 180-280 μ . diam., contextu parenchymatico; sporulis oblongis, utrinque attenuatis, medio 1-septatis, non constrictis, flavidulis, 9-11 \times 3,5-4.

Hab. in ramulis siccis *Deutziæ* crenatæ, Kecskemét Hungariæ.

18. **Diplodina Cydoniæ** (Schulz. v. Mügg.) Sacc. et Trott., *Micropora* 7058
Cydoniæ Schulz. v. Mügg., Verh. zool.-bot. Ges. Wien (1871) p. 1238, tab. XIII, fig. 16. — Pycnidiis subglobosis, subcutaneo-erumpentibus, cæspitulosis, astomis, nigricantibus, intus flavo-pallidis, cæspitulis 600-1000 μ . d.; sporulis late fusoideis, utrinque obtusulis, 8 \times 3,5, medio 1-septatis, non constrictis, madore cirrose exslientibus; sporophoris non observatis.

Hab. in ramis corticatis *Cydoniæ vulgaris* in Hungaria.

19. **Diplodina Rhodotypi** Hollós, Növenyt. Közlemén VI (1907) Extr. 7059 p. 40. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, umbrinis, poro pertusis, 100-120 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, medio 1-septatis, non constrictis, 2-4-guttulatis, hyalinis, 8-12 \times 3-3,5.

Hab. in ramis emortuis *Rhodotypi kerrioidis*, Kecskemét Hungariæ.

20. **Diplodina Gleditschiæ** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7060 p. 531. — Pycnidiis superficialibus, dense gregariis, nigris, poro pertusis, ellipsoideis, 240-350 \times 160-240, contextu celluloso; sporulis oblongo-ellipsoideis, diu continuis et hyalinis, demum medio 1-septatis, non v. vix constrictis, dilute ochraceis, 9-10 \times 3-3,5.

Hab. in ramis siccis decorticatis *Gleditschiæ Triacanthi*, Kecskemét Hungariæ.

21. **Diplodina Coluteæ** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 7061 p. 4. — Pycnidiis sparsis, epidermide velatis, lenticularibus, umbrinis, poro pertusis, 210-240 μ . diam., contextu celluloso; sporulis ellipsoideis, medio 1-septatis, non constrictis, biguttulatis, dilute olivaceis, 8-10 \times 3-3,5.

Hab. in ramulis emortuis *Coluteæ arborescentis*, Nagy-Körös Hungariæ.

22. **Diplodina Robiniæ** Peck, N. Y. St. Mus. Bull. n. 131 (1909) p. 21. 7062
 Pycnidiis minutis, in ligno insculptis, sparsis v. aggregatis, erum-

pentibus, aliquando linea nigra circumscriptis, pallidis v. nigricantibus; sporulis oblongo-fusiformibus, rectis, uniseptatis, hyalinis, 10-12 \approx 4-5.

Hab. ad ramos emortuos *Robiniae Pseudacaciae*, Barry-Town, Dutchess Co. Amer. bor.

23. **Diplodina Genistæ** Hollós, Ann. Mus. Nat. Hungar. IV (1906) 7063 p. 343. — Pycnidiis epidermide tectis, sparsis, globoso-depressis, fuscis, poro pertusis, 140-180 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, utrinque rotundatis, medio 1-septatis, non v. vix constrictis, dilute ochraceis, 8-10 \approx 3-3,5.

Hab. in ramis emortuis *Genistæ tinctoriae* prope Kecskemét Hungariæ.

24. **Diplodina Glycyrrhizæ** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7064 pag. 460. — Pycnidiis dense gregariis, superficialibus, globulosis, nigris, poro pertusis, 160-210 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque leniter attenuatis et rotundatis, medio 1-septatis, non constrictis, flavidulis, 10-12 \approx 2.

Hab. in caulis siccis *Glycyrrhizæ echinatae* pr. Kecskemét Hungariæ.

25. **Diplodina Wistariæ** Hollós, Növényt. Közlemén. VI (1907) Extr. 7065 p. 5. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, fuscis, poro pertusis, 140-210 μ . diam., contextu parenchymatico; sporulis ellipsoideis, medio 1-septatis, non constrictis, flavidulis, 8-10 \approx 3,5-4.

Hab. in ramis siccis *Wistariæ sinensis* prope Kecskemét Hungariæ.

26. **Diplodina Pimpinellæ** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7066 pag. 531. — Pycnidiis dense gregariis, superficialibus, globulosis, nigris, 170-210 μ . diam., ostiolo prominulo, contextu parenchymatico; sporulis ellipsoideis, initio continuis et hyalinis, demum medio 1-septatis, non v. vix constrictis, deorsum attenuatis, dilute brunneis, 8-10 \approx 3,5-4,5.

Hab. in caulis siccis *Pimpinellæ Saxifragæ* pr. Kecskemét Hungariæ.

27. **Diplodina fœniculina** Speg., Fungi Chilenses (1910) pag. 157. — 7067 Pycnidiis numerosis confertis, epidermide velatis, lenticularibus, parvis, 150-180 μ . diam., olivaceis, tenui-membranaceis, parenchymaticis, ostiolo latiusculo impresso perforatis; sporulis e cylindraceo subclavulatis, medio uniseptatis, non v. vix constrictulis, fumosis, 14-18 \approx 5-6.

Hab. in caulis siccis subputrescentibus *Fœniculi* piperriti in collibus prope Batuco Chile Amer. austr.

28. **Diplodina Lycopersici** Hollós, Ann. Mus. Nat. Hung. V (1907) 7068 p. 461. — Pycnidiis superficialibus, gregariis, globoso-depressis, fuscis, poro pertusis, 210-250 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, medio 1-septatis, non v. vix constrictis, flavidulis, 10-15 \times 3-4.

Hab. in caulis siccis decorticatis *Lycopersici* esculenti, Kecskemét Hungariæ.

29. **Diplodina atriseda** Kabát et Bubák, Hedw. (1905) pag. 354. — 7069 Pycnidiis fere regulariter distributis, sæpe confertis confluentibus que, epidermide diu tectis eamque pustuliformem nigram efficienibus, globoso-depressis, 100-280 μ . diam., primum pallide brunneis, demum obscure brunneis v. nigris, poro minuto rotundato erumpentibus et cirrum roseolum protrudentibus, contextu parenchymatico obscure brunneo, firmo; sporulis ovoideis, ellipsoideis v. elongatis, 5-9 \times 3-4, rectis raro curvulis, diu unilocularibus, maturis uniseptatis, ibique non constrictis, 2-4-guttulatis; sporophoris papilliformibus, hyalinis.

Hab. in ramis siccis *Daturæ* *Stramonii* prope Turnau, Bohemia (KABAT).

30. **Diplodina Physalidis** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7070 p. 345. — Pycnidiis epidermide tectis, gregariis, fuscis, poro pertusis, ellipsoideis, 210-250 \times 180-210, contextu parenchymatico; sporulis oblongo-ellipsoideis, medio 1-septatis, non v. vix constrictis, hyalinis, 9-11 \times 3.

Hab. in caulis siccis *Physalidis* Alkekengi, Kecskemét Hungariæ.

31. **Diplodina chilensis** Spieg., Fungi Chilenses (1910) pag. 156. — 7071 -- Pycnidiis solitariis v. laxe gregariis, primo epidermide tectis, mox nudis, membranaceis, atris, glabris, sublenticularibus, 250-300 μ . diam., eximie papillato-ostiolatis; sporulis cylindraceis utrinque rotundatis, 14-24 \times 4-5, ad medium 1-septatis, non constrictis, fumosis, loculis grosse 1- v. 2-guttulatis.

Hab. in ramis siccis subputrescentibus *Lobeliae* *salicifoliae*, Cerro Alegre de Valparaiso Chile Amer. austr.

32. **Diplodina Cynoglossi** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7072 p. 460. — Pycnidiis semiimmersis, sparsis, lenticularibus, nigris, poro pertusis, 100-120 μ . diam., contextu parenchymatico; spo-

rulis oblongo-ellipsoideis, utrinque attenuatis et rotundatis, medio 1-septatis, non v. vix constrictis, ochraceis, 10-12 \approx 2,5-3.

Hab. in caulis siccis *Cynoglossi officinalis* pr. Kecskemét Hungariæ.

33. **Diplodina Rostrupii** T. Vesterg., Ein bemerkensw. Pyknid. in 7073 Ark. för Bot. Stockh. V (1906) n. 11, tab. 1-2. — Pycnidiis sparsis v. subgregariis, innato-erumpentibus, inæqualiter globulosis, nigris, magnitudine variabilibus 150-500 μ . diam., obtusis, poro irregulari, subfimbriato, impresso dehiscentibus, intus 1-locularibus v. spurie et imperfecte inæqualiter plurilocularibus; contextu crassiusculo, heterogeneo-prosenchymatico-parenchymatico, intus sporophoris periphericis stipatis obsito; sporophoris iterato-ramosis, interdum subverticillatis, constricto-articulatis, sporulas duplo superantibus, hyalinis; sporulis oblongo-fusoideis, subrectis, utrinque obtusule acutatis, 1-septatis, non constrictis, circ. 10-16 \approx 2-3, hyalinis.

Hab. in capsulis siccis ex anno præterito *Phyllodoces cæruleæ* et *Andromedæ hypnoidis* in montibus altioribus Torne et Lule Lappark Lapponiæ. — A typo generis non parum deflectens et ad Excipulaceas forte nutans.

34. **Diplodina Salviæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 346. 7074 — Pycnidiis semiimmersis, gregariis, globosis, nigris, 240-280 μ . diam., apice ostiolo rotundato 30-35 μ . diam.; sporulis oblongo-ellipsoideis, medio 1-septatis, non v. vix constrictis, dilute ochraceis, 10-12 \approx 3,5-4.

Hab. in caulis emortuis *Salviæ officinalis*, Nagy-Körös Hungariæ.

35. **Diplodina Solidaginis** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7075 p. 50. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, fuscis, poro pertusis, 140-180 μ . diam.; contextu parenchymatico; sporulis oblongis, utrinque attenuatis, medio 1-septatis, non constrictis, flavidulis, 9-11 \approx 3-3,5.

Hab. in caulis siccis *Solidaginis Virgæ-aureæ*, Kecskemét Hungariæ.

36. **Diplodina Chrysanthemi** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7076 pag. 342. — Pycnidiis dense gregariis, erumpentibus, globoso-depressis, nigris, 300-400 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, initio hyalinis et continuis, dein flavidulis, medio 1-septatis, non v. vix constrictis, 7-11 \approx 3-4.

Hab. in caulis emortuis *Chrysanthemi* indici, Kecskemét Hungariæ.

37. *Diplodina rugosa* Sacc. in Ann. Mycol. X (1912) pag. 319. — 7077

Pycnidiis laxè gregariis, subcutaneo-erumpentibus, demum, cortice secedente, superficialibus, initio hemisphæricis sed mox valde appanatis, umbilicatis et conspicue rugosis, nigris, crassiuscule membranaceis, usque ad 1 mm. latis, ostiolo impresso, rotundo 50-60 μ . diam., contextu minute celluloso, fuligineo, cellulis circ. 8 μ . diam., saepius subrariantibus; sporulis teretiusculis, utrinque rotundatis, 1-septatis, non constrictis, 10-12 \times 2, hyalinis; sporophoris brevissimis papilliformibus.

Hab. in caulis emortuis, ut videtur, Compositarum majorum e. g. *Eupatorii* v. *Senecionis*, Selva, Treviso Italia (D. SACCARDO). — Licet matrix adhuc incerta, species vere distincta et non prætermittenda.

38. *Diplodina Artemisiæ* Bres. apud Jaap Ann. Mycol (1905) p. 400. 7078

— Pycnidiis 300 \times 210; sporulis 8-10 \times 2-2,5.

Hab. in caulis vetustioribus *Artemisiæ officinalis*, pr. Warnemünde Mecklenburg Germaniæ.

39. *Diplodina Inulæ* Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 344. 7079

— Pycnidiis epidermide tectis, globoso-depressis, nigris, poro pertusis, 210-250 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, utrinque attenuatis, medio 1-septatis, flavidulis, 10-12 \times 3-3,5.

Hab. in caulis siccis *Inulæ hirtæ* prope Kecskemét Hungariæ.

40. *Diplodina Dahliæ* Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 343. 7080

— Pycnidiis epidermide tectis, dense gregariis, globoso-depressis, nigris, 150-200 μ . diam., ostiolo rotundato 17-28 μ . diam.; sporulis oblongo-cylindraceis, utrinque rotundatis, medio 1-septatis, hyalinis, 10-12 \times 2,5-3.

Hab. in caulis siccis *Dahliæ variabilis*, Kecskemét Hungariæ.

41. *Diplodina Sonchi* P. Henn., Hedwigia XLV (1905) pag. 32. — 7081

Pycnidiis caulinolis, sub epidermide erumpentibus, hemisphæricis v. subglobosis, atris, medio pertusis, 100-120 μ . cr.; sporulis oblonge cylindraceis, rectis v. curvulis, 2-guttulatis dein medio 1-septatis, hyalinis, 8-13 \times 3-3,5.

Hab. in caulis siccis *Sonchi asperi*, Michailowskoe Rossiæ.

42. **Diplodina Bryoniæ** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7082

p. 49. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, fuscis, poro pertusis, 140-220 μ . diam., contextu parenchymatico; sporulis initio ellipsoideis, continuis, dein cylindraceis, utrinque rotundatis, medio 1-septatis, non v. vix constrictis, pluriguttulatis, hyalinis, 8-11 \approx 3,5-4.

Hab. in caulis siccis Bryoniæ dioicæ, Nagy-Körös Hungariæ.

43. **Diplodina Asclepiadis** Alm. et Cam., Rev. Agron. V (1907) p. 53, 7083

tab. I, fig. 7-8; Bol. Soc. Brot. XXV (1908-1909), Extr. p. 48.

— Pycnidiis sparsis v. gregariis, epidermide velatis, dein semi-erumpentibus, subglobosis, atris, 400-450 μ . diam.; sporulis subcylindraceis v. oblongis, rectis v. leniter curvulis, uniseptatis, non v. vix constrictis, enucleatis, utrinque rotundatis, subhyalinis, 10-15 \approx 2,5-3.

Hab. in caulis Asclepiadis verticillatae in horto bot. Coimbra Lusitaniæ (A. MOLLER).

44. **Diplodina Periplocæ** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7084

p. 461. — Pycnidiis semiimmersis, gregariis, lenticularibus, brunneis, poro pertusis, 180-250 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis v. cylindraceis, utrinque rotundatis, medio 1-septatis, non vel vix constrictis, hyalinis, 8-10 \approx 3-3,5.

Hab. in sarmentis decorticatis Periplocæ græcae, Nagy-Körös Hungariæ.

45. **Diplodina Asperulæ** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7085

p. 460. — Pycnidiis superficialibus, sparsis, depresso-globosis, fuscis, poro pertusis, 90-120 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, medio 1-septatis, non constrictis, flavidulis, 8-10 \approx 3-4.

Hab. in caulis siccis decorticatis Asperulæ cynanchicæ prope Kecskemét Hungariæ.

46. **Diplodina Fraxini** (Oud.) All. Krypt. Fl. Pilze VI, p. 687, fig. in 7086

p. 675. — Ita vocanda Ascochyta Fraxini Oud. — Syll. X, p. 297.

47. **Diplodina Syringæ** Hollós, Növényt. Közlemén. VI (1907) Extr. 7087

p. 5. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, fuscis, poro pertusis, 160-210 μ . diam., contextu parenchymatico; sporulis ellipsoideis, utrinque attenuatis, medio 1-septatis, non constrictis, flavidulis, 8-10 \approx 3,5-4.

Hab. in capsulis siccis Syringæ vulgaris, Kecskemét Hungariæ.

48. **Diplodina Weigeliæ** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7088

pag. 462. — Pycnidiis epidermide velatis, sparsis, lenticularibus, fuscis, poro pertusis, 210-230 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, medio uniseptatis, non constrictis, flavidulis, 9-11 \times 3-4.

Hab. in ramis emortuis Weigeliæ roseæ, Nagy-Körös Hungariae.

49. **Diplodina veronicicola** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7089

p. 531. — Pycnidiis sparsis, epidermide velatis, lenticularibus, nigris, poro pertusis, 160-200 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque leniter attenuatis et rotundatis, biguttulatis, medio 1-septatis, non constrictis, dilute ochraceis, 10-12 \times 2-3.

Hab. in caulis siccis Veronicæ spicatae prope Nagy-Körös Hungariae. — A *Dipl. Veronicæ* Br. differt sporulis minoribus, hyalinis, etc.

50. **Diplodina Salicorniæ** Jaap, Verh. Bot. Ver. Prov. Brandb. (1907) 7090

p. 16; Weit. Beit. Pilzfl. nordfr. Ins., Schrif. Naturw. Ver. Schlesw.-Holst., Bd. XIV, Heft 1, p. 29 ot Abh. Bot. Ver. Prov. Brandb.

- IL (1907) p. 16. — Pycnidiis sparsis, globosis, 200-275 μ . diam., nigris, ostiolo conico-papilliformi, 20-40 μ . diam., contextu flavobrunneo, parenchymatico; sporulis breviter cylindraceis, hyalinis, bicellularibus, fortiter constrictis, 6-9 \times 4-4,5, maturis 15-18 \times 6,5-7, flavidulis, sæpe 4-guttulatis.

Hab. in caulis vetustis Salicorniæ herbaceæ in insula Sylt, Schleswig-Holstein.

51. **Diplodina Obionis** Jaap, Verh. Bot. Ver. Brandb. (1905) p. 96; 7091

Weit. Beit. Pilzfl. nordfries Ins., Schrif. Naturw. Ver. f. Schlesw.-Holst., Bd. XIV, Heft 1, pag. 29, Exsicc. n. 98. — Pycnidiis sparsis, subcutaneo-erumpentibus et superficialibus, globosis, papilla hemisphærica præditis; 200-250 μ . diam., parenchymatico-contextis, dilute fuscis, circa ostiolum rotundum 25-30 μ . latum obscurioribus; sporulis oblongis, rectis, utrinque rotundatis, pro more bicellularibus, 12 \times 4,5 rarius 3-4-cellularibus 16 \times 4, hyalinis, v. dilute flavidis, medio non v. vix constrictis, plerumque egutulatis.

Hab. in ramulis vetustis Obionis portulacoidis in insula Amrum, Schleswig-Holstein.

52. **Diplodia Corispermi** Hollós, Növényt. Közlemen. VI (1907) Extr. 7092

p. 4. — Pycnidiis epidermide tectis, dense gregariis globoso-depressis, fuscis, poro pertusis, 180-240 μ . diam., contextu paren-

chymatico; sporulis oblongo-ellipsoideis, medio 1-septatis, valde constrictis, flavidulis, 14-18 \approx 6-8.

Hab. in caulis siccis *Corispermum nitidum* prope Kecskemét Hungariæ.

53. **Diplodina humulicola** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7093 p. 50. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, fuscis, poro pertusis, 140-210 μ . diam., contextu parenchymatico; sporulis oblongis, utrinque leniter attenuatis, medio 1-septatis, non constrictis, dilute ochraceis, 8-10 \approx 3-5-4.

Hab. in caulis siccis *Humulus Lupulus* prope Kecskemét Hungariæ. — A *Diplodina Humuli* Brun. diversa.

54. **Diplodina juglandina** Hollós, Ann. Mus. Nat. Hungar. VIII 7094 (1910) p. 4. — Pycnidiis superficialibus, gregariis, depresso-globosis, umbrinis, poro pertusis, 180-210 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque leniter attenuatis et rotundatis, medio 1-septatis, non constrictis, dilute ochraceis, 10-12 \approx 2-3.

Hab. in ramis emortuis *Juglans regia* prope Kecskemét Hungariæ.

55. **Diplodina ? salicicola** (Johns.) Sacc. et Trav. Syll. XIX p. 617. 7095 — *Macrodendrophoma salicicola* Johns. in Sci. Proc. Roy. Dubl. Soc. N. S. X (1904) p. 160, t. 13, f. 5-6. — Pycnidiis hinc inde aggregatis (an stromatice?), subcutaneo-erumpentibus, intus albis, epapillatis, globoso-conoideis; sporulis ovato-oblongis, 1-septatis, vix constrictis, utrinque rotundatis, intus granulosis, hyalinis, 12 \approx 4,5; sporophoris ramosis.

Hab. in ramis corticatis *Salicis triandrae* Hibernia Britanniæ, socia *Physalospora gregaria*, cuius, teste auctore, est pycnidium.

56. **Diplodina parasitica** (Hart.) Prill. Malad. pl. agric. II p. 292, 7096 f. 365. — Ita vocanda *Septoria parasitica* Hart. — Syll. XVIII p. 392 — quæ = *Ascochyta piniperda* Lindau in Engl. Pflanzenfam. I, 1** p. 367, t. XI f. A-E.

57. **Diplodina Taxi** Hollós, Ann. Mus. Nat. Hung. VIII (1910) p. 4. 7097 — Pycnidiis epidermide velatis, gregariis, brunneis, poro pertusis, 100-140 μ . diam., contextu celluloso; sporulis oblongo-ellipsoideis, medio 1-septatis, non v. vix constrictis; dulute ochraceis, 10-12 \approx 3-4.

Hab. in ramis siccis *Taxi baccatae* prope Kecskemét Hungariæ.

58. **Diplodina Junci** Oud., Syll. XVIII p. 354. — Sec. Ferdinandsen 7098

et Winge, Botan. Tidsskrift, 29 Bd. (1909) p. 314, synonyma sunt huius speciei: *Stagonospora juncicola* Rostr. — Syll. XVIII p. 360, et *Diplodina juncicola* (Rostr.) Lind.

59. **Diplodina arctica** J. Lind, Vidensk. Selskab. Skrif., Math. Naturv. Kl. Christiania (1909) n. 9, Extr. p. 14, t. I, f. 13-16. — Pycnidiis sparsis, nigris, sphæricis, 150-200 μ . diam., tectis, epidermide minute pustulatim sublevantibus, vix erumpentibus, poro 35 μ . diam. pertusis; sporulis oblongis, utrinque rotundatis, 1-septatis, cylindricis v. constrictis, leniter curvulis, hyalinis, endoplasmate granuloso, 30-42 \times 7-9.

Hab. in foliis dejectis *Alopecuri alpini* f. *muticæ* et *Poæ cenisiae*, King William Land Americæ Arcticæ.

60. **Diplodina Melicæ** Diedicke, Aufzähle. Erfurts Micromyc. (1910) p. 80. — Maculis specialibus nullis; pycnidiis sparsis, ellipsoideis, in culmo subseriatim, initio epidermide velatis, dein ostiolo prominulo erumpentibus et sæpe pustulatim emergentibus, atro-fuligineis, contextu pseudoparenchymatico laxiusculo, vertice dehiscen-tibus, 300 \times 225; sporulis majusculis, 25-40 \times 5-7, cylindraceis, utrinque rotundatis, rectis curvulisve, 1-septatis, non constrictis, hyalinis intus granulosis.

Hab. in foliis culmisque *Melicæ nutantis*, Berka pr. Erfurt Germaniæ. — Imprimis sporulis ratione generis majusculis dignoscenda specie.

61. **Diplodina Calamagrostidis** (Brun.) Allesch., Deut. Krypt. Fl. Pilze VI, p. 681. — Vestergren in Hedw. XLII (1903) p. 107, t. III, f. 11-12. Ita vocanda est *Ascochyta Calamagrostidis* Brun. — Syll. X p. 308 — Teste Vest. l. c. pycnidia seriatim disposita minutissima, lenticularia 111-165 \times 39-51, poro pertusa; sporulae 10-13 \times 3, utrinque guttulatæ et prope septum guttulis minutissimis 3-4 praeditæ, sæpe inæquilateræ, hyalinæ.

Hab. quoque in culmis *Avenæ elatioris*, Arensburg ins. Oesel maris Baltici (VESTERGREN).

62. **Diplodina Calvatiae** Hollós, Ann. Mus. Nat. Hungar. V (1907) p. 281. — Pycnidiis sparsis v. gregariis, lenticularibus, fuscis, poro pertusis, 140-160 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, medio 1-septatis, non constrictis, hyalinis 15-20 \times 4,5-5.

Hab. in endoperidio *Calvatiae candidæ* prope Kecskemét Hungariæ.

63. **Diplodina geastericola** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7103

p. 282. — Pycnidiis sparsis v. gregariis, lenticularibus, brunneis, poro pertusis, 140-200 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, medio 1-septatis, non constrictis, hyalinis, 12-16 \approx 2-2,5.

Hab. in stratu externo v. interno exoperidii *Geasteris hungarici* prope Nagy-Körös Hungariæ.

64. *Diplodina geasterina* Hollós, Ann. Mus. Nat. Hungar. V (1917) 7104

p. 282. — Pycnidiis sparsis, subcutaneis, oblongo-ellipsoideis, 250-350 \approx 140-210, fuscis, poro pertusis, contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, medio 1-septatis, non constrictis, hyalinis, 14-16 \approx 2,5-3.

Hab. in stratu externo exoporidii *Geasteris ambiguus* prope Nagy-Körös Hungariæ.

65. *Diplodina Geasteris* Hollós, Ann. Mus. Nat. Hungar. IV (1906) 7105

p. 534. — Pycnidiis gregariis, depresso-globosis, fuscis, poro pertusis, 140-160 μ . diam., contextu parenchymatico; sporulis fuscoideis, medio 1-septatis, non v. vix constrictis, hyalinis, 16-20 \approx 5-6.

Hab. in stratu interno exoperidii *Geasteris nani*, prope Monor Hungariæ.

66. *Diplodina Mycenastri* Hollós, Ann. Mus. Nat. Hung. IV (1906) 7106

p. 534. — Pycnidiis sparsis, globosis, fuscis, poro pertusis, 200-230 μ . diam., contextu parenchymatico; sporulis cylindraceis, rectis v. leviter curvulis, utrinque attenuatis, rotundatis, medio, 1-septatis, non constrictis, hyalinis, 16-20 \approx 4.

Hab. in endoperidio *Mycenastri Corii*, prope Kecskemét, Hungariæ.

VERMICULARIELLA Oud. (Jul. 1898). — Syll. XVI p. 941, XVIII

p. 357 (*Didymochæta* Sacc. et Ell. Syll. XIV p. 953, paullo posterior: Sept. 1898)

1. *Vermiculariella Drabæ* Moesz, Gomb. Budap. I (1909) p. 20, t. 7107

II, f. 3 a-b (Bot. Közlem.) — Pycnidiis superficialibus, subglobosis, atris, 214-286 μ . altis, 214-350 μ . latis, ostiolo 13-14 μ . diam., pilis vestitis, contextu dense parenchymatico, atro-griseo; pilis fuligineis, divergentibus, plus minusve rigidis, simplicibus, multiseptatis, apicem versus pallidioribus, fere hyalinis, 70-200 \approx 6-7,5; sporulis multiformibus, anguste fusoideis, cylindraceis, acicularibus, subclavatis, 14-24 \approx 1,5-2,5, hyalinis, obsolete 1-septatis, ad septum non constrictis, 4-guttulatis.

Hab. in foliis caulibusque siccis *Drabæ lasiocarpæ* prope Budapest Hungariæ.

2. **Vermiculariella poiophila** Speg., Myc. Argent. V, p. 365, cum 7108 icon. in An. Mus Nac. Buenos Aires XX (1910). — Pycnidiis numerosis laxe gregariis, subhemisphæricis, 120-180 μ . diam., obsolete ostiolatis, setulis erectis non v. vix flexuosulis simplicibus continuis subopace fuligineis, 30-150 \approx 3-5, basi bulbilloso-incrassatis vestitis; sporulis fusoideis leniter arcuatis, 20-25 \approx 3-5, medio uniseptatis non constrictis, hyalinis, levibus.

Hab. in culmis emortuis *Chloridis* cujusdam prope Formosa et in foliis aridis *Calamagrostidis* prope Lago San Martin Patagonia, Argentina Amer austr. — Ad hoc gen. pertinet etiam *Verm. Melicæ* (Fuck.) Sacc.

3. **Vermiculariella opuntiicola** (Speg.) Sacc. et Trott., *Didymochæta?* 7109 *opuntiicola* Speg., Myc. Argent. V p. 369, in Annal. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; pycnidiis solitariis v. laxe gregariis, erumpenti-subsuperficialibus, basi depresso, glabris sursum convexulis (250 μ . diam.) atris, coriacellis, in sicco collapsis udis subglobosis, setulis rigidulis, 100-150 \approx 5-8, 2-3-cellularibus fuligineis pellucidis laxe vestitis, ostiolo obsolete, contextu dense parenchymatico atro-fuligineo subopaco; sporophoris subbacillaribus, simplicibus, 10-15 \approx 1,5-2, chlorinulis, monosporis; sporulis ellipsoideo-subfusoideis utrinque acutiuscule subrotundatis, 16-20 \approx 3-3,5, rectis v. leniter inæquilateralibus, diblastis v. uniseptatis (non constrictis) loculis æquilongis, eguttulatis, chlorinis.

Hab. ad fructus sicclos *Opuntiae diadematæ* in aridis circa Catamarea Argentinæ Amer. austr. — A genere sporulis chlorinis non nihil recedens. (Subgen. *Didymochæta* Sacc. em. Speg.)

CHÆTODIPLODINA Speg. Myc. Argentin. V, p. 368, in An. Mus. Nac. Buenos Aires XX (1910) (Etym. *chæta* seta et *Diplodina*). — Pycnidia superficialia subglobosa, ostiolata, subiculo fuligineo insidentia; sporulæ 1-septatae hyalinæ.

1. **Chætodiplodina graminicola** Speg., l. c. p. 368. — Maculis nullis; subiculo tenuissimo laxissimo ex hyphis repentibus ramulosis septulatis olivaceis, 200-500 \approx 3-5, hinc inde ramulos erectos simplices fuligineos pellucidos multiseptulatos rectiusculos, apice acutiusculos 100-250 \approx 5-8 emittentibus; pycnidiis hinc inde sparsis globoso-depressis 90-100 μ . diam., ostiolo minuto impresso perforatis, tenui-membranaceis, contextu grosse parenchymatico,

fumoso olivaceo; sporulis bacillaribus, saepius basi obtusioribus, 30-45 \approx 4-6, rectis v. leniter inaequilateralibus, uniseptatis, ad septum non constrictis, loculis subaequilongis nubilosо-guttulatis, hyalinis.

Hab. ad folia viva Panici laxi in pratis Jbicuy Argentinæ Amer. austr. (E. AGUIRRE).

ROBILLARDA Sacc. — Syll. III p. 407, X p. 308, XI p. 525, XVI p. 935, XVIII p. 356.

1. **Robillarda americana** Speg., Myc. Argent. V, p. 367, in An. 7111 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis sed matrice tota sordide fuscescente; pycnidii amphigenis, innatis, membranaceis, atris, lenticulari-depressis, 200-250 μ . diam., ostio lo vix papillato ornatis, contextu per grosse parenchymatico, fuligineo; sporophoris bacillaribus 5-15 \approx 0,5, monosporis, hyalinis; sporulis cylindraceis, 20-28 \approx 3 basi muticis superne abrupte mucronatis, mucrone 5-10 \approx 0,5, recto, setulas 3 divaricatas, 15-20 \approx 0,5 fulcentibus, hyalinis, medio uniseptatis, rarius continuis v. utrinque parum sub apice 1-septatis.

Hab. ad folia dejecta putrescentia Gleditschiæ Triacanthi in silvula Santa Catalina prope Buenos Aires Amer. austr.

2. **Robillarda Geasteris** Hollós, Ann. Mus. Nat. Hung. V (1906) p. 7112 535. — Pycnidii depresso-globosis, fuscis, poro pertusis, 180-210 μ . diam., contextu parenchymatico; sporulis fusoideis rectis v. leviter curvulis, deorsum rotundatis, apice acutis, setis 2-5, longis, hyalinis ornatis, medio 1-septatis, non constrictis, hyalinis 18-20 \approx 3-3,5 (sine setulis).

Hab. in stratu interno exoperidii Geasteris ambigui et G. nani prope Nagy-Körös et Monor, Hungariæ.

DARLUCA Cast. — Syll. III. p. 410, X p. 310, XIV p. 948, XVI p. 936, XVIII p. 357.

1. **Darluca australis** Speg. — Syll. X p. 310 — var. **phylostictoides** 7113 Speg., Myc. Argent. V p. 366, in An. Mus. Nac. Buenos Aires XX (1910). — Habitu externo *Phyllostictam* optime simulans; pycnidii 70-100 μ . diam.; sporulis 12-14 \approx 3.

Hab. ad folia languida Persicæ vulgaris in hortis La Plata Argentina Amer. austr.

CYTODIPLOSPORA Oud. (1894) — Syll. XI p. 428, XVI p. 941, XVIII p. 358 (= *Placosphaerella* Pat. (1897) — Syll. XIV p. 948).

1. **Cytodiplospora Robiniæ** Bubák, Ann. Mycol. IV (1906) p. 116. — 7114
Stromatibus verruciformi-erumpentibus, ramos late tegentibus, nigris, ex hypostromate crassiusculo nigro-brunneo ligno immerso orientibus, 0,4-0,8 mm. latis, loculis verticaliter dispositis, raro liseriatis; contextu intus flavidus v. flavo-brunneo, extus obscure brunneo; sporulis ovoideis, ellipsoideis, elongatis v. biscoctiformibus, rectis raro curvulis, 6-10 \approx 3-4,5, 1-2-locularibus, apice rotundatis, uno latere, præcipue bilocularibus, angustioribus, hyalinis.

Hab. in ramis emortuis Robiniæ Pseudacaciæ prope Peruc Bohemia. — Socia ad est *Pleoamssaria Robiniæ* Bub.

2. **Cytodiplospora disciformis** Sacc. in Ann. Mycol. IX (1911) p. 252. 7115
— Stromatibus laxe gregariis, corticolis, innato-erumpentibus, disciformibus, utrinque applanatis, peridermio cinctis, 0,7-1 mm. diam., subcarbonaceis, extus nigris, intus subgriseis, disco parce obsoleteque papillulatis; loculis saepius periphericis, globulosis v. depressionis, 100-150 μ . diam.; sporulis fusoideis, lenissime curvis, utrinque acutiusculis, medio 1-septatis, non constrictis, 15-18 \approx 4, rarius usque ad 19 \approx 4,5, hyalinis, in basi sporifera fulvescente subsessilibus.

Hab. in ramis corticatis Æsculi Hippocastani in Gallia (P. HARIOT). — A *Cylodipl. Castaneæ* Oud. recedit stromatibus disciformibus, sporulis subsessilibus etc.

3. **Cytodiplospora Rhois** Sacc. Notæ Myc. VIII, Ann. Myc. v. IV (1906) p. 492, tab. X, fig. 6. — Stromatibus gregariis, corticolis, ambitu irregulariter circularibus. vix 1 mm. diam., cortice prominulo diu tectis, tandem poro irregulari erumpentibus, intus inæqualiter pluri-locularibus, nucleo farcto submelleo, excipulo imperfecto; sporulis fusoideis, utrinque acutulis, rectiusculis, 13-14 \approx 3 medio 1-septatis, non constrictis, hyalinis; sporophoris fasciculatis, bacillaribus, sursum tenuatis, 12-14 μ . longis, 2-3 μ . basi cr., hyalinis.

Hab. in ramis Rhois glabræ, Tamsel Marchiæ (VOGEL) — Verisimiliter pycnidium *Diaporthes stilbostomæ* vel affinis.

4. **Cytodiplospora silvatica** Sacc. — *Placosphaerella silvatica* Sacc. 7117
Ann. Mycol. X (1912) p. 148. — Stromatibus laxe gregariis, saepius hypophyllis, innatis, atro-nitidulis, 1-2 mm. long., 0,5 mm. lat., oblongis v. breve lanceolatis, 1-paucilocularibus; loculis glo-

bulosis 140 μ . diam., immersis, poro 28-30 μ . lato pertusis; sporulis fusoideis, saepe curvulis, utrinque acutatis, 14-15 \approx 2-2,5, diblasto-1-septatis, non constrictis, hyalinis; sporophoribus palliformibus stipatis, chlorinis, 5-6 \approx 2,5.

Hab. ad folia Festucæ heterophyllæ subviva pr. Erfurt, Steiger, Germania (H. DIEDICKE). Species pusilla, probabiliter pycnidium *Phyllachoræ silvaticæ*.

Sest. 5. Hyalophragmiæ

STAGONOSPORA Sacc. — Syll. III p. 445, X p. 330, XI p. 533, XIV p. 962, XVI p. 947, XVIII p. 358.

1. **Stagonospora berberidina** Sacc. in Ann. Mycol. X (1912) p. 312. — 7118
Maculis versiformibus arescendo sordide albidis, amphigenis, non discolori-marginatis; pycnidiiis globoso-hemisphæricis, epidermide velatis, rarissimis, nigricantibus, 140-160 μ . diam., ostiolo 30-40 μ . diam. pertusis, contextu dilute ochraceo-brunneo, circa ostiolum atro; sporulis fusoideis, utrinque subrotundatis, 3-septatis, non constrictis, 14-17 \approx 4, e hyalino viridulis, rarissime 3-4-septis tenuioribus interpositis, hinc 6-7-septatis.

Hab. in foliis Berberidis vulgaris in horto cultis, Lyndonville N. Y. Amer. bor. (FAIRMAN).

2. **Stagonospora Yerbæ** Speg., An. Mus. Nac. Buenos Aires v. 7119 XVII (1908) p. 136. — Pycnidiiis cortice insidentibus, primo epidermide velatis serius saepe denudatis, subconoideis, 120-150 μ . diam., papillato-ostiolatis, glabris, nigris, carbonaceis, contextu indistincto; sporulis elongato-fusoideis, constipatis, erectis, sursum attenuatis, truncatis, deorsum langius sensimque attenuato-subpedicellatis 100-120 \approx 8-9, initio continuis nubilosis, serius 9-11-guttulatis, 5-9-septatis, hyalinis.

Hab. ad ramos dejectos putrescentes Ilicis paraguariensis in silvis circa Campo das Cuias Misiones Argentina. — Var. **minor** Speg. l. c. — A typo recedit pycnidiiis minoribus 90-100 μ . diam. superne carbonaceis inferne membranaceis, contextu indistincto atro-subcyanescente; sporulis brevioribus, 70-85 \approx 7-9, validius fusoideis. — Ad ramulos emortuos Ilicis paraguariensis in dumetis circa San Pedro Misiones Argentina.

3. **Stagonospora Koelreuteriæ** Hollós, Ann. Mus. Nat. Hung. IV 7120 (1906) p. 354. — Pycnidiiis epidermide tectis, depresso-globosis,

fuscis, poro pertusis, 210-250 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, rectis v. curvulis, 3-septatis, non constrictis, hyalinis, 16-24 \approx 2,5-3,5.

Hab. in ramulis siccis Koelreuteriæ paniculatæ, Kecskemét Hungariæ.

4. **Stagonospora theicola** Petch, Ann. Roy. Bot. Gard. Peradeniya **7121** III, Pt. I (1906) p. 7. — Pycnidiis minutis, gregariis, innatis, nigris circ. 0,1 mm. diam.; sporulis tri septatis, viridi-hyalinis, oblongis, apicibus rotundatis, rectis v. leniter curvatis, 15-17 \approx 5.

Hab. in maculis griseis foliorum Theæ viridis, Ceylon. — Socia adsunt *Læstadia Theæ* Rac. et *Colletotrichum Camelliæ* Mass.

5. **Stagonospora Opuntiæ** Speg., Myc. Arg. V, p. 372, in An. Mus. **7122** Nac. Buenos Aires XX (1910). — Pycnidiis sparsis v. laxè gregariis, primo epidermide tectis dein erumpentibus v. denudatis, atris, glabris, subconoideis 250 μ . diam., valide crasseque papillato-ostiolatis, carbonaceis, contextu indistincto; sporulis cylindraceis v. obsoletissime clavatulis, rectis v. vix curvulis, utrinque rotundatis, 16-20 \approx 4-5, 1-3-septatis, non v. lenissime constrictulis, loculis hyalinis, saepius grosse 1-guttulatis.

Hab. ad articulos emortuos et aridos Opuntiæ aurantiacæ in montanis Potrerillos prope Mendoza, Argentina Amer. austr.

6. **Stagonospora Acænæ** P. Henn., Deutsche Südpolar-Exped. Bd. **7123** VIII (1906) Extr. p. 14, t. II, f. 20. — Pycnidiis sparsis v. subgregariis, innato-erumpentibus, atris, membranaceis v. subcarbonaceis, subglobosis, apice obtuso subostiolatis, perforatis, c. 300 μ . diam.; sporulis oblongo-fusoideis v. subcylindraceis, utrinque obtusiusculis, 3-5 septatis vix constrictis, hyalinis, 18-20 \approx 5-6; sporophoribus brevibus, subfiliformibus, hyalinis.

Hab. in ramis emortuis Acænæ ascendentiis, in insulis Kerguelen (WERTH). — Socia est *Phoma Acænæ*.

7. **Stagonospora Photiniæ** d'Alm. et da Cam., Bol. Soc. Brot. **7124** XXIV (1908-1909) Extr. p. 51. — Pycnidiis sparsis, epiphyllis, in macula cinerescente dispositis, primo diu tectis, demum erumpentibus, globulosis, poro minuto pertusis, 95-115 μ . diam.; sporulis subellipsoideis, utrinque uniguttulatis rotundatisque, biseptatis, ad septa interdum oblitterata, non v. vix constrictis, hyalinis, 8-10 \approx 2,5-3.

Hab. in foliis Photiniæ sp., in horto botanico Coimbra Lusitaniæ (A. MOLLER). — Socia *Pestalozzia Guepini*, Desm.

8. **Stagonospora Astragali** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7125
 p. 353. — Pycnidiis epidermide tectis, globoso-depressis, nigris, 160-180 μ . diam.; sporulis cylindraceis, rectis, utrinque rotundatis, 3-7-septatis et guttulatis, non constrictis, hyalinis 16-20 \approx 4.
Hab. in petiolis siccis. *Astragali exscapi* prope Kecskemét Hungariæ.
9. **Stagonospora Fumanæ** Hollós, Ann. Mus. Nat. Hung. V (1907) 7126
 p. 466. — Pycnidiis erumpentibus, gregariis, globulosis, fuscis, poro pertusis, 170 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque leniter attenuatis et rotundatis, rectis v. curvulis, 3-septatis, non constrictis, hyalinis, 18-28 \approx 2-3.
Hab. in ramulis siccis *Helianthemi Fumanæ* prope Kecskemét Hungariæ.
10. **Stagonospora heterospora** Sacc., in Ann. Mycol. VIII (1910) p. 253. 7127
 — Pycnidiis sub peridermio nidulantibus erumpentibusque, dense gregariis, globulosis, non papillatis, intus et extus nigricantibus, 200 μ . diam., hyphis brunneis, copiosis, intricatis, septatis, 4-5 μ . cr. quasi subiculum formantibus insidentibus, contextu pycnidii pseudoparenchymatico fuligineo, crassiusculo; sporulis versiformibus, ellipsoideis oblongo-ellipsoideis clavulatis, pro more 3-septatis, medio non v. parce constrictis, rarius 1-2-septatis, 16-19 \approx 6,5-7 hyalinis; sporophoris bacillaribus, fasciculatis, hyalinis, 16-28 \approx 2-2,5.
Hab. in ramis corticatis languidis v. emortuis *Amelopsidis quinquefoliae*, Lyndonville N. Y. Amer. bor. (C. E. FAIRMAN).
11. **Stagonospora Veronicæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7128
 p. 355, tab. VIII, fig. 15. — Pycnidiis epiphyllis, tectis, depresso-globulosis, atro-brunneis, poro pertusis, c. 150 μ . diam., contextu parenchymatico; sporulis fusiformi-subclavatis, 3-septatis, ad septa leviter constrictis, dilute flavidulis, 20-30 \approx 3,5-4.
Hab. in foliis inferioribus emortuis *Veronicae prostratae* prope Kecskemét Hungariæ.
12. **Stagonospora Hyalidis** Speg., Myc. Arg. V, p. 372, in An. Mus. 7129
 Nac. Buenos Aires XX (1910). — Pycnidiis epidermide velatis, non v. vix erumpentibus, sparsis, ex hemisphærico subconoideis, 80-120 μ . diam., ostiolo vix papillato pertusis, tenui-membranaceis, contextu grosse parenchymatico olivaceo; sporophoris saepius trichotomis, 15-20 \approx 1,5-2, hyalinis fasciculatis, ramulis monospermis; sporulis e cylindraceo subfusoideis, leviter curvulis, 3-septatis, ad septa non constrictis, 35-40 \approx 2,5-4.

Hab. ad ramulos aridos *Hyalidis argenteæ* in sabulosis prope Cordoba Argentina Amer. austr.

13. **Stagonospora baccharidicola** Hollós, Ann. Mus. Nat. Hungar. V 7130 (1907) p. 52. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, fuscis, poro pertusis, 210-250 μ . diam., contextu parenchymatico; sporulis fusiformibus, rectis, initio continuis, 2-3-guttulatis, dein 1- demum 3-septatis, hyalinis, 16-18 \approx 3,5-4.

Hab. in ramulis emortuis *Baccharidis halimifoliæ*, Kecskemét Hungariæ. — A. *Stagonospora Baccharidis* Ell. diversa.

14. **Stagonospora Crepidis** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7131 p. 534. — Maculis orbicularibus, 2-4 mm. diam., sordide brunneis, expallentibus, atro-cinctis; pycnidiis epiphyllis, sparsis, epidermide tectis, lenticularibus, poro pertusis, 100-140 μ . diam., dilute brunneis, contextu parenchymatico; sporulis ovato-oblongis, rectis v. nonnunquam curvulis, 1- dein obscure 3-septatis, non v. ad medium vix constrictis, hyalinis, 4-guttulatis, 12-16 \approx 4.

Hab. in foliis vivis Crepidis biennis prope Nagy-Körös Hungariæ.

15. **Stagonospora salicicola** (Johns.) Sacc. et Trav. — Syll. XIX, 7132 p. 879 — *Tetradia salicicola* Johnson in Proc. Roy. Dubl. Soc. n. ser. X (1904) p. 157, t. 13, f. 3-4. — Pycnidiis subcutaneo-prominulis, depresso conoideis, intus pallidis, vix erumpentibus; sporulis tereti-oblongis, utrinque obtusulis, hyalinis, 3-septatis, non v. vix constrictis, 8,7 \approx 2,3; sporophoris sporulam subæquantibus, bacillaribus, hyalinis.

Hab. in ramis corticatis *Salicis triandrae*, Hibernia Britanniae.

16. **Stagonospora linearis** Peck, Bull. Torr. Bot. Cl. XXXVI (1909) 7133 p. 338. — Pycnidiis pulvinatis v. hemisphæricis, 1-1,5 mm. latis, levibus v. rugulosis, erumpentibus, firmis, atris, intus albidis, basi flavescentibus, seriatim dispositis; sporulis rectis v. leviter curvis, utrinque obtusis, triseptatis, subcylindraceis, subclavatis, v. subfusciformibus, hyalinis, 40-60 \approx 5-6, sporophoribus gracilibus ramosis suffultis.

Hab. in ramulis emortuis *Caryæ* sp. River Forest Illinois Amer. bor. (E. F. et S. A. HARPER).

17. **Stagonospora Brunchorstii** Sacc. Cfr. Brunchorst, Krankheit der Schwarzföhre, Bergen, 1887, Bergens Museum, n. 6, t. I et II. — Pycnidiis innato-erumpentibus, obtusis, subinde confluentibus, irregularibus, nigris, intus pallidis, farctis; sporulis fusiformibus,

utrinque obtusulis, curvulis, 3- plerumque 4-septatis, non constrictis, obsolete guttulatis, hyalinis, $33-40 \approx 3$, rarius usque ad 50μ . long. ; sporophoris dense stipatis, filiformibus, septatis sporulâ triplo longioribus.

Hab. in foliis, quæ inde dilabuntur, *Pini austriacæ* et *P. montanæ* in Norvegia. — *St. Pini* Grove satis affinis sed distinguenda.

18. **Stagonospora Borbonicæ** Da Cam. — Syll. XVIII, pag. 359 (in 7135

Chamærope et Phœnice!) Cll. d'Almeida et Da Cam. in Bol. Soc. Brot. XXV, p. 50 (extr.) mutaverunt nomen in *Stag. Palmæ*, sed immerito nam fungillus in peraffini *Latania borbonica* facile reperiendus est.

19. **Stagonospora Crini** Bub. et Káb., Hedwigia XLII (1908) p. 361. 7136

— Maculis amphigenis, sparsis, rotundatis v. elongatis, plerumque parum elevatis, purpureo-brunneis, immarginatis, sæpe confluentibus, demum pallescentibus ; pycnidiis amphigenis, sparsis, sæpe confertis confluentibusque, inter nervos sæpe seriatis, globosis, compressis, $150-200 \mu$. d., e pallide brunneis brunneis, epidermide tectis, udis pustuliformibus, poro minuto rotundato papilliformi apertis, contextu tenui parenchymatico pallide brunneo ; sporulis numerosis, maturis cylindraceis v. fusoideis, sæpe irregularibus, $16-26,5 \approx 5-8,5$, rectis v. raro incurvatis 3- (raro 5) transverse septatis, ibique plerumque constrictulis, utrinque angustato-rotundatis, hyalinis ; sporulis immaturis 1-2-locularibus, minoribus ; sporophoris crassis, conoideo-papilliformibus, flavidis.

Hab. in foliis emortuis putrescentibus *Crini Powellii* pr. Turnau Bohemia (KABAT).

20. **Stagonospora Narcissi** Hollós, Ann. Mus. Nat. Hung. V (1906) 7137

p. 354, tab. VIII, fig. 16. — Maculis irregularibus, magnis, brunneis ; pycnidiis amphigenis, tectis, aggregatis, globoso-depressis, brunneis, poro pertusis, $140-180 \mu$. d., contextu parenchymatico ; sporulis cylindraceis, utrinque rotundatis, 1- dein 3-septatis, ad septa constrictis, 2-4-pluriguttulatis, hyalinis, $20-28 \approx 6-8$.

Hab. in foliis vivis *Narcissi poëtici*, Kecskemét Hungariæ. — An diversa a *Stagonospora Curtisii* (Berk.) Sacc.

21. **Stagonospora Eriophori** Rostr., Rep. second. Norweg. arctic Ex- 7138

ped. Fram (1906) pag. 9. — Pycnidiis sparsis, globulosis, nigris ; sporulis exacte cylindraceis, utrinque obtusis, septatis, guttulatis, hyalinis v. subflavidis, $45-52 \approx 3$.

Hab. in foliis *Eriophori polystachii*, E. Havne Fjord Norvegiae.

22. **Stagonospora Typhæ** von Höhnel, Stzb. k. Ak. d. Wiss. Wien, 7139 CXVIII, Abt. I (1909) pag. 404. — Pycnidiis globoso-depressis, nigris, immersis, infra hyphis 2-4 μ . cr. circumdatis; parietibus membranaceis, obscure brunneis, e cellulis polygoniis 8-12 μ . cr.; sporulis hyalinis 3-4-locularibus, ad septa plerumque constrictis, guttulatis, apice rotundatis, elongatis, 20-24 \times 6-8.

Hab. in vaginis *Typhæ angustifoliæ*, Sonntagberg Austriae inf. (STRASSER).

23. **Stagonospora Typhoidearum** (Desm.) Sacc. — Syll. III p. 451 — 7140 Sec. Bub. et Kab., Hedw. L (1909) p. 42, diagnosis plenior est sequens: pycnidiis sparsis v. gregariis, interdum confluentibus, epidermide tectis dein rimose fissa tectis, contextu subcarbonaceo parenchymatico, atro-brunneo; sporulis copiosis, cylindraceis, 30-38 \times 8, rectis curvulivis, utrinque rotundatis 1-3, raro 4-septatis, constrictis v. non, grosse 3-4-guttatis; sporophoris 5-10 \times 3-4, sursum tenuatis. — Locum adde ad caules *Typhæ angustifoliæ* pr. Münchengrätz Bohemiæ. — Cl. de Höhnel, Frag. z. Myk. 1902 et 1909, contendit hanc speciem potius ad *Ascochyta spectere* quod ineptum videtur ob sporulas valde longas et 1-3-septatas.

24. **Stagonospora elegans** (Bk.) Sacc. et Trav. Syll. XIX p. 878. — 7141

Hendersonia elegans Berk. in Ann. and Mag. Nat. Hist VI (1841) n. 208, t. XI, f. 9. — Pycnidiis in maculis minutis atro-brunneis singulatim innatis, nitidulis, prominulis; sporulis strato subgeltinoso insertis, late fusoideis, majusculis, apice obtuse tenuatis, deorsum in sporophorum brevissimum desinentibus, 6-8-septatis, hyalinis, loculis æqualibus, subinde vero turgidis, crassiuscule 1-guttulatis, tunica crassa.

Hab. in culmis *Phragmitis communis* in Britannia.

25. **Stagonospora ?cornuligera** Speg., Myc. Arg. V. p. 371 in Anal. 7142 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis sed matrice tota sordide cinerescente; pycnidiis sparsis innato-erumpentibus, membranaceis, globulosis, 75-100 μ . diam., eximie ostiolato-pertusis, contextu grosse parenchymatico fuligineo; sporulis subcylindraceis v. subclavatulis, rectis v. subcurvulis, superne obtusis, saepius corniculis mucosis duobus breviusculis ornatis, postice subattenuato-acutatis, 32-38 \times 4-6, pedicello persistente brevissimo

gracillimoque suffultis, saepius 7-septatis ad septa non v. vix constrictis, chlorinis, corniculis et pedicellus 5 ~ 1, semper hyalinis.

Hab. ad culmos aridos Boutelouæ lophostachyæ in montanis Potrerillos prope Mendoza, Argentina America austr.

26. **Stagonospora Alopecuri** Rostr., Rep. second. Norweg. arctic 7143
Exped. Fram. (1906) p. 9. — Pycnidiis gregariis, prominentibus, perexiguis, globulosis; sporulis cylindraceo-bacillaribus, utrinque obtusis, 3-septatis, hyalinis v. pallide flaveolis, 25-32 ~ 5-6.

Hab. in foliis Alopecuri alpini, E. Fram's Haven Norvegiæ.

27. **Stagonospora Arundinis** (Lév.) Sacc. — *Dothidea Arundinis* Lév. 7144
Voyage dans la Russie merid. II, p. 109, t. V, f. 3 (1842). —
Maculis flavo-fuscescentibus v. nullis; pycnidiis erumpentibus, amphigenis, globosis albo-farctis, prominulis, uni-biserialibus, stromate atro conjunctis, ostiolis obsoletis; sporulis septatis, hyalinis.

Hab. in foliis Phragmitis communis, Inkerman et Yatta Rossiæ merid. — Ob confluentiam pycnidiorum habitus subhysterioideus. An sit eadem ac *Stag. Arundinis* (Cooke) imperfecte descripta, non liquet. Cl. Léveillé sumit sporulas pro ascis.

28. **Stagonospora vexata** Sacc. — Syll. fung. III, p. 455 — var. 7145
Baldingeræ Sacc., Ann. Mycol. VII (1909) p. 434. — Sporulis paullo angustioribus, nempe 55-60 ~ 5,5-6, plerumque tantum 7-8-septatis, hyalinis.

Hab. in foliis emortuis Baldingeræ arundinaceæ in Gallia (P. HARIOT).

29. **Stagonospora Geasteris** Hollós, Ann. Mus. Nat. Hung. IV 7146
(1906) p. 535. — Pycnidiis gregariis, depresso-globosis, fuscis, poro pertusis, 80-100 μ . diam., contextu parenchymatico; sporulis fusoides, rectis v. curvulis, obscure 3-septatis, non constrictis, hyalinis, 20-22 ~ 2-2,5.

Hab. in stratu interno exoperidii Geasteris nani, prope Monor Hungariæ.

30. **Stagonospora geasterina** Hollós, Ann. Mus. Nat. Hungar. V 7147
(1907) p. 283. — Pycnidiis sparsis, subcutaneis, hemisphæricis, astomis, fuscis, 250 μ . diam., contextu parenchymatico; sporulis cylindraceis utrinque rotundatis, rectis v. leviter curvulis, 3-septatis, non constrictis, hyalinis, 28-34 ~ 2,5-3.

Hab. in stratu interno exoperidii Geasteris pseudolimbati prope Jász-Szent László Hungariæ.

31. **Stagonospora geastericola** Hollós, Ann. Mus. Nat. Hungar. V 7148
(1907) p. 282. — Pycnidiis sparsis v. gregariis, depresso-globo-

sis, fuscis, poro pertusis, 100-140 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque leniter attenuatis, curvulis, vermicularioideis, 3-5-septatis, non constrictis hyalinis, 30-42 \approx 3-4.

Hab. in stratu interno exoperidii Geasteris minimi, in stratu interno et externo exoperidii Geasteris hungarici, Bakony-Szent-László et Nagy-Körös Hungariæ.

KELLERMANNIA Ell. et Ev. — Syll. X p. 337, XIV p. 964, XVI p. 950, XVIII p. 362.

1. **Kellermannia gongrogena** (Temme) Sacc. et Trav. — Syll. XX p. 7149 1260. — Ita vocanda *Pestalozzia gongrogena* Temme. — Syll. X p. 489 — et ita describenda: — Pycnidiis subcutaneo-erumpentibus, subglobosis, nigris, non papillatis, exiguis, 40-100 μ . diam., contextu parenchymatico fuligineo; sporulis fusoideis, curvis, utrinque obtusulis, sursum leviter crassioribus, 24 \approx 4, triseptatis, non constrictis, hyalinis, intus granulosis, apice setula hyalina, sporula triplo breviore præditis; sporophoris filiformibus 7-8 μ . longis, hyalinis.

Hab. in ramis Salicis viminalis et S. undulatae in quibus tumores (*Weidenkropfen*) efficit in Borussia et Saxonia.

2. **Kellermannia cercosperma** (Rostrup) J. Lind, Micromycetes from North-East Groenland, Kiobenhavn (1910) p. 157. — Ita vocanda *Rhabdospora cercosperma* (Rostr.) Sacc. Syll. X p. 391 (= *Rhab. caudata* (Karst.) Sacc., Syll. III p. 593).

Sect. 6 Phæophragmiæ.

HENDERSONIA Berk. — Syll. III p. 418, X p. 317, XI p. 528, XIV p. 441, XVI p. 946, XVIII p. 368.

1. **Hendersonia Clematidis** Hollós, Ann. Mus. Nat. Hung. V.(1907) 7151 p. 465. — Pycnidiis sparsis, hemisphæricis, ostiolo minuto, perforato erumpentibus, fuscis, 280-350 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, rectis v. curvulis, 3-septatis, non v. vix constrictis, dilute brunneis, 24-26 \approx 2-2,5.

Hab. in caulibus siccis Clematidis integrifoliæ prope Kecskemét Hungariæ.

2. **Hendersonia Rubi** (West.) Sacc., Syll. III p. 424, X p. 321, XI 7152 p. 530 — var. **Clematidis** Strasser, Verh. k. k. zool.-bot. Ges.

Wien Bd. LX (1910) p. 320. — Sporulis brunneis, quadrilocularibus, loculo inferiore hyalino attenuato, cum sporophoris $34 \approx 5,7$.

Hab. in ramulis siccis Clematidis Vitalbæ, Sonntagberg Austriæ.

3. **Hendersonia Alyssi** v. Höhn. Ann. Mycol. III (1905) p. 332. — 7153
— Pycnidiis gregariis usque ad 190 μ . latis, globosis, ostiolo non distincte papillato 10-12 μ . lato, supra brunneolis infra pallidioribus, subepidermicis; sporulis primum hyalinis dein pallide brunneolis, cylindraceis, utrinque truncatulis, rectis v. curvulis, quadrilocularibus $32-48 \approx 3-5$ sed plerumque $40 \approx 3-3,5$.

Hab. in caulis siccis Alyssi corsici prope Bastia Corsicæ.

— In pycnidiis vetustioribus sporulæ *Phomæ* occurunt.

4. **Hendersonia sarmentorum** West. — Syll. III p. 420 — var. 7154
Mahoniæ Hollós, Ann. Mus. Nat. Hungar. VII (1909) p. 55. — Sporulis ellipsoideis, flavo-brunneis, 3-septatis, non v. vix constrictis, $10-12 \approx 4-5$.

Hab. in ramulis siccis Mahoniæ Aquifolii prope Kecskemét Hungariæ. — Var. **Deutziæ** Hollós, Ann. Mus. Nat. Hungar. V (1907) p. 55. — A typo differt sporulis ellipsoideis, flavo-brunneis, 3-septatis, non v. vix constrictis $10-13 \approx 4-5$. — In ramulis siccis Deutziæ crenatae, Kecskemét Hungariæ. — Var. **Baccharidis** Hollós, Növényt. Közlemen VI (1907) Extr. p. 8. — Sporulis ellipsoideis, flavo-brunneis, 3-septatis, ad septa non v. vix constrictis, $10-12 \approx 5-6$. — In ramulis emortuis Baccharidis halimifoliae, Kecskemét Hungariæ. — Var. **Coluteæ** Hollós l. c. — Sporulis oblongo-ellipsoideis, v. cylindraceis, flavidulis, initio 1- dein 3-septatis, ad septa non v. vix constrictis $12-16 \approx 4-5$. — In ramulis emortuis Coluteæ arborescentis, Kecskemét Hungariæ. — Var. **Pteleæ** Hollós l. c. — Sporulis oblongo-ellipsoideis, flavidulis, 3-septatis, vix constrictis, $8-12 \approx 3-3,5$. — In ramulis emortuis Pteleæ trifoliatae, Nagy-Körös Hungariæ. — Var. **Spiraeæ** Hollós l. c. — Sporulis ellipsoideis, flavo-brunneis, 3-septatis, ad septa constrictis, $12-14 \approx 5,5$. — Var. **lonicericola** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 466. — Sporulis ellipsoideis, flavo-brunneis, 3-septatis non v. constrictis, $12-14 \approx 5-6$. — In sarmentis emortuis Loniceræ Caprifolii, Nagy-Körös Hungariæ. — Var. **Aceris** Hollós l. c. VI (1908) p. 534. — Sporulis ellipsoideis, flavo-brunneis, 3-septatis, non constrictis $12-13 \approx 4-5$. — In ramulis siccis Aceris Negundinis, Kecskemét Hungariæ. — Var. **Cytisi** Hollós, Ann. Mus. Nat. Hung. IV (1906) p.

263, tab. IX fig. 23. — Sporulis ellipsoideis, dilute flavis, apice rotundatis, deorsum acutatis, 3-septatis, ad septa non v. vix constrictis, 12-16 \approx 5-6. — In ramis siccis Cytisi Laburni, Kecskemét Hungariæ. — Var. **Eonymi** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 363, tab. IX, fig. 24. — Sporulis ellipsoideis, flavo-brunneis, 3-septatis, 10-13 \approx 5-6. — In ramis siccis **Eonymi verrucosi** prope Kecskemét Hungariæ. — Var. **Genistæ** Hollós Ann. Mus. Nat. Hung. IV (1906) p. 363. — Sporulis ellipsoideis, flavo-brunneis, 3-septatis, 11-12 \approx 5-6. — In ramis siccis **Genistæ tinctoriae** prope Kecskemét Hungariæ. — Var. **Viburni** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 363. — Sporulis ellipsoideis v. ovoideis, flavo-brunneis, 3-septatis, ad septa non v. vix constrictis, 12-13 \approx 5-6. — In ramis siccis **Viburni Opuli**, Kecskemét Hungariæ. — Var. **Xanthoceratis** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 362. — Sporulis, oblongo, ellipsoideis, luteo-brunneis, 3-septatis, non constrictis, 12-14 \approx 5-6. — In ramulis emortuis **Xanthoceratis sorbifolii** culti, Kecskemét Hungariæ. — Var. **Clematidis** Trav. in Bull. n. 8 Flore Valdôtaine, p. 28 extr. (1912). — Sporulis 13-15 \approx 5-7. — In sarmentis **Clematidis Vitalbae** Valpelline Valle d'Aosta, Ital. bor.

5. **Hendersonia Astragali** Karst. ap. Berl. Ic. fung. II p. 86, t. 119, 7155 f. A. — Pycnidiis gregariis globulosis non v. obsolete papillatis, rugulosis; sporulis cylindraceis, 3-septatis, ad septa non constrictis 15-22 \approx 5-6, utrinque rotundatis, fuligineis.

Hab. ad caules *Astragali monspessulanus* et *Astr. virgatus* in Gallia et Hungaria, socia *Cucurbitaria Astragali* quæ ut st. ascophorus est habenda.

6. **Hendersonia triseptata** Da Camara, Bol. Soc. Broteriana XXV 7156 (1910) Extr. p. 18. — Pycnidiis globulosis, atris, in macula plus minus orbiculata albidaque dispositis, initio epidermide velatis, dein erumpentibus, poro pertusis, 80-100 μ . diam.; sporulis cylindraceis v. oblongo-ellipsoideis, pallide melleo-fuligineis, rectis, utrinque rotundatis, triseptatis, 12-15 \approx 3.

Hab. in foliis *Violæ albæ*, in horto botanico Coimbra Lusitanie (A. MOLLER).

7. **Hendersonia Mangiferæ** Koord., Botan. Untersuch. Java (1907) p. 7157 210. — Pycnidiis gregariis v. sparsis, plano-orbiculatis v. pseudodisciformibus, primo epidermide tectis, dein sub-erumpentibus, vix papillatis, atris, 0,1-0,5 mm. diam., sporulis 3-septatis, cylindraceis, rectis v. curvulis, utrinque obtuse leniter attenuatis, 30-35 \approx

7-8, non constrictis, hyalinis dein fuligineis; sporophoris 17-20 \approx 3-4 hyalinis; paraphysibus destitutis.

Hab. in cortice *Mangiferae* indicæ in Purworedjo prov. Kedu Java (KOORDERS).

8. **Hendersonia Dianthi** Bubak in Handel-Mazzetti, Bot. Reise Pont. 7158 Randgeb. in Ann. Naturhist. Hofmus. Wien XXIII (1909) p. 105. — Pycnidiis caulicolis, dispersis v. aggregatis, subepidermicos, globosis, 80-120 μ . diam., atris, contextu fusco-castaneo laxe parenchymatico, in medio poro rotundato apertis; sporulis fusideo-cylindraceis, rectis v. curvulis 15-24 \approx 2-3, pallide olivaceo-brunneis, 3-septatis, ad septa non constrictis, utrinque attenuatis, rotundatis; cellulis extimis pallidioribus.

Hab. ad caules emortuos *Dianthi liburnici* in Montibus Ponticis Anatoliæ. — *Hend. stagonosporioidi* affinis sed differt pycnidiis minoribus, sporophoris angustioribus etc.

9. **Hendersonia Alsines** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 7159 359, cum icon. — Pycnidiis epidermide tectis, sparsis, globoso-hemisphæricis, nigris, apice ostiolo conico papillato perforatis, 120-240 μ . diam., contextu parenchymatico; sporulis cylindraceis, rectis v. curvulis, utrinque rotundatis, flavo-brunneis, 7-13-plerumque 7-vel 9-septatis, ad septa non v. leniter constrictis, 28-60 \approx 5-6.

Hab. in foliis emortuis *Alsines vernæ* prope Kecskemét Hungariæ. — *Hend. tenella* Schr. sporulis 3-septatis, 20-25 \approx 3-4 distinguitur.

10. **Hendersonia Opuntiæ** H. Zimmermann Verhandl. naturf. Verein, 7160 Brünn, XLVII 1908 (1909) p. 42, t. I, f. 11 (extr.). — Pycnidiis in maculis fuscis sub prominulis nigris, 150 μ . diam., contextu parenchymatico, cum ostiolo 12 μ . lato; sporulis cylindraceis, badiis 18-35 \approx 4-6, 6-9-septatis, cirris fuscis.

Hab. in caulis *Opuntiæ* comanchicæ in horto Eisgrubensi Austræa.

11. **Hendersonia Mate** Speg., Anal. Mus. Nac. Buenos Aires XVII 7161 (1908) p. 136. — Pycnidiis per epidermidem pustulatim disrupta sub exsertulis, nigris, glabris, lenticulari-conoideis, 150 μ . diam., ostiolo non viso, contextu obsolete parenchymatico olivaceo subcarnosulo donatis (an completis?); sporophoris conoideis 10-15 \approx 5, hyalinis, monosporis; sporulis ellipsoideis utrinque obtusiusculis 10-12 \approx 5-6, 2-3-4-blastis, ad pseudosepta non constrictis, fuligineis.

Hab. ad ranulos aridos adhuc pendulos Ilicis paraguariensis secus rivulum «Matto Queimado» Misiones Reip. Argentina.

12. **Hendersonia Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires t. 7162 XVII (1908) pag. 136. — Substrato denudato albescenti-cinereo; pycnidiis hinc inde laxe gregariis, basi matrici insculptis subhemisphæricis, 100 μ . diam., perforato-ostiolatis, atris, glabris submembranaceis, contextu minute denseque parenchymatico-olivaceo; sporulis fusoideis, rectis v. lenissime inæquilateralibus, apice supero acutiusculis, apice infero subtruncatis, 28-30 \times 4-5, 5-7-septatis, ad septa non v. vix constrictis, olivaceis.

Hab. ad ramulos emortuos aridos Ilicis paraguariensis in dumetis circa San Pedro Misiones, Argentina.

13. **Hendersonia Trevoæ** (Speg.) Sacc. et Trott. — *Hendersonia Trevoæ* Speg., Fungi Chilenses (1910) p. 163. — Pycnidiis ligno denudato insidentibus, plus minusve confertiusculis, superficialibus, hemisphærico-depressis, 150-180 μ . diam., atris, glabris, coriaceis, obsolete ostiolatis; sporulis ellipsoideis, cylindraceis v. subclavatis non v. leniter inæquilateralibus, 3-septato-constrictis, 8-12 \times 5-6, fuligineis.

Hab. in ramulis siccis subputrescentibus Trevoæ trinervis in collibus San Bernardo prope Santiago Chile, Amer. austr.

14. **Hendersonia Ætoxici** Speg., Fungi Chilenses (1910) p. 163, cum 7164 icon. — Maculis epiphyllis orbicularibus, determinatis, 5-10 mm. diam., cinereis, areola angustissima purpurascenti cinctis; pycnidiis hypodermicis lenticularibus, 100-120 μ . diam.; coriacellis, atris, sparsis; sporulis ellipsoideo-subnavicularibus, transverse bi-septatis, 18-20 \times 8-9, loculo centrali ceteris leniter crassiore obscurioreque.

Hab. in follis vivis Ætoxici punctati in silvaticis Cerro Caracol de Concepcion Chile, Amer. austr.

15. **Hendersonia Buxi** Sacc. et Cub. ap. Sacc. in Ann. Mycol X p. 319, 7165 — Maculis candidis (propriis?) interdum dimidium folium occupantibus, aridis, amphigenis, non discolori-marginatis; pycnidiis epiphyllis, sparsis, globoso-depressis, initio epidermide velatis, obsolete ostiolatis, nigricantibus, 180-200 μ . diam.; sporulis ellipsoideis, utrinque rotundatis, diu hyalinis et subcontinuis, dein distincente 3-septatis, non constrictis, 9-11 \times 4-5, brunneis, brevissime obsolete pedicellatis v. subsessilibus.

Hab. in foliis languidis Buxi sempervirentis, Coneglia-

no, Aprili 1885 (G. CUBONI). — Est species ex subgen. *Phyllohendersonia* Tassi.

16. **Hendersonia mexicana** Saccardo, Microm. Amer. novi in Journ. of Myc. v. XII (1906) p. 51. — Maculis minutis, epiphyllis, subinde paullum elevatis, nigricantibus, non v. vix discolori-marginatis, circ. 1 mm. diam.; pycnidiis subhemisphæricis, epidermide velatis sed prominulis, 140-160 μ . diam., subastomis; contextu minute celluloso, fuligineo; sporulis tereti-oblongis, utrinque obtuse rotundatis, 3-septatis, ad septa constrictis, 12-14 \times 5,5-7 fuligineis; sporophoribus obsoletis.

Hab. in foliis languidis Perseæ gratissimæ vulgo Aguacate, Tenancingo, Mexico (BONANSEA). — Ad subgen. *Phyllohendersoniam* spectat. Septa manifestissima.

17. **Hendersonia Oenotheræ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7167 p. 361, tab. IX, fig. 22. — Pycnidiis epidermide tectis, sparsis, ellipsoideis, nigris, poro pertusis, 310 \times 210; sporulis flavo-brunneis, ellipsoideis, 3-septatis, 16-20 \times 6-7, sporophoribus hyalinis, 20-26 μ . longis suffultis.

Hab. in caulis siccis Oenotheræ biennis prope Nagy-Körös Hungariæ.

18. **Hendersonia Polygalæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7168 p. 362. — Pycnidiis epidermide tectis, sparsis, depresso-globosis, nigris, poro pertusis, 240-280 μ . diam., contextu parenchymatico; sporulis cylindraceis, rectis v. curvulis, utrinque rotundatis, initio hyalinis, dein flavidulis, continuis, demum flavo brunneis, 9-11-septatis, ad septa non v. vix constrictis, rarius guttulatis 40-54 \times 6.

Hab. in caulis siccis Polygalæ comosæ prope Izsák Hungariæ.

19. **Hendersonia Opizii** (Peyl) Sacc. et Trav. — Syll. XIX p. 858 — 7169 *Sporocadus Opizii* Peyl, in Lotos VII (1857) p. 27, f. 4. — Pycnidiis cortice nidulantibus, peregrinis, vix conspicuis, nigris, hemisphæricis v. depresso-conoideis, apice poro pertusis; sporulis elliptico-oblongis, 2-3-septatis, nigricantibus, separatim pellucidis.

Hab. in ramis corticatis emortuis Camelliæ japonicæ cultæ Kacin Bohemiæ (PEYL).

20. **Hendersonia Eriobotryæ** Speg., Myc. Argent. V p. 373, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus, 3-7 mm. diam., arecentibus, cinerescentibus, areola angustissima rubescente cinctis; pycnidiis innatis, epiphyllis, spar-

sis, lenticularibus, 80-100 μ . diam., atris, tenui-membranaceis, contextu parenchymatico olivaceo, ostiolo rotundo impresso perforatis; sporulis e cylindraceo subfusoideis, utrinque attenuato-subacutiusculis, 30-35 \approx 5-6 saepius 7-septatis, lenissime constrictulis, saepius leniter inaequilateralibus, chlorinis.

Hab. ad folia languida Eriobotryæ japonicæ in hortis Lenzana Buenos Aires Argentina Amer. austr.

21. **Hendersonia putaminum** Hollós, Növényt. Közlemén, VI (1907) 7171
Extr. p. 8. — Pycnidiis gregariis, superficialibus, globoso-depressis, nigris, apice ostiolo minuto, 240-280 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, plerumque uno apice interdum utrinque attenuatis, fuscis, 3-septatis, non v. vix constrictis, 10-13 \approx 5-6.

Hab. in putamine putrescente Armeniacæ vulgaris, Kecskemét Hungariæ.

22. **Hendersonia septem-septata** Vestergr. — Syll. XIV p. 955 — 7172
fm. **foliicola** Potebnia, Myc. St. in Ann. Myc. v. V (1907) p. 17,
fig. 33 et Trav. Soc. Nat. Univ. Kharcov XXXXIII (1907). —
Pycnidiis obscure brunneis 170 μ . cr., amphigenis; sporulis brunneis 5-7-septatis, non v. parum constrictis, rectis v. curvulis, 26-30 \approx 5-7, loculis terminalibus leviter attenuatis, longioribus et pallidioribus.

Hab. in foliis vivis Caraganæ arborescentis prope Kursk Rossiæ. Occurrit in maculis *Phyllostictæ Spæthianæ*.

23. **Hendersonia genisticola** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7173
p. 361 — Pycnidiis epidermide tectis, depresso-globosis, nigris, poro pertusis, 240-280 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, initio hyalinis, dein flavidulis, continuis, demum flavo-brunneis, 7-8-septatis, rarius guttulatis, 28-44 \approx 6.

Hab. in ramis siccis Genistæ tinctoriae prope Kecskemét Hungariæ.

24. **Hendersonia Sophoræ** (Peyl) Sacc. et Trav. — Syll. XIX p. 859. 7174
— *Sporocadus Sophoræ* Peyl, Lortos VII (1857) p. 28, f. 5. —
Pycnidiis subglobosis, basi applanatis, subcutaneis, prominentibus, dense gregariis, vertice dehiscentibus et epidermidem stellatim finitibus, nucleo atro; sporulis ellipsoideis, utrinque rotundatis, 3-4-septatis, non constrictis, fuligineis, demum e poro exeuntibus.

Hab. in ramis Sophoræ japonicæ frigore necatis, Kacin Bohemiæ (PEYL).

25. **Hendersonia Erythrinæ** (Alm. et Da Cam.,) Sacc. et Trott. — 7175

Hendersonulina Erythrinæ Alm. et Da Cam., Soc. Brot. XXV (1908-1909) Extr. p. 51. — Pycnidiis punctiformibus, sparsis, innatis, vertice sub prominulis, subglobosis, interdum depresso 150-200 μ . diam.; sporulis numerosissimis, ovoideo-oblongis, plerumque ellipsoideis, utrinque rotundatis v. plus minusve attenuatis, rectis, initio 1- dein 2- demumque 3-septatis, deorsum septo rare oblique disposito prædictis, non constrictis, fuscis, 10-12 \approx 5-6.

Hab. in caulis *Erythrinae* Cristæ-galli, in horto bot. Coimbra Lusitiana (A. MOLLER).

26. **Hendersonia Hydrangeæ** Fairm. Ann. Mycol VII (1910) p. 325. — 7176

Pycnidiis minutis, globosis, vix papillatis, in rimis corticis nidulantibus, demum superficialibus, gregariis, atris, 0,5 mm. latis; sporulis oblongis v. obovatis, utrinque rotundatis, primo continuis, hyalinis, continuis v. uniseptatis, dein brunneis et triseptatis, non constrictis, 10-13 \approx 4-5.

Hab. in ramis emortuis *Hydrangeæ* paniculatæ grandifloræ, Lyndonville N. Y. Amer. bor.

27. **Hendersonia Bignoniacearum** v. Höhnel, Ergebn. Bot. Exp. Süd-

bras. 1901 Denkschr. k. Akad. d- Wiss. Wien. Bd. LXXXIII (1907) Extr. p. 35. — Pycnidiis subepidermicis, brunneis, depresso globosis, 200 μ . circ. cr., sparsis, ostiolo depresso 12 μ . circ. lato rotundato; sporulis numerosis, obscure brunneis, plerumque 8-locularibus, cylindraceis, rectis v. curvulis, utrinque rotundato-angustatis, 26-30 \approx 5-6.

Hab. in cirris Bignoniaceæ cujusdam, Parnahyba Sao Paulo Brasiliæ.

28. **Hendersonia pulchella** Sacc. — Syll. III p. 430 — Var. *teco-*

micola Hollós, Növényt. Közlemén. VI (1907) Extr. p. 9. — Pycnidiis epidermide tectis, gregariis, nigris, depresso ovatis, 260-280 \approx 210-245, contextu parenchymatico; sporulis fusoideis, rectis v. curvulis, utrinque attenuatis, flavo-brunneis, 7-10-septatis, guttulatis v. eguttulatis, 36-46 \approx 5-6.

Hab. in ramis siccis *Tecoma* radicantis, Kecskemét Hungariæ. — Var. *Epipactidis* Hollós, Ann. Mus. Nat. Hung. V (1907) p. 465. — Pycnidiis sparsis, tectis, globulosis, atris, poro pertusis, 210-280 μ . diam., contextu parenchymatico; sporulis elongato-fusoideis, rectis v. curvulis, 11-septatis, non constrictis, guttulatis, flavo-brunneis, 42-54 \approx 6-7. — In caulis *Epipactidis rubiginosæ*, Kecskemét in Hungaria. — Var. *Pimpinellæ* Hol-

lós, Ann. Mus. Nat. Hung. VI (1908) p. 534. — Pycnidiis sparsis, innato-prominulis, globulosis, breviter papillatis, atris, 250 μ . diam., contextu cellulozo; sporulis elongato-fusoideis, rectis v. curvulis, 9-11-septatis, non constrictis, luteolis, dein obscurioribus, 40-60 \approx 4-5. — In caulis siccis Pimpinellæ Saxifragæ prope Kecskemét Hungariæ. — Var. **Prunellæ** Hollós, Ann. Mus. Nat. Hung. VII (1909) p. 56. — Pycnidiis sparsis, epidermide velatis, depresso-globosis, breviter papillatis, atris, 240-280 μ . diam., contextu cellulozo; sporulis elongato-fusoideis, rectis v. curvulis, 9-11-septatis, constrictis, flavo-brunneis, guttulatis, 44-50 \approx 5-6. — In caulis siccis Prunellæ albæ prope Kecskemét Hung. — Var. **Scorzonerae** Hollós l. c. — Pycnidiis sparsis, globulosis, breviter papillatis, atris, 180-250-300 μ . diam., contextu cellulozo; sporulis elongato-fusoideis, rectis v. curvulis, initio continuis et luteolis, demum 9-11-septatis, non constrictis, guttulatis, flavo-brunneis, 28-36 \approx 4-5. — In caulis siccis Scorzonerae purpureæ, prope Nagy-Körös Hungariæ. — Var. **Lini** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 465. — Pycnidiis, 200-250 μ ., sporulis 7-septatis, non v. vix constrictis, flavidulis demum flavo-brunneis, 32-40 \approx 4-6. — In caulis siccis Lini glabrescentis, prope Nagy-Körös Hungariæ. — Var. **Sedi** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 466. — Pycnidiis superficiaibus, depresso-globosis, 250-300 μ ; sporulis 7-11-septatis, non constrictis, guttulatis, flavo-brunneis, 40-54 \approx 5,5-6. — In caulis siccis decorticatis Sedi maximi, prope Kecskemét Hungariæ.

29. **Hendersonia Campanulæ** Hollós, Ann. Mus. Nat. Hung. IV 7179 (1906) p. 360. — Pycnidiis epidermide tectis, sparsis, depresso-globosis, nigris, 350-420 μ . diam., ostiolo conico 140 \approx 170, erumpentibus, contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, initio hyalinis et continuis, dein medio 1-septatis, demum flavo-brunneis, 3-septatis, 10-16 \approx 5-6.

Hab. in caulis siccis Campanulæ glomeratæ, prope Kecskemét Hungariæ.

30. **Hendersonia diplodioides** Ell. et Ev. — Syll. III p. 422. — Var. 7180 **divergens** Peck, N. Y. St. Mus. Bull. 131 (1909) p. 38. — Differt sporulis maximis, irregularibus, rectis v. curvulis, oblongis, subpiriformibus v. ellipsoideis, 1-5-septatis, plerumque 3-septatis, 30-40 \approx 12-24.

Hab. in ramis emortuis Sambuci, Red Butte Camyon, Utah, Amer. bor. (A. O. GARRETT).

31. **Hendersonia diplodiopsis** P. Henn., Verh. Bot. Ver. Prov. Brandb. 7181 XLVII (1905) p. XII. — Pycnidiis subcutaneis epidermide bullata rimosa tectis, sparsis, subhemisphæricis, atris, c. 150-170 μ . diam.; sporophoris hyalinis, brevibus; sporulis oblongis, cylindraceis, utrinque obtusis, rectis v. subcurvulis, primo, continuis hyalinis, dein castaneis v. fuscis, medio uniseptatis, deinde sæpe 3-septatis, 8-11 \approx 3,5-4,5.

Hab. in ramulis siccis Lonicerae Hylostei, Hellmhüle Germaniae. — Ab *Hendersonia pulchella* et *Hendersonia Periclymeni* omnino diversa.

32. **Hendersonia serbica** Bubák et Ranojevic, Ann. Mycol. VIII 7182 (1910) p. 388. — Pycnidiis globosis, subapplanatis v. parum conoideis, 300-400 μ . diam., primum subepidermicis, dein nudis, nigris, subnitidis, contextu pseudoparenchymatico brunneo, basi hyphis brunneis numerosis prædito; sporulis ex ellipsoideo cylindraceis, 11-14 (raro 19) \approx 3,5-6, primum pallidis et bicellularibus, dein brunneo-olivaceis et quadricellularibus, apice rotundatis, ad septa non v. parum constrictis; sporophoris brevibus, ampullaceis, hyalinis.

Hab. in ramis siccis Achilleæ clypeolatae prope Pirot Serbia.

33. **Hendersonia ?Proustiæ** Speg., Myc. Argent. V p. 374, in Anal. 7183 Mus. Nac. Buenos Aires XX (1910). — Pycnidiis ligno denudato insidentibus, dense gregariis, subemisphæricis, 150-200 μ . diam., subcarbonaceis, minute papillato-ostiolatis, hyphis septulatis non-nullis radiantibus repentinibusque parce ramosis olivaceis adspersis; sporulis subellipsoideo-cylindraceis, 26-28 \approx 9-10, 3-septatis, ad septa non v. lenissime constrictis, loculis æquilongis eguttulatis fuligineis.

Hab. ad ramos dejectos putrescentesque Proustiæ ilicifoliæ in montanis Cacheuta prope Mendoza Argentina Amer. austr.

34. **Hendersonia Asterisci** (Speg.) Sacc. et Trott. — *Hendersonulina* 7184 *Asterisci* Speg., Fungi Chilenses (1910) p. 161. — Pycnidiis epidermide tectis subseriatis subglobosis, 75-120 μ . diam., membranaceis, atris, ostiolo minuto perforatis; sporulis subclavulatis sæpius 3-septatis (raro 1-2) ad septum medium tantum leniter constrictulis, 12-14 \approx 5-5,5, pallide olivaceis.

Hab. in caulis emortuis siccis Asterisci chilensis, Cerro Caracol de Concepción Chile Amer. austr.

35. Hendersonia Santolinæ Hollós, Ann. Mus. Nat. Hung. IV (1906) 7185
p. 362, tab. IX, fig. 31. — Pycnidiis epidermide tectis, gregariis, globulosis, brunneis, 240-280 μ . diam., ostiolo rotundato 30-35 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, 3-septatis, ochraceis, 9-12 \approx 3,5-4, aliis immixtis 1-2-septatis.

Hab. in caulis siccis Santolinæ Chamæcyparissi, Kecske-mét Hungariæ.

36. Hendersonia Oleæ (Speg.) Sacc. et Trott. — *Hendersonulina Oleæ* 7186
Speg., Fungi Chilenses (1910) p. 162 cum icon. — Pycnidiis laxissime gregariis, cortice innatis, epidermidem perforantibus, globosis, 250 μ . diam., coriacellis, eximie ostiolato-papillatis; sporulis ellipsoideis v. subobovatis, 12-16 \approx 5-6, saepius 3-septato-constrictulis, fuligineis.

Hab. parasitice in ramulis siccis Oleæ europææ, in hortis de Santiago Chile Amer. austr. — Socia *Calospora oleicola* Speg. cuius formam pycnidicam verisimiliter sistit.

37. Hendersonia pachytheca Bubák, Bull. Herb. Boiss., 2 sér., VI 7187
(1906) p. 482. — Pycnidiis sparsis, usque in ligno immersis, epidermide tectis, papilla brevi prominentibus, globosis, sed usque ad 20 μ . depresso-depressis, 100-150 μ . latis, parietibus crassis præditis, nigris; contextu infra pallide castaneo-brunneo v. flavo-brunneo, supra subnigro; sporulis elongato-ellipsoideis v. subcylindraceis, 9-13 \approx 4-5, utrinque rotundatis, 3-septatis, leniter constrictis, castaneo-brunneis; sporophoris phialiformibus v. conoideis, basi fortiter inflatis, 6-11 \approx 2-2,5, hyalinis.

Hab. in ramulis siccis Osyridis albæ prope Ulicinj Montenegro.

38. Hendersonia Periplocæ Hollós, Ann. Mus. Nat. Hung. V (1907) 7188
p. 466. — Pycnidiis semi-immersis, gregariis, depresso-glöbosis, fuscis, poro pertusis, 240-280 μ . diam., contextu parenchymatico; sporulis fusoideis, dein 1- demum 3-septatis, non vel vix constrictis, dilute brunneis, 16-20 \approx 3,5-4.

Hab. in sarmentis decorticatis Periplocæ græcæ, Nagy-Körös Hungariæ.

39. Hendersonia salicella Kalchbr., Math. Termész. Közlemen. V 7189
(1867) p. 272, tab. V, fig. 6. — Pycnidiis gregariis; sporulis oblongo-fusoideis, utrinque obtusulis, 3-septatis, demum constrictis, fuscis, cellula ultima ut plurimum hyalina; sporophoris fasciculatis, filiformibus, sporulam subæquantibus.

Hab. in ramis salicinis in Hungaria. — Teste auctore esset

st. pycnidicus *Diaporthe* (Chor.) *salicellæ*; quod dissonum videtur.

40. **Hendersonia Sabaleos** Ces. — Syll. III, p. 434 — var. **Arecæ** 7190
Teresa Mariani in Atti Soc. It. Sc. Nat. L (1911) p. 168. — A typo differt sporulis angustioribus, 11-13 \approx 2,5-3 et matrice valde diversa.

Hab. in foliis **Arecæ** sapidæ, in horto botanico conimbricensi Lusitaniæ socia *Coniothyrii* sp. (A. MOLLER).

41. **Hendersonia acicola** Münch et v. Tub. in Nat. Zeitschr. f. Land.- 7191
u. Forstw. VIII (1910) p. 44. — Pycnidiis in acubus violaceo-vel brunneo-tinctis insidentibus, c. 140 μ . diam.; sporulis plerumque 3-cellularibus, raro 2-vel 4-cellularibus, brunneis, 11-15 \approx 4-5; sporophoris nullis.

Hab. in acubus **Pini silvestris** pluribus locis Germaniæ.

42. **Hendersonia cytisporoides** (Peyl) Sacc. et Trav. — Syll. XX 7192
p. 1249. — *Sporocadus cytisporoideis* Peyl, Beschreib. einig. neuer Pilze in Lotos VIII.(1858) p. 30, t. I, f. 16. — Pycnidiis subcutaneis, conoideis, subsparsis, prominulis, epiphyllis, apice pertusis, erumpentibus; sporulis oblongis, apice rotundatis, basi acutis, 3-septatis, non constrictis, brunneis, diaphanis, in cirrum filiformem nigrum, longum eructatis, inter se diu cohærentibus.

Hab. in foliis emortuis **Cupressi sempervirentis** in frigidario cultæ in Bohemia.

43. **Hendersonia Thujæ** Diedicke, Ann. Mycol. IV (1906) p. 415. — 7193
Pycnidiis in ramulis sparse insidentibus, epidermide tectis, globosis, subprominulis, flavo-brunneis, contextu indistincto, c. 400 μ . diam.; sporophoris parvis, indistinctis, vix prominentibus; sporulis elongato-ellipsoideis, triseptatis, apice rotundatis, demum obscure brunneis, 13-17 \approx 5-7.

Hab. in ramis emortuis **Thujæ**, Friedhöfe in Thuringia.

44. **Hendersonia Ephedræ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7194
p. 360, tab. IX, fig. 30. — Pycnidiis epidermide tectis, globoso-depressis v. ellipsoideis, nigris, poro pertusis, 240-300 μ . diam., contextu parenchymatico; sporulis cylindraceis, rectis v. curvulis, utrinque rotundatis, initio hyalinis et continuis, dein flavo-brunneis, plerumque 7-septatis, non v. vix constrictis, rarius guttulatis, 30-50 \approx 5-6.

Hab. in ramis siccis **Ephedræ distachyæ** prope Kecskemét Hungariæ.

45. **Hendersonia Crucheti** Sacc. et Trott., *Hendersonia Ephedræ* Cru- 7195

chet in Bull. Soc. Vaud. Sc. Nat. XLIV (1909) p. 475, nec Hollós. — Pycnidiis immersis, dein erumpentibus, seriatim dispositis, confertis, brunneo-nigris, apice leniter apertis (80-120 μ . diam.), saepe confluentibus; sporulis cylindraceis, utrinque parum attenuatis, 6-8-septatis, in quoque loculo uniguttulatis, 25 \approx 4, brunneis.

Hab. in ramis siccis Ephedræ helveticae, prope Sion Valais Helvetiae. — An satis diversa a precedente?

46. **Hendersonia Asparagi** Passer. — Syll. X, p. 327 — var. **minor** 7196

Ter. Mariani, Atti Soc. it. Sc. nat. L (1911) p. 168. — A typo differt sporulis brevioribus, 13-16 \approx 3.

Hab. in caulis emortuis Asparagi in horto bot. Coimbra, Lusitania (A. MOLLER).

47. **Hendersonia Alstrœmeriae** (Speg.) Sacc. et Trott., *Hendersonulina* 7197

Alstrœmeriae Speg., Fungi Chilenses (1910) p. 161. — Pycnidiis sparsis, lenticularibus, 90-100 μ . diam., olivaceis, parvulis, ostio-lato-perforatis; sporulis e cylindraceo ellipsoideis, 3-septatis, non constrictis, utrinque rotundatis, 12-14 \approx 4-5 e chlorino fulvellis.

Hab. in ramulis siccis emortuis Alstroemeriae sp. Cerro Allegre de Valparaiso, Chile Amer. austr.

48. **Hendersonia microspora** Massee, Kew Bull. (1910) pag. 4. — Py- 7198

cnidiis dense gregariis, saepius plagulas majusculas formantibus, erumpentibus, globulosis, atris, ostiolo minutissimo vix papillato, contextu indistincto donatis; sporulis elliptico-cylindraceis, utrinque obtusatis, 3-5-septatis, fuligineis, 6-7 \approx 3,5; sporophoris subconoideis suffultis.

Hab. in foliis emortuis v. languidis Oncidii luridi, Trinidad Indiae occid. (I. H. HART). — Affinis *Hendersoniae Magnoliae*. 7199

49. **Hendersonia gigantea** J. Lind, Micromycetes from North-East

Greenlandia, Kiobenhavn (1910) p. 161, tab. X, fig. 7. — Pycnidiis immersis, saepe seriatim digestis, tectis, subglobosis, papillatis, brunneis, 225 μ . diam., contextu parenchamytico; sporulis cylindrico-fusoideis, flexuosis, late flavo-brunneis, utrinque rotundatis, 92-108(-188) \approx 5-6, 7-septatis, ad septa non constrictis, guttulatis.

Hab. in foliis emortuis Caricis pullæ, Termometerfjeld Groenlandia.

50. **Hendersonia Caricis** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7200

p. 54. — Pycnidiis epidermide velatis, seriatim dispositis, depresso-oblongis, 180-250 \approx 140-180, fuscis, poro pertusis, contextu parenchymatico; sporulis cylindraceis, utrinque obtuse leniter attenuatis, curvulis, vermicularioideis, 15- vel pluriseptatis, saepius

16-25-guttulatis, flavidulis, 50-70 \approx 3-4; sporophoris fasciculatis, filiformibus fultis.

Hab. in foliis Caricis strictæ prope Nagy-Körös Hungar.

51. **Hendersonia caricicola** Hollós, Ann. Mus. Nat. Hung. V (1907) 7201

p. 54. — Pycnidiis epidermide velatis, sparsis, depresso-globosis, nigris, poro pertusis, 210-250 μ . diam., contextu parenchymatico; sporulis fusoides, rectis v. curvulis, initio continuis et hyalinis, dein flavidulis, 3-septatis, demum flavo-brunneis, 5-septatis, 6-guttulatis v. eguttulasis, 22-28 \approx 4-5.

Hab. in foliis siccis Caricis conglobatæ et C. præcocis prope Kecskemét Hungariæ. — Ab *Hend. riparia* Sacc., *H. distante* Brun., *H. Stefansonii* Rostr. diversa.

52. **Hendersonia melicicola** Speg., Myc. Argent. V, p. 373, in Anal. 7202

Mus. Nac. Buenos Aires XX (1910). — Matrice tota sordide fuscocinerascente; pycnidiis hinc inde 3-12-aggregatis sed relaxatis, primo tectis dein erumpentibus, 150 μ . diam., ostiolo 25 μ . lato pertusis, membranaceis, contextu eximie parenchymatico, pellucido, olivaceo; sporulis subcylindraceis, rectis v. leniter curvulis, utrinque subattenuatis sed obtuse rotundatis, 30-35 \approx 5-6, primo hyalinis 1-3-septatis, serius olivaceis saepius 7-septatis, ad septa leniter constrictulis.

Hab. ad culmos emortuos putrescentesque Melicæ laxifloræ in montanis prope Cacheuta, Argentina Amer. austr.

53. **Hendersonia rhizomatophila** Speg., Myc. Argent. V, p. 374, in 7203

Anal. Mus. Nac. Buenos Aires XX (1910). — Pycnidiis primo epidermide tectis dein erumpentibus plus minusve exertis saepius 3-5-gregariis subglobosis 500-1000 μ . diam., nigris, glabris, non carbonaceis, ostiolo subrostrato ornatis; sporophoris dense constipatis subconoideis 10-15 \approx 3-5, subhyalinis, monosporis, paraphysibus filiformibus simplicibus v. ramosis quadruplo v. quintuplo longioribus cinctis; sporulis e cylindraceo subclavulatis, 26-42 \approx 6-8 rectis vel saepius leniter curvulis, primo continuis vel 2-6-blastis hyalinis, serius saepius 5-7-septatis ad septa non constrictis, pallide fuligineis.

Hab. ad rhizomata languentia Paspali vaginati circa Salta, Argentina Amer. austr.

54. **Hendersonia Hierochloæ** (Speg.) Sacc. et Trott., *Hendersonulina* 7204

Hierochloæ Speg., Fungi Chilenses (1910) pag. 161. — Pycnidiis sparsis v. laxe gregariis et subseriatim, epidermide tectis, globulosis, 75-80 μ . diam., atris, coriacellis, ostiolo minuto perforatis;

sporulis cylindraceis v. lenissime subclavulatis, 3-septatis, subconstrictulis, 14-16 \approx 5-6, olivaceis; sporophoris duplo brevioribus, 5-10 \approx 2-3, hyalinis suffultis.

Hab. in vaginis siccis Hierochloæ utriculatæ pr. Ciudad de Valdivia, Chile Amer. austr.

55. **Hendersonia Oryzæ** I. Miyake, Pilze Reispfl. Japan in Journ. College Agricult. Tokyo II (1910) p. 259, t. XIV, f. 58. — Pycnidii epidermide tectis ostiolo papillato apertis, brunneis, ostiolo obscuriore, ellipsoideis, 100-125 μ . diam.; sporulis cylindraceis apice rotundatis, brunneis, 10-18 \approx 3-4, 3-septatis, ad septa demum constrictulis, in quaque cellula minute 2-3-guttulatis.

Hab. in foliis glumisque Oryzæ sativæ, in Japonia.

56. **Hendersonia Phyllostachydis** I. Miyake et Hara, in Bot. Mag. Tokyo (1910) p. (354) [japonice].

Hab. in Phyllostachydis sp. in Japonia.

57. **Hendersonia kerguelensis** P. Henn., Deutsche Südpolar-Exped. Bd. VIII (1906) Extr. p. 14, tab. II, fig. 21. — Pycnidii gregariis, punctoideis, atris, innato-erumpentibus, subglobosis, poro pertusis, membranaceis, 80-100 μ . diam.; sporulis cylindraceo-subfusoideis, utrinque obtusiusculis, rectis vel curvulis, 3-7-septatis, haud constrictis, hyalino-fuscidulis, 15-24 \approx 3-4; sporophoris brevibus, hyalinis.

Hab. in foliis siccis Deschampsiae antarcticæ et Agrostidis antarcticæ, in insul. Kerguelen (WERTH).

58. **Hendersonia Geasteris** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 535. — Pycnidii gregariis, depresso-globosis, fuscis, poro pertusis, 140-180 μ . diam., contextu parenchymatico; sporulis fusoides, rectis v. curvulis, utrinque attenuatis, initio continuis, flavobrunneis, dein 7-septatis, brunneis, ad septa non constrictis; 30-42 \approx 5-6.

Hab. in stratu interno exoperidii Geasteris nani prope Monor Hungariæ.

59. **Hendersonia geastericola** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 283. — Pycnidii sparsis, erumpentibus, depresso-globosis, fuscis, poro pertusis, 100-120 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque leniter attenuatis, acutatis, curvulis, vermicularioideis, 7-septatis, non constrictis, hyalinis, 28-34 \approx 2,5-3.

Hab. in stratu interno exoperidii Geasteris pseudolimbati, prope Jász-Szent-László Hungariæ.

WOJNOWICIA Sacc. — Syll. X p. 328 XIV p. 960, XVIII p. 367.

1. **Wojnowicia exilis** (Corda) Sacc. et Trav. — Syll. XX p. 1145 — 7210
Sporocadus exilis Corda, Icon. fung. IV (1840) p. 39, t. 8, f. 110.
 — Cæspitulis effusis, fuscis, subtomentosis; pycnidiis convexis, subhemisphæricis, minutis, atro-fuscis, pilis sparsis, erectis, subulatis, septatis, fuscis tectis; sporulis oblongis, 2-septatis, non constrictis, utrinque rotundatis, hyalinis; sporophoris tenuissimis, sporulâ multo brevioribus suffultis, 4-5 \vee 2-2,5.

Hab. in fragmentis ligneis Coniferarum, Reichenberg Bohemiæ.

2. **Wojnowicia Ephedræ** Hollós, Ann. Mus. Nat. Hungar. IV (1906) 7211 p. 364, tab. IX, fig. 33. — Pycnidiis epidermide tectis, sparsis, globosis, nigris, ostiolo conico setuloso erumpentibus, majorum inferioribus partibus hyphis flavidulo-brunneis, septatis, 3-4 μ . d. vestitis, magnitudine variis 210-450 μ . diam., contextu parenchymatico; setulis atro-brunneis, septatis, apice pallidioribus, obtusiusculis, 140-180 \vee 6-8; sporulis initio hyalinis, continuis, dein flavidulis, deorsum attenuatis, apice crassis, rotundatis, fusiformibus, 2-septatis, ad septa leviter constrictis, guttulatis, 24-34 \vee 4-5,5.

Hab. in ramis siccis Ephedræ distachyæ prope Kecskemét Hungariæ.

HENDERSONULA Speg. — Syll. III p. 445, XI p. 533, XIV p. 961.

1. **Hendersonula botryosphaerioides** Bres., in Strasser III Nachtr. 7212 Pilze Sonntagb. in Verhandl. zool. bot. Gesell. Wien (1905) p. 618.
 — Stromatibus erumpentibus, dothideaceis, cute laciniatim fissa cinctis, orbicularibus v. oblongis, 1-2 mm. latis, atris; pycnidiis numerosis, obovatis v. compressis, plus minusve prominulis subpapillatis, 150-200 μ . diam. intus pallidis; sporulis luteis, obovato-elongatis v. subfusoideis, 1-3-septatis, haud constrictis, 13-20 \vee 7-10; sporophoris bacillaribus, 20-24 \vee 2 suffultis.

Hab. ad ramos emortuos Rhamni Frangulæ in Monte Sancto Sonntagberg Austriæ inf.

2. **Hendersonula conglobata** (Sacc.) v. Höhn., in Strass. III Nachtr. 7213 Pilz. Sonntagb. Verhandl. zool. bot. Gesell. Wien (1905) p. 618.
 — Ita dicenda esset *Sphaeropsis conglobata* (Fuck.) Sacc. — Syll. III, p. 299 — teste v. Höhnel.

CRYPTOSTICTIS Fuck. — Syll. III p. 433, X p. 330, XI p. 532, XIV p. 961, XVI p. 947, XVIII p. 369.

1. **Cryptostictis lapagericola** Speg., Fungi Chilenses (1910) p. 164, 7214 cum icon. — Pycnidiis amphigenis dispersis circinantibus vel in nervis seriatis, plus minusve numerosis, confertis, lenticularibus, 120-150 μ . diam., erumpentibus, atris; sporulis fusoideis vel ellipsoideo-fusoideis utrinque acutis, 4-septato-constrictulis, loculis 3 intimis fuligineis, 2 extimis conoideis hyalinis, supero setulis 2-3 brevibus (5-10 \approx 1) divaricatis armato, infimo in pedicellum, duplo triplove longiore, 20-30 \approx 1 producto.

Hab. in foliis siccis subputrescentibus *Lapageriae roseæ* in silvaticis Cerro Caracol de Concepcion Chile Amer. austr. — Ex descriptione, diversa a *Pestalozzia Lapageriae* P. Henn.

2. **Cryptostictis pleurochæta** Speg., Myc. Argent. V, pag. 375, cum 7215 icon., in Anal. Mus. Nac. Buenos Aires XX (1910). — Pycnidiis plus minusve dense gregariis, tectis vel nudis, hemisphærico-depressis, 100-120 μ . diam., atris carbonaceis glabris, late irregulatiterque ostiolatis, contextu indistincto; sporulis subclavatis 3-septatis, 30-35 \approx 10-12, loculis 3 internis fuligineis, superne truncatis, cellula suprema hyalina in setam subretrorsam rectam v. incurvam, 25-30 \approx 1, producta, infima hyalina conoidea in pedicellum concolorem breviusculum 10-15 \approx 2-3 attenuata.

Hab. vulgata ad ramulos aridos putrescentesque Montteæ aphyllæ in collinis Chacras de Corsia et montanis Potrerillos prope Mendoza Argentina Amer. austr.

3. **Cryptostictis apoda** Speg., Myc. Argent. V, pag. 374, in Anal. 7216 Mus. Nac. Buenos Aires XX (1910). — Pycnidiis matrice infuscata insidentibus solitariis v. paucis gregariis, primo cortice tectis dein denudatis pusillis, glabris, nigris, membranaceo-coriacellis, minute ostiolatis, hemisphærico-depressis 120-150 μ . diam., contextu minute denseque parenchymatico olivaceo; sporulis fusoideis utrinque attenuato-acutatis, 20 \approx 5, saepius 3-septatis ad septa non vel vix constrictis, rectis v. leniter inæquilateralibus, loculis omnibus pallide fuligineis, extimis conoideis, supremo setulibus tribus apicalibus, 5 \approx 1, molliusculis erectis praedito, infimo stipite destituto.

Hab. ad ramos emortuos putrescentes Achyroclines saturejoidis in dunis maritimis prope Necochea Argentina Americæ australis.

SCIRRHOIPSIS P. Henn., Verh. bot. Ver. Prov. Brandenb. XLVII (1905) pag. XII (Etym. *Scirrhia* et *opsis* aspectus). — Stromata linearia, conferta confluentia, sub epidermide nidulantia, per rimas

parallelas erumpentia, atra, loculis immersis; sporulae oblongæ, pluriseptatae, coloratae, hendersonioideæ.

1. **Scirriopsis hendersonioides** P. Henn., l. c. p. XII. — Stromati- 7217
bus linearibus inter nervos parallele dispositis, saepe confluentibus,
epidermide colore cinereo-fuligineo tincta cinctis, rima longitudi-
nali fissa tectis, atris; loculis immersis, globulosis; sporulis oblonge
ellipsoideis v. fusoideis, utrinque obtusis, rectis v. subcurvulis 3-
rarissime 4-septatis dein subconstrictis, fuscis, 8-15 \approx 3,5-4,5; co-
nidiphoris brevibus, hyalinis.

Hab. in vaginis siccis Phragmitis communis, Hellsee Ger-
mania. — Verisimiliter status conidicus *Scirriæ rimosæ*.

Sect. 7. Phæodictyæ.

CAMAROSPORIUM Schulz. — Syll. III p. 459, X, p. 338, XI p. 536,
XIV p. 964, XVI p. 951, XVIII p. 369.

1. **Camarosporium Trevoæ** (Speg.) Sacc. et Trott., *Camarosporulum* 7218
Trevoæ Speg., *Fungi Chilenses* (1910) p. 166. — Pycnidiis ligno-
denudato insidentibus superficialibus, laxe gregariis hemisphærico-
depressis, 90-120 μ . diam., glabris, atris, subcarbonaceis, obsolete
ostiolatis; sporulis ellipsoideis v. obovatis, fuligineis, septis trans-
versis 1-3, verticalibus 0-1, ad septa plus minusve constrictulis,
14-18 \approx 8-9.

Hab. frequens in ramis vetustis siccis Trevoæ trinervis
in collibus Batuco Chile Amer. austr.

2. **Camarosporium Lepidii** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7219
pag. 535. — Pycnidiis foliicolis, innato-erumpentibus, globulosis,
ostiolatis, nigris, 80-100 μ . diam., contextu celluloso; sporulis sub-
globosis v. ellipsoideis, 3- horizontaliter, 1-2-verticaliter septatis,
ad septa non constrictis, brunneis, 10-16 \approx 8-10.

Hab. in foliis languidis Lepidii ruderalis pr. Kecskemét
Hungariæ.

3. **Camarosporium Hibisci** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7220
p. 367. — Pycnidiis erumpentibus, globosis, conico-papillato-ostio-
latis, nigris, 400-500 μ . diam., contextu parenchymatico; sporulis
oblongo-ellipsoideis, initio continuis et hyalinis, dein 3- interdum
4-5-septatis, ad septa non vel leniter constrictis, loculis uno alte-
roque longitrorum septatis, dilute umbrinis, 14-24 \approx 7-10.

Hab. in ramis siccis Hibisci syriaci, Kecskemét Hungariæ.

4. **Camarosporium Lyndonvillæ** Sacc., Not. Myc. VII, Ann. Myc. IV 7221 (1906) p. 277. — Pycnidiis densiusculæ gregariis, subcutaneo-erumpentibus, subglobosis, nigris, obtuse papillatis, 0,5 mm. diam.; contextu parenchymatico, fuligineo; sporulis tereti-oblongis, utrinque rotundatis, rectis curvulisve, 5-7-septato-muriformibus, ad septa non v. vix constrictis, 25-28 \approx 7-8, olivaceo-fuligineis; sporophoris crassis brevibus, celluliformibus, 6-8 \approx 5-6.
Hab. in ramulis Hibisci syriaci culti Lyndonville N. Y., Amer. bor. (C. E. FAIRMAN).
5. **Camarosporium megalosporum** Da Camara, Mycetæ aliquot Theobromæ Cacao in Sancti Thomé Insula, Lisboa (1910) p. 5, tab. VI fig. 3-7. — Pycnidiis subsuperficialibus, primo epidermide tectis dein erumpentibus, plus minus globosis, atris, ostiolo rotundo pertusis, 250-450 μ . diam.; sporulis oblongo-ellipsoideis, primo umbrinis et pluriguttulatis, dein fuligineis demumque brunneis et eguttulatis, utrinque rotundatis, septis 7 usque ad 14 transversalibus, 3-4- longitudinalibus et adhuc plus numerosis, ad septa leniter constrictis, 37-70 \approx 12-28.
Hab. in cortice Theobromæ Cacao in ins. St. Thomé (J. J. DE ALMEIDA et CANNAS MENDES).
6. **Camarosporium Tamaricis** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7223 p. 367. — Pycnidiis sub epidermide solitariis v. gregariis, erumpentibus, globosis, nigris, minute papillato-ostiolatis; sporulis ellipsoideis, brunneis, 3-septatis, loculis uno alteroque longirostrum septatis, 18-24 \approx 8-10.
Hab. in ramis siccis Tamaricis africanae, Kecskemét Hungariæ.
7. **Camarosporium Potebniæ** Sacc. et Trott., *Camarosporium Tamaricis* 7224 Potebnia, Myc. Stud. Ann. Myc. V (1907) p. 18. fig. 38 et Trav. Soc. Nat. Univ. Kharkow XXXIII (1907). — Pycnidiis $\frac{1}{3}$ mm. cr., obscure brunneis; sporulis 28 \approx 12, brunneis, transverse 3-5-septatis, longitudinaliter 1-septatis.
Hab. in ramis Tamaricis gallicæ, socia *Hendersonia Tamaricis* f. *minore*, Kharkow Rossia. — An satis diversum a præcedente anteriore?
8. **Camarosporium pulchellum** Speg., Myc. Argent. V, p. 377, cum 7225 icon., in Anal. Mus. Nac. Buenos Aires XX (1910). — Matrice extus tota sordide fuscescente, intus immutata; pycnidiis eutypeis, sparsis v. laxe gregariis, ligno omnino immersis, e latere compressis, 180-300 μ . diam., tenui-membranaceis, atris, nucleo fuscescenti

subcarnosulo, cellulis proliferis 5-10 \approx 3-5, paraphysibus filiformibus longiusculis, 50-60 \approx 1, hyalinis vestito, farctis; sporulis ex ellipsoideo obovatis, 3-5-septatis, 36-40 \approx 18-22, ad septa non vel leniter constrictis, loculis septo altero longitudinali continuo divisus, fuligineis, duobus centralibus saepius obscurioribus, non vel grosse 1-guttulatis.

Hab. ad ramos aridos putrescentes Citri Limonis, Orán Salta Argentina Amer. austr.

9. **Camarosporium Pteleæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7226 p. 367. — Pycnidiis dense gregariis, erumpentibus, globosis, conico-papillatis, fuscis, c. 0,5 mm. diam.; sporulis ellipsoideis, initio hyalinis, continua, dein brunneis, 1-3-septatis, ad septa plerumque leviter constrictis, in 1-3 cellulis longitudinaliter septatis, 18-24 \approx 8-10.

Hab. in ramis emortuis Pteleæ trifoliatae, Kecskemét Hungariæ.

10. **Camarosporium Persicæ** Maubl., Bull. Soc. Myc. de Fr. XXIII 7227 (1907) p. 144, tab. XX, fig. 21-22. — Pycnidiis gregariis, globosis, papillatis, erumpentibus, demum subliberis, poro pertusis, 300-400 μ . diam.; sporulis oblongis, utrinque rotundatis, 3-5-septatis, ad septa non constrictis, loculis 2-3 septo longitudinali, saepe obliquo divisionis, pallide fuligineis, 17-23 \approx 8-9; sporophoris brevissimis.

Hab. in ramis emortuis Persicæ vulgaris, Parisiis Gallia.

11. **Camarosporium Rhodotypi** Hollós, Növényt. Közlemén. VI (1907) 7228 Extr. p. 9. — Pycnidiis sub epidermide dense gregariis, globoso-depressis, nigris, 210-350 μ . diam.; sporulis oblongo-ellipsoideis v. cylindraceis, initio continua et hyalinis, dein flavidulis, demum dilute umbrinis, 3-5-septatis, ad septa non v. vix constrictis, in 1-3 v. pluribus cellulis longitudinaliter aut oblique divisionis, 18-24 \approx 8-12.

Hab. in ramis siccis Rhodotypi kerrioidis, Kecskemét Hungariæ.

12. **Camarosporium Kerriæ** Hollós, Ann. Mus. Nat. Hungar. VIII 7229 (1910) p. 8. — Pycnidiis epidermide tectis, sparsis, atris, depresso-globosis, 200 μ . diam., contextu celluloso; sporulis ellipsoideis 3-horizontaliter, 1-verticaliter septatis, ad septa non constrictis, dilute umbrinis, 14-16 \approx 7-8.

Hab. in ramulis siccis Kerriæ japonicae, Nagy-Körös Hungariæ.

13. **Camarosporium Cladastidis** P. Henn. in Kabát et Bubák, Fungi 7230

imp. exs. n. 358 (1906). — Pycnidiis subcutaneo-erumpentibus, sparsis vel aggregatis confluentibusque, depresso-globosis, subcoriaceo-membranaceis, fuscis, subostiolatis, ca. 300-350 μ . diam., sporophoris filiformibus, hyalinis, varie longis; sporulis ellipsoideis, rectis, primo subhyalinis 1-septatis, dein fuscis 3- rariissime 5-septatis, interrupte muriformibus, 12-22 \approx 8-13.

Hab. in ramis siccis Cladastidis luteæ, in horto botan. Dahlem Germaniæ.

14. **Camarosporium Astragali** von Höhn., Ann. Naturhist. Hofmus. 7231

Wien XX (1905-1906) Heft 4, pag. 5 extr. — Pycnidiis sparsis, erumpentibus, demum fere superficialibus, nigris, parietibus tenuibus præditis, carbonaceis, globosis, basi depressis distincte ostiolo-papillatis, 250-300 mm. cr.; sporulis obscure umbrinis, elongatis, cylindraceis, utrinque rotundatis, transverse 3- raro 4-septatis, raro septis longitudinalibus præditis, tenuiter tunicatis, 16-21 \approx 6-7.

Hab. in rhachidibus foliorum Astragali sp., Erdschias-Dagh 2300 m. alt., Anatoliæ. — Ob septa longitudinalia est *Camarosporium* potius quam *Hendersonia* et ab *Hend. Tragacanthi* certe diversa.

15. **Camarosporium astragalinum** Sacc. et Trott., *Camarosporium A-* 7232

stragali Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 365, t. VIII, fig. 10. — Pycnidiis sub epidermide nidulantibus, solitariis v. gregariis, erumpentibus, depresso-subglobosis, olivaceo-brunneis, subcoriaceis, glabris, minute papillato-ostiolatis, c. 0,5 mm. diam.; sporulis oblongo-ellipsoideis, initio hyalinis, continuis, dein flavidulo-brunneis, 3-septatis, ad septa non constrictis, 14-18 \approx 6, cellulis 1-2 longitudinaliter septatis.

Hab. in caulis siccis Astragali virgati prope Izsák Hungariæ. — Socia adest *Cucurbitaria Astragali* cuius videtur status pycnidicus. An satis diversum a præcedente?

16. **Camarosporium Dulcamaræ** Diedicke, Ann. Mycol. IV (1906) 7233

pag. 415. — Pycnidiis in ligno insidentibus, depresso conoideis, apice nigrescente nitidulo corticem rumpentibus, c. $\frac{1}{2}$ mm. d.; sporulis ovoideis, e flavo obscure brunneis, triseptatis, 13-20 \approx 8-9, loculis mediis septum longitudinalem plus vel minus distinctum ostendentibus.

Hab. in ramis emortuis Solani Dulcamaræ, Delitzsch Thuringia.

17. **Camarosporium phlomidicola** Bubák, Bull. Herb. Boiss. 2 sér. 7234

VI (1906) pag. 483. — Pycnidiis sparsis, in cortice nidulantibus, epidermide tectis, e rotundato elongatis, fortiter depresso, 120-200 μ . latis, nigris, breviter papilliformi prominentibus, contextu flavo-brunneo, supra castaneo-brunneo; sporulis variabilibus, ovoides, ex ellipsoideo elongatis, 11-15 \times 6,5-9, transverse 1-3-septatis, septo longitudinali unico indistincto saepe donatis, utrinque rotundatis, obscure castaneo-brunneis.

Hab. in caulis emortuis Phlomidis tuberosæ prope Ulcinj Montenegro.

18. **Camarosporium andicola** (Speg.) Sacc. et Trott., *Camarosporulum* 7235
andicola Speg., Myc. Argent. V, p. 375, in Anal. Mus. Nac. Buenos Aires XX (1910). — Pycnidiis per peridermum fissum erumpentibus, globoso-depressis 150-180 μ . diam., molliusculis, atris, minute ostiolatis, contextu parenchymatico parum distincto, fuligineo, hyphis nonnullis crassiusculis repentinibus adspersis; sporulis ellipsoideis v. obovatis, quandoque continuis quandoque transverse uniseptatis, quandoque cruciatim septatis, saepius tamen transverse 3-longitudinaliter 1-septatis, pallide olivaceis, 10-12 \times 9-10, ad septa non v. lenissime constrictis.

Hab. ad ramos emortuos Lippiæ microphyllæ in montanis Potrerillos prope Mendoza Argentina Amer. austr.

19. **Camarosporium lyciicola** (Speg.) Sacc. et Trott., *Camarosporulum* 7236
lyciicola Speg., Myc. Argent. V, p. 376, Anal. Mus. Nac. Buenos Aires XX (1910). — Pycnidiis sparsis v. hinc inde laxè gregariis innato-erumpentibus e globoso depresso 180-200 μ . diam., glabris, coriacellis, obsolete ostiolatis, contextu indistincto atro; sporulis globosis, ovoides v. ellipsoideis, saepius transverse 3-septatis, saepe subtorulosis, loculis pro parte v. omnibus septo altero longitudinali recto v. obliquo divisis, 10-16 \times 8-12, levibus, fusco-olivaceis.

Hab. ad ramulos dejectos subputrescentesque Lycii chilensis in montanis Potrerillos prope Mendoza Argentinae Amer. austr.

20. **Camarosporium chilense** Speg., Fungi Chilenses (1910) p. 165, 7237 cum icon. — Pycnidiis cortice tectis eaque fissa erumpentibus et plus minusve denudatis, laxè gregariis subseriatis, globoso-depressis, 100-200 μ . diam., carbonaceis, vix ostiolato-perforatis; sporulis globosis v. ellipsoideis, transverse 1-3-, longitudinaliter 0-1-septatis, 2-4-6-locularibus, primo fulvellis, pellucidis, tunica mucosa hyalina tenui involutis, serius nudis opacis fuligineis 10-16 \times 8-10.

Hab. in ramulis siccis Haplopappi canescentis? in caulis San Bernardo prope Santiago, Chile Amer. austr.

21. **Camarosporium Achilleæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7238
 pag. 365, tab. IX, fig. 25. — Pycnidiis erumpentibus, depresso-sphæricis, nigris, apice perforatis, 210-280 μ . diam., contextu parenchymatico; sporulis oblongis, utrinque rotundatis, initio hyalinis, continuis, dein flavidulis, 1- mox 3-septatis, ad septa non v. vix constrictis, demum in una cellula longitudinaliter septatis, 14-18 \approx 5-6.

Hab. in caulis siccis Achilleæ setaceæ prope Kecskemét Hungariæ. — A *Cam. Compositarum* Cooke et Harkn. sporulis minoribus diversa species.

22. **Camarosporium Chrysanthemi** Hollós, Ann. Mus. Nat. Hung. IV 7239 (1906) p. 366. — Pycnidiis erumpentibus, globosis, conico-papillato-ostiolatis, nigris, 400-500 μ . diam., contextu parenchymatico; sporulis oblongo-ellipsoideis, flavo-brunneis, 3-septatis, ad septa non constrictis, in 1-2 interdum 3 cellulis longitudinaliter septatis 14-18 \approx 7-8.

Hab. in caulis emortuis Chrysanthemi indici, Kecskemét Hungariæ

23. **Camarosporium Artemisiæ** Hollós, Ann. Mus. Nat. Hungar. VII 7240 (1909) p. 56. — Pycnidiis sparsis v. seriatim dispositis, epidermide fissa tectis, dein suberumpentibus, depresso-sphæricis, nigris, 0,5-0,75 mm. diam., papillato-ostiolatis, contextu celluloso; sporulis oblongis, utrinque rotundatis, initio hyalinis et continuis, mox flavidulis, demum dilute umbrinis, 3-5- rariter 6-7-septatis, ad septa non constrictis, loculis uno alterove longitrorsum v. oblique septatis, 18-24 \approx 8-9, rarius 30-34 \approx 9-10.

Hab. in caulis siccis Artemisiæ scopariæ prope Kecskemét Hungariæ.

24. **Camarosporium Forsythiæ** Hollós, Ann. Mus. Nat. Hungar. IV 7241 (1906) p. 366, tab. IX, fig. 32. — Pycnidiis sub epidermide nidulantibus, erumpentibus, depresso-globosis, nigris, c. 350 μ . d.; sporulis ellipsoideis, initio hyalinis et continuis, dein 1- mox 3-septatis, demum brunneis, ad septa leviter constrictis, 1-2- vel 3 cellulis longitudinaliter septatis, 14-20 \approx 8-10.

Hab. in ramis emortuis Forsythiæ suspensæ Nagy-Körös Hungariæ.

25. **Camarosporium Opuli** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7242 p. 368. — Pycnidiis sub epidermide gregariis, depresso-globosis, nigris, apice ostiolo minuto papillatis, c. 0,5 mm. diam., contextu parenchymatico; sporulis ellipsoideis, initio hyalinis, dein flavidu-

lis, continuis, mox 1-3-septatis, ad septa non vel leviter constrictis, loculis uno altero longitrorum septatis, fuscis, 16-20 \approx 8-11.

Hab. in ramis siccis Viburni Opuli, Kecskemét Hungariæ.

26. **Camarosporium santiaguinum** Spèg., Fungi Chilenses (1910) p. 166. 7243

— Pycnidiis sparsis lenticularibus, 100-120 μ . diam., cortice innatis, epidermide tectis, membranaceis, atris, obsolete ostiolatis; sporulis irregulariter subellipsoideis, 10-18 \times 5-10, fuligineis, septis transversis 3, longitudinalibus 0-1, ad septa plus minusve constrictis.

Hab. in caulis siccis Vincæ majoris, Cerro de Santa Lucia de Santiago Chile Amer. austr.

27. **Camarosporium elæagnellum** Fairm. Ann. Myc. VIII (1910) p. 322. 7244

Pycnidiis fuligineis v. tabacino-brunneis, erumpenti-superficialibus, epidermide fissa cinctis, approximatis, globosis, papillatis; sporophoris hyalinis; sporulis oblongo-ellipsoideis, utrinque rotundatis, 3-septatis, demum 5-septatis, muriformibus, olivaceo-brunneis, 15-30 \approx 10.

Hab. ad ramulos Elæagni longipedis culti, Lyndonville N. Y. Amer. bor.

28. **Camarosporium Elæagni** Potebnia, Myc. St. Ann. Myc. V (1907) 7245

p. 18, fig. 37 et Trav. Soc. Nat. Univ. Karkov XXXXIII (1907).

— Pycnidiis initio immersis dein erumpentibus 350-500 \approx 200-250, apice ostioli loco papillatis, quandoque mycelio pseudostromatico basi circumdati; sporulis forma et magnitudine variabilibus; aliis 1-loclaribus 9-10 μ . cr. (*Conioth. Montagnei*?), aliis subinde 3-4-loclaribus, aliis Hendersoniæ-similibus 21-23 \approx 8-10 (*Henders. Tamericis* var. *Elæagni* Cooke), aliis denique murali-septatis, constrictis, omnino camarosporioideis, 25-28 \approx 8-10.

Hab. in ramis siccis Elæagni angustifoliæ in Kharkov, Rossia. — Verisimiliter sporulæ 1-cellulares sunt tantum immaturæ vel abnormes!

29. **Camarosporium Hollosii** Sacc. et Trott., *Camarosporium Elæagni* 7246

Hollós, Ann. Mus. Nat. Hung. VIII (1910) pag. 8. — Pycnidiis sub epidermide nidulantibus, gregariis, atris, globosis, circiter 0,5 mm. diam., ostiolo conico longo, corticem perforante præditis; sporulis oblongo-ellipsoideis v. cylindraceis, rectis v. leviter curvulis, dilute umbrinis, 4-7-plerumque 6-septatis, non constrictis, in 1-3 v. pluribus cellulis oblique divisis, 22-30 \approx 8-9.

Hab. in ramis emortuis Elæagni angustifolii pr. Kecskemét Hungariæ. — An species diversa a præcedente?

30. **Camarosporium Tricyclæ** Spieg., Myc. Argent. V, p. 377, in Anal. 7247

Mus. Nac. Buenos Aires XX (1910). — Pycnidiis sparsis v. laxæ gregariis, primo tectis, dein, cortice delapso, superficialibus, semi-lenticularibus, coriacellis, atris, glabris, 150-200 μ . diam., contextu opaco indistincto; sporulis ellipsoideis v. ellipsoideo-ovoideis, medio 1-septatis, 10-12 \times 8-10, ad septum medium non v. vix constrictis, loculo supero vel utrinque longitudinaliter uniseptatis, levibus, olivaceis.

Hab. ad ramos emortuos aridosque Tricyclæ spinosæ in montanis Potrerillos prope Mendoza Argentina Amer. austr.

31. **Camarosporium tricyclinum** Spieg., Myc. Argent. V, p. 377, in 7248

Anal. Mus. Nac. Buenos Aires XX (1910). — Pycnidiis sparsis v. subgregariis, primo tectis dein denudato-superficialibus, subhemisphæricis, 150-250 μ . diam., atris, glabris, coriacellis, minute papillato-ostiolatis, contextu indistincto atro; sporulis subellipsoideis utrinque rotundatis, transverse 3-septatis, rectis v. inæquilateribus, ad septa non v. vix constrictis, 15-18 \times 7-9, loculis centralibus saepius longitudinaliter divisis, olivaceis.

Hab. ad ramos emortuos Tricyclæ spinosæ in montanis Potrerillos Argentina Amer. austr.

32. **Camarosporium Roumeguerei** Sacc. — Syll. III, p. 469. — var. 7249

Halimi R. Maire, Bull. Soc. bot. Fr. LIV (1907) p. CLXXXIX. — A typo differt sporulis crassioribus, circ. 16-20 \times 9-13, transverse 2-3-septatis.

Hab. ad gallas in ramis Atriplicis Halimi, Khreider Africæ bor.

33. **Camarosporium Obionis** Jaap, Verh. Bot. Ver. Prov. Brandenburg (1905) p. 97, Exsicc. n. 98. — 7250

Pycnidiis depresso-globosis, dense approximatis, 200 μ . diam.; contextu pallide flavo 10 μ . cr., circa ostium brunneo; sporophoris simplicibus, hyalinis, usque ad 70 μ . longis; sporulis 3-5-locularibus muriformibusque, pallide melleis, 18 \times 12, versiformibus, ovoideis, late ellipsoideis v. subrotundis.

Hab. in caulis emortuis Obionis portulacoidis in insula Amrum Schleswig-Holstein, socia *Diplodina Obionis*.

34. **Camarosporum Thujæ** Hollós, Növényt. Közlemén. VI (1907) 7251

Extr. p. 9. — Pycnidiis sub epidermide nidulantibus, erumpentibus, sparsis, globoso-depressis, nigris, c. 400 μ . diam.; sporulis ellipsoideis, 3-septatis, non v. vix constrictis, loculis uno alteroque longitrorsum septatis, flavo-brunneis, 13-15 \times 6-8.

Hab. in ramis siccis *Thujæ occidentalis*, Kecskemét Hungariae.

35. **Camarosporium Phyllostachydis** Miyake et Hara, in Bot. Mag. 7252 Tokyo (1910) p. (354) [japonice].

Hab. in *Phyllostachydis* sp. in Japonia.

36. **Camarosporium Stipæ** Diedicke, Aufzähld. Erfurts Micromyc. (1910) 7253 p. 89. — Pycnidiis sparsis, subcutaneis, dein erumpentibus et leviter prominulis, subglobosis, 120 μ . diam., contextu dense parenchymatico, maturitate vertice dehiscentibus, atro-brunneis; sporophoris brevibus; sporulis late fusoideis, utrinque acutatis, cellula ima hyalina, ultima pallida, ceteris flavo-brunneis, 3-5-septato-muriformibus, 26-35 \times 10.

Hab. in foliis emortuis *Stipæ capillatæ*, Schwellenburg pr. Erfurt Germaniae.

37. **Camarosporinm Henningsianum** Kab. et Bub. in Hedw. LII (1912) 7254 p. 355. — Ita vocandum *Cam. Amorphæ* P. Henn. (1908) — Syll. XVIII, pag. 370 — non v. vix *Cam. Amorphæ* Sacc. (1883) — Syll. II, p. 311.

PIRINGA Speg. Myc. Argent. V, p. 378, in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. nomen familiare filiæ auctoris et synon. *Gardeniæ*). — Pycnidia superficialia, minuta, nigra, atro-villosa; sporulæ muriformes olivaceæ. — Genus a *Cytosporio* pycnidiis villosis recedens; huc quoque ducendum *Cytosporium basitrichum* Sacc.

1. **Piringa setulifera** Speg., Myc. Argent. V, p. 378, in Anal. Mus. 7255 Nac. Buenos Aires XX (1910). — Matrice sæpius cortice denudata plus minusve nigrefacta; pycnidiis sparsis v. hinc inde pauci-gregariis, udis globosis, 150-220 μ . diam., siccis collabescientibus, astomis, contextu olivaceo indistincto donatis, setulis patentiusculis rigidulis rectiusculis apice obtusissimis 100-120 \times 10, non v. vix subincrassatis continuis v. 1-2-septatis, obscure fuligineis vestitis; sporulis obovatis, septis summopere ludentibus, transversis 0 v. 2 longitudinalibus 0 v. 1, ad septa non constrictis levibus 14-18 \times 8-10.

Hab. ad ramulos emortuos Verbenæ asperæ in montanis Potrerillos prope Mendoza Argentina Amer. austr.

2. **Piringa andina** Speg., l. c., pag. 378. — Ramulis infectis cortice 7256 plane orbatis, pallide cinerescentibus; pycnidiis sæpius irregulariter sparsis rarius hinc inde pauci-gregariis, primo tectis dein denudatis hemisphærico-depressis, 120-180 μ . diam., atris, coriacellis

vilosulis, contextu parenchymatico ægre perspicuo; sporulis ellipsoideis utrinque subattenuato-acutatis, rectis v. leniter inæquilateralibus, 14-18 \times 8-10, saepius transverse 3-septatis, loculis uno alterove septo longitudinali recto v. obliquo divisis, olivaceis, ad septa transversa lenissime constrictis.

Hab. ad ramos emortuos Lippiæ microphyllæ in montanis Potrerillos prope Mendoza, Argentina Amer. austr.

THYROCOCCUM Sacc. — Syll. X, p. 642 (1892) ut subg. *Stemphilii*, non v. Höhn. Fragm. z. Mykol. n. 155 (1901), nec Bubák *), nec Buchanan **), Cfr. Ann. Mycol. XI (1911) p. 253, ut genus. (Etym. *thyra* fenestra et *coccum* granum). — Pycnidia mox erumpentia, globulosa, atra, contextu tenuissimo. Sporulæ globoso-sarciniformes, clathratæ, coloratæ, sporophoris filiformibus sursum furcatis v. varie ramosis hyalinis suffultæ. — Præeunte cl. prof. v. Höhnel, cui exemplar meum communicavi, pycnidium adest etsi tenuissimum, hinc non *Stemphylium* sed potius *Camarosporium*. Tamen præsentibus sporophoris ramosis et excipulo tenuissimo genus servandum puto. *Thyrococcus* v. Höhn. nec Sacc. nunc *Thyrostroma* a von Höhn. in litt. vocatur, sed a *Steganosporio* non satis differt.

1. **Thyrococcus punctiforme** Sacc., l. c. sub *Stemph.* (Thyrococc.) 7257
punctiforme. — Sporophora usque ad 30 \times 2, semel raro bis furcata. — Num *Camarosporium Atriplicis* d' Alm. et da Cam. — Syll. XVIII, p. 373 — et *Camar. Halimi* Maubl. — Syll. XVIII, p. 374 — sint speciei præsentis varietates caulinolæ inquirendum.

MYXOCYCLUS Riess in Fresen. Beitr. I (1852) p. 63 (Etym. *myxa* mucus et *cyclus* circulus, ob sporulas muco obvolutas). — A generibus *Steganosporio*, *Hendersonia* et *Camarosporio* rite distinguitur: pycnidii contextu crasso, sporulis murali-divisis et initio strato mucoso obvolutis.

1. **Myxocyclus polycystis** (B. et Br.) Sacc., Ann. Mycol. VI (1908) 7258
p. 559, *Myxocyclus confluens* Riess in Fresen. I, p. 63, t. VIII, f. 41-45 (1852), *Steganosporium muricatum* Bonord. Handb. p. 60, f. 52 (1851) — Syll. III, p. 806 — *Steganosporium Betulæ* Bres. ap.

*) Cfr. Ber. Deutsche Bot. Gesell. 1910.

**) Cfr. Mycologia, Jan. 1911.

Noelli, in Malp. (1903) p. 417 et Syll. XVIII, p. 488 — *Hendersonia polycystis* B. et Br. (1850) — Syll. III, p. 441.

Hab. in cortice Betulæ albæ in Germania, Britannia, in agro Tridentino (BRESADOLA), Parisensi, Parc. de S. Cloud (P. HARIOT) etc. — Sporulæ 55-70 \times 20-21; pedicellus usque ad 80-90 μ . longus. — Teste Tulasneo est status pycnidicus *Massaria Argi*, nec *Pseudovalsæ lanciformis* ut autumaverat Currey.

DICHOMERA Cooke — Syll. III p. 471, X p. 348, XIV p. 967, XVIII p. 375.

1. **Dichomera prunicola** Ell. et Dearn., Fungi Columb. n. 2021 (1905). 7259 — Stromatibus numerosis, erumpentibus, 1-1,5 mm. diam., subcarnosis, orbicularibus, epidermide rupta cinctis, depressis, nigris, intus, præcipue madore expallidis; pycnidii in quoque stromate 3-4, immersis, minutis, obsolete ostiolatis; sporulis globosis, 7-10 μ . diam., subinde ovoideis, 10-12 \times 7-8, brunneis, 1-5-septatis, sæpius 1-septatis.

Hab. in ramis emortuis Pruni virginianæ, London Ontario Canada Amer. bor. (DEARNESS, qui diagnosim communicavit).

2. **Dichomera Carpini** Griff. et Maubl., Bull. Soc. Myc. Fr. XXV 7260 (1909) p. 59, cum icon. — Stromatibus sparsis, in cortice demum fisso nidulantibus, nigris, simplicibus v. sæpius 2-3-locularibus, poro unico centrali apertis, nucleo nigro; sporulis ellipsoideis v. rarius subreniformibus, biseptatis, loculis 1-2 medio septo longitudinaliter v. oblique divisis, rufo-brunneis, 13-18 \times 6-8; sporophoris rectis, brevibus.

Hab. in ramulis exsiccatis Carpinii Betuli, Rigny-sur-Arroux, Saône-et-Loire Galliæ (FLAGEOLET).

Sect. 7. Hyalodictyæ.

HYALOTHYRIDIUM Fl. Tassi — Syll. XVI p. 955.

1. **Hyalothyridium mutilum** (Fr.) Sacc. et Trott., Camarosporium ? *mutilum* (Fr.) Sacc. et Trav. — Syll. XIX, p. 219 — *Sphaeria mutila* Fr. p. p. (Cfr. *Diplodia mutila* Fr. — Syll. III, p. 353) — Currey in Trans. Linn. Soc. XXII (1858) p. 284, tab. 49, f. 191. — Pycnidii sporulis copiosis, e hyalino chlorinis, forma variabilibus, fusoideo-oblongis, sæpe curvulis, 20-30 μ . long., trans-

verse 5-septatis sœpeque septis 1-2-longitudinalibus partitis et cu-boideo-nucleatis.

Hab. in ramis corticatis Populi sp. in Suecia.

2. **Hyalothyridium leptitanum** Sacc. et Trott., in Ann. Mycol. X (1912) 7262 p. 513. — Pycnidiis erumpenti-superficialibus, nigris, subglobosis v. leviter depresso, $\frac{1}{4}$ mm. circ. cr., contextu brunneo indistincte parenchymatico; sporulis ovato-ellipsoideis, utrinque præcipue apice obtuse rotundatis, transverse 1-3-septatis, rarius 4-septatis, loculis 1-2 v. omnibus septo longitudinali recto v. obliquo partitis, ad septa non v. vix constrictis, 16-18 \approx 9-10, hyalinis v. subchlorinatis, plasmate multipartito, hinc multiguttulatis; sporophoribus brevibus, mox evanidis, hyalinis.

Hab. in ramulis decorticatis emortuis sed adhuc stantibus Rhois oxyacanthæ M. Mergheb pr. Homs (Leptis magna) Tripolitanæ, Afr. bor., socio *Coniothecio Rhois*. — Ab affini *Hyal. viburnicola* Tassi præcipue recedit forma et septatione sporularum, matrice et patria.

Sect. 8. Scolecosporæ.

SEPTORIA Fr. — Syll. III p. 474, X p. 349, IX p. 538, XIV p. 967, XVI p. 956, XVIII p. 376.

1. **Septoria Cirrosæ** Sacc., Ann. Mycol. VI (1908) p. 555. — Maculis 7263 amphigenis, sed supra distinctioribus, orbicularibus, 8-10 mm. d., late atro-purpureo marginatis, medio alutaceis; pycnidiis amphigenis, sed supra copiosioribus, dense gregariis, punctiformibus, prominulis, nigricantibus; sporulis bacillaribus, utrinque obtusulis, 36-45 \approx 2-2,5, rectiusculis, 4-5-nucleato-pseudoseptatis, hyalinis.

Hab. in foliis languidis Clematidis cirrosæ, Villa Favrita, Palermo, Sicilia (J. H. MATTEI). — Ab affinibus *S. Clematis-Flammulæ* et *S. Flammulæ* notis datis distinguenda videtur.

2. **Septoria Lycoctoni** Speg. — Sacc. Syll. III, p. 525. — var. **macrospora** C. Mass., in Madonna Verona III (1909) p. 22. — Maculis 7264 cinereis zona atro-fusca limitatis; pycnidiis epiphyllis paucis; sporulis filiformibus falcatis 35-50 \approx 1,5-2.

Hab. in foliis languidis Aconiti Lycoctoni L., Badia Calavena, Verona, Ital. bor.

3. **Septoria Aconiti** Bacc., Funghi Schen-Si sett., Nuovo Giorn. bot. it. N. S. XII (1905) p. 697. — Maculis fuscis, rotundis, bullatis,

margine rubescens; pycnidii sparsis, hypophyllis, minutis, ostiolo minuto inconspicuo, 90-100 μ . latis; sporulis filiformibus, hyalinis, indistincte pluriseptatis 45-48 μ . cr.

Hab. in foliis *Aconiti* sp. in monte Thac-pe-i-san Sinarum.

4. **Septoria Sisymbrii** P. Henn. et Ranojevic, Ann. Mycol. VIII 7266 (1910) p. 390, fig. 16-18, Kab. et Bub., Fungi imp. exsicc. 557. — Maculis rotundatis, elongatis, utrinque conspicuis, albidis, usque ad 6 mm. diam., confluentibus; pycnidii plerumque epiphyllis, numerosis, congregatis, nigris, epidermide tectis dein poro lato erumpentibus, globosis v. subapplanatis, contextu brunneo pseudoparenchymatico, 90-198 μ . lat.; sporulis cirrum albidum v. flavidum efformantibus, unicellularibus v. 1-5- sed plerumque 1-2-septatis, bacillaribus, utrinque angustatis v. late acicularibus, rectis, v. contortis, 19-62 \approx 2-3, hyalinis; sporophoris ovoideis, conoideis, piriformibus, hyalinis, 7,5-15 \approx 3-7.

Hab. in foliis vivis *Sisymbrii orientalis* et altissimi prope Belgrad et Pirot Serbia.

5. **Septoria repanda** Bubák, Ann. Mycol. IV (1906) p. 116. — Maculis albidis vel flavidis, rotundatis v. irregularibus, indistinctis, demum arescentibus; pycnidii epiphyllis, crebris, 80-120 μ . latis, subcompressis, nigris, prominentibus, contextu crasso nigro-brunneo, poro irregulari apertis; sporulis cylindraceis, raro rectis, plerumque curvulis quandoque plus minusve fortiter et circulariter arcuatis, apice angustatis, ibique obtusatis, 24-52 (raro usque ad 62) \approx 2,5-4,5, continuis v. 1-3-septatis, hyalinis, non guttulatis.

Hab. in foliis *Erysimi* repandi prope Laun Bohemia (Houska). — A *Sept. Erysimi* Niessl sporulis majoribus, pycnidii superficialibus crebris diversa.

6. **Septoria Cardamines-resedifoliæ** Heim., in Verh. z. bot. Ges. Wien 7268 LVII (1907) p. 456. — Pycnidii in areis minutis, dein ampliatis foliorum, initio brunneis dein dealbatis sitis, modo sparsis, modo proximatis, amphigenis, globulosis, 100-120 μ . diam., subinde depresso, ostiolo latiusculo, rotundo, prominulo, nigro-brunneo pertusis; sporulis filiformibus, curvulis vel subrectis, 18-28 \approx 1-1,5, plerumque 22-24 μ . longis, continuis v. medio obsolete 1-septatis, non v. vix guttulatis.

Hab. in foliis *Cardamines resedifoliæ*, Steinwend, alt. 1500 m. Isargo (Eisacktal) Tiroliæ cisalpinæ. — Affinis *Septoriæ Cardamines-trifoliæ*.

7. **Septoria Cardamines-trifoliæ** v. Höhn., Annal. naturhist. Hofmus. 7269

Wien Bd. XXIV, p. 277 (1911) et Crypt. exs. n. 1736. — Maculis subrotundis, albidis, fusco-marginatis, amphigenis, paucis subinde numerosis, 1-2 mm. diametro; pycnidiis epiphyllis, dispersis vel interdum dense aggregatis, plerumque numero 1-3, interdum 20-30 in quaque macula, nigro-brunneis v. subnigris, 50-100 μ . d., ostiolo plano, fusco-marginato, 20-30 μ . lato præditis, contextu pallido vel subfusco, tenui, cellulis parvis composito; sporulis hyalinis, eseptatis, plerumque subrectis, uno apice acutis, altero apice obtusis, ca. 25-32 \approx 1-1,5 metentibus.

Hab. ad folia persistentia Cardamines trifoliæ prope Reckawinkel, Austriæ (F. v. HÖHNEL). — Peraffinis *Sept. Cardamines-resedifoliæ* Heim.

8. **Septoria capsellicola** Hollós, Ann. Mus. Nat. Hung. VIII (1910) 7270 p. 4. — Pycnidiis epiphyllis, gregariis, lenticularibus, atris, poro pertusis, 40-50 μ . diam., contextu celluloso; sporulis acicularibus, rectis v. curvulis, continuis, hyalinis, 24-36 \approx 1,5-2.

Hab. in foliis exsiccatis Capsellæ Bursæ-pastoris prope Kecskemét Hungariæ. — A *Septoria Capsellæ* sporulis minoribus diversa.

9. **Septoria Limnanthemi** Voglino, Atti R. Acc. Sc. Torino XLIII 7271 (1907-1908) p. 95 (249). — Maculis distinctis, plerumque numerosis, epiphyllis, totam folii substantiam penetrantibus, inde amphigenis, circularibus, raro confluentibus et tunc subellipticis, sinuosis, umbrinis, vulgo flavo-virenti-marginatis, 2-3-4 usque ad 7 mm. latis; pycnidiis semper epiphyllis, erumpentibus, minutis, 120-140 μ . latis, lenticularibus, nigris; sporulis fusoideo- v. clavato-oblongis, acutis, rectis v. lenissime curvulis, obsolete 4-6-septatis, hyalinis, 36-38-48 \approx 1,5-2,5.

Hab. in foliis vivis Limnanthemi nymphoidis in lacibus Candia, Viverone Pedemontii Italiæ bor.

10. **Septoria polygalicola** Hollós, Ann. Mus. Nat. Hung. VIII (1910) 7272 p. 5. — Maculis totum folium occupantibus, ochraceis; pycnidiis hypophyllis, sparsis, lenticularibus, atris, poro pertusis, 90-120 μ . diam., contextu celluloso; sporulis acicularibus, rectis v. curvulis, continuis, hyalinis, 24-32 \approx 1,5.

Hab. in foliis languidis Polygalæ comosæ prope Kecskemét Hungariæ.

11. **Septoria Jujubæ** Trav. et Spessa, Bol. Soc. Brot. (1910) p. 183, 7273 t. III, f. 19. — Pycnidiis plerumque hypophyllis et dense gregariis, maculas minutas, irregulares, angulosas, fuligineo-ochraceas

efformantibus, rarius subsparsis, globosis, poro minuto distincto pertusis, 80-120 μ . diam., fuligineo-melleis; sporulis longe bacilaribus, continuis vel interdum spurie 1-septatis, rectis vel leniter curvulis, $14-17 \approx 1^{\frac{1}{2}}$.

Hab. in foliis languidis *Zizyphi Jujubæ* in Horto botanico conimbricensi Lusitania (A. MOLLER). — A *Septoria Zizyphi* præcipue maculis minoribus et minus distinctis, pycnidiis gregariis et hypophyllis satis differt.

12. **Septoria Hyperici** Desm. — Syll. III, p. 515 — var. **Hyperici-** 7274 **quadranguli** C. Mass., Atti Acc. Sc. Med. e Nat. Ferrara, LXXXIV (1910) Extr. p. 10. — Maculis rubiginoso-subfulvis, luteo-marginatis; sporulis vulgo 30-40 μ . long.

Hab. in foliis *Hyperici quadranguli*, Mt. Turcato Veronæ Ital. bor. — Var. **Burseri** R. Maire, Bull. Soc. Bot. de Fr. t. LV (1908) p. CLXIV. — Epiphylla, maculis rotundatis v. irregularibus, brunneis, purpureo-marginatis; pycnidiis minutis, 60-150 μ . diam., atris; sporulis linearibus, rectis v. flexuosis, 15-32 ≈ 2 , 1-2-septatis. — In foliis vivis *Hyperici Burseri*, Cauteret in Pyrenæis Galliæ (MOTILLARD).

13. **Septoria Daniloi** Bubák, Bull. Herb. Boiss. 2. ser., VI (1906) 7275 p. 478. — Maculis rotundatis, elongatis v. irregularibus, parvis, 2-3 mm. latis, brunneo-alutaceis, indistinctis, plerumque linea prominenti marginatis, parce v. multi-gregariis, quandoque late distributis; pycnidiis epiphyllis, 1-10-irregulariter gregariis, subepidermicis, 90-120 μ . latis, 110-150 μ . altis, nigris, demum erumpentibus, contextu obscure brunneo præditis; sporulis filiformibus 50-70 $\approx 2,2$, rectis v. curvulis transverse 3-4-septatis, utrinque sensim angustatis, obtusatis.

Hab. in Geranio lucido prope Kosciele, Rijeka et Ulcinij Montenegro.

14. **Septoria drimydicola** Spegazz., Fungi Paulist., Rev. Mus. La Plata t. XV, p. 37 (1908). — Maculis amphigenis irregulariter orbicularibus, pulvinato-prominulis suborbicularibus 3-5 mm. d., eximie determinatis fuscescentibus; pycnidiis centro macularum laxè gregariis innatis, lenticularibus 65-80 μ . diam., tenuibus, membranaceis, contextu denso subimperspicuo olivaceo; sporulis arcuatis v. sigmoideis utrinque acutiusculis 25 ≈ 1 , continuis, hyalinis.

Hab. ad folia languida Drimydis cujusdam in hortis Sao Paulo Brasilia (USTERI).

15. **Septoria Blumenbachiae** Speg., Myc. Argent. V, p. 380, in Anal. 7277 Syll. Fung. XXII (V-1913)

Mus. Nac. Buenos Aires XX (1910). — Maculis difformibus subindeterminatis, 5-15 mm. diam., pallescenti-arescentibus; pycnidiis laxe gregariis innatis, nigris, lenticularibus, 75-90 μ . diam., ostiolo minuto perforatis, contextu tenui imperspicuo fuscidulo; sporulis acicularibus, rectis v. leniter arcuatis, 45-50 \times 1,5-2, saepius triseptatis, hyalinis.

Hab. ad folia viva Blumenbachiae urentis in silvis prope Bompland Argentina Amer. austr. (P. JÖRGENSEN).

16. **Septoria Vandasii** Bubák, Ann. Mycol. IV (1906) p. 117. — Py- 7278
cnidiis numerosis, ramos, folia, bracteas, calicesque nigrefactos late obtegentibus, 55-120 μ . diam., globosis, poro irregulari lato aper-
tis, contextu minute parenchymatico, obscure brunneo, basi palli-
diori; sporulis filiformibus, plus v. minus incurvatis, 22-31 \times 2,
bilocularibus, raro unilocularibus, apice angustatis; sporophoris
papilliformibus hyalinis v. brunneolis.

Hab. in Alsine glomerata, Kale Rhodope Bulgaria (leg.
FORMANEK, misit VANDAS).

17. **Septoria Velenovskyi** Bubák, Bull. Herb. Boiss., 2 sér., VI (1906) 7279
p. 479. — Maculis minutis, rotundatis, 1 mm. circ. long., flavo-
alutaceis; pycnidiis globosis, 70-100 μ . latis, brunneolis, margine
obscurioribus, contextu grosse parenchymatico, subradiato; spo-
rulis cylindraceis, 20-24 \times 3, rectis v. curvulis, apice rotundato-
angustatis, medio transverse uniseptatis, non constrictis, hyalinis.

Hab. in foliis Saginæ tenuifoliæ var. Velenovskyi pr.
Virbazar Montenegro.

18. **Septoria Commersoniana** Speg., Myc. Argent. V, p. 381, in Anal. 7280
Mus. Nac. Buenos Aires XX (1910). — Foliis infectis totis pale-
scentibus; pycnidiis innatis, laxe gregariis lenticularibus, 50-80 μ .
diam., nigris, membranaceis, ostiolo subfimbriatulo perforatis, con-
textu minute parenchymatico, fusco-olivaceo, parum distincto; spo-
rulis bacillaribus utrinque obtusiuscule rotundatis 25-32 \times 3, ad
medium saepius uniseptatis, hyalinis.

Hab. ad folia languida Cerastii humifusi in pratis uligino-
sis Lezama prov. Buenos Aires Argentina Amer. austr.

19. **Septoria pusilla** (Trail) Bubák, Beitr. z. Pilzfl. Ung. in Növé- 7281
nytani Közlemények (1907) Heft 4, Extr. p. 35. — Ita vocanda
est, sec. Bubák l. c., *Septoria Lychnidis* Desm. var. *pusilla* Trail
— Syll. X, p. 364 — quia specifice distinguenda.

20. **Septoria Silenes-nutantis** C. Mass. ap. Sacc., in Ann. Mycol. IX 7282
(1911) p. 252. — Maculis subrotundis albido-luteolis, 2-3 mm. d.,

raro confluentibus, zona subviolacea cinctis; pycnidiis epiphyllis, subinde etiam amphigenis, minutissimis, 30-50 μ . diam., membranaceis, subachrois (semper?); sporulis acicularibus tenuissimis, continuis, hyalinis, 60-70 \times 1,5-2.

Hab. in foliis languidis *Silenes nutantis*, socio *Uromycete Silenes*, in Selva di Progno agri Veronensis, Ital. bor. — *Septoriæ Doehlii* Syd. affinis.

21. **Septoria Dominii** Bubák, Bull. Herb. Boiss., 2 sér., VI (1906) 7283 p. 477. — Maculis elevatis, rotundatis, parvis, saepe 1 mm. tantum latis, pallide flavo-ochraceis v. flavidis, linea angusta limitatis et areola flavidula cinctis; pycnidiis epiphyllis plus v. minus aggregatis quandoque arcte confertis, parvis, 45-90 μ . diam., globosis, subdepressis, nigris, contextu grosse parenchymatico, flavidio præditis, maturis conoideo prominentibus; sporulis rectis, curvulis v. contortis, 20-31 \times 2,5-3, transverse uniseptatis, hyalinis.

Hab. in foliis vivis *Silenes inflatae* var. *latifoliæ* prope Ulcinj Montenegro.

22. **Septoria Jaapii** Bres. apud Jaap, Ann. Mycol. III (1905) p. 400. 7284 — Pycnidiis numerosis in maculis magnis, albido-flavidis, plerumque brunneo-marginatis insidentibus; sporulis 1-3-locularibus, 33-60 \times 3-4, minute guttulatis.

Hab. in foliis Melandrii albi, prope Warnemünde Mecklenburg Germaniæ.

23. **Septoria Melandrii** Pass. — Syll. III, p. 517. — var. *andrijevicensis* Bubák, Bull. Herb. Boiss., 2 sér., VI (1906) pag. 478. 7285 — Sporulis 60-82 \times 2, transverse 1-5-septatis, curvatis, ceterum ut in typo.

Hab. in foliis vivis Melandrii nemoralis prope Andrijevica Montenegro.

24. **Septoria Trapæ-natantis** Wisniewski in Kosmos (1910) p. 78-79. 7286 — Maculis epiphyllis subcircularibus, usque ad 0,5 cm. latis, zona atro-purpurea cinctis; pycnidiis in centro maculæ sitis, in stratu folii paliformi innatis; sporulis filiformibus.

Hab. in foliis rosulæ exterioribus Trapæ in stagno quodam pr. Nowa Grobla in Galicia occidentali.

25. **Septoria Thomasiana** Saccardo, Fungi aliquot africani, Bol. Soc. Broteriana XXI (1904-1905) pag. 7. 7287 — Maculis subcircularibus, amphigenis, sed epiphyllis distinctioribus, 2-3 mm. diam., isabellinis, angustissime fusco-purpureo-marginatis; pycnidiis in quaue macula numerosis, gregariis, lenticularibus 60-80 μ . diam., poro

minuto rotundo pertusis; contextu celluloso rufo-fuligineo; sporulis bacillaribus, curvulis, utrinque rotundatis, 33-36 \times 2, obsolete multi-nucleatis, hyalinis.

Hab. in foliis languidis Jussieuæ acuminatæ, Caixao Grande S. Thomé, Africa (A. MOLLER). — A *Septoria Jussieuæ* differt pycnidiiis in quaque macula numerosis, maculæ forma et colore, etc.

26. **Septoria jussieuicola** Spegazz., Myc. Argent. V, p. 383, in Anal. 7288 Mus. Nac. Buenos Aires XX (1910). — Maculis rufescentibus sub-determinatis repando-orbicularibus, 2-5 mm. diam., areola livescente cinctis, amphigenis; pycnidiiis epiphyllis, parenchymate innatis, epidermide tectis, sublenticularibus, 75-80 μ . diam., tenuissime membranaceis parenchymaticis, ostiolo rotundo parvulo pertusis; sporulis acicularibus, non v. lenissime curvulis, 35-50 \times 1,5, hyalinis, continuis.

Hab. ad folia languida Jussieuæ montevidensis in paludosis prope La Plata Argentina Amer. austr. — An satis diversa a præcedente?

27. **Septoria euphorbicola** Hollós, Ann. Mus. Nat. Hungar. VIII 7289 (1910) p. 5. — Maculis amphigenis, rotundatis, minutis, 1 mm. diam., olivaceo-brunneis, centro demum expallentibus, in pagina superiore rubro-vinoso-cinctis; pycnidiiis epiphyllis, in centro macularum solitariis, prominulis, poro pertusis, 140-160 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque attenuatis et rotundatis, leniter curvulis, 3-septatis, hyalinis, 16-20 \times 2-2,5.

Hab. in foliis vivis Euphorbiæ procerae prope Nagy-Körös Hungariæ.

28. **Septoria Hariotiana** Sacc. Notæ Myc. VIII, Ann. Myc. IV (1906) 7290 p. 493, tab. X, fig. 10. — Maculis amphigenis, dense gregariis, eximie circularibus, centro ex isabellino albidis, angusteque atro-purpureo-marginatis, totis 1 mm. diam.; pycnidiiis in quaque macula singulis v. raro 2-4, lenticularibus, atris, 120-125 μ . diam., poro minuto pertusis; sporulis bacillaribus, utrinque obtusulis, rectis curvulisve, 3-4-septatis, non constrictis, 30-32 \times 3, hyalinis.

Hab. in foliis vivis Euphorbiæ palustris, Méry-s-Seine Galliæ (P. HARIOT). — A ceteris speciebus euphorbicolis maculis sporulisque diversa et vere pulchella.

29. **Septoria sedicola** Peck, New York St. Mus. Bull. n. 139 (1909) 7291 p. 29. — Maculis orbicularibus, 4-8 cm. latis, vulgo in quoque folio una v. duabus, primum definitis, depresso, in partibus folii circumdantibus, absque decoloratione, deinde supra convexis, infra con-

cavis, foliis flavescentibus, tenuibus, flaccidis, moribundis; pycnidiiis numerosis, minutis, amphigenis, nigris; sporulis filiformibus, rectis, curvatis v. flexuosis, enucleatis, 20-40 \approx 1-1,5.

Hab. in foliis vivis *Sedi purpurei* (*Sedum telephium*), Fine St. Lawrence co. Amer. bor. — *Septoriæ Sedij* proxima sed pycnidiiis amphigenis, sporulis enucleatis præcipue recedit.

30. **Septoria Fici-indicæ** Voglino — Syll. XVIII, p. 378. — Huc 7292 ducenda est *Septoria Opuntiae* Voglino, Atti R. Acc. Sc. Torino XLIII (1907-1908) p. 95 (249).

31. **Septoria grossularicola** C. Mass., Ann. Myc. III (1905) p. 168. 7293 — Maculis amphigenis, irregularibus, primo pallide cinnamomeis, dein areolatis, areolis parvis sæpe confluentibus, albicantibus et linea fusca limitatis; pycnidiiis epiphyllis, prominulis, nigris, minutis, punctiformibus, poro manifesto perviis; sporulis subfiliformibus, varie inflexis, vermicularibus (*tylenchoideis*), hyalinis, continuis, 35-50 \approx 2.

Hab. ad folia *Ribis Grossulariae* supra Badia Calavena valle dei Rugolotti, prov. Verona Ital. bor. — A *Sept. aurea*, *S. Grossulariae* et *S. Ribis* differt tam forma et colore macularum, quam magnitudine et characteribus sporularum.

32. **Septoria dissolubilis** Aderh., in Arb. Biol. Anst. f. Land- u. Forstwirtschaft IV (1905) pag. 461, c. ic. — Pycnidiiis in greges 3-5 mm. diam. dense dispositis, subepidermicis, erumpentibus, globosis, 70-100 μ . diam., atris; sporophoris nullis; sporulis baculiformibus, fusoideis, plerumque lenissime curvulis, 1- vel rarius 2-cellularibus, hyalinis, 10-16 \approx 2-3.

Hab. in foliis emortuis *Pruni Cerasi*, Proskau Silesiæ.

33. **Septoria Eriobotryæ** Maffei, Contr. Mic. Ligust., Atti R. Ist. Bot. Pavia, ser. II, v. XII, Extr. p. 12, t. f. 9-11 (1907). — Maculis irregularibus, nigrescentibus; pycnidiiis amphigenis, 120-150 μ ., gregariis, punctiformibus, immersis, prominulis, atris; ostiolo crateriformi; sporulis bacillaribus, cylindricis, numerosis, rectis v. leniter curvulis, 1-septatis, spurie bi-triseptatis, guttulatis, hyalinis, 14-22 \approx 1,5-2.

Hab. in foliis languentibus *Eriobotryæ japonicæ*, Genova Italiæ bor.

34. **Septoria Rosarum** West. — Syll. III, p. 486 — var. **leptosperma** 7296 Spégazz., Fungi Paulist., Rev. Mus. La Plata t. XV, p. 38 (1908). — Maculis parvulis subindeterminatis candidis areola atro-violascente cinctis; pycnidiiis epidermide nigrificata tectis adnatisque,

60-90 μ . diam. nucleo hyalino farctis; sporulis curvulis v. flexuosis, continuis, utrinque acutiusculis, 30-50 \approx 1, hyalinis.

Hab. ad folia Rosarum in hortis Quedas Sao Paulo Brasilia (USTERI).

35. **Septoria Rubi** West. — Syll. III, p. 486 — var. **asiatica** Bubák 7297 in Handel-Mazzetti, Bot. Reise Pont. Randgeb. in Ann. Naturhist. Hofmus. Wien XXIII (1909) p. 105. — A typo et a var. *saxatili* differt maculis forma et colore diversis, pycnidiis hypophyllis, sporulis latioribus nempe 30-60 \approx 2-2,5.

Hab. in foliis vivis Rubi sp. in montibus ponticis Anatoliæ (BLUMENCRON).

36. **Septoria corcontica** Kab. et Bub., Myc. Beitr. Hedw. Bd. XLIV 7298 (1907) p. 294. — Maculis epiphyllis, sparsis, rotundato-angulosis v. inter nervos elongatis, primum sordide viridibus, dein alutaceis, demum arescendo griseo-cinereis, brunneo-purpureo-marginatis v. non, quandoque late confluentibus; pycnidiis epiphyllis, regulariter distributis, nigris, immersis, dein apice erumpentibus, globosis, 60-100 μ . diam., diu clausis, demum late apertis, contextu parenchymatico obscure brunneo; sporulis filiformibus, curvis, raro rectis, apice angustatis rotundatisque, 20-30 \approx 1,5-2, unilocularibus v. hydrati chloralici ope transverse uniseptatis; sporophoris brevibus, papilliformibus.

Hab. in foliis Potentillæ procumbentis, Riesengebirge Bohemia (KABAT).

37. **Septoria Kerriæ** Syd., Ann. Mycol. VII (1909) p. 171. — Maculis amphigenis, orbicularibus, 3-5 mm. diam., pallidis; pycnidiis epiphyllis, tectis, globosis, atris, 70-100 μ . diam., late pertusis; sporulis filiformibus, rectis vel varie curvis, continuis, hyalinis 20-38 \approx 1.

Hab. in foliis Kerriæ japonicæ, Oji Tokyo, Japonia.

38. **Septoria Rhodotypi** Hollós, Növényt. Közlemén. VI (1907) Extr. 7300 p. 5. — Maculis irregularibus, rufescentibus; pycnidiis amphigenis, sparsis, lenticularibus, brunneis, poro pertusis, 60 μ . diam., contextu parenchymatico; sporulis filiformibus, flexuosis, continuis, hyalinis, 20-22 \approx 1-1,5.

Hab. in foliis vivis Rhodotypi kerrioidis, Kecskemét Hungariæ.

39. **Septoria Henryana** Trav. in Bull. n. 8 Société Flore Valdôtaine, 7301 p. 28 extr. (1912). — Maculis irregulariter circularibus, 2-5 mm. diam., in epiphylo magis distinctis, centro albido-griseis, margine

griseo-ochraceis, linea atro-purpurea elevatula cinctis et sæpe, maculis majoribus, lineis 2-3 atro-purpureis concentrica notatis; pycnidiis epiphyllis, sat copiosis, in parte macularum externa sitis, pallide fuscis dein nigris, immerso-prominulis, globulosis, 180-220 μ . diam., ostiolo amplissimo circulari, usque ad 100 μ . lato, excipulo tenui, dilute melleo, circa ostiolum saturatiore, castaneo-fusco, sporulis in cirros breves et crassos, roseolos eructatis, filiformibus, rectis vel varie sinuosis, utrinque obtusis, majusculis, 120-160 \approx 3-4, hyalinis, maturis 7-13-septatis.

Hab. in foliis vivis *Anthyllidis Vulnerariae* pr. Glacier, Valpelline, Valle d'Aosta, Ital. bor. — Pulcherrima et perdistincta species, cum *Sept. Anthyllidis* nequaquam comparanda.

40. **Septoria Serobrianikowii** Sacc., in Ann. Myc. (1911) p. 252 II. — 7302
Pycnidiis in foliis uniformiter arescendo flavidantibus hinc inde aggregatis v. subsparsis, pro more hypophyllis, globulosis, majusculis, prominulis, firmulis, 200 μ . diam., poro pertusis; sporulis bacillaribus sursum paullo attenuatis, medio 1-septatis, non constrictis, 40-45 \approx 2,5-3, hyalinis, rectis v. lenissime curvis.

Hab. in foliis *Astragali Onobrychidis* languidis in prov. Ufa Rossiæ (SEREBRIANIKOW). — A *Sept. astragalicola* statim distinguatur pycnidiis majoribus, sporulis angustioribus, 1-septatis.

41. **Septoria podgoricensis** Bubák, Bull. Herb. Boiss., 2 sér., VI (1906) 7303
p. 479. — Pycnidiis foliicolis v. caulincolis in areis flavo-alutaceis late distributis, plerumque epiphyllis, rotundatis vel subellipticis, globosis, 90-170 μ . latis, subepidermicis, primum albidis, dein margine brunneis, minute ostiolatis et cirrum ostendentibus, dein late apertis, contextu flavo-brunneo supra obscuriori; sporulis longe cylindraceis, rectis v. curvulis, 20-42 \approx 2,5-3, utrinque plerumque rotundatis v. infra angustatis, transverse uniseptatis, contextu granuloso; sporophoris usque ad 20 μ . long., rectis v. curvulis, basi fasciculato-cæspitosis sporulas sæpe lateraliter gerentibus.

Hab. in foliis caulinisque vivis *Lathyrus annuus* prope Podgorica Montenegro. — *Sept. silvestri* affinis a qua differt sporulis bilocularibus, brevioribus.

42. **Septoria Phaseoli** Maubl., Bull. Soc. Mycol. de Fr. XXII (1906) 7304
p. 66. — Maculis amphigeris, viridulis, parum conspicuis, irregularibus, non vel vix marginatis; pycnidiis amphigenis, fuscis, erumpentibus, tunica tenui, globulosis, minutis, 60-100 μ . diam.; poro prominulo, late aperto; sporulis filiformibus, leniter curvulis, 1-2-septatis, eguttulatis, 15-30 \approx 1,5, in cirros albos protrusis.

Hab. in foliis Phaseoli sp., in horto bot. Sao Paulo Brasiliæ (PUTTEMANS).

43. **Septoria Vignæ** P. Henn., in Fl. du Bas- et Moy. Congo, Ann. Mus. du Congo v. II, fasc. II (1908) p. 102. — Maculis rotundatis exarido-pallidis, fusco-cingulatis; pycnidiis gregariis, lenticularibus atris, poro pertusis, 50-70 μ . diam.; sporulis filiformibus, flexuosis, obtusiusculis, 3-septatis, 25-35 \times 1.

Hab. in foliis Vignæ sp., Dembo Congo Africæ (VANDERYST).

44. **Septoria Cytisi** Desm. — Syll. III, pag. 485 — var. **Genistæ** 7306 (Bäumler ?) Sacc. Dom. in Atti Soc. Ven. Trent. (1897) pag. 23, t. 5, f. 7 (extr.). — Maculis ovatis, albis, centro vero margineque fuscis; pycnidiis punctiformibus, 150-180 μ . diam., poro pertusis; sporulis bacillaribus sæpe leviter tortuosis, 4-6-septatis, hyalinis, 40-45 \times 3-3,5.

Hab. in foliis Genistæ tinctoriæ in M. Sytno Hungariæ. (KMET).

45. **Septoria Erythrophlæi** P. Henn., Engl. Jahrb. XXXVIII (1905) 7307 p. 117. — Maculis angulato-rotundatis dein effusis, pallide exaridis, zona rufo-brunnea circumdatis; pycnidiis epiphyllis gregarie sparsis, subhemisphærico- v. lenticulari-erumpentibus, punctiformibus, atro-membranaceis, poro pertusis, c. 80-120 μ . diam.; sporulis filiformibus, flexuosis, hyalinis, eguttulatis, 80-100 \times 1-1,5.

Hab. in foliis Erythrophlæi guineensis, Dar-el-Salâm Africæ or. trop. (HOLTZ).

46. **Septoria Kennedyæ** Trav. et Spessa, Bol. Soc. Brot. XXV (1910) 7308 p. 183, t. III, f. 24. — Maculis minutis, irregularibus, in pagina superiore foliorum ochraceis, in inferiore griseis; pycnidiis hypophyllis in quaque macula gregariis, erumpentibus, nigris, sphæroideis, 80-100 μ . diam., poro circulari pertusis, contextu minute pseudoparenchymatico melleo; sporulis cylindraceo-bacillaribus, utrinque obtusatis, rectis vel parum curavtis, 14-20 \times 1 $^{1/2}$ -2.

Hab. in foliis exsiccatis Kennedyæ sp. in horto botanico coimbricensi Lusitaniæ (A. MOLLER). — *Sept. Hardenbergiæ* Sacc. affinis.

47. **Septoria Bonanseana** Sacc., in Ann. Mycol. X (1912) p. 312. — 7309 — Maculis numerosis, amphigenis, subcircularibus, 2-3 mm. diam., albidis, ochraceo-marginatis; pycnidiis punctiformibus, epidermide velatis, 80-100 μ . diam., poro irregulari pertusis, contextu laxe celluloso, dilute ochraceo; sporulis bacillaribus leniter curvis, utrinque obtusis et fere truncatis, apicibus interdum mucillo præditis,

hyalinis, plerumque 2-septatis v. granulosis, non constrictis, 30-38 \approx 2,7-3.

Hab. in foliis *Erythrinae brevifloræ*, Oaxaca Mexico (Communic. Doct. BONANSEA).

48. **Septoria bupleurina** Gen. de Lamarl., Rev. de Bot. (1894) p. 3, 7310 f. 36-37 (extr.). — Maculis centro nigris, demum brunneis, subrotundis v. angulosis, zone virescenti anguste cinctis et circumcirca halone indeterminato, lato, purpureo-brunneo circumdatis; pycnidiis exiguis 100 μ . d., aggregatis, sat numerosis, poro latiusculo pertusis, contextu pallide brunneo, circa porum nigricante; sporulis filiformi-bacillaribus, rectiusculis, utrinque obtusulis, 32-43 \approx 2,2, hyalinis, continuis, eguttulatis.

Hab. in foliis vivis *Bupleuri longifolii* culti pr. laboratorium biologiæ vegetalis, Fontainebleau Galliæ.

49. **Septoria hydrocotylicola** Speg., Fungi Paul., Rev. Mus. La Plata 7311 t. XV, p. 38 (1908). — Maculis amphigenis repando-orbicularibus 0,5-4 mm. diam., testaceis, nitidulis, sæpe confluentibus, areola latiuscula atro-violascente cinctis; pycnidiis lenticularibus 60-70 μ . diam., sæpius epiphyllis, membranaceis, contextu parenchymatico fuligineo; sporulis rectis v. flexuosulis utrinque acutiusculis, 40-50 \approx 1, obsolete 3-septatis, hyalinis.

Hab. ad folia languida *Hydrocotylis* cujusdam circa Sao Paulo Brasilia (USTERI). — *Sept. Spegazzinii* Sacc. affinis sed maculis areola latissima atro-violascente cinctis distincta.

50. **Septoria phlyctæniformis** Bub. et Kab. Sechst. Beitr. Pilz. Tir., 7312 Ann. Myc. V (1907) p. 43. — Maculis foliicolis amphigenis, sparsis, rotundatis v. angulosis, 1-5 mm. diam., supra parum depressis, ex alutaceo pallide brunneis, nervis limitatis, sæpe brunneo marginatis, quandoque confluentibus; pycnidiis epiphyllis subgregariis, immersis, epidermide tectis, siccis applanatis udis subinflatis, globosis v. subdepressis, brunneis, 150-200 μ . diam., contextu tenui parenchymatico, pallide brunneo, basi indistincto, primo poro lato dein late irregulariterque apertis et cirrum crassum gelatinosum roseolum v. flavidum ostendentibus; sporulis filiformibus, utrinque rotundatis, plerumque rectis, raro curvulis, 40-70 \approx 3-4, 1-3-septatis, ad septa non constrictis, loculis quandoque magnitudine dissimilibus, hyalinis; sporophoris cylindraceis, apice subinflatis, usque ad 20 μ . long., 3-4 μ . cr., hyalinis.

Hab. in foliis vivis *Laserpitii Gaudinii*, pr. Madonna

di Campiglio in ditione Tridentina. — Socium quandoque *Cylindrosporium Laserpitii*.

51. **Septoria heracleicola** Kab. et Bub., Sechst. Beitr. Pilzfl. Tir., Ann. 7313

Myc. V (1907) pag. 43. — Maculis foliicolis utrinque visilibus, sparsis, parvis, 1-2 mm. latis, rotundato-subpolygonis, brunneis demum arescentibns et e subochraceo sordide albis, theobromino-marginatis, saepe confluentibus; pycnidiis paucis epiphyllis, globosis v. parum depresso, 60-80 μ . diam., e brunneo obscure brunneis, epidermide tectis, poro minuto rotundato apertis v. irregulariter laceratis, contextu tenui parenchymatico pallide brunneo; sporulis filiformibus, rectis v. curvulis, utrinque angustatis, 20-40 \times 1,5-2, unilocularibus, hyalinis.

Hab. in foliis vivis Heraclei sibirici prope Pinzolo in agro Tridentino.

52. **Septoria Heraclei-palmati** R. Maire, Bull. trim. Soc. Myc. de 7314

France, vol. XXI (1905) p. 167 cum icon. — Maculis primo flavis dein brunneis, confluentibus; pycnidiis præcipue hypophyllis, nigris, confluentibus, rarius sparsis, subglobosis, pertusis, biformibus; aliis (pycnidiis) sporas vermiculares, hyalinas, 1-septatas, verstice acuto, antice obtusas, curvatas, 50-70 \times 3; aliis (micropycnidiis) sporulas cylindraceo-oblongatis, hyalinas, continuas, 3-6 \times 1-1,5, gignentibus.

Hab. ad folia languida Heraclei palmati in pascuis subalpinis mt. Ghiona Doridis. — Verisimiliter *Phyllachoræ* cujusdam stat. pycnid. et micropycnidicus.

53. **Septoria Podagrariæ** Lasch — Syll. III p. 529 — var. **Pimpinellæ-magnæ** Kab et Bub. V. Beitr. Pilz. Tir. in Ber. Naturw.-med. Ver. Innab. XXX Jahrg. (1905-1906) Extr. p. 11. — 7315

Pycnidiis epiphyllis, immersis, utrinque distincte prominentibus, sparsis, raro confluentibus 140-250 μ . latis, globosis v. subdepresso, brunneis, contextu brunneo grosse parenchymatico; sporulis filiformibus 50-85 \times 3-4,5, curvis, raro subrectis, apice angustatis obtusisque, unilocularibus v. uni-septatis, hyalinis.

Hab. in foliis vivis Pimpinella magnæ prope Sanct Johann Villnösstal (Funés) Tirolia cisalp.

54. **Septoria Peucedani** Hollós, Ann. Mus Nat. Hung. V (1907) 7316

p. 51. — Maculis amphigenis, numerosis, minutis, subcircularibus, pallide ochraceis fusco-marginatis; pycnidiis epiphyllis, dense gregariis, lenticularibus, fuscis, medio pertusis, demum late aper-
tis, 100-120 μ . diam., contextu parenchymatico; sporulis filiformi-

bus, plerumque curvulis, continuis, granulosis, hyalinis, 32-44 \approx 1-1,5.

Hab. in foliis vivis Peucedani Cervariæ prope Kecskemét Hungariæ. — A *Sept. Oreoselini* (Lasch) differt pycnidiis et sporulis majoribus.

55. **Septoria gallica** Sacc. Notæ myc. VIII, Ann. Myc. v. IV (1906) 7317 p. 493, tab. X, fig. 11. — Maculis parvis, saepius marginalibus, albidis, amphigenis, 2-3 mm. long., non discolori-marginatis; pycnidiis punctiformibus, lenticularibus, copiosius epiphyllis, dense gregariis, 100-120 μ . diam., poro impresso pertusis, distincte parenchymaticis, brunneis; sporulis bacillaribus, saepius curvulis, utrinque obtusulis, dense multi-guttulatis, 30-40 \approx 1, hyalinis.

Hab. in foliis vivis v. languidis Peucedani gallici, Marly Galliæ (LUDWIG, comm. P. HARIOT). — Affinis *S. Oreoselini* sed maculæ non discolori-marginatæ et sporulæ majores.

56. **Septoria coniicola** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7318 p. 346. — Maculis nullis; pycnidiis amphigenis, sparsis, tectis, lenticularibus, brunneis, poro pertusis, 70-100 μ . diam., contextu parenchymatico; sporulis filiformibus, flexuosis, continuis, hyalinis, 40-60 \approx 1,5-2.

Hab. in foliis languidis Conii maculati, Kecskemét Hungariæ. — A *Sept. Conii* Syd. differt pycnidiis et sporulis majoribus.

57. **Septoria Petroselini** Desm. var. **Apia** Br. et Cav. — Syll. III, 7319 p. 530 et XIV, p. 972 — forma **emaculata** Sacc. Ann. Mycol. VI (1908) p. 559. — Maculis peculiaribus nullis.

Hab. in foliis Apia graveolentis culti, prope Parisios (P. HARIOT). — Folia æqualiter flavicantia, sed maculæ candicantes nullæ.

58. **Septoria cumulata** Syd., Ann. Mycol. VI (1908) p. 530. — Pycnidiis amphigenis, maculis nullis v. indistinctis insidentibus, sparsis v. maculiformiter aut stromatice aggregatis, innatis, subglobosis, atris, pertusis, c. 120-200 μ . diam.; sporulis cylindraceis, curvatis, distincte uniseptatis, utrinque obtusis, hyalino-chlorinis 35-65 \approx 3-4.

Hab. in foliis Malabailæ porphyrodisci, in monte Elwend Persiae occ. (PICHLER).

59. **Septoria Seseli** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 7321 p. 6. — Pycnidiis amphigenis, sparsis, epidermide velatis, subsphaericis, atris, poro pertusis, 80-100 μ . diam., contextu celluloso;

sporulis acicularibus, rectis v. curvulis, continuis, hyalinis, 25-35 \approx 1,5-2.

Hab. in foliis languidis *Seseli glauci* prope Kecskemét Hungariæ.

60. **Septoria Asiaticæ** Speg., *Fungi Chilenses* (1910) p. 168. — Maculis amphigenis repando-orbicularibus, 2-10 mm. diam., superne cinerescentibus ambitu et inferne tabacinis; pycnidii epiphyllis innato-erumpentibus, subhemisphæricis, 75-100 μ . diam., atris, membranaceo-parenchymaticis, ostiolo parvo-pertusis; sporulis acicularibus utrinque acutis, rectis v. flexuosis, 40-60 \approx 1-1,5, hyalinis.

Hab. copiose in foliis vivis *Centellæ asiaticæ*, prope Temuco Chile Amer. austr.

61. **Septoria versicolor** Bubák, *Ann. Mycol.* IV (1906) p. 117. — Maculis amphigenis, in epiphyollo magis conspicuis, rotudatis v. subpolygonis, 3-10 mm. latis, albo-flavidis, arescentibus, zona tripli circumdatis, interna flavo-brunnea, externa purpurea, media angustiori nigra; pycnidii epiphyllis, sparsis v. gregariis, nigris, 150-220 μ . latis, poro magno 50 μ . lato apertis, contextu parenchymatico supra obscure castaneo infra flavido; sporulis incurvatis, apice angustato-acutatis, 26-33 \approx 2-2,5, flavidis v. hyalinis, sparse guttulatis, non septatis; sporophoris cæspitosis 6-10 \approx 2, flavidulis.

Hab. in foliis vetustioribus adhuc viventibus *Soldanellæ montanæ* prope Tábor Bohemia. — A *S. Soldanellæ* pycnidii majoribus, sporulis falcatis diversa.

62. **Septoria Soldanellæ** Speg. — *Syll. III* pag. 532. — Var **Pirolæ**. — *foliæ Voglino*, *Ann. R. Acc. Agric. Torino* v. XLIX (1907) Extr. p. 21. — A typo differt maculis griseo-ochraceis, irregularibus, linea atro-purpurea cinctis; pycnidii epiphyllis gregariis; sporulis filiformibus 16-18 \approx 1.

Hab. in foliis *Soldanellæ pirolæfoliæ*, Ital. bor. in horto alp. «Rostania» et Helvetia in Horto alp. «Linnæa».

63. **Septoria relicta** Bubák, *Ann. Mycol.* IV (1906) p. 116. — Pycnidii late sparsis, hypophyllis, raro epiphyllis, primum flavo-brunneis, dein obscure brunneis, demum nigris, subdepressis, contextu laxe parenchymatico, demum irregulariter ostiolato, 100-130 μ . diam.; sporulis filiformibus rectis v. curvulis, 38-60 \approx 3-3,5, apice rotundatis, hyalinis, 1-3-septatis.

Hab. in foliis *Galii silvatici* prope Tábor Bohemia.

64. **Septoria Galii-borealis** P. Henn., *Engl. Jahrb.* XXXVII (1905) 7326

p. 163. — Maculis pallidis, atro-violaceo- v. fusco-zonatis; pycnidiis epiphyllis, sparsis, atris, lenticularibus, pertusis, 60-80 μ . cr.; sporulis filiformibus, utrinque acutis, 3-5-septatis, hyalinis, 25-45 \times 2,5-3.

Hab. in foliis Galii borealis var. japonici, Nikko Japanæ (SHIRAI).

65. **Septoria Asperulæ-taurinæ** Bubák, Beitr. Pilzfl. Hung. in Nové-nytani Közlemények (1907) Heft 4 Extr. 33. — Maculis epiphyllis 1-3 in quoque folio, sordide flavo-alutaceis linea obscuriori distincte marginatis et areola flavo-alutacea lata indeterminata circumdatis, ellipticis v. elongatis, 2-3 mm. latis, 3-6 mm. long.; pycnidiis epiphyllis æque distributis, obscure brunneis, globosis, subepidermicis, primum poro brevi papilliformi prominentibus dein late apertis, contextu grosse parenchymatico brunneo; sporulis filiformibus, 45-80 \times 2,5-3,5, raro rectis plerumque curvulis basi regulariter supra fortiter angustatis, transverse 2-4-septatis, hyalinis, in cirrum brevem subchlorinum productis.

Hab. in foliis vivis Asperulæ taurinæ Csernatal prope Herculefürdö Hungariæ. — A *S. Asperulæ* Bäuml. maculis sporulisque diversa.

66. **Septoria Rubiæ** (Pat.) Bubák et Ranojevic, Ann. Mycol. VIII (1910) p. 390. — Ita vocanda *Rhabdospora Rubiæ* Pat. — Syll. XIV p. 985. — A *Sept. Galiorum* Ell. var. *Rubiæ* Sacc. et Scalia sporulis majoribus diversa.

67. **Septoria Calycophylli** Spieg., Myc. Argent. V p. 381, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis numerosis, amphigenis suborbicularibus indeterminatis, 1-7 mm. diam., lineolis tenuissimis elevatulis concentricis notatis, rufo-fulvescentibus; pycnidiis parenchymate innatis, centralibus, epiphyllis, sublenticularibus, 100-120 μ . diam, contextu parenchymatico parum distincto fuligineo, ostiolo parvulo perforatis; sporulis utrinque leniter attenuatis, linearibus, 50-75 \times 2,5-3, leniter arcuatulis, hyalinis, multiguttulatis.

Hab. ad folia viva Calycophylli multiflori in silvis prope Fraile Pintado Salta Argentina Amer. austr.

68. **Septoria Berkelyi** Sacc. et Trav. Syll. XX p. 785, *Depazea* (Septoria) *maculosa* Cooke in Journ. Linn. Soc. 18 (1881) p. 462 t. 18, f. 8, non Lév. — Maculis pallidis subrotundis; pycnidiis sparsis, paucis, punctiformibus; sporulis fusoideo-elongatis, 20 μ . longis, saepius 7-nucleatis, hyalinis, utrinque acutis.

Hab. in foliis Coffeæ arabicæ in America australi. — Socia adest *Sphaerella coffeicola*, quæ verisimiliter est st. ascophorus.

69. **Septoria Vogliniana** Sacc. et Trott. — *Septoria longispora* Voglino, Atti R. Ac. Sc. Torino v. XLIII, (1907-1908) p. 96 (250) 7331 non Boud., Shear., Miyake. — Maculis exaridis indeterminatis, irregularibus, sæpe confluentibus, castaneis; pycnidiis epiphyllis, minutis, innato-prominulis, olivaceo-fuscis, sphæroideis, 100-130-150 μ . diam.; sporulis cylindraceis subflexuosis, utrinque rotundatis, hyalinis, distincte 5-9-septatis, 70-80-120 \approx 3.

Hab. in foliis Phlogis Drummondii quæ maxime vexantur in Pedemontio Italiæ bor.

70. **Septoria Fabletiana** Speg., Myc. Argent. V p. 382, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus determinatis, 2-5 mm. diam., pallescentibus, anguste purpureo-areolatis; pycnidiis hypodermicis, fulvellis, globosis, 50-75 μ . diam., astomis, tenuissime membranaceis, contextu parum distincto; sporulis filiformibus vix flexuosis, utrinque acutiusculis, continuis, 25-35 \approx 1, conglobatis.

Hab. ad folia viva Convolvuli Soldanellæ in dunis maritimis prope Necochea Argentina Amer. austr. (A. FABLET).

71. **Septoria longispora** Bondarzew, Acta Horto Petropol. XXVI 7333 (1906) p. 44 (Extr.). — Maculis minutis, rotundatis, brunneis v. griseis terminalibus, paullum sublevatis; pycnidiis (sepius singulo in centro maculæ) epiphyllis, rotundatis, 200-300 μ . diam.; sporulis filiformibus, curvatis, hinc v. utrinque acutis, 70-130 \approx 2,5-3, quinqueseptatis, hyalinis.

Hab. in foliis vivis Convolvuli arvensis in ditione Kursk Rossiæ.

72. **Septoria Calaminthæ** C. Mass. ap. Sacc. in Ann. Mycol. IX (1911) 7334 p. 252. — Maculis parvis, 2 mm. lat., raro confluentibus, ferrugineo-fuscis, non marginatis; pycnidiis hypophyllis, minutissimis, 40-60 μ . diam., globulosis, subcutaneis, ostiolo latiusculo pertusis; sporulis capillaribus, hyalinis, rectis v. curvulis, continuis, 22-30 \approx 0,8-1.

Hab. in foliis Calaminthæ officinalis, Calavena in agro Veronensi. — *Sept. Melissæ* proxima.

73. **Septoria Bornmüllerii** Syd. Ann. Mycol. VI (1908) p. 18. — 7335 Maculis irregularibus, sordide flavo-brunneis, tandem subinde centro pallescentibus, immarginatis, sæpe totum folium occupantibus; pycnidiis epiphyllis, in maculis vel per totum folium æque den-

siuscule dispersis, atris, lenticularibus vel globoso-lenticularibus, 150-200 μ . diam.; sporulis numerosissimis, filiformibus, utrinque rotundatis, rectis vel varie flexuosis, plerumque 1-septatis, hyalinis, 35-55 $\approx 1\frac{1}{2}$ -2.

Hab. in foliis *Nepetæ teucrifoliæ*, in valle Scheheristanek montis Elburs occid. Persiæ borealis (BORNMUELLER). — A *Sept. Nepetæ* probe diversa.

74. **Septoria Catariæ** Bubák, Beitr. Pilzfl. Ung. in Növénytani Közlemények (1907) Heft 4, Extr. p. 33. — Maculis minute polygoniis, flavidis v. flavo-ochraceis, nervis limitatis, sæpe areola lata griseo-viridi circumdatis, sparsis v. gregariis et tunc sæpe confluentibus; pycnidiis epiphyllis, globosis, 135-500 μ . diam. in mesophyllo immersis, pallide brunneolis, contextu pallide flavo-brunneo grosse parenchymatico, poro usque ad 150 μ . cr. demum late apertis; sporulis cylindraceis, 30-60 $\approx 2,5$ -4, rectis v. raro curvulis, utrinque angustatis, transverse 1-3-septatis, hyalinis, in circum brevem albo-flavidulum productis.

Hab. in foliis vivis *Nepetæ catariæ*, Csernatai prope Herkulesfürdö Hungariæ. — A *S. Nepetæ* omnino diversa.

75. **Septoria Salviæ** Pass. — Syll. III p. 540. — Var **Sclareæ** C. Mass. 7337 Atti Acc. Sc. Med. e Nat. Ferrara LXXXIV (1910) Extr. p. 10. — Maculis foliicolis minutis sordide albis, internerviis, angulosis; pycnidiis minutissimis 80 μ . circ. diam., epiphyllis membranaceis, fusco-rubiginosis, ostiolo latiusculo; sporulis tenuissimis, capillaribus 50-60 ≈ 1 .

Hab. in foliis *Salviæ Sclareæ* pr. Avesa Veronæ Ital. bor. 7338

76. **Septoria Ipirangæ** Spegazz., Fungi Paulist., Rev. Mus. La Plata tab. XV (1908) p. 38. — Maculis amphigenis suborbicularibus determinatis arecenti-pellucidis 2-5 mm. diam.; pycnidiis depresso-lenticularibus 60-80 μ . diam., nervulis insidentibus latiuscule perforato-ostiolatis, tenui-membranaceis, contextu parenchymatico olivaceo; sporulis utrinque acutiusculis 30 ≈ 1 , arcuatis v. uncinatis, continuis, hyalinis.

Hab. ad folia languida Bignoniaceæ cujusdam, Cambucy Ipiranga Brasilia (USTERI).

77. **Septoria Chrysanthemi-rotundifolii** Namyslowski, Kosmos XXXIII 7339 (1908) p. 329. — Epiphylla, maculis brunneis, circularibus v. irregularibus et confluentibus 6-10 mm. lat.; pycnidiis gregariis brunneis, sphærioideis, 80-160 μ . diam.; sporulis hyalinis, filiformibus, subclavulatis, septatis, 50-70 ≈ 2 .

Hab. in foliis Chrysanthemi rotundifolii in Monte Czarnohora Poloniæ, Galicia.

78. **Septoria Chrysanthemi-indici** Bub. et Kab., Myc. Beitr., Hedwigia Bd. XLVI (1907) p. 294. — Maculis epiphyllis, rotundatis v. raro irregularibus, usque ad 8 mm. latis, primum obscure brunneis, dein nigro-brunneis, non distincte limitatis, quandoque confluentibus et folium totum obtegentibus; pycnidiis epiphyllis, sparsis, punctiformibus, immersis, globosis, 80-140 μ . diam., nigris, poro minuto apertis, contextu parenchymatico, flavo-brunneo; sporulis filiformibus, rectis v. incurvatis, supra sensim angustatis, basi obtusatis, 55-70 (raro usque ad 90) \approx 2,5-3,5, multiseptatis (subinde 10 raro 15-septatis), hyalinis; sporophoris breviter papilliformibus.

Hab. in foliis vivis Chrysanthemi indici Turnau Bohemia (KABAT).

79. **Septoria Tanaci-macrophylli** Bubák, Beitr. Pilzfl. Ung. in Növénytani Közlemények (1907) Heft 4 Extr. p. 35. — Maculis numerosis sparsis v. gregariis, elongatis v. irregularibus, flavo-alutaceis v. sordide viridibus, centro saepè alutaceis, extusque sordide viridibus, saepè confluentibus; pycnidiis epiphyllis, plus v. minus confertis, brunneis, siccis discoideis, subepidermicis, globosis, 100-150 μ . diam., contextu tenui parenchymatico, parum distincto, brunneo, primum poro papilliformi erumpentibus demum late apertis; sporulis clavato-filiformibus 50-70 \approx 2-2,5, curvis vel contortis, uno apice fortiter angustatis, hyalinis, distincte transverse 3-5-septatis.

Hab. in foliis vivis Tanaci macrophylli, Csernatal prope Herkulesfürdö. — A S. Pyrethri Bres. et Kr. et a S. Tanaci Niessl. diversa.

80. **Septoria Linosyris** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7342 p. 532. — Maculis indeterminatis; pycnidiis amphigenis, sparsis, lenticularibus, nigris, poro pertusis, 60-90 μ . diam., contextu parenchymatico; sporulis bacillaribus, utrinque obtusatis, leviter flexuosis, continuis aut plerumque 3- nonnunquam pluri-septatis, hyalinis, 40-70 \approx 2-3.

Hab. in foliis Linosyris vulgaris, Kecskemét Hungariæ.

81. **Septoria Cyani** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 462. 7343 Maculis indeterminatis; pycnidiis amphigenis, gregariis, depresso-globosis, fuscis, poro pertusis, 70-90 μ . diam., contextu parenchy-

matico; sporulis filiformibus, flexuosis, pluriseptatis et pluri-guttulatis, hyalinis, 30-40 \times 2.

Hab. in foliis languidis Centaureæ Cyani prope Kecskemét Hungariae. — A *Sept. Centaureæ* (Roum.) Sacc. et *S. centaureicola* Brun. diversa.

82. **Septoria Aderholdi** Voglino, Atti R. Acc. Sc. Torino XLIII 7344 (1907-1908) p. 95 (249); Boll. Soc. Agric. it. XIII (1908) p. 460.

— Amphigena; maculis indeterminatis, cinereo-fuscis; pycnidiis numerosis, raro vix prominulis, subglobosis, 90-120-130 μ . latis, fuliginosis; sporulis cylindraceis v. bacillari-fusoideis, utrinque obtusiusculis, attenuato-rotundatis, continuis, inde obsolete 3-septatis, hyalinis, rectis v. minime curvulis, 22-30 \times 2.

Hab. in foliis vivis Centaureæ candidissimæ in hortis Pedemontii Italiæ bor.

83. **Septoria czarnohorica** Namysłowski, Kosmos XXXIII (1908) 7345 p. 329. — Epiphylla, maculis brunneo-ochraceis, orbiculatis v. irregularibus et confluentibus; pycnidiis parcis, nigrescentibus, sphærioideis, 60-80 μ ., raro usque ad 100 μ . diam.; sporulis hyalinis, filiformibus, 35-60 \times 1.

Hab. in foliis Doronici cordifolii in Monte Czarnohora Poloniæ Galicia.

84. **Septoria Selloi** Speg. Myc. Argent. V p. 385 in Anal. Mus. 7346 Nac. Buenos Aires XX (1910). — Maculis subpellucidis, orbicularibus, 1-2 mm. diam., candidis, rugula prominula callosula angustissima limitatis, areola destitutis; pycnidiis solitariis v. paucis gregariis, saepius epiphyllis, primo epidermide tectis dein erumpentibus lenticularibus, 100-120 μ . diam., tenuissime membranaceis, contextu chlorino imperspicuo, ostiolo parvo rotundato perforatis; sporulis filiformibus flexuosulis sigmoideis v. arcuatulis utrinque acutiuscule rotundatis, 25-40 \times 1,5-1,75, eguttulatis, hyalinis, continuis.

Hab. ad folia viva Senecionis Seltoi in uliginosis prope Bompland Misiones, Argentina America austr.

85. **Septoria Gaillardiae** Speg. Myc. Argent. V p. 382 in Anal. Mus. 7347 Nac. Buenos Aires XX (1910). — Maculis amphigenis cinerescentibus suborbicularibus subdeterminatis, 1-12 mm. diam., areola latissima fuscescenti cinctis; pycnidiis epiphyllis paucis, laxè gregariis, vix prominulis, subglobosis, 50-60 μ . diam., atris, membranaceis, minute ostiolatis, contextu parenchymatico parum distincto

fuligineo; sporulis subcurvulis v. leniter sigmoideis, utrinque acutiusculis, 30-50 \approx 1,25-1,50, hyalinis, continuis.

Hab. ad folia languida Gaillardiae Donianæ in sabulosis Metan prope Salta, Argentina America. austr.

86. **Septoria bulgarica** Bubák et Malkoff, Ann. Myc. VI (1908) 7348 p. 24. — Maculis copiosis, sparsis, amphigenis, rotundatis v. oblongis, minutis 2-4 mm. lat., saepe elevatis, e brunneo nigricantibus, arescendo centro griseis, zona flava plus minus distincta cinctis; pycnidiis immersis, epidermide tectis, poro minuto papilliformi erumpentibus v. irregulariter detectis, globosis, 60-100 μ . diam.; contextu tenui vix 5 μ . cr. minute parenchymatico, atro-brunneo; sporulis filiformibus rectis v. valide curvatis 40-70 \approx 2, obsolete 1-5-septatis, utrinque sensim tenuatis, hyalinis.

Hab. in foliis vivis Cirsii appendiculati, Boikowo Bulgariæ (K. MALKOFF). — A *S. Cirsii* Niessl probe diversa.

87. **Septoria associata** Bub. et Kab., Sechst. Beit. Pilzfl. Tir. in Ann. Myc. v. V (1907) p. 42. — Pycnidiis epiphyllis gregariis, profunde immersis, epidermide tectis, dein poro minuto papilliformi erumpentibus, globosis, nigris, 50-100 μ . diam., contextu minute parenchymatico obscure brunneo; sporulis filiformibus, utrinque angustatis, 18-45 \approx 1-1,5, rectis v. curvulis, unilocularibus, raro indistincte transverse uniseptatis.

Hab. in foliis vivis Cardui deflorati prope Madonna di Campiglio prope Tridentum Ital. bor. — Socium est *Fusicladium Schnablianum*.

88. **Septoria Stenactidis** Vill in Sydow. Ann. Myc. VIII (1910) p. 493, 7350 Myc. Germ. n. 929. — Maculis amphigenis, orbicularibus v. suborbicularibus, minutis, 2-3 mm. diam., arescendo albidis v. griseis, margine purpureo cinctis; pycnidiis epiphyllis, singulis v. paucis in quaque macula, atris, exiguis; sporulis filiformibus, rectis v. flexuosis, guttulatis v. spurie septatis, hyalinis, 35-40 \approx 1.

Hab. in foliis inferioribus Stenactidis annuae prope Gerolzhofen Franconiae inf. in Bavaria (A. VILL).

89. **Septoria Matricariæ** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 7351 p. 5. — Pycnidiis sparsis, epidermide tectis, globulosis, atris, poro pertusis, 100-130 μ . diam., contextu celluloso; sporulis vermicularibus, intus granulosis, continuis, hyalinis, 40-60 \approx 2-2,5.

Hab. in foliis languidis Matricariæ discoideæ prope Nagy-Körös Hungariae.

90. **Septoria baccharidicola** Spegazz., Fungi Paulist., Rev. Mus. La 7352

Plata t. XV, p. 37 (1908). — Maculis amphigenis orbiculari-repandulis parvis 1-5 mm. diam., linea callosa atra limitatis, centro sordide subtestaceis; pycnidiis lenticularibus 75-80 μ . diam. innato-erumpentibus, membranaceis, glabris, nigris, primo epidermide tectis dein erumpentibus, ostiolo latiusculo perforatis, contextu minute denseque parenchymatico fuligineo; sporulis e cylindraceo lenissime subclavulatis, superne obtusiusculis inferne acutiusculis, 30-35 \times 3, rectis v. sigmoideis, obsolete triseptatis, hyalinis.

Hab. ad folia Baccharidis speciei cujusdam prope São Paulo Brasilia (USTERI) — Species cum *Sept. Pingrææ* Speg. non comparanda.

91. **Septoria flourensicola** Speg., Fungi Chilenses (1910) p. 169. — 7853
 Maculis orbicularibus determinatis, amphigenis, albescensibus, 1-5 mm. diam.; pycnidiis saepius solitariis centro macularum ad epiphyllum innato-erumpentibus, lenticularibus, 50-75 μ . diam., minute ostiolatis, tenuissime membranaceis; sporulis bacillaribus rectis, arcuatis v. sigmoideis, 1-septatis, hyalinis, 20-40 \times 2-3.

Hab. in foliis languidis Flourensiæ thuriferæ, Cerro Caracol de Concepción, Chile Amer. austr.

92. **Septoria Mutisiæ** Speg., Myc. Argent. V p. 385, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis v. obsoletissimis, foliis infectis arescentibus plus minusve sordide cinerescentibus hinc inde pallidioribus; pycnidiis sparsis v. laxè gregariis epidermide velatis, vix prominulis, sublenticularibus, 90-110 μ . diam., membranaceis, ostiolatis, contextu pellucido subdistincto olivaceo; sporulis subfusoideis v. lenissime subclavulatis, 50-60 \times 4-5, rectis v. vix curvulis, hyalinis, 1-3-septatis.

Hab. ad folia languida Mutisiæ subspinosæ in montibus Cacheuta Argentina America austr.

93. **Septoria Taraxaci** Hollós, Ann. Mus. Nat. Hung. V (1907) 7355
 p. 462. — Maculis orbicularibus, cinereis, nigro-cinctis; pycnidiis epiphylloides, sparsis, lenticularibus, olivaceis, poro pertusis, 100-120 μ . diam., contextu parenchymatico; sporulis acicularibus, rectis v. curvulis, continuis, hyalinis, 16-24 \times 1.

Hab. in foliis vivis Taraxaci officinalis prope Kecskemét Hungariæ.

94. **Septoria sonchicola** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7356
 p. 533. — Maculis orbicularibus, ochraceis, nigro-cinctis, 1-2 mm. diam.; pycnidiis amphigenis gregariis v. sparsis, lenticularibus, nigris, poro pertusis, 80-100 μ . diam., contextu parenchymatico;

sporulis acicularibus, rectis v. curvulis, continuis, hyalinis, 40-54 \approx 2.

Hab. in foliis semivivis *Sonchi uliginosi* prope Kecskemét Hungariae. — A *Sept. Sonchi* Sacc., *S. sonchifolia* Cooke, *S. sonchina* Thüm. diversa.

95. **Septoria modonia** Sacc. Ann. Mycol. VII (1909) p. 434. — Ma- 735 culis amphigenis, minutis, subcircularibus, 1-2 mm. latis, mox candidis, fusco-purpureo-marginatis; pycnidiis paucis, punctiformibus, atro-brunneis, pertusis, 60-70 μ . diam.; sporulis bacillaribus, rectis curvulisve, utrinque rotundatis, 40-50 \approx 2, haud guttulatis, continuis, hyalinis.

Hab. in foliis, raro, caulis *Sonchi arvensis* adhuc vivis, pr. Parisios Galliae (P. HARIOT). — A *Sept. sonchifolia*, *sonchina* et *Sonchi* diversa. An var. præcedentis?

96. **Septoria Hyoseridis** Maire, Bull. Soc. Bot. Fr. LIV (1907) pag. 735 CLXXXVIII. — Pycnidiis nigris, in macula arida purpureo-maculata, 1-3 mm. diam. immersis, globosis, 70-80 μ . diam., ostiolo papillato; sporulis acicularibus, utrinque acutis, interdum, 1-2-septatis, 25-35 \approx 1.

Hab. in foliis vivis *Hyoseridis radiatæ*, Tlemcen, Africa bor.

97. **Septoria ambrosicola** Spieg., Myc. Argent. V in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis, orbicularibus, determinatis, 1-3 mm. diam., candidis; pycnidiis epiphyllis, paucis, epidermide tectis, sublenticularibus, 90-100 μ . diam., nigris, ostiolatis, membranaceis, contextu parenchymatico parum perspicuo olivaceo; sporulis filiformibus utrinque attenuato-acutatis, 50-100 \approx 1,5-2, subarcuatis dein flexuosulis, hyalinis, continuis.

Hab. vulgatissima ad folia viva Ambrosiæ scabré in sylvaticis circa La Plata Argentina Amer. austr.

98. **Septoria succisicola** Sacc. — Syll. III p. 553 — Var. *intermedia* 7360 Sacc. in Ann. Mycol. XI (1911) p. 252. — A typo dignoscitur sporulis æque breviusculis, 18-20 \approx 0,5, maculis vero foliorum atro-purpureo-marginatis ut in *Septoria scabiosicola* Desm.

Hab. in foliis languidis Succisæ in Gallia (P. HARIOT).

99. **Septoria citrullicola** Potebnia, Myc. St. in Ann. Myc. v. V (1907) p. 10 et Trav. Soc. Nat. Univ. Kharkoi XXXXIII (1907). — Maculis albidis, rotundatis, 1,5-2 mm. latis, zona obscuriori circumdatis; pycnidiis 2-10 in quaque macula, 120 μ . cr.; sporulis curvulis, intricatis, 45 \approx 1.

Hab. in foliis vivis *Citrulli vulgaris* prope Kursk Rossia. — A *Sept. Citrulli* Ell. et Ev. sporulis duplo longioribus diversa.

100. **Septoria Rohlænæ** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 7362 p. 479. — Maculis epiphyllis, infra indistinctis, griseis, nervis limitatis, angulosis, brunneo-marginatis, 2-4 mm. latis, saepe confluentibus; pycnidiiis epiphyllis numerosis, confertis, saepe confluentibus, globosis, 60-80 μ . latis, nigris, subepidermicis, dein collo conoideo 25 μ . lato, depresso prominentibus; contextu grosse parenchymatico castaneo-brunneo; sporulis filiformibus, supra leniter angustatis, apice acutiusculis, 24-45 \times 1,5-2, transverse 1-3-septatis, rectis v. curvulis, hyalinis, in sporophoris papilliformibus insidentibus.

Hab. in foliis vivis *Scrophulariæ Scopolii* prope Lukavica Planina Montenegro. — A *Sept. Scrophulariæ* diversa.

101. **Septoria Triphylli** Hollos, Ann. Mus. Nat. Hung. IV (1906) 7363 p. 347. — Maculis nullis; pycnidiiis emphigenis, aggregatis, lenticularibus, nigris, poro pertusis, 100-150 μ . diam., contextu parenchymatico; sporulis filiformibus, rectis v. leviter flexuosis, utrinque obtusis, continuis, hyalinis, 40-70 \times 1,5-2.

Hab. in foliis languidis *Veronicæ triphylli*, Kecskemét et Nagy-Körös Hungariæ. — A ceteris omnibus speciebus *Septoriæ* in *Veronica* vigentibus videtur diversa.

102. **Septoria Veronicæ** Desm., Sacc., Syll. III p. 534 — var. **cotyledonica** C. Mass., Osserv. fitolog. in Madonna Verona v. II (1908) Extr. p. 9. — Pycnidiiis gregariis, 100-170 μ . diam., amphigenis, globosis, prominentibus, saepe confluentibus, nigris, membranaceis et ostiolo lato pertusis; maculis suborbicularibus pallide cinereis et zona rufescente limitatis; sporulis subfiliformibus, hyalinis, continuis, vix utrinque attenuatis, 40-60 \times 2.

Hab. in cotyledonibus nascentibus *Veronicæ hederifoliae* Tregnago Verona Italiæ bor.

103. **Septoria Tozziae** R. Maire (ad interim), in Oesterr bot. Ztschr. LVII (1907) p. 424. — Maculis brunneis aridis; pycnidiiis saepe hypophyllis, 80-120 μ . diam., fuscis, immersis; sporulis filiformibus, flexuosis, 1-3-septatis apice acutis, basi obtusatis v. retusis, 12-30 \times 1.

Hab. in foliis vivis v. languidis *Tozziae alpinæ*, prope Mau-rach Tiroliæ, 1600 m. alt.

104. **Septoria Melampyri** Strasser, Verh. k. k. zool. bot. Ges. Wien 7366

LX (1910) p. 316. — Pycnidiis membranaceis, depresso sphæroideis, udis flavescentibus, pseudoparenchymaticis, siccis nigricantibus, 60-70 μ . diam., numerosis, sed sparsis in maculis irreguläribus, albidis dein brunneis non vel leniter marginatis; sporulis hyalinis non septatis, curvulis, 24-36 \times 1-1,5.

Hab. in foliis Melampyri silvatici, Sonntagberg Austriæ (GELBENEGGER).

105. **Septoria solanophila** Speg., Myc. Argent. V p. 386, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus, 1-3 mm. diam., candidis purpureo-areolatis; pycnidiis epiphyllis hypodermicis, in centro macularum solitariis v. paucis, lenticularibus, 80-100 μ . diam., contextu parum distincto, atris, membranaceis, minute ostiolatis; sporulis acicularibus leniter arcuatis 50-80 \times 3-4, 3-5-septatis, hyalinis.

Hab. vulgata ad folia viva Solani verbascifolii in hortis La Plata Argentina Amer. bor.

106. **Septoria Tomates** Spegazz., Fungi Paulist., Rev. Mus. La Plata t. XV, p. 39 (1908). — Maculis suborbicularibus 1-3 mm. diam, saepe confluendo totum folium obtegentibus, subindeterminatis, ad epiphyllum concaviusculis, e fusco sordide subtestaceis; pycnidiis solitariis v. laxissime pauci-gregariis, hypophyllis, innatis, lenticularibus 60-90 μ . diam., tenui-membranaceis, contextu parenchymatico fuligineo; sporulis arcuatulis v. subsigmoideis 30-50 \times 1, hyalinis, obsolete septulatis.

Hab. ad folia languida Solani Lycopersici in hortis São Paulo Brasilia (USTERI). — A *Sept. Lycopersici* Speg. toto cælo recedens.

107. **Septoria Lycopersici** Spegazz. — Syll. III p. 535, — fm. *italica* 7369 Ferr., Malpighia XX (1906) p. 148. — Maculis arescendo albidis, suborbicularibus in pag. superiore olivaceis; pycnidiis præcipue hypophyllis; sporulis 70-75 \times 2,5-3, indistincte septatis.

Hab. in foliis Solani Lycopersici culti quod valde vexat, Alba in Pedemontio, Italia bor.

108. **Septoria Hyoscyami** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7370 p. 532. — Maculis amphigenis, orbicularibus, usque ad 10 mm., ochraceis, brunneo-marginatis; pycnidiis epiphyllis, sparsis v. hinc inde dense gregariis, globulosis, prominulis, poro pertusis, brunneis, 180-220 μ . diam., contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, rectis v. curvulis, 1-2-septatis, non v. constrictis, hyalinis, intus granulosis, 16-30 \times 5-7.

Hab. in foliis vivis *Hyoscyami nigri* prope Kecskemét Hungariæ. — A *Septoria pinzolensi* Kab. et Bub. diversa.

109. **Septoria Himeranthi** Speg., Myc. Argent. V p. 383, in Anal 7371 Mus. Nac. Buenos Aires XX (1910). — Maculis orbicularibus determinatis sordide pallescentibus, areola angusta obscure olivascens limitatis; pycnidiis epiphyllis innatis, laxe gregariis, subcircinatis, sublenticularibus 100-110 μ . diam., membranaceis ostiolatis, contextu parum distincto olivaceo; sporulis acicularibus continuis, utrinque acutatis, 35-45 \times 1, non v. vix flexuosis, hyalinis.

Hab. ad folia languida *Himeranthi runcinati* in pratis circa La Plata Argentina Amer. austr.

110. **Septoria Sheareana** Sacc. et Trott. — *Septoria longispora* 7372 Shear in Bull. Torr. Bot. Cb. XXXIV (1907) p. 308, non Bond., nec Voglino, nec Miyake. — Pycnidiis gregariis v. quandoque sparsis, globosis v. depresso-globosis, suberumpentibus, epidermide tectis, ostiolatis, 150-225 μ . diam.; ostiolo parvo; sporulis hyalinis filiformibus, curvulis, saepe sigmoideis, quandoque pseudo-septatis, 150-240 \times 3-4, nonnullis usque ad 300 μ . long.; sporophoris simplicibus, angustis, 6-9 μ . long.

Hab. in foliis fructibusque *Vaccinii macrocarpi*, in America boreali.

111. **Septoria Azaleæ-indicæ** Maubl. Bull. Soc. Myc. de Fr. XXII 7373 (1906) p. 66. — Maculis orbicularibus, amphigenis, superne candidis, atro-marginatis; pycnidiis punctiformibus, atris, sparsis, epiphyllis, circ. 150 μ . diam.; sporulis filiformibus, curvulis v. flexuosis, continuis, demum obscure septatis, hyalinis, 50-65 \times 1,5.

Hab. in foliis vivis *Azaleæ indicæ*, Sao Paulo Brasiliæ (PUTTEMANS). — A *S. Azaleæ* Vogl. diversa.

112. **Septoria Syriacæ** Kab. et Bub. Hedwigia XLII (1908) p. 360; 7374 Fungi imp. exs. fasc. XI (1909) n. 523. — Maculis epiphyllis, copiose distributis, rotundato-angulosis, nigris, opacis, saepe confluentibus, initio elevatis denique excavatis, expallescentibus, immarginatis; pycnidiis epiphyllis, raro hypophyllis, minutis, paucis gregariis v. sparsis, profunde immersis, diu epidermide tectis, poro minuto papilliformi rotundato v. irregulari erumpentibus et sporulos in cirrum tenuem album expellentibus, brunneis, globosis, 60-150 μ . diam., contextu tenui parenchymatico; sporulis filiformibus 20-32 \times 1,5 rectis v. raro curvulis, transverse uniseptatis, hyalinis.

Hab. in foliis languidis v. emortuis *Asclepiadis syriacæ*, prope Turnau Bohemia (KABAT).

113. *Septoria Rajkoffii* Bub., Fungi imp. exs. fasc. XI (1909) n. 522 7375 (sine diagnosi).

Hab. in foliis *Cynanchi acuti* pr. Sadovo Bulgariæ. — Auctor monet se proxime diagnosim editurum fore.

114. *Septoria Periplocæ* Hollós, Ann. Mus. Nat. Hung. VII (1909) 7376 p. 54. — Maculis subrotundo-ellipticis, brunneis, medio expal-lentibus, 3-5 mm. long.; pycnidiis epiphyllis, sparsis, depresso-globosis, fuscis, poro pertusis, 50-60 μ . diam., contextu celluloso; sporulis acicularibus, rectis v. curvulis, continuis, minute guttu-latis, hyalinis, 18-22 \times 1-15.

Hab. in foliis languidis *Periplocæ græcæ* prope Nagy-Körös Hungariæ.

115. *Septoria Arjonæ* Spieg., Myc. Argent. V, p. 379, in Anal. Mus. Nac. Buenos Aires XX (1910). — Pycnidiis confertis sed discre-tis, innatis, epidermide tectis, lenticularibus 90-110 μ . diam., te-nuissime membranaceis, contextu minute parenchymatico fumoso; sporulis linearibus subfusoideis, saepius uniseptatis, non v. lenissi-me curvulis, ad septum non constrictis, 24-28 \times 3-4.

Hab. vulgata ad folia caulesque *Arjonæ longifoliæ* in montanis Potrerillos prope Mendoza Argentina Amer. austr.

116. *Septoria Stelleræ* Rostr., Bot. Tidsskz., XXVIII (1907) pag. 7378 218. — Pycnidiis atris, minutis, primo tectis, cortice immersis, densissime gregariis; sporulis semicirculari-curvatis, 20 \times 1-2.

Hab. in ramis *Stelleræ Lessertii*, Chiwa ad Giaur-Kala Asia media.

117. *Septoria? loranthicola* Spieg. Myc. Argent. V, p. 384, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis sub-orbicularibus, 2-5 mm. diam., parvis, calloso-convexulis, sordide pallideque rufescentibus, determinatis; pycnidiis innato-erumpenti-bus, confertis, coriacellis, atris, subhemisphæricis, 80-110 μ diam., contextu opaco indistincto, ostiolo obsoleto; sporulis utrinque obtusiuscule acutatis, curvulis, hyalinis, 25-30 \times 1-1,5, minute parce-que guttulatis.

Hab. ad folia viva *Loranthi ligustrini* in silvis Lechi-guana prov. de Salta Argent. Amer. austr.

118. *Septoria Riviniæ* Patouill., Bull. Soc. Mycol. Fr. XXIV (1908) 7380 p. 12. — Maculis brunneis, polygoniis, sparsis v. confluentibus, postremo albicantibus; pycnidiis globosis, atris, coriaceis, glabris,

250 μ . diam.; contextu anguloso-celluloso; sporulis hyalinis, falciformibus, continuis, apice attenuatis, inferne truncatis, 45-60 \times 3; sporophoris monosporis, simplicibus, 20 \times 4.

Hab. in pagina inf. foliorum *Riviniæ octandræ*, Guadalupe, Amer. centr. (Duss).

119. **Septoria?** *Talæ* Speg., Myc. Argent. V, p. 387, in Anal. Mus. 7381 Nac. Buenos Aires XX (1910). — Maculis amphigenis suborbicularibus, 5-15 mm. diam., pallescentibus, centro sæpius albicantibus, subdeterminatis; pycnidiis epiphyllis innato-erumpentibus, 150-250 μ . diam., atris, astomis, tenui-membranaceis, contextu indistincto olivaceo; sporulis bacillaribus utrinque subacutiuscule rotundatis, 40-60 \times 5-6, primo continuis dein 1-3-septatis, non constrictis, obsolete polyblastis, hyalinis.

Hab. ad folia languida *Celtidis Talæ* in silvula Santa Catalina Argentina Amer. austr.

120. **Septoria turcica** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 7382 p. 480. — Maculis rotundatis v. elongatis, brunneo-alutaceis, are-scentibus, vix distincte marginatis; pycnidiis amphigenis confertis, minutis, globosis, 40-90 μ . latis, nigris, contextu obscure brunneo, primum minute ostiolatis dein late apertis; sporulis fusoideis, 11-20 \times 2, rectis v. falcatis, utrinque angustatis, transverse uniseptatis, hyalinis, sæpe irregularibus.

Hab. in foliis vivis *Mercurialis annuae* prope Ulcinj in horto Turci cujusdam, Montenegro.

121. **Septoria Parietariæ** Davis, Trans. Wisconsin Acad. of Sc. XVI, 7383 Pt. II (1909) p. 764. — Maculis suborbicularibus v. irregularibus, immarginatis, fuligineis; pycnidiis epiphyllis sed infra emergentibus, sparsis, obscure brunneis v. nigris, globosis, ostiolatis, 70-100 μ . diam.; sporulis hyalinis, bacillaribus, rectis v. curvulis, 30-36 \times 1-1.5.

Hab. in foliis *Parietariæ pennsylvanicæ*, Sullivan Amer. bor.

122. **Septoria humulina** Bondarzew, Journ. f. Pflanzenkrankh.; Ber. d. 7384 phytopathol. Zentralst. d. k. Bot. Gartens in St. Petersburg (1910) p. 34. — Maculis foliicolis pallide et sordide ferrugineis, primum sparsis dein confluentibus; pycnidiis subimmersis, 60-90 μ . diam.; sporulis hyalinis unilocularibus v. 1-3-raro 4-septatis, 25-40 \times 1.5.

Hab. in foliis *Humuli Lupuli* in ditione Kursk Rossiæ.

123. **Septoria Elasticæ** Koord., Botan. Untersuch. Java (1907) p. 211, 7385

f. 28. — Maculis amphigenis subcircularibus irregularibusve, arescendo expallescentibus, linea nigra distinctissima marginatis, 1-3 mm. latis; pycnidiis subcarbonaceis plerumque (an semper?) hypophyllis, erumpentibus, late ovoideis v. subglobosis, poro pertusis, glabris, 120-150 μ . diam.; sporulis filiformibus v. bacillaribus, curvulis v. curvatis v. flexuosis, indistincte 1-3-septatis v. guttulatis, 15-28 \approx 1-1,5, plerumque 25-28 \approx 1,33, hyalinis.

Hab. in foliis emortuis Fici elasticæ prope Loano prov. Kedu Java oct. 1905 (KOORDERS). — *Septoria brachysporæ* Sacc. proxima sed satis diversa.

124. *Septoria eburnea* v. Höhnel, Frigm. z. Mykol., Sitzb. k. Ak. d.

7386 Wiss. Wien. Bd. CXVI Abt. I (1907) p. 144. — Maculis irregulariter rotundato-angulosis, numerosis, 2-7 mm. latis, supra postremo albo-eburneis, infra brunneis late obscure brunneo-marginatis; pycnidiis epiphyllis, æqualiter distributis, usque ad 50 in quoque macula, ovoideis, immersis, 200 \approx 170, supra obtusis, poro depresso 60 μ . lato præditis; parietibus celluloso-plectenchymaticis, stratu externo flavo-brunneo, tenuiore, interno hyalino; sporulis filiformibus, apice obtusis, indistincte 3-5-septatis, 64-92 \approx 1,5-2,5.

Hab. in foliis Artocarpi incisæ, M. Apia in Ins. Samoa (RECHINGER).

125. *Septoria dryophila* Sacc., Ann. Mycol. VI (1908) p. 556. — 7387

Maculis epiphyllis candidantibus, inferne alutaceis, angustissime atro-marginatis, modo angulo-orbicularibus, 3-5 mm. diam. modo confluendo multo amplioribus; pycnidiis paucis, punctiformibus, lenticularibus, nigris, 100-150 μ . diam.; sporulis bacillaribus, rectiusculis, utrinque obtusulis, crebro sub-10-septatis, 50-56 \approx 3, hyalinis.

Hab. in foliis languidis Quercus Ilicis, Villa Favorita, Palermo, Sicilia (J. H. MATTEI). — Affinis *Septoria dryinæ* a qua differt maculis ampliusculis, non rubro-cinctis, sporulis duplo crassioribus etc.

126. *Septoria marmorata* Kab. et Bub., Fünft. Beitr. Pilzfl. Tir. in

7388 Ber. naturw.-med. Ver. Innsbruck, XXX Jahrg. (1905-1906) Extr. p. 10. — Maculis epiphyllis, utrinque visilibus, irregulariter rotundato-angulosis, nervis vix limitatis, 1-6 mm. latis, primum indistinctis, dein brunneis, demum pallide flavo-alutaceis et medio albo-aridis, marmoratis, saepe late confluentibus; pycnidiis epiphyllis in maculis copiose distributis, pellucidis, globosis v. confertis, 100-140 μ . latis, pallide brunneis v. brunneis, diu epidermide tec-

tis clausisque demum erumpentibus, contextu parenchymatico, flavo-brunneo, cyanescenti; sporulis filiformibus, 25-60 \approx 1,5-2,5, rectis v. curvulis uno apice angustatis altero rotundatis, 1-3-septatis, hyalinis.

Hab. in foliis vivis Populi Tremulæ, San Stefano Valle di Genova, in agro Tridentino

127. **Septoria Populi** (Desm.?) P. Henn. Pilzfl v. Lanke II in Ver- 7389
handl. bot. Vereins Brandb (1905) p. 222, an *Sept. Populi* Desm.? — Sporulis utrinque obtusis, continuis, minute pluriguttulatis, 30-60 \approx 3,5.

Hab. in foliis Populi tremulæ, Lanke Germaniæ.

128. **Septoria Podocarpi** Niessl in Rabenh. Fungi Europ. n. 1960 7390
(1875). — Pycnidiis epiphyllis, sparsis, punctiformibus, innato-prominulis, 120-150 μ . diam., nigris; sporulis elongatis, cylindraceis v. curvatis, utroque polo obtusis, plerumque 3-septatis, 120-130 \approx 2-3, hyalinis.

Hab. in foliis Podocarpi dejectis in Horto bot. Neapolit. (CESATI). — Egr. TURCONI communicavit notas pycnidii ex exempl. Horti Papiensis, nam in meo ad n. 1960 alia res conspicitur.

129. **Septoria ornithogalicola** Hollós, Ann. Mus. Nat. Hung. VI 7391
(1908) p. 532. — Maculis amphigenis magnam foliis partem occupantibus, ochraceis, margine indefinito; pycnidiis amphigenis, gregariis sparsisve, epidermide velatis, lenticularibus, ochraceis, poro pertusis, 180-250 μ . diam., contextu celluloso; sporulis bacillaribus, utrinque leniter attenuatis, rectis v. curvulis, intus granulosis v. spurie pluriseptatis, hyalinis, 80-100 \approx 2,5-3,5.

Hab. in foliis languidis, quæ sursum demum arescunt, Ornithogali Boucheani prope Czegled et Nagy-Körös Hungariæ.

— A *Sept. ornithogalea* Oud. et *S. Ornithogali* Pass. diversa.

130. **Septoria Bellevaliæ** Patouill. Bull. trim. Soc. Myc. de France, 7392
vol. XXI (1905) p. 121. — Maculis elongatis, albidis, linea rubra limitatis, 2-4 cm. long., 6 mm. latis; pycnidiis sparsis, numerosis, erumpentibus, globoideis, nigris, coriaceis 180 μ . cr., ostiolatis; sporulis copiosis, hyalinis, rectis v. curvulis, linearibus, utrinque attenuatis, 45 60 \approx 3-4, transverse triseptatis, ad septa non constrictis, guttulatis v. non.

Hab. in foliis Bellevaliæ dubiæ, Algeria Africa bor.

131. **Septoria Polygonati** Kab. et Bub. Hedwigia L (1909) p. 41. — 7393
Maculis amphigenis, subcircularibus v. ellipticis, 8 mm. lat., radius ad 1,5 cm., alutaceis, demum arescendo subgriseis, late atro-

purpureo-brunneo limbatis, sæpe duabus confluentibus, copiosis; pycnidiis epiphyllis, raro hypophyllis, punctiformibus, subsparsis raro confertis, depresso-globosis, atro-brunneis, translucide ochraceis, 100-150 μ . diam., diu epidermide tectis, papilla breviter cylindracea erumpentibus, contextu laxè parenchymatico; sporulis copiosis, falciformibus, raro rectis, 25-38 \approx 2-2,5, utrinque acutatis, hyalinis; sporophoris brevibus.

Hab. in foliis vivis *Polygonati multiflori* culti, Turnau Bohemiæ. — *Sept. carpophilæ* affinis.

132. **Septoria falcispora** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 7394 p. 477. — Maculis utrinque visilibus, rotundatis v. elongatis, 5-8 mm. latis, sordide albidis, non limitatis; pycnidiis epiphyllis, utrinque visilibus, globosis, leniter depresso, flavo-ochraceis, 50-100 μ . latis, contextu flavidò v. subhyalino, subepidermicis demum erumpentibus et irregulariter apertis; sporulis falcatis, raro subrectis, 15-24 \approx 2-2,5, apice angustatis, unilocularibus, hyalinis; sporophoris cæspitosis, 10 \approx 3,5-4,5, hyalinis, cellulis cylindraceis brevibus, flavidis suffultis.

Hab. in foliis emortuis *Erythronii Dentis-canis* prope Ulcinj Montenegro.

133. **Septoria malisorica** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 7395 p. 478. — Maculis utrinque visilibus, elongatis, usque ad 3 cm. longis, 3-4 mm. latis, griseis, purpureo-brunneo-marginatis, arecentibus; pycnidiis æque distributis, amphigenis, subglobosis, sordide flavo-brunneis, 90-180 μ . latis, tenuiter tunicatis, subepidermicis, demum erumpentibus, contextu minute cellulari flavo-ochraceo; sporulis breviter fusoideis, 35-55 \approx 2,5-3, quadrilocularibus, raro longioribus et tunc sexlocularibus, rectis v. curvulis, apice angustatis, hyalinis.

Hab. in foliis vivis *Leucoji aestivi* prope Ulcinj Montenegro.

134. **Septoria Muscari-neglecti** Bubak, Bull. Herb. Boiss. 2 sér. VI (1906) p. 478. — Pycnidiis amphigenis, primum pallide brunneis, dein in partibus exsiccatis subnigris, epidermide tectis, globosis 128-150 μ . latis, contextu castaneo-brunneo; sporulis anguste fusoideis, 45-60 \approx 2,5-4, plerumque incurvatis, utrinque angustatis, transverse 3-septatis, hyalinis, sporophoris brevibus, confertis, hyalinis.

Hab. in foliis vivis *Muscari neglecti* prope Ulcinj Montenegro.

135. **Septoria Allii-striatelli** Speg., Myc. Argent. V p. 378, in Anal. 7397

Mus. Nac. Buenos Aires XX (1910). — Maculis pallescentibus indeterminatis; pycnidiis plus minusve gregariis, innato-erumpentibus, globulosis, 75-125 μ . diam., membranaceis, nigro ostiolatis, contextu minute parenchymatico; sporulis filiformibus utrinque acutiusculis, 40-50 \approx 1,5, saepius leniter curvulis, continuis, hyalinis.

Hab. vulgata ad folia viva Allii striatelli in herbosis La Plata Argentina Amer. austr.

136. **Septoria macrospora** Alm. et Cam., Revista Agron. IV (1906) 7398

p. 138, tab. III, fig. 5-6; Bol. Soc. Brot. XXV (1908-1909) Extr. p. 53. — Pycnidiis plerumque epi- raro etiam hypophyllis, sparsis, subgloboso-depressis, aterrimis, immersis, tectis, demum vero, epidermide lacerata, detectis, ostiolo simplici, pertuso, erumpenti, 400-550 \approx 350-400; sporulis cylindraceis, fusoideis v. subclaviformibus, saepius 3- vel 4-septatis, haud constrictis, rectis v. leniter sursum attenuatis, hyalinis, 85-100 \approx 10-12.

Hab. in foliis Yuccæ aloifoliæ, in horto bot. Coimbra Lusitania (A. MOLLER). — An potius *Stagonosporæ macrosporæ* (in Agave) varietas?

137. **Septoria eriophoricola** Hollós, Ann. Mus. Nat. Hungar. V 7399

(1907) p. 51. — Pycnidiis sine macula inter nervos folii seriatis, epidermide tectis, lenticularibus, nigris, poro pertusis, 110-150 μ . diam., contextu parenchymatico; sporulis filiformibus, curvulis continuis, granulosis, hyalinis, 30-40 \approx 1.

Hab. in foliis Eriophori latifolii prope Kecskemét Hungariæ. — A *Septoria Eriophori* Oud. pycnidiis majoribus et sporulis minoribus diversa.

138. **Septoria Schœni** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 7400

p. 6. — Pycnidiis sparsis, punctiformibus, epidermide tectis, globulosis, fuscis, ostiolo papillato erumpentibus, 120-160 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque obtusis, rectis v. curvulis, continuis, pluriguttulatis, dilute flavidulis, 54-70 \approx 2,5-3.

Hab. in calamis Schœni nigricantis prope Izsák Hungariæ.

139. **Septoria scirpicola** Hollós, Ann. Mus. Nat. Hungar. VIII 7401

(1910) p. 6. — Pycnidiis sparsis, epidermide tectis, subsphæricis, fuscis, poro pertusis, 140-180 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque rotundatis, curvulis, 5-septatis, guttulatis, flavidulis, 65-90 \approx 3,5 \approx 4.

Hab. in calamis Scirpi Holoschœni prope Kecskemét Hun-

gariæ. — A *Septoria Holoschæni* characteribus sporluarum omnino diversa.

140. **Septoria Polypogonis** Sacc. et Trott. Ann. Mycol. X (1912) 7402

p. 513. — Maculis obsoletis oblongis irregularibus, arescentibus inefinitis, centro pallidioribus; pycnidiis innato-erumpentibus, sublenticularibus, nigris, ostiolo latiusculo 18-20 μ . lato, præditis, $\frac{1}{10}$ mm. diam.; sporulis subcylindraceis v. saepius elongato-subclavulatis, plerumque curvulis v. subsigmoideis, triseptatis, 22-35 \times 4-6, guttulatis, hyalinis.

Hab. in foliis vivis *Polypogonis monspeliensis*, Gargaresc prope Tripoli Africæ trop. (A. TROTTER).

141. **Septoria? andropogonicola** Speg. Myc. Argent. V, p. 379, in 7403

Ann. Mus. Nac. Buenos Aires XX (1910). — Pycnidiis seriatis constipatis confluentibusque v. lineolas nigras 1-2 mm. long. 100-150 μ . cr. efformantibus, atris, subcarbonaceis, globulosis 100-120 μ . diam., contextu opaco' indistincto donatis, ostiolo minuto irregulari pertusis; sporulis acicularibus, 40 \times 1, rectis v. subflexuosis, continuis v. obsolete multiseptatis, hyalinis.

Hab. ad folia languida v. arida *Andropogonis condensati* prope Apostoles Misiones, Argentina, Amer. austr.

142. **Septoria bromicola** Speg., Fungi Chilenses (1910) p. 168. — 7404

Maculis nullis; pycnidiis parenchymate innatis, laxe seriatis, epidermide minute nigrificata tectis, lenticularibus, 100-120 μ . diam., atris, subcarbonaceis, ostiolo parvulo perforatis; sporulis filiformibus, hyalinis, plus v. minus flexuosis, 35-40 \times 1-1,25.

Hab. in foliis siccis *Bromi unioloidis*, Cerro Caracol de Concepción Chile Amer. austr.

143. **Septoria bromivora** Speg., Myc. Argent. V, p. 380, in Anal. 7405

Mus. Nac. Buenos Aires XX (1910). — Pycnidiis folio toto arescente innatis, gregariis, amphigenis, sublenticularibus, 100-150 μ . diam., atris, membranaceis, ?astomis, contextu grosse parenchymatico fuligineo; sporulis bacillaribus arcuatulis superne attenuato-acutatis, inferne rotundatis, 30 \times 2, hyalinis.

Hab. ad folia languida v. arida *Bromi cujusdam*, Rio Grande Fuegia Argentina Amer. austr.

144. **Septoria halophila** Speg. Myc. Argent. V, p. 382, in Anal. Mus. 7406

Nac. Buenos Aires XX (1910). — Maculis nullis sed matrice tota arescente et subcrescente; pycnidiis parenchymate innatis, collagenibus, lenticularibus, 200-250 μ . diam., membranaceis, atris, ostiolatis, parenchymaticis; sporulis filiformibus utrinque acutatis,

45-50 \approx 1,5, saepius medio 1-septatis, hyalinis, rectis v. sigmoideis.

Hab. ad folia arida v. languida *Hordei halophili*, Villa Maria prov. Cordoba, Argentina Amer. austr.

145. **Septoria Urvilleana** Spieg. Myc. Argent. V, p. 387, in An. Mus. Nac. Buenos Aires XX (1910). — 7407

Maculis indeterminatis cinerescentibus; pycnidiis amphigenis sparsis v. laxe gregariis, rarius subseriatis, parenchymate innatis epidermide tectis, sublenticularibus, 80-150 μ . diam., membranaceis, atris, subastomis, contextu parenchymatico parum distincto fuligineo; sporulis linearisubfusiformibus, 20-90 \approx 5-6, primo hyalinis continuis, serius 5-7-septatis, subchlorinulis.

Hab. ad folia languida v. arida *Panici Urvilleani* in dunis Pampa Central et Juárez Celman prope Cordoba, Argentina Amer. austr.

146. **Septoria laxa** Spieg., Myc. Argent. V, p. 383, in An. Mus. Nac. 7408

Buenos Aires XX (1910). — Foliis infectis totis plus minusve pallescentibus; pycnidiis quandoque solitariis, quandoque plus minusve numerosis constipatis v. subconfluentibus, innatis, atris, obsolete ostiolatis, globoso-depressis, 120-150 μ . diam., contextu opaco indistincto; sporulis filiformibus utrinque acutiusculis, 50-60 \approx 1, saepius leniter flexuosis, hyalinis, continuis.

Hab. ad folia languida *Panici laxi* prope Gualeguaychu, Entre Ríos Argentina America austr.

147. **Septoria macrostoma** Spieg. Myc. Arg. V, p. 384, in Anal. 7409

Mus. Nac. Buenos Aires XX (1910). — Maculis obsoletis pallenscentibus; pycnidiis amphigenis sparsis v. laxe gregariis, subseriatis, innato-suberumpentibus, sublenticularibus, e latere compressis, 75-90 \approx 50-75, contextu parenchymatico parum distincto, ostiolo elliptico 30 \approx 20 compresso perforatis; sporulis acicularibus, 20-25 \approx 2, leniter curvulis, continuis v. 1-septatis, hyalinis.

Hab. ad folia languida *Phalaridis canariensis* in arvis prope La Plata Argentina America austr.

148. **Septoria thalassica** Spieg. Myc. Argent. V, p. 387, in Anal. 7410

Mus. Nac. Buenos Aires XX (1910). — Maculis nullis sed partibus infectis saepius totis flavescentibus; pycnidiis sparsis v. hinc inde laxe gregariis, innato-erumpentibus, carbonaceis, subglobosis, 150-300 μ . diam., contextu indistincto, ostiolo, latiusculo perforatis; sporulis filiformibus utrinque rotundatis, flexuosis, minute denseque guttulatis, hyalinis, 60-100 \approx 2,5-3,5.

Hab. ad folia nec non ad rhizomata languida *Distichlidis*

thalassicæ in salsis ad ostia Rio Deseado, Argentina America austr.

149. **Septoria Elymi-europæi** Jaap, Beitr. Pilzfl. d. Schw., Ann. Myc. 7411 V (1907) pag. 265. — Pycnidiis longitudinaliter seriatis, minutis, punctiformibus, in maculis flavidis dein brunneis insidentibus; sporulis filiformibus, septatis, $70 \approx 2\text{-}3$.

Hab. in foliis vivis Elymi europæi, Schynigen Platte supra Breitlauenen Helvetiæ.

150. **Septoria culmifida** Lind, Ann. Mycol. V (1907) p. 276. — M-7412 culis foliicolis utrinque visilibus, sed in epiphyllum distinctius, sic-
cis albo-griseis, rotundatis, 3 mm. diam., late rubro-purpureo-
marginatis, raro confluentibus; pycnidiis epiphyllis, prominulis,
numerosis, minutis, elongatis, nigris, lineariter inter nervos dispo-
sitatis, poro latiusculo præditis, c. 90 μ . diam.; sporulis fusoideis,
sublunatis, unilocularibus, hyalinis, $12\text{-}17 \approx 2\text{-}2,5$.

Hab. in foliis adhuc vivis Phlei pratensis, Horsens Jüt-
landia Dania. — Ad *Metaspherium culmifidam* verisimiliter spectat.

151. **Septoria trapezuntica** Bubák in Handel-Mazzetti, Bot. Reise 7413 Pont. Randgeb. in Ann. Naturhist. Hofmus. XXIII (1909) p. 105. — Pycnidiis hypophyllis, crebris, dense distributis, subepidermicis,
globosis, parum applanatis v. irregulariter globulosis, $70\text{-}130 \mu$.
diam., nigris, contextu dense parenchymatico, nigro-brunneo, in
medio poro pertusis, ibidemque obscurioribus; sporulis fusoideis,
rectis v. parum falcatis, $11\text{-}18 \approx 2\text{-}2,5$, utrinque attenuatis, hyali-
nis; sporophoribus brevibus, conico-papillatis, luteolis.

Hab. in foliis Oryzopsis miliacea var. Thomasi, in
montibus ponticis Anatoliæ.

152. **Septoria curvula** I. Miyake, Pilze Reispfl. Japan in Journ. Col- 7414 lege Agricolt. Tokyo II (1910) p. 260, t. XIV, f. 60. — Pycni-
diis subconfertis, globosis v. ellipsoideis, nigris, $90\text{-}100 \mu$. diam.;
sporulis varie incurvatis v. contortis, 5-8-septatis et pluriguttu-
latis, $50\text{-}80 \approx 2,5\text{-}3$.

Hab. in foliis Oryzæ sativæ, Suwa, Nagano Japonia.

153. **Septoria Oryzæ** Catt. — Syll. III, p. 562 — var. **brasiliensis** 7415 Spegazz., Fungi Paulist., Rev. Mus. La Plata t. XV, p. 38 (1908). — A typo differt sporulis 2-5-septulatis, subcrassioribus, $20\text{-}30 \approx 3$,
leviter chlorinulis.

Hab. ad glumas languidas Oryzæ sativæ in Escola Poly-
technica Sao Paulo Brasilia (USTERI).

154. **Septoria Miyakæi** Sacc. et Trav. — Syll. XX, p. 790 — Septo- 7416

ria longispora I. Miyake, Pilze Reispfl. Japan in Journ. College Agricult. Tokyo, II (1910) p. 259, t. XIV, f. 59, non Voglino, Shear et Bondarz. — Pycnidii immersis, ellipsoideis, papillato-prominulis, 140-150 μ . diam. 100-110 μ . alt., nigris, pseudoparenchymaticis; sporulis elongatis, apice rotundatis v. truncatis, hyalinis, sæpe incurvatis, non septatis, 30-40 \times 2,5-3,2.

Hab. in glumis *Oryzæ sativæ*, Tottori Japonia.

155. **Septoria Cristati** Hollós, Ann. Mus. Nat. Hungariæ VIII (1910) 7417 pag. 6. — Maculis indeterminatis; pycnidii epiphyllis, epidermide velatis gregariis, lenticularibus, ochraceis, poro pertusis, 80-120 μ . diam., contextu celluloso; sporulis acicularibus, rectis v. curvulis, continuis, hyalinis, 14-20 \times 0,7-1.

Hab. in foliis languidis *Tritici cristati* prope Kecskemét Hungariæ.

156. **Septoria pteridicola** Kab. et Bub., Fünft. Beitr. Pilzfl. Tir., 7418 in Ber. naturw.-med. Ver. Innsbruck, XXX (1905-1906) Extr. p. 12. — Maculis epiphyllis, utrinque visilibus, pallide brunneis v. alutaceis, irregularibus, plerumque late confluentibus; pycnidii epiphyllis, sparsis v. gregariis, quandoque confluentibus, diu epidermide tectis, globoso-depressis, 90-180 μ . latis, contextu parenchymatico pallide flavo-brunneo; sporulis cylindraceis v. subclavatis, 10-35 \times 3-4, rectis v. irregulariter incurvatis, utrinque rotundatis, primum unilocularibus, dein distinete 1-3-septatis, non constrictis, hyalinis.

Hab. in frondibus vivis v. emortuis *Pteridis aquilinæ*, Val di Genova in ditione Tridentina.

157. **Septoria subinconspicua** Massal., De nonnull. micr. in Atti Ist. 7419 Ven. LIX (1900) pag. 690 et Novit. Fl. mycol. Veron. pag. 44, tab. 5, fig. 15. — Ita vocetur *Sept. inconspicua* Mass. — Syll. XVI, p. 964 (ex err.).

158. **Septoria rostrata** Kabák et Bub., Österr. Bot. Ztschr. (1905) 7420 p. 185, tab. II, fig. 1-2. — Ita dicatur *Septoria prostrata* Kab. et Bub. — Syll. XVIII, p. 384 — ita inscripta ex err. typi in Kab. et Bub. l. c. (corr. vero in expl. tabulæ p. 192).

PHÆOSEPTORIA Spegazz., Fungi Paulist., Rev. Mus. La Plata t. XV (1908) pag. 39 (Etym. *phaios* obscurus et *Septoria*). — Pycnidia subcutaneo-erumpentia, nigricantia, minuta. Sporulæ bacillares v. anguste fusoidæ, coloratæ. — Est quasi *Septoria* sporulis olivaceis distincta.

1. **Phæoseptoria Papayæ** Spegazz., l. c. p. 39. — Maculis angulato- 7421
suborbicularibus 0,5-3 mm. diam., calloso-convexus, candidis, de-
terminatis, areola destitutis, sæpe confluentibus; pycnidiis epi-
phyllis laxe gregariis, innato-superficialibus, lenticularibus, 60-90
 μ . diam., atris, glabris, membranaceis, contextu minute parenchy-
matico olivaceo; sporulis lenissime fusoideis v. obsoletissime cla-
vulatis, continuis v. 1-3-septatis, utrinque acutiuscule rotundatis
30 \approx 3, olivaceis.

Hab. ad folia languida Caricæ Papayæ in Horto botanico
Sao Paulo Brasilia (USTERI).

2. **Phæoseptoria Oryzæ** I. Miyake, Pilze Reispfl. Japan in Journ. Col- 7422
lege Agr. Tokyo II (1910) p. 260, t. XIV, f. 61-63. — Pycnidiis
brunneis v. nigris, globosis, ovoideis v. ellipsoideis, immersis, dein
ostiole papilliformi prominulis, crasse pseudoparenchymaticis, 100-
150 μ . diam. 100-125 μ . altis; sporophoris parvis hyalinis; spo-
rulis filiformibus curvatis et contortis, sæpe elongato-clavatis, apice
rotundatis, 4-6-septatis, obscure flavis, 30-45 \approx 2,5-3, non guttu-
latis.

Hab. in foliis et glumis Oryzæ sativæ in Japonia.

RHABDOSPORA Mont. — Syll. III p. 578, X p. 387, XI p. 548,
. XIV p. 982, XVI p. 976, XVIII p. 397.

1. **Rhabdospora albanica** Bubák, Bull. Herb. Boiss. 2 sér., VI (1906) 7423
pag. 480. — Pycnidiis in maculis conspicuis griseo-nigrescentibus
sparse insidentibus, elongatis v. globosis quandoque fortiter de-
pressis, 80-100 μ . latis, subepidermicis, erumpentibus, nigris, con-
textu obscure castaneo-brunneo; sporulis filiformibus 25-40 \approx 1,1-5,
rectis v. curvulis, transverse 1-3(raro 4)-septatis.

Hab. in caulinis siccis Ranunculi Villarsi prope Andri-
jevica Montenegro.

2. **Rhabdospora Anemones** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7424
p. 347. — Pycnidiis epidermide tectis, sparsis, globoso-depressis,
nigris, 280-320 μ . diam., contextu parenchymatico; sporulis bacil-
laribus, rectis v. leviter flexuosis, utrinque obtusatis, continuis v.
obscure 3-septatis, granulosis, hyalinis, 28-32 \approx 2.

Hab. in petiolis siccis Anemones silvestris prope Kecské-
mét Hungariæ.

3. **Rhabdospora Trollii** P. Henn., Hedw. XLV (1905) p. 33. — Ma- 7425
culis pallidis effusis; pycnidiis sparsis, punctiformibus, sub epider-
mide erumpentibus, hemisphæricis, fuscis, poro pertusis, 60-80 μ .

cr.; sporulis oblonge fusoideis, rectis v. curvulis, hyalinis, continuis $10 \approx 0,5$

Hab. in caulis *Trollii europæi*, Michailowskoe Rossiæ (Graef. SCHEREMETEFF).

4. **Rhabdospora Coriariæ** Speg., *Fungi Chilenses* (1910) p. 170. — 7426
 Pycnidiis sparsis cortice innatis, epidermide tectis, lenticularibus, 90-100 μ . diam., eximie papillato-ostiolatis, atris, subcarbonaceis; sporulis acicularibus, arcuatulis, mediocribus, hyalinis, non v. 1-3-septatis, $20-35 \approx 2-3$.

Hab. in ramulis emortuis *Coriariæ ruscifoliæ*, Cerro Caracol de Concepción, Chile Amer. austr.

5. **Rhabdospora serbica** Bubák et Ranojevic, *Ann. Mycol.* VIII (1910) 7427 p. 392. — Pycnidiis in caulis sparsis v. congregatis, quandoque in maculis brunneis insidentibus, subepidermicis, lenticulari-applanatis, rotundatis v. ellipsoideis, e rubro-brunneis brunneo-nigris, 150-220 μ . lat., ex contextu pseudoparenchymatico formatis, centro poro rotundato obscuriori præditis; sporulis bacillaribus, curvatis, plerumque ad apicem, $28-35 \approx 2$, hyalinis, unilocularibus; sporophoribus papilliformibus, brevibus, hyalinis.

Hab. in ramis siccis *Polygalæ comosæ*, Cer, Serbia. — An satis diversa a *Sept. Polygalæ* Hollós?

6. **Rhabdospora polygalicola** Hollós, *Ann. Mus. Nat. Hung.* IV (1906) 7428 p. 352. — Pycnidiis epidermide tectis, gregariis, globoso-depressis, brunneis, poro pertusis, 60-70 μ . d., contextu parenchymatico; sporulis acicularibus, rectis, utrinque acutis, hyalinis, $20-24 \approx 1$.

Hab. in caulis siccis *Polygalæ comosæ* prope Kecskemét Hungariæ.

7. **Rhabdospora Polygalæ** Hollós, *Ann. Mus. Nat. Hung.* IV (1906) 7429 p. 351. — Pycnidiis epidermide tectis, gregariis, globoso-depressis, brunneis, poro pertusis, 140-210 μ . diam., contextu parenchymatico; sporulis subfalcatis, granulosis, hyalinis, $24-34 \approx 2$.

Hab. in caulis siccis *Polygalæ comosæ*, prope Nagy-Körös Hungariæ.

8. **Rhabdospora Dictamni** Hollós, *Ann. Mus. Nat. Hungar.* V (1907) 7430 q. 463. — Pycnidiis sparsis, erumpentibus, globoso-depressis, fuscis, poro pertusis, 80-100 μ . diam., contextu parenchymatico; sporulis acicularibus, rectis v. curvulis, utrinque acutis, continuis, hyalinis, $16-22 \approx 0,5$.

Hab. in caulis siccis *Dictamni albi* prope Nagy-Körös Hungariæ.

9. **Rhabdospora Geranii** Hollós, Ann. Mus. Nat. Hung. VII (1909) 7431 p. 54. — Pycnidiis sparsis, epidermide velatis, fuscis, ellipsoideis, 120-140 \times 90-100, poro pertusis, contextu celluloso; sporulis acicularibus, rectis v. leviter flexuosis, continuis, hyalinis, 18-22 \times 0,5-1.
Hab. in caulis siccis Geranii sanguinei prope Kecskemét Hungariæ.
10. **Rhabdospora Telephii** Strasser, Verh. k. k. zool. bot. Gesell. 7432 Wien LX (1910) pag. 317. — Pycnidiis globosis, nigro-brunneis, poro centrali distincto apertis, pseudoparenchymaticis, 80-150-(180) μ . diam., primum erumpentibus et maculas griseas efformantibus; sporulis hyalinis acicularibus, uno apice subincrassatis, 20-30 \times 1-1,5; sporophoris non visis.
Hab. in pedunculis siccis Sedii Telephii, Sonntagberg Austriae.
11. **Rhabdospora sinensis** Speg., Myc. Argent. V, p. 391, in Anal. 7433 Mus. Nac. Buenos Aires XX (1910). — Pycnidiis ligno denudato insidentibus, sparsis v. saepius gregariis atque subseriatis, subglobosis 100-150 μ . diam., atris, carbonaceis, vix papillato-ostiolatis; sporophoris dense constipatis, deorsum incrassatulis, sursum attenuato-acutatis, 10-15 \times 1,5-2, hyalinis, monosporis; sporulis unciformibus, 20 \times 1, hyalinis, continuis.
Hab. a ramos aridos putrescentesque Wistariæ sinensis in hortis La Plata Argentina Amer. austr.
12. **Rhabdospora bituminosa** Bubák, Bull. Herb. Boiss., 2 sér., VI 7434 (1906) p. 480. — Pycnidiis confertis, caules ramulosque late obtengentibus, epidermide grisea tectis, 55-90 μ latis, globosis, nigris, parietibus 11-12 μ . cr., contextu firme, minute parenchymatico castaneo-brunneo, dein apice conoideo prominentibus; sporulis e fusoideo filiformibus 10-22 \times 1-2, rectis v. curvis, utrinque acutatis, medio transverse uniseptatis, hyalinis.
Hab. in caulis emortuis Psoraleæ bituminosæ prope Ulcinj Montenegro.
13. **Rhabdospora Arenariæ** Hollós, Ann. Mus. Nat. Hung. V (1907) 7435 p. 463. — Pycnidiis gregariis, epidermide tectis, depresso-globosis, nigris; poro pertusis, 80-100 μ . diam., contextu celluloso; sporulis acicularibus, rectis v. leviter flexuosis, medio 1-septatis, 20-26 \times 1,5.
Hab. in caulis siccis Onobrychidis arenariæ pr. Kecskemét Hungariæ. — *Rhabdosp. Onobrychidis* Syd. differt sporulis majoribus.

14. **Rhabdospora Genistæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7436
 p. 350. — Pycnidiis epidermide tectis, gregariis, globoso-depressis, atro-brunneis, poro pertusis, 210-280 μ . diam., contextu parenchymatico; sporulis curvulis, e medio ad utrumque finem versus attenuatis, nonnunquam tenuiter 1-septatis, utrinque obtusatis, granulosis, hyalinis, 30-38 \times 3-3,5.
Hab. in ramulis siccis Genistæ tinctoriae prope Kecskemét Hungariæ. — *Rh. phomatoides* Sacc. et *Rh. vermicularioides* Syd. pycnidiis et sporulis minoribus distinctæ.
15. **Rhabdospora Glycyrrhizæ** Hollós, Ann. Mus. Nat. Hung. V (1907) 7437
 p. 463, *Rhabdospora Galegæ* Hollós, Ann. Mus. Nat. Hungar. IV (1906) p. 350, tab. VIII, fig. 19 (ex errore matricis). — Pycnidiis epidermide tectis, gregariis, globoso-depressis, nigris, poro pertusis, 220-260 μ . diam., contextu parenchymatico; sporulis cylindraceis, rectis v. plerumque leviter curvulis, utrinque obtusatis, 1-3-septatis, eguttulatis, hyalinis, 20-24 \times 2-3.
Hab. in caulis siccis Glycyrrhizæ echinatae (nec *Galega officinalis*), prope Kecskemét Hungariæ.
16. **Rhabdospora Gymnocladi** Hollós, Növényt. Közlemén. VI (1907) 7438
 Extr. p. 5. — Pycnidiis epidermide tectis, sparsis, lenticularibus, brunneis, 210-250 μ . diam., contextu parenchymatico; sporulis cylindraceis, subfalcatis, utrinque acutatis, continuis, granulosis, hyalinis, 20-26 \times 1,5-2.
Hab. in ramis siccis dejectis Gymnocladi canadensis Nagy-Körös Hungariæ.
17. **Rhabdospora ramealis** (Desm. et Rob.) Sacc. — Syll. III. pag. 7439
 580 — var. **macrospora** Appel et Laubert, Arb. k. Biol. Anst. f. Land. u. Forstw. V, Heft III (1905) p. 150. — A typo differt sporulis majoribus, nempe 24-60 \times 1,5-2,5.
Hab. in Rubi sp., Darss Germaniæ.
18. **Rhabdospora hamatospora** (Schulz.) Sacc. et Trav. — Syll. XX p. 7440
 670, *Mazzantia hamatospora* st. pycn. Schulz. v. Mügg. in Verh. zool.-bot. Gesell. Wien (1871) p. 1228, t. 13, f. 7. — Pycnidiis erumpenti-subsuperficialibus, globoso-conoideis, nigris, poro pertusis, 120-400 μ . diam., coriacellis; sporulis bacillaribus, demum exquisite hamatis, utrinque obtusulis, 25 μ . longis, hyalinis.
Hab. in ramis Cydoniæ vulgaris in Hungaria.
19. **Rhabdospora Fragariæ** Atkins., Ann. Mycol. VI (1908) p. 59. 7441
 — Pycnidiis hypophyllis, sparsis, v. laxè gregariis, ovatis, immersis, 90-100 μ . latis; ostiolis atris late conicis erumpentibus,

25-35 μ . longis; sporulis bacillaribus, utrinque leniter attenuatis, leviter curvulis v. rectis, minute guttulatis, obscure 1-2. (an 3?) septatis, 25-30 \approx 1-1,5.

Hab. ad folia emortua *Fragariæ* vescæ, Ithaca N. Y. Americæ bor.

20. **Rhabdospora persiciphila** Spegazz., Rev. Ministerio Agricult. Buenos Aires II (1908) n. 2, p. 38, Nota, cum icon. — Maculis suborbicularibus repandulis fusco-arescentibus, impressulis, anguste calloso-limitatis; pycnidiis epidermide velatis, subsparsis, minutis 85-120 μ . lat., latiuscule ostiolatis, coriacellis, atris, contextu parenchymatico fusco-atro; sporulis filiformibus arcuatis, 30-35 \approx 1-1,5, utrinque acutis, continuis, hyalinis.

Hab. in ramulis *Persicæ vulgaris*, morbum «viruela de las púas» dictum efficiens, prope La Plata in Rep. Argentina.

21. **Rhabdospora Daticæ** Earle, Bull. of the New York Bot. Gard. (1904) p. 296. — Pycnidiis late sparsis, subepidermicis v. demum erumpentibus, brunneo-nigris, membranaceis, subglobosis, sed leniter depresso-depressis, circ. 100-120 μ . diam., ostiolatis; sporulis acicularibus, rectis, 35-50 \approx 15.

Hab. in caulis *Daticæ* glomeratæ, Stanford University, California (C. F. BAKER).

22. **Rhabdospora Dauci** Hollós, Ann. Mus. Nat. Hungar. VII (1909) p. 54. — Pycnidiis sparsis, epidermide velatis, atris, ellipsoideis, 240 \approx 170, poro pertusis, contextu celluloso; sporulis acicularibus, rectis v. leviter flexuosis, continuis, hyalinis, 20-32 \approx 0,5-1.

Hab. in caulis siccis *Dauci* Carotæ, Nagy-Körös Hungariæ.

23. **Rhabdospora Seseli** Hollós, Ann. Mus. Nat. Hung. IV (1906) p. 352, tab. IX, f. 29. — Pycnidiis epidermide tectis, gregariis, globoso-depresso-depressis, fuscis, poro ampio apertis, 150-190 μ . diam., contextu parenchymatico; sporulis falcatis, utrinque obtusis, hyalinis, 24-28 \approx 1,5-2.

Hab. in caulis siccis *Seseli glauci* prope Kecskemét Hungariæ.

24. **Rhabdospora Heraclei** Earle, Bull. of the New York Bot. Gard. (1904) p. 296. — Pycnidiis late sparsis, nigris v. obscure brunneis, immersis, ostiolo erumpentibus, v. caule dilacerato expositis, subglobosis, non collabescentibus, circ. 400 μ . diam., contextu firme, cellulis 8-10 μ . latis, ostiolo prominenter papillato, crassisculo; sporulis acicularibus, rectis, multiguttulatis, 30-40 \approx 2.

Hab. in caulis emortuis *Heraclei lanati*, Snow Valley Peak, Ormsby Co. Nevada Amer. bor. (C. F. BAKER).

25. **Rhabdospora Aegopodii** Karst., Acta Soc. pro Fauna et Fl. fenn. 7447 XXVII, 4 (1905) p. 9. — Pycnidiis erumpenti-superficialibus, subsphæroideis, sparsis v. seriatim confluentibus, ostiolo papillato, atris, exiguis; sporulis filiformibus, utrinque attenuatis, continuis, saepe curvulis, hyalinis, 70-80 \times 4.

Hab. ad caules siccis *Aegopodii Podagrariæ*, in Fennia.

26. **Rhabdospora venenosa** Spieg., Myc. Argent. V, p. 391, in Anal. 7448 Mus. Nac. Buenos Aires XX (1910). — Substrato toto sordide cinerescente sed circa pycnidia saepius albescente; pycnidiis ligno insidentibus, epidermide tectis, atris, coriacellis, minute ostiolatis, subhemisphæricis, 120-150 μ . diam.; sporulis unciniformibus utrinque acutiusculis, hyalinis, 20-25 \times 1.

Hab. ad caules aridos putrescentesque *Daturæ Stramonii* in arvis La Plata Argentina Amer. austr.

27. **Rhabdospora Symphyti** Hollós, Ann. Mus. Nat. Hung. VII (1909) 7449 p. 55. — Pycnidiis sparsis, epidermide velatis, suberumpentibus, fuscis, ellipsoideis, 170-210 \times 100-140, ostiolo brevi conoideo, contextu celluloso; sporulis acicularibus, rectis v. leviter flexuosis, continuis, hyalinis, 20-30 \times 0,5-1.

Hab. in caulis siccis *Symphyti officinalis* prope Kecskemét Hungariæ.

28. **Rhabdospora Cerinthes** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7450 p. 533. — Maculis oblongis, argenteo-griseis; pycnidiis subcutaneis, suberumpentibus, gregariis, depresso-globosis, fuscis, poro pertusis, 170-190 μ . diam., contextu parenchymatico; sporulis acicularibus, rectis v. nonnunquam leviter flexuosis, continuis, granulosis, hyalinis, 24-30 \times 1-1,5.

Hab. in caulis siccis *Cerinthes minoris*, Kecskemét Hungariæ.

29. **Rhabdospora Cynoglossi** Hollós, Ann. Mus. Nat. Hung. V (1907) 7451 p. 462. — Pycnidiis epidermide tectis, gregariis, lenticularibus, fuscis, poro pertusis, 80-100 μ . diam., contextu parenchymatico; sporulis filiformibus, rectis v. plerumque leviter curvulis, utrinque acutis, continuis, hyalinis, 40-54 \times 1,5.

Hab. in caulis siccis *Cynoglossi officinalis* prope Kecskemét Hungariæ.

30. **Rhabdospora Globulariæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7452 p. 351. — Pycnidiis epidermide tectis, gregariis, globoso-depres-

sis, nigris, poro pertusis, 100-120 μ . diam., contextu parenchymatico; sporulis filiformibus, rectis v. leviter curvulis, hyalinis, 24-30 \times 1-1,5.

Hab. in caulis siccis Globulariæ Willkommii, prope Kecskemét Hungariæ.

31. **Rhabdospora Maireana** Sacc. et Trott. — *Rhabdospora Globula-* 7453
riæ R. Maire ad int., Bull. Soc. Myc. de Fr. LV (1908) pag. CLXV, fig. 1, non Hollós. — Pycnidiis superficialibus, subglobosis, levibus, nigris, coriaceis, apice ostiolo minute papillato pertusis, 300-500 μ . diam.; sporulis aciculari-fusoideis, curvatis, utrinque acutis v. acutiusculis, levibus, hyalinis, 1-2-septatis, 11-25 \times 1,5-2,5, in sporophoris cylindraceis, pauciseptatis, hyalinis, 15-20 \times 1,5-2 acro-v. pleurogenis.

Hab. in caulis aridis Globulariæ nudicaulis, prope Port de Gavarnie in Pyrenæis.

32. **Rhabdospora midzürensis** Bubák et Ranojevic, Ann. Mycol. VIII 7454 (1910) p. 392. — Pycnidiis sparsis, subepidermicis, dein nudis, globosis, parum applanatis, 60-100 μ . diam., nigris, contextu bruno-olivaceo, tenui præditis, sporulis bacillaribus, 18-22 \times 2,5-3, ad apicem fortiter attenuatis, unilocularibus, hyalinis; sporophoris cæspitosis, elongatis, 5-8 \times 3,5-4, flavidis.

Hab. in ramis emortuis Androsaces carneæ, Mt. Midzur, 2186 m. alt., Serbia.

33. **Rhabdospora Gentianæ** Diedicke, Aufzählung Erfurts Microm. 7455 (1910) p. 84. — Pycnidiis solitariis, v. maculis nigris ex hyphis mycelicis subepidermicis fuligineis formatis, 1-5 mm. longis insertis, leviter prominulis, magnitudine variis, 50-150 μ . diam., globosis, nigris, subcarbonaceis, astomis; sporulis acicularibus, utrinque obtusulis, 18-26 \times 1, hyalinis, subcontinuis.

Hab. in caulis emortuis Gentianæ ciliatae, Arnstadt Germaniæ.

34. **Rhabdospora Strasseri** Bubák, Ann. Mycol. IV (1906) p. 117. — 7456 Pycnidiis subepidermicis, rotundatis v. ellipsoideis, 200-250 μ . diam., vel usque ad 400 μ . long. 100-200 μ . altis; contextu parenchymatico, extus nigricante intus flavidus, parietes 30-45 μ . cr. efformante; sporulis filiformibus, 45-55 \times 1,5-2, rectis v. curvulis, utrinque angustatis, 5-septatis; sporophoris breviter papilliformibus.

Hab. in ramis emortuis Betonicæ officinalis, Sonntagberg Austria inf. (STRASSER). — A Rh. Betonicæ omnino diversa.

35. **Rhabdospora Betonicæ** Sacc. et Br. — Syll. X p. 392 — var. 7457
Brunellæ Bres. in Strasser Verh. k. k. zool.-bot. Ges. Wien LX (1910) p. 318. — Pycnidiis subcutaneis, apice erumpentibus, subglobosis, ostiolo conoideo 300-400 μ . latis; sporulis hyalinis filiformibus, flexuosis, v. curvatis, raro rectis, utrinque attenuatis, sed uno latere magis attenuatis, 20-28 \approx 1-1,5.
Hab. in *Brunella vulgari*, Sonntagberg Austriæ. — A typo differt sporulis flexuosis.
36. **Rhabdospora Menthæ** Strasser, Verh. k. k. zool.-bot. Ges. Wien 7458 LX (1910) p. 317. — Pycnidiis depresso globosis, leniter papillatis, basi hyphis brunneis cinctis; sporulis acicularibus utrinque acutatis, hyalinis, non septatis, non guttulatis, 60-68 \approx 1,5.
Hab. in caulis *Menthæ silvestris*, Sonntagberg, Austriæ — Socia *Sphaerella Manthæ* Lamb.
37. **Rhabdospora clinopodicola** Hollós, Ann. Mus. Nat. Hung. IV 7459 (1906) p. 348, tab. VIII, fig. 21. — Pycnidiis epidermide tectis, sparsis, globosis, leviter oblongis, nigris, 350-420 μ . diam., medio ostiolo rotundato 35-42 μ . diam., contextu parenchymatico; sporulis acicularibus, rectis v. leviter flexuosis, utrinque acutatis, granulosis, hyalinis, 64-110 \approx 2, plerumque 80-90 \approx 2.
Hab. in caulis siccis *Clinopodii vulgaris* prope Kecskemét Hungariæ. — A *Rhab. Clinopodii* All. et *Rh. Bäumleri* Sacc. et Syd. diversa.
38. **Rhabdospora Dracoccephali** Hollós, Ann. Mus. Nat. Hungar. IV 7460 (1906) pag. 349, tab. IX, fig. 36. — Pycnidiis epidermide tectis, gregariis, globulosis, subellipsoideis, nigris, poro pertusis, 130-160 \approx 100-120, contextu parenchymatico; sporulis filiformibus, curvulis, utrinque obtusatis, granulosis, hyalinis, 30-70 \approx 1,75-2.
Hab. in caulis siccis *Dracoccephali austriaci* pr. Kecskemét Hungariæ.
39. **Rhabdospora dracocephalicola** Hollós, Ann. Mus. Nat. Hung. IV 7461 (1906) p. 349. — Pycnidiis gregariis, superficialibus, globulosis, nigris, 70-90 μ . diam., contextu parenchymatico; sporulis filiformibus, leviter curvulis, hyalinis, 20-30 \approx 1-1,5.
Hab. in caulis siccis *Dracoccephali austriaci* pr. Kecskemet Hungariæ.
40. **Rhabdospora Orobanchæ** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7462 p. 534. — Pycnidiis gregariis, superficialibus, lenticularibus, atro-brunneis, poro pertusis, 70-100 μ . diam., contextu parenchymatico; sporulis acicularibus, rectis, continuis, hyalinis, 20-32 \approx 1-1,5.

Hab. in caulis siccis *Orobanches stigmatoidis* prope Kecskemét Hungariæ.

41. **Rhabdospora Ipomœæ** Trav. et Spessa, Bol. Soc. Brot. XXV (1910) 7463 p. 183, t. III, f. 23. — Pycnidiis gregariis, minutis, prominulis, globosis vel e globoso conoideis, 80-120 \approx 80-100, fuligineis, poro distincto pertusis; contextu tenuissimo dilute melleo, sed circa ostium crassiusculo et fuligineo; sporulis filiformibus, curvato-falcatis, utrinque obtusis, continuis, 28-35 \approx 2-2 $\frac{1}{2}$.

Hab. in sarmenis languidis Ipomœæ in horto botanico coimbricensi Lusitaniæ (A. MOLLER).

42. **Rhabdospora Tecomæ** Hollós, Növényt. Közlemén. VI (1907) 7464 Extr. p. 6. — Pycnidiis epidermide tectis, dense gregariis, lenticularibus, brunneis, poro ampio apertis, 210-250 μ . diam., contextu parenchymatico; sporulis cylindraceis, rectis v. plerumque subfalcatis, continuis, granulosis, hyalinis, 16-18 \approx 2.

Hab. in ramis siccis Tecomæ radicantis, Kecskemét Hungariæ.

43. **Rhabdospora Veronicæ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7465 p. 352. — Pycnidiis epidermide tectis, gregariis, globoso-depressis v. ellipsoideis, brunneis, poro pertusis, 100-140 μ . diam., contextu parenchymatico; sporulis filiformibus, rectis v. flexuosis, granulosis, 24-45 \approx 1-1,5.

Hab. in caulis siccis Veronicæ Chamædrys prope Kecskemét Hungariæ.

44. **Rhabdospora Oxycocci** Shear, Bull. Torr. Bot. Club XXXIV (1907) p. 311 et Cranberry Diseas. tab. V, fig. 21-24. — Pycnidiis plerumque hypophyllis, sparsis, immersis, plus v. minus irregulariter depresso-globosis, suberumpentibus, 150-225 μ . diam.; ostio parvo, applanato, parietibus submembranaceis, bistratosis, collabescentibus; cellulis epidermicis nigricantibus; sporophoris ramosis; sporulis hyalinis, elongato-fusoideis, curvulis, 1-3-septatis v. pseudoseptatis, 20-26 \approx 2-3.

Hab. in foliis vetustis Vaccinii macrocarpi prope Whitesville N. Jers. Amer. bor.

45. **Rhabdospora Demetriana** Bubák, Journ. of Mycol. XII (1906) 7467 p. 54. — Pycnidiis caulicolis, in maculis elongatis, argenteo-griseis, saepe vero nullis, aggregatis, subepidermicis, globoso-depressis, 120-200 μ . diam., nigris, collo saepe usque ad 22 μ . lato, papillifermi praeditis, contextu parenchymatico, 15 μ . circ. cr., castaneo-brunneo, ad apicem fere nigro; sporulis acicularibus, 13-

24 \approx 1,5-2, rectis v. curvulis, apice angustatis, unilocularibus vel parum distincte uniseptatis, hyalinis; sporophoris papilliformibus.

Hab. in caulis Asclepiadis verticillatae, Emma Salina Co. Missouri Amer. bor. (C. H. DEMETRIO). — A *Rh. cynanchica* pycnidiis majoribus, sporulis angustioribus diversa.

46. **Rhabdospora vincicola** Hollós, Ann. Mus. Nat. Hung. V (1907) 7468
p. 463. — Pycnidiis epidermide velatis, gregariis, globosis, nigris,
140-230 μ . diam., ostiolo 70 \approx 50 epidermidem perforante, contextu
parenchymatico; sporulis acicularibus, rectis v. nonnunquam levi-
ter curvulis, continuis, hyalinis, 20-34 \approx 1,5-1,75.

Hab. in caulis siccis Vincæ herbaceæ prope Kecskemét
Hungariæ. — *Rhabdospora Vincæ* Oud. est sporulis longioribus
diversa.

47. **Rhabdospora Vincetoxici** Massalongo, Nuove reclute flora mic. ve- 7469
ronese p. 10, in Malpighia XX (1906). — Pycnidiis densissime
in maculis oblongis et fusco-olivaceis aggregatis, carbonaceis, pro-
minulis 60-80 μ . diam., ostiolo 15-20 μ . lato pertusis; sporulis
cylindraceo-fusoideis, continuis, vix utrinque attenuatis, rectis vel
interdum curvulis, 12-30 \approx 2-2,5.

Hab. in pericarpio sicco Vincetoxici officinalis prope
pagum Tregnago ex loco « Calavena » Verona, Ital. bor. — Cha-
racteribus fere media inter *Rh. cynanchicam* Sacc. et *Rh. Gom-
phocarpi* F. Tassi.

48. **Rhabdospora Arnoseridis** Lind, Ann. Mycolog. III (1905) p. 429. 7470
— Pycnidiis gregarie sparsis, parvis, subglobosis, epidermide te-
ctis, dein ostiolo erumpentibus et prominentibus, brunneis, 90-
100 μ . diam.; contextu parenchymatico; sporulis filiformibus vel
acicularibus, rectis v. curvulis, continuis, hyalinis, 28-35 \approx 1.

Hab. in caulis emortuis Arnoseridis minimæ, Horsens
et Langaa in Jütland Sueciæ.

49. **Rhabdospora Saccardiana** Oertel, Ann. Mycol. IV (1906) p. 35, 7471
cum icon. — Pycnidiis dense gregariis, punctiformibus, atris, epi-
dermide velatis, globoso-lenticularibus, 100-154 μ . diam., contextu
distincte parenchymatico, coriaceo, brunneo; sporulis curvis, 20-
38 \approx 2-2,5, obsolete 3-septatis, hyalinis, obtusis; sporophoris bre-
vissimis.

Hab. in caulis Tanaceti vulgaris, Sondershausen Thü-
ringen Germania. — Maculæ albo-griseæ indistinctæ.

50. **Rhabdospora Absinthii** Sacc., in Ann. Mycol. X (1912) p. 317. — 7472
Pycnidiis gregariis subcutaneis, vix erumpentibus, globoso-depres-

sis, 250 μ . diam., nigricantibus; sporulis bacillaribus, sæpe leniter curvis, utrinque obtusulis, 16-19 \approx 1,5, continuis, hyalinis; sporophoris brevibus, paliformibus, stipatis, parum distinctis.

Hab. in caulibus emortuis *Artemisiæ Absinthii* in Horto Musei agrarii Romæ (D. SACCARDO). — A *Rhab. Artemisiæ* Trail differt pycnidiis majoribus, sporulis nunquam fusoideis et paullo longioribus.

51. **Rhabdospora Cirsii** Karst. — Syll. III, p. 592. — var. **Gnaphalii** 7473

Karst., Acta Soc. pro Faun. et Fl. fenn. XXVII, 4 (1905) p. 9.

— Pycnidiis sparsis v. subgregariis, subcutaneis, dein erumpentibus, punctiformibus, atris; sporulis filiformibus, continuis, rectis v. curvulis, 40-50 \approx 1,5.

Hab. in caulibus emortuis *Gnaphalii silvatici* prope Mustiala Fennia.

52. **Rhabdospora punctiformis** Karst., Acta Soc. pro Faun. et Fl. fenn. 7474

XXVII, 4 (1905) p. 9. — Pycnidiis gregariis, erumpentibus, punctiformibus, atris; sporulis filiformibus, flexuosis, continuis, usque ad 60 μ . longis, 1 μ . crassis.

Hab. in caulibus aridis *Artemisiæ vulgaris* prope Mustiala Fenniæ.

53. **Rhabdospora Scorzonerae** Hollós, Ann. Mus. Nat. Hungar. VII 7475

(1909) p. 54. — Pycnidiis epidermide velatis, sparsis, globoso-depressis, nigris, poro pertusis, 140-170 μ . diam., contextu celluloso; sporulis acicularibus, rectis v. leviter curvulis, continuis, hyalinis, 22-26 \approx 1.

Hab. in caulibus siccis *Scorzonerae purpureæ* pr. Nagy-Körös Hungariæ.

54. **Rhabdospora tanaceticola** Bub. et Kab. Hedw. L (1909) p. 42. — 7476

Pycnidiis sparsis, subinde confertis v. seriatis, 100-150 μ . diam., lenticularibus depresso-nigris, subcutaneis, poro papillato excentrico nigro dehiscentibus; contextu atro-brunneo parenchymatico; sporulis copiosis, filiformibus, 20-42 \approx 2,5-3, curvulis vel arcuatis, raro rectis, utrinque tenuatis sed rotundatis, initio continuis, dein 3-septatis, hyalinis v. chlorinis.

Hab. in caulibus emortuis *Tanaceti vulgaris*, socia *Leptosphaeria dolioloides*, pr. Münchengrätz Bohemiæ. — A *Rhab. Tanaceti* sporulis multo minoribus differt.

55. **Rhabdospora Baccharidis** Hollós, Ann. Növényt. Közlemén. VI 7477

(1907) Extr. p. 5. — Pycnidiis epidermide tectis, gregariis, lenticularibus, fuscis, poro pertusis, 200-250 μ . diam., contextu paren-

chymatico; sporulis cylindraceis, utrinque rotundatis, curvulis, continuis, granulosis, hyalinis, 18-22 \approx 3-4.

Hab. in ramulis emortuis Baccharidis halimifoliæ, Kecskemét Hungariæ.

56. **Rhabdospora Chrysanthemi** Hollós, Ann. Mus. Nat. Hungar. IV 7478 (1906) p. 348. — Pycnidiis epidermide tectis, gregariis, lenticularibus, fuscis, poro pertusis, 140-170 μ . diam., contextu parenchymatico; sporulis acicularibus, rectis v. leviter curvulis, interdum obscure 3-septatis, granulosis, hyalinis, 36-52 \approx 2-2,5.

Hab. in caulis siccis Chrysanthemi indici Kecskemét Hungariæ.

57. **Rhabdospora insulana** Saccardo, Fungi aliquot africani, Bol. Soc. Broteriana XXI (1904-1905) p. 8. — Pycnidiis dense late gregariis, perexiguis, subcutaneis, dein erumpentibus, globoso-lenticularibus, nigris, 90-100 μ . diam., poro minuto pertusis; sporulis filiformibus, leviter flexuosis, 35-55 \approx 1, continuis, hyalinis.

Hab. in caulis emortuis Lactucæ nudicaulis in ins. S. Thiago, Cabo Verde, Afr. (Communic. A. MOLLER). — Ab affini *Rh. Lactucarum* (Schw.) Starb. differt minutie pycnidiorum, ostiolo non umbilicato, macula fibrillosa nulla.

58. **Rhabdospora Taraxaci-officinalis** Atkins., Ann. Mycol. VI (1908) 7480 p. 59. — Pycnidiis sparsis v. aggregatis, membranaceis, minutis, atris, 50-60 μ . latis, ostiolo leviter erumpente; sporulis minutis, rectis v. leviter curvulis, saltem 1-septatis, 20-25 \approx 1-1,5.

Hab. ad folia emorta Taraxaci officinalis Ithaca New York Americæ bor.

59. **Rhabdospora Kochiae** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7481 p. 351, tab. VIII, fig. 18. — Pycnidiis epidermide tectis, sparsis, globoso-depressis, atro-brunneis, poro ampio apertis, 160-210 μ . diam., contextu parenchymatico; sporulis cylindraceis, æqualiter crassis, utrinque obtusatis, rectis v. plerumque subfalcatis, granulosis, hyalinis, 18-24 \approx 3-3,5.

Hab. in caulis siccis Kochiae arenariæ prope Kecskemét Hungariæ.

60. **Rhabdospora Humuli** Hollós, Ann. Mus. Nat. Hungar. V (1907) 7482 pag. 52. — Pycnidiis epidermide tectis, sparsis, globoso-depressis, fuscis, poro pertusis, 140-180 μ . diam., contextu parenchymatico; sporulis filiformibus, rectis v. plerumque curvulis, granulosis v. obscure 7-septatis, hyalinis, 44-64 \approx 1,5.

Hab. in caulis siccis Humuli Lupuli prope Kecskemét Hungariæ.

61. **Rhabdospora maculicola** Voglino, in Annali R. Accad. Agricolt. 7483
Torino LIII 1910 (1911) p. 370. — Maculis griseis, albicantibus,
rotundis, ellipticis v. irregularibus, margine sinuatis, 4-8-10 mm.
latis, rarissime confluentibus, 12-16-18 mm. latis; pycnidiis pro-
minentibus, minutis, 70-80 μ . latis, globosis, poro pertusis, exci-
pulo levi, brunneo-olivaceo; sporulis filiformibus, curvis, flexuosis,
continuis, hyalinis, 12-16 rar. 18 \approx 0,5; sporophoris brevissimis.

Hab. in ramis corticatis Populi canadensis, La Mandria,
Venaria Reale, in Pedemontio Ital. bor.

62. **Rhabdospora Ephedræ** Speg., Myc. Arg. V, p. 390, in Ann. Mus. 7484
Nac. Buenos Aires XX (1910). — Maculis nullis sed ramulis infe-
ctis totis cinereo-albicantibus; pycnidiis pauci-gregariis epidermide
tectis, sublenticularibus, 100-120 μ . diam., obsolete ostiolatis, gla-
bris, contextu indistincto; sporulis linearibus utrinque attenuato-
subacutatis, arcuatulis, 35-40 \approx 2-3, multiguttulatis hyalinis.

Hab. ad ramulos emortuos et aridos Ephedræ americanæ
in montanis Potrerillos prope Mendoza Argentina Amer. austr.

63. **Rhabdospora Phœnicis** Alm. et Cam., Rev. Agron. V (1907) 7485
p. 21, tab. I, fig. 34; Bol. Soc. Brot. XXV (1908-1909), Extr.
p. 55. — Pycnidiis primo epidermide tectis, demum erumpentibus,
solitariis, lenticularibus, nigris, 180-270 \approx 130-180; sporulis curvu-
lis, raro rectis, filiformibus, utrinque attenuatis, continuis, hyali-
nis, 19-23 \approx 1.

Hab. in ramis siccis Phœnicis reclinatæ prope Povoa de
Lanhoso Lusitania (BALTH. DE MELLO).

64. **Rhabdospora Antherici** Hollós, Ann. Mus. Nat. Hung. VIII (1910) 7486
p. 7. — Pycnidiis dense gregariis, epidermide velatis, atris, 100-
130 μ . diam., contextu celluloso; sporulis cylindraceis, utrinque
rotundatis, leviter curvulis, 3-septatis, hyalinis, 70-90 \approx 3-3,5.

Hab. in caulis siccis Antherici Liliaginis prope Nagy-
Körös Hungariæ.

65. **Rhabdospora groenlandica** J. Lind, Vidensk.-Selskab. Skrift. Math.-
Naturw. Kl. Christiania (1909) n. 9, Extr. p. 14 et Micromycetes
from North-East Groenlandia, Kobenhavn (1910) p. 159. — Syn.
Septoria nebulosa Rostr. — Syll. X, p. 385 — non *Rhabdospora*
nebulosa (Desm.) Sacc. — Syll. III, p. 589.

66. **Rhabdospora antarctica** Speg., Myc. Argent. V, p. 390, in Anal. 7488
Mus. Nac. Buenos Aires XX (1910). — Maculis nullis, sed ma-

trice suberosula; pycnidii pauci gregarii, epidermide tectis, subcarbonaceis, atris, ostiolatis, globoso-depressis, 75-90 μ . diam., glabris, opacis, contextu indistincto; sporulis bacillaribus, utrinque rotundato-subtruncatis, 12-16 \times 2-3, continuus v. 1-septatis, hyalinis.

Hab. ad ramulos vivos thalli *The loschystidis* cujusdam in scopolosis antarcticis Nuevas Orcadas Argentina Amer. austr.

PSEUDOSEPTORIA Speg., Myc. Arg. V, p. 388, in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. *pseudes* falsus et *Septoria*). — Pycnidia superficialia astoma; sporulæ fusoideæ, continuæ v. pauci-septatæ, hyalinæ.

1. **Pseudoseptoria donacicola** Speg., l. c. p. 388, cum icon. — Ma- 7489 culis ellipticis, 1-2 mm. diam., albis, areola angusta purpurascente obsoleta cinctis; pycnidii superficialibus, paucis, globosis, 80-90 μ . diam., glabris, tenuiter membranaceis, laciniatim dehiscentibus, contextu eximie parenchymatico olivaceo; sporulis plus minusve arcuatis, utrinque acutissimis, 25 \times 4, continuus vel 1-3-septatis, hyalinis.

Hab. ad folia languida Arundinis Donacis in insula Santjago prope La Plata Argentina Amer. austr.

PHLYCTÆNA M. et D. — Syll. III p. 593, X p. 400, XI p. 550, XIV p. 986, XVI p. 981, XVIII p. 403.

1. **Phlyctæna ?linicola** Speg., Myc. Argent. V, pag. 389, in Anal. 7490 Mus. Nac. B. Aires XX (1910). — Partibus infectis primo lutescentibus serius pallescenti-arescentibus; pycnidii cortice vel parenchymate innatis, epidermide tectis, numerosis, primo fulvescentibus, subincompletis, minute ostiolatis, lenticularibus, 75-100 μ . d.; sporulis e cylindraceo subfusoideis, non v. lenissime curvulis, eguttulatis, 20-30 \times 1,5-3.

Hab. ad folia caulesque Lini usitatissimi morbum vulgo « pasmo » vocatum efficiens, vulgata in campis prope La Plata Argentina America austr.

2. **Phlyctæna Hyperici** Hollós, Ann. Mus. Nat. Hungar. IV (1906) 7491 p. 353, tab. VIII, fig. 17. — Pycnidii epidermide tectis, sparsis, nigris, poro pertusis, ellipsoideis, 450-700 \times 300-400, contextu parenchymatico; sporulis cylindraceis, apice semper curvatis, deorsum rectis, continuis, hyalinis, 22-30 \times 1-1,5.

Hab. in partibus inferioribus caulis aridi Hyperici perforati, prope Kecskemét Hungariæ.

3. **Phlyctæna phomatella** Sacc. — Syll. III, p. 594 — fm. **Sophoræ** 7492 Ferr., Malpighia XX (1906) p. 149. — Sporulis hyalinis 24-28 \times 1,2-1,5, flexuosis, hamatis.

Hab. in ramis siccis Sophoræ pendulæ, Alba Pædemontii, Italia bor.

4. **Phlyctæna ? halophila** Spegazz., Myc. Argent. V, p. 389, in Anal. 7493 Mus. Nac. Buenos Aires XX (1910). — Foliis et vagina primum albo-maculatis, mox totis aridis albescensibus, serius ostiolis atro-punctulatis, per ætatem irregulariter rimosis; pycnidiis parenchymate innatis, primo globulosis, 80-100 μ . diam., dein e mutua pressione subconfluentibus et lineolas breves fuscas epidermide tectas efficientibus, carnosulis, obsolete ostiolatis, fuscidulis; sporulis arcuatis, utrinque attenuatis, 18-20 \times 2-3,5, superne acutioribus continuis, hyalinis.

Hab. ad vaginas et folia viva v. arida Hordei halophili prope Santa Maria prov. Cordoba, Argentina Amer. austr.

CHÆTOPHIOPHOMA Speg., Myc. Argent. V, p. 388, in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. *chæte* seta, *ophis* anguis et *Phoma*, h. e. *Chætophoma* scolecospora). — Pycnidia minuta, atra, subglobosa, superficialia, subiculo olivaceo insidentia; sporulæ aciculares v. filiformes, continuæ v. septulatæ, hyalinæ. — Est *Chætophoma* sporulis vermicularibus prædita.

1. **Chætophiophoma Tremæ** Speg., l. c. pag. 388. — Plagulis primo 7494 orbicularibus dein confluendo difformibus, 2-10 mm. diam., tenuiter fibrillosis, arctiuscule matrici adnatis, ex hyphis gracilibus, 4-6 μ . cr., dense alterne ramulosis septulatisque hyphopodiis parcis obovatis alternis ornatis constitutis; pycnidiis globosis, 50-75 μ . diam., superne parenchymaticis olivaceis persistentibus, deorsum hyalinis fluxilibus, astomis, membranaceis; sporulis utrinque attenuatis, acutiusculis, arcuatis, 25-30 \times 1,5-2, fasciculatis, continuis, levibus multiguttulatis.

Hab. ad folia viva Tremæ micranthæ prope Puerto Léon Misiones Argentina Amer. austr.

COLLONEMA Grove — Syll. X p. 397, XVI p. 981.

1. **Collonema levissimum** Karst., Acta Soc. pro Faun. et Fl. fenn. 7495 XXVII (1905) 4, p. 10. — Pycnidiis membranaceis, sphæroideis, superficialibus, glabris, atris, nitentibus, minutis; sporulis fusideo-cylindraceis, continuis, hyalinis, 8-12 \times 1; sporophoris tenellis.

Hab. in radice emortua *Myrtilli* in regione Kuopioënsi, Kotkankallio (O. LÖNNBOHM).

2. **Collonema roseum** v. Höhn., Fragm., z. Mykol., Sitzb. k. Ak. d. 7496 Wiss. Wien, Bd. CXVI, Abt. I (1907) p. 143. — Pycnidiis superficialibus, sparsis, opace brunneo-nigris, coriaceo-membranaceis, plerumque elongatis, 500-600 \approx 150-200, breviter papillato-ostiolatis, extus subrugulosis, basi hyphis 4 μ . cr., supra præcipue ad ostiolum setulis obtusis brunneo-nigris, apice pallidioribus, 40-80 \approx 4 præditis; parietibus stratu externo brunneo-nigro, 20-25 μ . cr., interno hyalino v. subhyalino, sporophoris 20 \approx 1, hyalinis, simplicibus tecto; nucleo roseo; sporulis hyalinis, rectis v. subcurvulis, cylindraceis, apice subacutatis, 4-5-guttulatis, continuis, 12-16 \approx 1,5-2.

Hab. in ligno fagineo putri, Pfalzberg pr. Pressbaum, Austria.

MICROPERA Lév. — Syll. III p. 604, X p. 404, XI p. 551, XIV p. 987, XVIII p. 404.

1. **Micropora ampelina** Sacc. et Fairm. in Saccardo, Microm. Amer. 7497 novi, Journ. of Myc. XII (1906) p. 49. — Pycnidiis sparsis vel seriatis, erumpenti-superficialibus, inæqualiter globosis, astomis, cereo-membranaceis, olivaceis, albo-furfuraceis, 700 μ . diam., basi stipitiformi crassa, 400 μ . longa immersa præditis, intus albido-farctis, excipulo minute celluloso, strato proligerò crasso dilute olivaceo; sporulis tereti-fusoideis, curvis, utrinque obtusulis, 28-30 \approx 7,5-8, farctis, hyalinis; sporophoris bacillaribus 15 \approx 2-5, hyalinis.

Hab. in ramulis nondum emortuis *Vitis viniferae*, Ridgway, Orleans Co., N. Y., Amer. bor. — A ceteris generis speciebus probe distincta. Furfur a granulis crystallinis refringentibus constat. Sporulæ initio ellipsoideæ rectiusculæ, 10-11 \approx 4-5.

MICROPERELLA v. Höhn. Fragm. Mykol. VII (1909) p. 67 (Etym. a *Micropora*, cuius analogum genus). — Stromata superficialia, extus carbonacea, intus carnosa, basi medio tantum adfixa; pycnidia late insidentia, globosa, ostiolata, racemoso-conferta; sporophora simplicia v. cæspitoso-ramosa; sporulæ fusoideæ, 2-pluriloculares.

1. **Microperella Quercus** v. Höhn. l. c. — Ostium usque ad 90 μ . 7498 lat.; sporophora brevia; sporulæ fusoideæ, 2-4-cellulares, 25-36 \approx 5-8, e flavo hyalinæ, intus oleoso-granulosæ.

Hab. in foliis *Quercus glaucæ* in Japonia (YOSHINAGA). — Syll. Fung. XXII (V-1913)

Status pycnid. *Yoshinagaiæ* P. Henn. cujus, teste v. Höhn. asci maturi nondum observati sunt.

SPHÆROGRAPHIUM Sacc. — Syll. III p. 596, X p. 401, XVIII p. 404.

1. **Sphaerographium petiolicola** Karst., Acta Soc. pro Fauna et Fl. fenn. XXVII, 4 (1905) pag. 15. — Pycnidiis sparsis v. gregariis, conoideis, fusco-atris, minutissimis; sporulis elongato-fusoideis, curvulis, 8-16 \times 2.

Hab. in petiolis emortuis Sorbi aucupariæ prope Kuopio Fennia (LÖNNBOHM).

DILOPHOSPORA Desm. — Syll. III p. 600, XVIII p. 405. — Cfr. Journ. of Mycol. (1906) p. 57.

1. **Dilophospora graminis** Desm. — Syll. III, pag. 600 — fm. **Holci** Fuck. Symb. mycol. p. 130, *Dilophospora Holci* Fuckel, Bot. Zeitg. (1861) p. 250, tab. X, fig. 5. — Pycnidiis rotundis, nigris, 250 μ . diam., immersis, crustula nigra tenui tectis, inter nervos seriatis, poro albido pertusis, pustulatim prominulis, in macula flava immarginata sitis; sporulis numerosis, cylindraceis, curvulis, continuis, 4-nucleatis v. (simulate?) 3-4-septatis, non constrictis, utrinque setularum interdum furcatarum fasciculo auctis.

Hab. in vaginis foliisque Holci lanati prope Oestrich Rhenogovia.

2. **Dilophospora chilensis** Speg., Fungi Chilenses (1910) p. 170, cum icon. — Pycnidiis innato-erumpentibus, e lenticulari hemisphæricis, sparsis v. inordinate, gregariis, atris, glabris, coriacellis 80-100 μ . diam.; sporulis hyalinis subcylindraceis, apice altero abrupte obtuseque rotundato altero attenuato-acutato, 28-32 \times 4, parte obtusa biciliata, ciliis 5-7 \times 1, parte acuta cilio altero acrogeno altero laterali, primo continuis serius tetrablastis v. 3-septatis.

Hab. in culmis emortuis Hierochloæ utriculatæ prope Ciudad de Valdivia Chile Amer. austr.

SEPTOSPORIELLA Oud. — Syll. X p. 403.

1. **Septosporiella atrata** (Rob.) Sacc., Notæ myc. VIII, Ann. Myc. v. IV (1906) p. 493, tab. X, fig. 12, *Septoria atrata* Roberge in herb. Mus. Paris. ined. et absque diagnosi. — Stromatibus laxè gregariis v. sparsis, longitudinaliter oblongis, depresso pulvinatis, nigricantibus, epidermide atrata tectis, 2-4 mm. longis, 1-1,5 mm.

lat., intus nigricantibus; loculis seu pycnidiis globoso-lenticularibus, 250 μ . latis, vix 100 μ . cr., intus farctis, albis, in stromatis superficie paullulum protuberantibus; sporulis filiformi-bacillaribus, 40-50 \times 1, rectiusculis, utrinque obtusulis, minute multiguttulatis, hyalinis.

Hab. in caule emortuo *Malvæ silvestris*, Caen Galliæ (ROBERGE, comm. P. HARIOT).

CYTOSPORINA Sacc. — Syll. III p. 601, X p. 347, XI p. 537, XIV p. 966, XVIII p. 375.

1. **Cytosporina Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires t. XVII 7503 (1908) p. 137. — Stromatibus elliptico-difformibus, depressis, 2-6 mm. diam., tuberculiformibus, intus cinereis extus atris, gyrose loculigeris; sporophoris tenuissimis filiformibus, hyalinis, 20-30 \times 0,75-1, monosporis; sporulis sigmoideis arcuatis, utrinque acutis, hyalinis, continuis, 20-25 \times 0,75-1.

Hab. vulgata ubique ad ramulos dejectos putrescentes *Ilicis paraguariensis*, Misiones, Argentina.

2. **Cytosporina Halimi** Maubl., Bull. Soc. Mycol. Fr. XXIII (1907) 7504 pag. 144, tab. XX, fig. 19-20. — Pycnidiis immersis, epidermide hinc nigrificata tectis, ostiolo paululum prominulis, intus 2-3-loocularibus, septis transversalibus, sæpe incompletis divisis; stromate dilute colorato; sporulis filiformibus, hyalinis, curvulis, continuis v. obsolete septatis, 28-32 \times 2; sporophoris brevibus.

Hab. in ramis emortuis *Atriplicis Halimi*, Pornic Loire Inf. Galliæ.

3. **Cytosporina Feurichii** Bubák, Ann. Mycol. IV (1906) p. 118. — 7505 Stromatibus ex elongato ellipsoideis, sæpe longitudinaliter confluentibus, depressis, in ligno superficialiter nigrefacto nidulantibus, 200-250 μ . latis, nigris, stellatim apertis, intus parietibus indistinctis pallidioribus præeditis; sporulis filiformibus, variabilibus, plerumque fortiter incurvatis, raro rectis, 45-75 \times 0,75-1, hyalinis; sporophoris filiformibus cæspitosis, hyalinis.

Hab. in ligno decorticato *Salicis* sp. prope Göda Saxonia (FEURICH).

ERIOSPORA B. et Br. — Syll. III p. 600, XIV p. 987.

1. **Eriospora hypsophila** Speg., Myc. Argent. V, pag. 391, in Anal. 7506 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis deter-

minatis, sæpius rotundatis, 1-2 mm. diam., areola angusta purpurascente cinctis inferne cinereis superne albescensibus; pycnidiis paucis epiphyllis epidermide tectis, 75-90 μ . diam., minute ostiolatis, membranaceis, contextu fuligineo parenchymatico parum distincto; sporulis rectis v. leniter sigmoideis, 35-45 \times 1,5-2; sporophoro concolori recto, 5-10 \times 1,5, geminatim v. ternatim suffultis, continuis.

Hab. ad folia viva *Polylepidis* racemosæ in alpinis Jujuy, Argentina Amer. austr.

2. **Eriospora circunicola** Spieg., Myc. Argent. V, pag. 391, in Anal. 7507 Mus. Nac. Buenos Aires XX (1910). — Stromatibus minutis innato-erumpentibus atris, laxe gregariis, subcarbonaceis, lenticulari-depressis, 300-500 μ . diam., contextu indistincto; loculis paucis globosis 50-100 μ . diam., albo-farctis; sporophoris bacillaribus simplicibus, 30 \times 1, rectis, hyalinis; sporulis ternatis sigmoideis arcuatæ v. uncinatis, utrinque acutiusculis, 25 \times 1, hyalinis.

Hab. ad ramos dejectos putrescentes Pircuniæ dioicæ in Silva Santa Catalina prope Buenos Aires, Argentina Amer. austr.

Fam. 2. Nectrioidaceæ Sacc.

Sect. 1 Hyalosporæ

ZYTHIA Fr. — Syll. III p. 614, X p. 404, XI p. 552, XIV p. 988, XVI p. 983, XVIII p. 408.

1. **Zythia seminicola** P. Henn. in Hedw. XLV (1905) p. 33. — Pycnidiis sparsis v. aggregatis, subsuperficialibus, globulosis, papillatis, ceraceo-molliusculis, succineis, 80-120 μ . cr.; sporulis oblongis utrinque obtusiusculis, rectis v. curvulis, 2-guttulatis, continuis, hyalinis, 5-8 \times 2 $\frac{1}{2}$ -3.

Hab. in seminibus Viciæ silvaticæ, Michailowskoë Rossiæ.

2. **Zythia valparadisiaca** Spieg., Fung. Chilenses (1910) p. 171. — 7509 Pycnidiis ligno denudato subiculoque (an heterogeneo?) tenuissimo araneoso insidentibus, globulosis, 90-120 μ . diam., fulvellis, tenuissime membranaceis, glabris, minute ostiolato-perforatis; sporulis minutissime cylindraceo-ellipsoideis, rectis v. curvulis, utrinque rotundatis, 3-4 \times 1, sæpe biguttulatis, hyalinis.

Hab. in ramis emortuis siccis *Lobeliæ salicifoliæ*, Cerro Alegre de Valparaiso, Chile Amer. austr.

3. **Zythia occultata** Bres. in Strasser Verh. k. k. zool.-bot. Ges. 7510 Wien LX (1910) p. 321. — Pycnidiis astomis, dein lacerato-apertis, superficialibus, subglobosis, subcervinis, membranaceis, contextu distincte prosenchymatico, 200-400 μ . diam.; sporulis hyalinis falcatis, 24-39 \approx 6-8, sporophoris filiformibus, 25-45 \approx 3-4 suffultis.

Hab. in cortice dejecto *Fraxini*, Sonntagberg Austriæ. — Socius adest *Sphæronëma parabolicum*. Incertum est utrum ad gen. *Zythiam* pertineat, an potius ad *Microperam* vel etiam ad *Excipulaceas*.

4. **Zythia cæruleo-atra** v. Höhnel, Sitzb. k. Ak. d. Wiss. CXVII 7511 (1908) Abt. I, p. 1022. — Pycnidiis sparsis, superficialibus, nigris, subcyanescentibus, globosis, siccis depressis, molli-carnosis, 250-350 μ . diam.; contextu tenui, membranaceo-carnoso, molli, sordide griseo-cyaneo, plectenchymatico, ex hyphis ramosis, 3-4 μ . cr., parietibus firmis præditis constituto; ostiolo minuto rotundato; sporophoris hyalinis, filiformibus, simplicibus, 12-15 \approx 1-1,5; sporulis singulis acrogenis, subhyalinis, griseo-cyaneis, unilocularibus, elongatis, rectis v. curvulis, 3-5 \approx 1,5-2.

Hab. in ligno dejecto *Carpini Betuli*, Sattelberg prope Pressbaum Austriæ.

5. **Zythia muscicola** v. Höhn., Sitzb. k. Ak. d. Wiss. Wien CXV 7512 Abt. I (1906) p. 27. — Pycnidiis globosis, sparsis v. parce gregariis confluentibusque, 80-200 μ . diam., tenui-membranaceis, sordide obscure violaceis, plerumque immersis et ostiolo papilliformi nigro depresso prominulis, levibus, hyphis tenuibus hyalinis v. pallide violaceis circumdati, ostiolo 10-12 μ . lato; sporulis in circum hyalinum projectis, hyalinis, plerumque breviter cylindraceis, 4-5 \approx 1,5.

Hab. in capsulis siccis *Orthotrichi fastigiati* prope Almensberg Austriæ inf. (SCHIFFNER).

SIROZYTIA v. Höhn. — Syll. XVIII p. 410.

1. **Sirozythia olivacea** v. Höhn. Fragm. zur. Myk. XI (1910) p. 37. 7513 — Pycnidiis gregariis primum immersis et epidermide tectis, globosis, astomis, demum prominentibus, rotundato-apertis, 500 μ . lati, 300 μ . altis; contextu tenui-carnoso, hyalino, levi, infra circ. 10 μ . supra usque ad 20 μ . cr. fibroso-parenchymatico; sporopho-

ris crebris parallele dispositis, 40-60 \approx 1,5, simplicibus, hyalinis, apice pallide viridi-olivaceis et sporulas catenulatim eformantibus; sporulis solitariis subhyalinis, in massa obscure olivaceo-viridibus, cylindraceis, apice obtusis, rectis, 3-5 \approx 2, demum conglutinatis.

Hab. in ramis Berberidis vulgaris prope Krems in Austria Inferiori.

ELEUTHEROMYCELLA v. Höhnel Fragm. zur. Mykol. V, in Sitzb. k. Ak. d. Wiss. Wien CXVII (1908) Abt. I, p. 1023 (Etym. *Eleutheromyces* *) quocum analogiam habet). — Pycnidia globosa v. oblonga, carnosο-membranacea, mollia, erastrata, primo innata, dein erumpentia, ostiolata; contextu distincto parenchymatico. Sporulae fusoideæ, utrinque ciliatæ, continuæ, sporophoris longis simplicibus v. e basi ramosis suffultæ.

1. **Eleutheromycella mycophila** v. Höhnel, Sitzb. k. Ak. d. Wiss. Wien CXVII (1908) Abt. I, p. 1023. — Pycnidiiis globosis, 300-600 μ . diam., nigricantibus (ab initio?), innato-erumpentibus v. subsuperficialibus, basi coarcatis subinde usque ad 800 μ . altis, papilla conica et poro 40-50 μ . diam. præditis; contextu subcarnoso 35 μ . crasso, e cellulis 6-8 μ . diam. angulosis, atro-brunneis formato; sporophoris 50 \approx 1,5-2; sporulis acro-pleurogenis fusoideis, 8-11 \approx 1,3-1,5, raro 10 \approx 1,7, setula infera brevi, supera 24-40 μ . longa præditis, minute guttulatis.

Hab. in pileo et hymenio Polysticti versicoloris, Wienerwald Austriæ.

RHODOSTICTA Woronichin in Bull. Jardin bot. imp. St. Pétersb. XI (1911) p. 13 (Etym. *rhodon* rosa et *stictos* punctatus). — A gen. *Polystigmina* differt stromate tenuiore et sporulis cylindraceis, brevibus (latitudine duplo longioribus) nec aciculari-filiformibus.

1. **Rhodosticta Caraganæ** Woronichin l. c. — Stromatibus plerumque amphigenis, sparsis v. totum folium occupantibus, pallide roseis v. roseo-ochraceis, rarius albidis; pycnidiiis immersis, globo-

*) Quoad *Eleuteromyctem subulatum*, cum ascos ei tribuant præter me quoque ol. Winter, Schröter, Ellis et Everhart etc., contra sententiam v. Hohenelii (Cfr. l. c.) fieri potest ut reapse de formis diversis, nempe ascophora et pycnidica, agatur.

sis, 40-60 μ . diam. v. oblongis, 60-80 \approx 40-50, amphigenis; contextu subescenti; sporulis brevibus oblongo-bacillaribus, 5 \approx 2-2,5, continuis, hyalinis.

Hab. in foliis vivis *Caraganae fruticis*, Samara et Ufa Rossiæ (E. ISPOLATOV et I. SIVAEVSKIJ). — Sistit pycnidium *Woronichinæ Caraganae*.

ASCHERSONIA Mont. — Syll. III p. 619, X p. 408, XI p. 522, XIV p. 989, XVI p. 984, XVIII p. 411.

1. **Aschersonia Jacarandæ** Spieg., Myc. Arg. V, p. 456, in Anal. Mus. 7516 Nac. Buenos Aires XX (1910). — Stromatibus sparsis superficialibus facile deciduis, subsuberosis subhemiphæricis, 1-2 mm. diam., pruinulosis, inordinate punctato-impressis; loculis difformibus 150-200 μ . diam., nucleo succineo compacto farctis; sporulis ellipsoideis, ambitu costato-marginatis, utrinque conoideo-appendiculatis, 14 \approx 4-5, sine appendicibus 5-6 \approx 4, hyalinis, eguttulatis, levibus.

Hab. ad folia viva *Jacarandæ Carobæ* prope Puerto León Misiones Argentina Amer. austr. — A ceteris speciebus differet videtur etiam quia ut videtur, non entomophila.

2. **Aschersonia Eugeniae** Koord., Botan. Untersuch. Java (1907) p. 214, 7517 fig. 31. — Stromatibus carnosis, amphigenis v. ramicolis, aurantiacis, semiglobosis, 1 mm. latis; sporulis continuis, hyalinis, fusoideis, rectis, utrinque acutis, 10-12 \approx 3-3,5; sporulis filiformibus continuis 12-17 μ . longis, paraphysibus destitutis.

Hab. parasitice in Coccidiis ad folia viva et ramulos Eugeniae cymosæ prope Sapuram prov. Kedu Java et Eugeniae polyanthæ prope Penunggalan (KOORDERS).

3. **Aschersonia tephrosicola** P. Henn., in Fl. du Bas. et Moy. Congo, 7518 v. II, fasc. III (1908) p. 228. — Stromatibus in Lecaniis parasitantibus, hypophyllis, singularibus, pulvinato-discoideis, fusco-castaneis, rugulosis, margine radiato-repandis, 2-4 mm. diam., loculis immersis subovoideis; sporulis fusoideis, acutis 3-4 guttalatis, hyalinis 8-10 \approx 1,5-2, filis hyalinis 40-60 \approx 1-1,5 intermixtis.

Hab. in Lecanio ad folia Tephrosiae sp., Hindu Congo Africa (VANDERYST).

4. **Aschersonia Henningsii** Koord., Botan. Untersuch. Java (1907) p. 7519 213, fig. 30. — Stromatibus carnosis, epiphyllis, subsolitariis, pulvinatis, purpureis, intus pallidioribus, 0,7 mm. diam.; pycnidii peripherice immersis, remotiusculis, pallide fuscellis, poro circulari

ampliusculo non emergente apertis; sporulis, creberrimis, falcato-fusoideis, initio continuis, dein distincte 3-4-septatis, hyalinis, utrinque acuminatis, 50-65 \approx 4-5; sporophoris longe cylindraceis v. bacillaribus, indivisis, hyalinis, 15-25 \approx 3; paraphysibus continuis, indivisis 120-200 \approx 4, intermixtis.

Hab. parasitice in Coccidiis viventibus in foliis Litsoæ amaræ prope Penunggalam prov. Kedu Java (KOORDERS).

5. **Aschersonia lauricola** Speg., Myc. Arg V, p. 457, in An. Mus. 7520 Nac. Buenos Aires XX (1910). — Stromatibus sæpius epiphyllis nervisedis, globoso-depressis, 1-3 mm. diam., inferne coarctatis et cingulo loculigero cinctis, superne ruga concentrica infossa etiam loculigera ornatis, subsuberosis, extus rubris intus albis, loculis inferis amorphis superis globosis 100-150 μ . diam.; sporulis cylindraceo-fusoideis utrinque acutis 6-8 \approx 1,5, hyalinis levibus.

Hab. ad corpora emortua Cacci (Aleurodes?) cujusdam ad folia viva Phœbes in silvis Jujuy, Argentina Amer. austr. (A. RIMBACH). — Secund. Cl. Spegazzini *Aschersoniæ* certe *Hypocreellarum* status pycnidicos sistunt et non in vegetabilibus sed in Coccis sine dubio ullo parasitantur.

6. **Aschersonia pisiformis** Patouill., Bull. Soc. Mycol. Fr. XXII (1906) 7521 p. 59. — Stromate globoso, fusco-olivaceo nigrescenti, 2-5 mm. diam., inferne marginato; contextu albo, indurato, ex hyphis latis crasse tunicatis; pycnidii immersis, sparsis, globoso-ovoides, circiter 200 μ . latis; sporulis hyalinis, fusoideis, eguttulatis, utrinque acutis, 6-8 \approx 1-1,5.

Hab. in corpore emortuo Cacci sp. ad folia Cocos nuciferae, Taravao Polynesia.

MUNKIA Speg. — Syll. X p. 408.

1. **Munkia guaranitica** Speg., Myc. Argent. V p. 392, in An. Mus. 7522 Nac. Buenos Aires XX (1910). — Stromatibus candidis subcaseosis compactiusculis subglobosis, usque ad 5-10 cm diam.; pycnidii v. loculis peripherice dense constipatis fere corticem efformantibus, monostichis, globosis, 100 μ . diam., tenuissime membranaceis contextu ochroleuco subindistincto, ostiolo minuto rotundo impresso perforatis; sporulis subellipsoideis, 5-7 \approx 2,5-3, continuis eguttulatis hyalinis.

Hab. ad ramos vivos Merostachydis argyronemæ in silvis prope Rio San Antonio, Misiones, Argentina Amer. austr. — Gen. *Munkia* Speg., biophilum bambusicola, statum imper-

fectum *Mycomali* Moell. et affinum sistit, a *Glaziella* Brk. saprophilo toto cælo recedens nec quidem comparandum. — Stromata in ramulis pleurogena sæpe pugni magnitudine æquantia panem biscoctum in mentem revocantia, ab incolis inde «galleta de macaco» vocata.

PSEUDOPATELLINA v. Höhnel Fragm. z. Myk. V, in Sitzb. k. Ak. d. Wiss. Wien CXVII (1908) Abt. I, p. 1025 (Etym. *pseudes* falsus et *Patellina*). — Pycnidia immersa, erumpentia, mollia pallida, carnosæ-membranacea, denique superne fissa et tunc nivalaria; sporophora totum pycnidium impletia longe filiformia, ramoso-anastomosantia; sporulæ continuæ, minutæ, hyalinæ, subovatæ, pleurogenæ. — An *Dacrymycetellæ* Bizz. affine genus?

1. **Pseudopatellina conigena** (Niessl.) v. Höhn. l. c., *Dacrymyces conigena* Niessl, ad interim, in Rab. — Wint. F. Europ. N. 2628, *Pactilia strobilicola* (Kalchbr.) Sacc. Syll. IV p. 614. — Charact. generis; sicca griseo-brunneola, 400-500 μ . diam., sporophoris filiformibus, 1,5-2 μ . cr.; sporulis ellipsoideis, 2,5-3 \approx 1,5-1,7, hyalinis, extus mucosis.

Hab. in conis Pini silvestris pr. Brünn Moraviæ.

Sect. 2. Hyalodidymæ

PSEUDODIPLODIA Karst. — Syll. III p. 621, X p. 409, XI p. 553, XVI p. 986, XVIII p. 416.

1. **Pseudodiplodia cyanogena** (Speg.) Sacc. — *Diplodia cyanogena* 7524 Speg. Ampelom. Ital. in Riv. Vit. ed Enol. Conegliano II (1878) p. 472, f. 13. — Pycnidii solitarii in maculis brunneis, oblongis insidentibus, innato-erumpentibus, 150-180 μ . diam., subsphæricis v. lenticularibus, ostiolo impresso perforatis, contextu laxè celluloso-parenchymatico læte cyanescente; sporulis ellipsoideis, v. oblongo-ellipsoideis, utrinque obtusulis, initio continuis 1-guttulatis, dein plasmate bipartito 1-septatis, constrictisque, 18-20 \approx 10, chlorinis v. dilute roseo-fuscillis; sporophoris cylindraceis, 15-25 \approx 2-3.

Hab. ad baccas exsiccatas Vitis viniferæ, Conegliano Ital. bor., socio *Fusario roseo*. — Fere absque dubio st. pycnidicus *Liseæ* v. *Gibberellæ* speciei.

2. **Pseudodiplodia herbarum** Strasser, Verh. k. k. zool.-bot. Ges. 7525

Wien LX (1910) p. 321. — Pycnidiis sparsis, siccis globosis, clausis, extus subsulcatis, ceterum levibus, nigricantibus, uidis e carneo brunneolis, cerasaceis, globosis v. ovoideis, late apertis, depresso-solis, 100 μ . circa diam.; sporulis hyalinis, biseptatis, obtuse fusoides, 12-16(-18) \times 4.5.

Hab. in caulibus putrescentibus *Cirsii*, Sonntagberg Austriæ.

3. **Pseudodiplodia Xylariæ** Ferd. et Winge, Botanisk Tidsskrz. XXIX 7526 (1908) p. 21, tab. II, fig. 10. — Pycnidiis superficialibus dense gregariis, globosis, subconico-protractis, nonnunquam applanatis, formaque *Roselliniam thelenam* in memoriam revocantibus, membranaceis, 100-125 μ . diam., luteis; excipulo stratis circ. 5 minute cellularibus composito, intimo sporulifero ideoque sporophoris nullis; sporulis oblongis, apice rotundatis v. ellipsoideo-subfusiformibus, nonnunquam varie irregularibus, maturis 1-septatis, ad septum saepius leniter constrictis, guttulis 2-4 oleosis farctis, 6,5-8 \times 2 $\frac{1}{4}$ -3 $\frac{1}{4}$, subinde longioribus, hyalinis.

Hab. ad clavulas Xylariæ sp. in insula St. Jan Indiæ occ. (RAUNKIÆR). — Habitus, primo obtutu, quasi *Eurotii*.

Sect. 3 Hyalophragmiæ

STAGONOPSIS Sacc. — Syll. III p. 621, X p. 410, XVIII p. 417.

1. **Stagonopsis sclerotioides** v. Höhn., Ann. Naturh. Hofmus. Wien 7527 XX Heft 4 (1905) Extract. p. 5. — Pycnidiis astomis, irregulatiter disrumpentibus, subglobosis, superficialibus, sclerotioideis, solitariis v. gregariis, sordide rubro-brunneis, opacis, rugulosis, 0,5-1 mm. latis et altis, basi pallidioribus, angustatis, in mycelio ex hyphis subhyalinis 4 μ . cr. constituto insidentibus; parietibus rubro-ochraceo-flavis, mollibus, 20 μ . circ. cr., 3-4 stratos, grosse plectenchymaticis; sporulis cylindraceo-fusoideis, apice acutatis, quadrilocularibus, hyalinis, 16-20 \times 3-4; sporophoris simplicibus 16-20 μ . long. 3-4 μ . cr.

Hab. in caulibus Astragali sp. in Mt. Erdschias-Dagh Anatoliæ.

Sect. 4 Scolecosporæ

TRICHOSPERMA Speg. — Syll. X p. 411, XVIII p. 419.

1. **Trichosperma cyphelloidea** v. Höhn., Fragm. z. Mykol., Sitzb. 7528

k. Ak. d. Wiss. Wien, Bd. CXVI, Abt. I (1907) p. 145. — Subiculo late effuso, albo, arcte adnato, tenui-membranaceo; pycnidiiis sparsis, superficialibus, navicularibus, supra conoideo-crateriformibus, late apertis, tenuiter membranaceo-marginatis, extus levibus v. asperatis, albidis, usque ad 1 mm. altis et cr., disco pallide flavido; contextu ex hyphis plectenchymaticis, tenuibus, crasse tunicatis constituto; sporophoris simplicibus filiformibus 40-50 \times 1,5-2; sporulis filiformibus curvulis v. contortis, septatis, 60-90 \times basi 2-3, supra 1,5-1,8; loculis 6-7 μ . long.

Hab. in ligno putri, Upolu in Ins. Samoa (RECHINGER).

2. **Trichosperma æruginosa** v. Höhn. Fragm. z. Mykol. IX (1909) pag. 7529 70. — Pycnidiiis superficialibus, epiphyllis, maculis nullis, æqualiter sparsis, vegetis saturate æragineis, superne pallidioribus, primo clausis, depresso globosis, demum conchiformibus late apertis, siccis varie contortis, nigris, nitidulis, glabris, membranula basali usque ad 60 μ . cr., carnosula suffultis, deorsum gelatinoso-carnosulis, superne carnosono-membranaceis; sporophoris pycnidii partem dimidiata inf. obtengentibus, simplicibus, 7-8 \times 2-3, apice rotundatis, monosporis; sporulis cylindrico-vermicularibus, spirali-ter convolutis, apice obtusulis, saepe sigmatoideis 60 \times 2, sursum usque ad 4 μ . incrassatis, conglutinatis.

Hab. in foliis vivis Myrtaceæ cujusdam (Myrtus?) Villa Maria pr. S. Paulo Brasilia (USTERI). — Quoad contextus structuram cfr. v. Höhnel l. c., qui speciem suam serius in nota ms. ad gen. *Pyrenotrichum* Mont. duxit.

TRICHOCREA March. — Syll. X p. 410.

1. **Trichocrea valdiviensis** Speg., Fungi Chilenses (1910) p. 172. — 7530 Pycnidiiis laxè gregariis, epidermide tectis, serius erumpentibus, candidis, latissime ostiolatis, membranaceo-carnosulis, sublenticularibus, 75-100 μ . diam.; sporulis filiformibus majusculis, flexuosis, hyalinis, septulatis, 50-60 \times 1,50-1,75.

Hab. in caulis emortuis subputrescentibus Lobeliæ Tupæ prope Ciudad de Valdivia Chile Amer. austr.

CHROMOCYTOPORA Speg., Myc. Argent. V, p. 392, in Anal. Mus. Nac. Buenos Aires XX (1910). (Etym. *chroma* color et *Cytospora*, h. e. *Cytosporina* læte colorata). — Stromata saprophila, valsea v. eutypea ceracea, læticoloria, inordinate multilocularia; sporulæ fili-

formes, hyalinæ. — Genus *Cytosporinæ* affine, stromatibus loculisque nectrioideis recedens.

1. **Chromocytospora ricinella** Speg. l. c. p. 392, cum icon. — Stromatibus elliptico-difformibus, 0.5-1 mm. long. et lat., depresso scrupulosis, ex albo roseo-flavescentibus, primo tectis dein per fissuras epidermidis erumpentibus, 4-5-loocularibus, loculis minutis 100-250 μ . diam., e mutua pressione difformibus; sporulis arcuato-unciniformibus, utrinque acutatis, 20-30 \times 1, continuis.

Hab. ad ramulos dejectos putrescentes Ricini communis in sepibus La Plata Argentina Amer. austr.

Fam. 3. Leptostromataceæ SACC.

Sect. 1 Hyalosporæ

LEPTOTHYRIUM Kunze. — Syll. III p. 626, X p. 412, XI p. 553, XIV p. 992, XVI p. 986, XVIII p. 419.

1. **Leptothyrium vulgare** (Fr.) Sacc. — Syll. III p. 633 — var. 7532 **Corni-suecicæ** (Fr.) Starb., Stud. Fies Herb. I (1894) p. 95, t. 4, f. 74. — *Phoma Corni-suecicæ* (Fr.) Sacc. Syll. III p. 86. — Pycnidii superficialibus depresso elongatis, membranaceis, cellulis rectangularibus versus ostium centrale convergentibus, 150-200 μ . diam.; sporulis rectis, cylindraceis, hyalinis, 5-6,5 \times 1,5-2.

Hab. in ramis Corni suecicæ in Suecia.

2. **Leptothyrium Peronæ** Briosi et Cav., Funghi parass. n. 348 (1900). 7533 — Maculis orbicularibus v. vagis, fuscis, nigro-marginatis; pycnidii epiphyllis subsuperficialibus, clypeatis, radiato-contextis, fibrillis eximie ramosis, medio perforatis; sporophoris bacillaribus brevissimis, stipatis; sporulis perminutis, ellipsoideis v. ovoideis, levibus, hyalinis, 2-4 μ . longis.

Hab. in foliis Pæoniæ Moutan in arboreto Instituti Silviculturæ, Vallombrosa Toscana (V. PERONA).

3. **Leptothyrium Pæoniæ** Voglino, Ann. R. Acc. Agricolt. Torino vol. LI (1908) Extr. p. 26 notas. — Maculis latis, ochraceis, fusco cinctis, circularibus v. oblongis; pycnidii epiphyllis, disciformibus, scutatis, fuliginosis v. nigris. in lineam circularem dispositis, medio sparsis, 800 μ . usque ad 1 mm. latis; sporulis oblongo-ellipsoideis, hyalinis, 7-8 \times 2; sporophoris filiformibus, 50 \times 1.

Hab. in foliis Pæoniæ arboreæ, Rivoli, Torino, Ital. bor.

4. **Leptothyrium berberidicola** C. Massap. Sacc. in Ann. Myc. III 7535 (1905) p. 168. — Pycnidiis punctiformibus, nigris, crebre disseminatis, epiphyllis, depresso-clypeatis, contextu subanhistro minutissime punctulato, fere ab epidermide mutata formato; sporulis bacillaribus, utrinque rotundatis, 4-5 \approx 1-1,5; sporophoribus aciculibus 8-10 \approx 1,5.

Hab. in foliis siccis Berberidis vulgaris supra Badia Calavena in agro Veronensi Italiae bor. — A *Lept. Berberidis* Cooke et M. (an = *Lept. Berberidis* Richon?) diversum.

5. **Leptothyrium acerigenum** Kab. et Bub. Hedw. L (1910) p. 43. — 7536 Maculis amphigenis, saepius epiphyllis, 1 cm. lat., irregulariter rotundatis, bullosis, alutaceis, dein griseis; pycnidiis amphigenis, sparsis, ostiolatis, scutatis, nigris, rugosis, opacis, udis convexis, nitidis, 0,3-0,5 mm. diam., astomis, contextu indistincte parenchymatico-radiato; sporulis exiguis, 3-4 \approx 1, rectis, hyalinis, eguttulatis; sporophoribus dendroideo-ramosis, filiformibus, apicibus attenuatis, 15-20 \approx 2-2,5, hyalinis.

Hab. in foliis putrescentibus praeteriti anni Aceris platanoidis pr. Turnau Bohemiæ. — A ceteris speciebus acericolis minutie sporularum imprimis distinguitur.

6. **Leptothyrium microstomum** Spegazz., Fungi Paulist. Rev. Mus. 7537 La Plata t. XV p. 39 (1908). — Maculis nullis; pycnidiis amphigenis dimidiato-scutatis 70-80 μ . diam., nigris, glabris, subiculo destitutis, ostiolo parvulo 5-8 μ . diam. perforatis, margine vix fimbriato, membranaceo, contextu parenchymatico radiante, fuligineo; sporulis utrinque obtusissimis, 6-8 \approx 4, eguttulatis.

Hab. in foliis Lauraceæ cujusdam, Ipiranga Moca Brasilia, (USTERI)

7. **Leptothyrium rubicola** Speg., Fungi Chilenses (1910) p. 173. — 7538 Maculis nullis; pycnidiis superficialibus orbicularibus, 75-80 μ . diam., dimidiato-scutatis, membranaceo-coriacellis, contextu prosenchymatico-radiante, centro ostiolo rotundo obsolete perforatis, margine integerrimis; sporulis cylindraceis, 4-5 \approx 1, utrinque obtusis, hyalinis, rectis v. vix subcurvulis.

Hab. in sarmentis siccis Rubi sancti prope Ciudad de Valdivia Chile Amer. austr.

8. **Leptothyrium serotinum** Kab. et Bub., Myc. Beitr., Hedwigia Bd. 7539 XLVI (1907) p. 295. — Pycnidiis epiphyllis, raro hypophyllis, gregariis v. sparsis, quandoque confluentibus, subellipsoideis, 60-120 μ . latis, nigris, nitidis, carbonaceis, epidermide tectis, diu clau-

sis, demum poro irregulariter rotundato apertis, brunneo-olivaceis, firmis, contextu parenchymatico; sporulis cylindraceis, utrinque rotundatis, uno latere saepe angustatis, rectis, 12-18 \approx 2-3, hyalinis, pluriguttulatis; sporophoris brevibus.

Hab. in foliis siccis, putrescentibus *Pruni serotinæ*, prope Turnau Bohemia (KABAT).

9. **Leptothyrium exiguum** Syd. Ann. Mycol. V (1907) p. 361. — Pycnidiis epiphyllis, maculis albidis insidentibus, atris, sparsis vel etiam hinc inde aggregatis, exiguis, punctiformibus, 40-70 μ . diam., dimidiato-scutatis, contextu radiato fuligineo; sporulis globosis, subglobosis vel ovatis, continuis, hyalinis, 4-5 \approx 3 $\frac{1}{2}$ -4 $\frac{1}{2}$.

Hab. in foliis Myrtaceæ spec. indeterminatæ, Prov. São Paulo, Campinas Brasilia. — Folia fungo affecta habitum erysipheum seu oidiaceum induunt, qui vero nil est nisi exsudatio quædam a fungillo generata.

10. **Leptothyrium lunula** v. Höhn., Ann. Naturhist. Hofmus. Wien XX, Heft 4 (1906) p. 6. — Pycnidiis erumpenti-superficialibus, depressis, rotundatis v. elongatis, 200-400 μ . long., nigris tenuiter tunicatis, irregulariter disrumpentibus; parietibus pseudoparenchymaticis ex cellulis irregulariter dispositis stratum simpliçem efformantibus, 8-20 μ . cr.; sporulis hyalinis, in massa pallide brunneolis, fusoideis, apice acutatis, lunato-falcatis, 15-24 \approx 2,5-5 plerumque 18-20 \approx 3-4.

Hab. in rhachidibus foliorum *Astragali* sp. in Erdschyas-Dagh 2700-2900 m. alt. Asiæ minoris.

11. **Leptothyrium Kellermani** Bubák, Journ. of Mycol. XII (1906) p. 55. — Pycnidiis plerumque hypophyllis, raro epiphyllis quandoque in maculis pallescentibus sparsis, depresso scutatis, 90-150 μ . diam., nigris, non nitidis, contextu parenchymatico obscure brunneo, olivaceo; sporulis bacillaribus 3-4,5 \approx 1, rectis, unilocularibus; sporophoris subclavatis, 6-8 μ . long., tenuibus, infra fasciculatis, hyalinis.

Hab. in foliis *Sassafras officinalis*, Fairfield Co. Ohio Amer. bor. (W. A. KELLERMAN). — Socia adest *Sphaerella Sassafras* Ell. et Ev.

12. **Leptothyrium drimydicola** Speg., Fungi Chilenses (1910) p. 172. — Maculis orbicularibus determinatis amphigenis, subpallescentibus, obsolete marginatis, 1-5 mm. diam.; pycnidiis centro macularum ad epiphyllum laxe insidentibus, 50-90 μ . diam., dimidiato-scutatis, glabris, atris, opacis, centro stellatim dehiscentibus; spo-

rulis cylindraceis, hyalinis, 14-16 \approx 3-3,5, 2-4-guttulatis; sporophoris cylindraceis 5-6 \approx 1, hyalinis.

Hab. in foliis vivis *Drimydis Winteri* in silvaticis Bahia de Corral, Chile Amer. austr.

13. **Leptothyrium Azorellæ** P. Henn., Deutsche Süd-polar-Exped. Bd. 7544 VIII (1906) Extr. p. 15, tab. 22, a, b, c. — Pycnidiis superficialibus, sparsis, singularibus discoideo-rotundatis, atris, membranaceis cellulosis, astomis, 150-180 μ . diam.; sporulis oblongis, subfusoides, rectis, obtusis, eguttulatis, continuis, hyalinis 6-7 \approx 2-2,5.

Hab. in foliis *Azorellæ Selaginis*, in Kerguelen (WERTH).

14. **Leptothyrium Monotropæ** P. Henn., Pilzfl. v Lanke II in Verhandl. 7545 bot. Vereins Brand. (1905) p 222. — Pycnidiis gregariis, dimidiato-discoideis, ellipsoideis v. rotundatis, membranaceis, atro-nitentibus c. 100-150 \approx 50-60; sporulis cylindraceis, obtusis, hyalinis, continuis, 12-16 \approx 2,5-3.

Hab. in caulis emortuis *Monotropæ Hypopitys*, Anhöhen ad Hellsee Germania.

15. **Leptothyrium Psychotriæ** Syd. Ann. Mycol. V (1907) p. 362. — 7546 Pycnidiis hypophyllis, sine maculis, sparsis, rotundatis, 200-250 μ . diam., scutato-dimidiatis, atris, opacis, contextu radiatim angusteque parenchymatico, obscure fuligineo, centro saturatiore, poro pertusis; sporulis ellipsoideis, utrinque obtusis, continuis, hyalinis, $2\frac{1}{2}$ - $3\frac{1}{2}$ \approx 1- $1\frac{1}{2}$.

Hab. in foliis *Psychotriæ auconifoliae* (?), in horto bot. Sao Paulo Brasiliæ.

16. **Leptothyrium heterospermum** Speg., Myc. Argent. V, p. 393, in 7547 An. Mus. Nac. Buenos Aires XX (1910). — Pycnidiis epiphyllis scutiformibus, 150-180 μ . diam., pauci-gregariis, areola leniter infuscata sæpius cinctis, astomis; sporulis obovatis, utrinque obtusis, 10-12 \approx 7-8, hyalinis, muco vestitis, in sporophoris filiformibus non v. vix longioribus, 10-15 \approx 1, solitarie acrogenis, paraphysibus numerosis filiformibus mox in articulos cylindraceos, 10 \approx 1,5, secedentibus cinctis.

Hab. ad folia viva *Macfadyenæ cynanchoidis* in silvis Jujuy Argentina.

17. **Leptothyrium gentianicola** (DC.) Bäuml. — Syll. X p. 415 — 7548 var. **olivaceum** Bubák, Ann. Mycol. VII (1909) p. 61. — Pycnidiis epidermide velatis, lenticularibus, 150-250 μ . diam., membra-na tenui inferne crassiore nigricante; sporulis cylindraceis, 13-

$22 \approx 2,5-3$, dilute olivaceis; sporophoris $5-8 \mu$. long., apicem versus incrassatis et $3-4 \mu$. cr., hyalinis.

Hab. in foliis emortuis *Gentianæ acaulis*, Wienerschneeburg Austria.

18. ***Leptothyrium glomeratum*** Patouill., Bull. Soc. Mycol. Fr. XXIV 7549 (1908) p. 12. — Maculis nullis; pycnidiis orbicularibus, convexo-dimidiatis $45-75 \mu$. diam., solitariis v. dense glomeratis, sæpe confluentibus quandoque pilis brevibus erectis simplicibus fuligineis parce vestitis, contextu fuliginoso, radiante; ostiolo punctiformi; sporulis hyalinis, rectis, cuneiformibus, intus granulosis, $10 \approx 2$.

Hab. in pagina inferiori foliorum *Cionandræ racemosæ*, Guadalupe (Duss).

19. ***Leptothyrium tumidulum*** Sacc. in Ann. Mycol. X (1912) p. 312. 7550 — Maculis plerumque epiphyllis, minutis, subcircularibus, brunneolis, $0,5-1$ mm. diam., non discolori-marginatis; pycnidiis 1-paucis in quaque macula, subhemisphæricis, dimidiatis, nigris, nitidulis, $110-140 \mu$. diam., apice convexis, diu astomis, tandem poro $25-28 \mu$. diam. dehiscentibus; contextu fuligineo e cellulis sinuosis, nonnihil radiantibus, prope porum obscurioribus formato et basi circum circa breviter decurrente, subfimbriato; sporulis ovoido-oblongis, basi acutiusculis, leviter inæquilateralibus, levibus, $14-15 \approx 7-8$, nubilosso-farctis, hyalinis; sporophoris brevissimis.

Hab. in foliis petiolisque vivis *Solidaginis rigidæ*, London Ontario Canada (J. DEARNESS). — Sæpe promiscue occurunt scutula insecti cujusdam, pycnidiorum æmula. — Species subaffinis videtur *Leptothyrio punctiformi* et *Lept. Bornmüllerii* sed rite distincta; imprimis pycnidiis tumidis etsi vere dimidiatis dignoscitur.

20. ***Leptothyrium Oxycocci*** Shear, Bull. Torr. Bot. Club. XXXIV 7551 (1907) p. 311, Cranberry Dis. tab. V, fig. 29-33. — Pycnidiis nigris, dimidiatis, amphigenis, sparsis, subcoriaceis, irregulariter subglobosis, $160-250 \mu$. diam., epidermide circumdatis, quandoque superficialibus v. subsuperficialibus et collabescentibus, basi sæpe erumpentibus et tunc massam sporularum ostendentibus; parietibus irregulariter incrassatis plerumque ad apicem; sporulis subfusoideis, hyalinis, quandoque leniter curvulis, pseudoseptatis, $10-15 \approx 2,5-3$; sporophoris simplicibus leniter conoideis, sporulas leniter superantibus.

Hab. in foliis emortuis *Vaccinii macrocarpi* prope Wareham et Piercerville Mass. Amer. bor.

21. **Leptothyrium Pazschkeanum** Bubák, Journ. of Mycol. XII (1906) 7552

p. 55. — Pycnidiis in caulis emortuis late gregariis, depresso-scutatis, 50-120 μ . latis, brunneis, contextu parenchymatico pallide flavo-brunneo, poro centrali obscuriori irregulariter rotundato; sporulis bacillaribus 3-4,5 \approx 1, rectis v. curvulis, hyalinis; sporophoris brevibus indistinctis.

Hab. in caulis emortuis *Asclepiadis verticillatae*, Emma Salina Co. Amer. bor. (C. H. DEMETRIO).

22. **Leptothyrium Gibellianum** Cav. in Briosi et Cavara, Funghi 7553

parass. n. 273 (1896). — Pycnidiis spuriis e cuticula mutata atrataque efformatis, plerumque hypophyllis, applanatis, nigris, plicatisque; sporophoris e strato stromatico tenui, hyalino orientibus, cylindraceis v. clavulatis sporulas paullo superantibus, monosporis; sporulis ellipsoideis, subbotuliformibus, intus granulosis, hyalinis, 6-8 \approx 2-3,

Hab. in foliis *Betulæ albæ* in horto bot. Torino Ital. bor. (G. GIBELLI).

23. **Leptothyrium alneum** (Lév.) Sacc. — Syll. III p. 627 — f. **Alni-** 7554

cordatæ Trott. ap. Sacc. in Ann. Mycol. IX (1911) p. 253. — A typo tantum recedit pycnidiis sporulisque paullo majoribus, postremis 11-15 \approx 2.

Hab. in pag. sup. foliorum adhuc viventium *Alni cordatæ* pr. Paola Calabriæ, (A. TROTTER). — Cl. C. Massalongo (Osserv. fitol. in Mad. Verona II (1908) p. 10 extr. formam citat in foliis *Alni incanæ*, Bolca Verona It. bor.

24. **Leptothyrium didermatum** Kab. et Bub. Myc. Beitr. Hedwigia 7555

Bd. XLVI (1907) p. 295. — Pycnidiis hypophyllis, sparsis v. gregariis, quandoque confluentibus, rotundatis v. angulosis, scutatis, 100-250 μ . latis, nigris, nitidis, siccis plicatis, asperulis, udis pustuliformibus, irregulariter disrumpentibus; contextu parenchymatico dupli; stratu exteriori parenchymatico brunneo, interno pallidiori et e cellulis elongatis plus minusve radiantibus constituto; sporulis cylindraceis 3-4 \approx 1-1,5, rectis, hyalinis; sporophoris basi cæspitose confertis, rectis v. curvis, 20-30 \approx 1-1,5, hyalinis.

Hab. in foliis putrescentibus *Fagi silvaticæ*, Bohemia (KABAT).

25. **Leptothyrium californicum** Bubák, Journ. of Mycol. XII (1906) 7556

p. 55. — Maculis epiphyllis, rotundatis, non distincte limitatis, saepe confluentibus, brunneis; pycnidiis epiphyllis, parvis, copio-

sis, 90 μ . circ. latis, scutatis, convexis, nigris, nitentibus, subepidermicis, demum irregulariter apertis, contextu crassiusculo, indistincto, sordide castaneo-brunneo; sporulis breviter ellipsoideis, 4-6,5 \times 2-3, hyalinis; sporophoris breviter cylindraceis, 15 μ . circ. longis, crebris, pallide olivaceo-brunneolis.

Hab. in foliis vivis *Quercus Morehi*, Pine Grove, Amador Co. California Amer. bor. (HANSEN). — Socia adest *Phleospora Hansenii*.

26. **Leptothyrium Tremulæ** Kab. et Bub. Hedw. L (1909) p. 44. — 7557

Maculis pallide alutaceis, utrinque conspicuis, minutis, irregularibus; pycnidiis plerumque epiphyllis, raro hypophyllis, subinde nervi-petiolicolis, sparsis v. gregariis, raro 2-pluribus confluentibus, orbicularibus, 0,2-0,5 mm. lat., nigris, opacis, astomis, contextu compacto, atro-brunneo, indistincte radiatim celluloso; sporulis minutissimis, breve bacillaribus, 2,3-3,5 \times 1-1,5, hyalinis; sporosporophoris dense fasciculatis, 12-20 \times 2-2,5, hyalinis.

Hab. in foliis putrescentibus *Populi Tremulæ* pr. Turnau Bohemiæ.

27. **Leptothyrium discosoides** (Sacc.) Keissl. in litt. Nov. 1912. — 7558

Ita dicetur *Phoma discosoides* Sacc. — Syll. III p. 114 — nam pycnidium est appланatum, radiatim contextum et subastomum.

Hab. in foliis fagineis non tantum in Gallia sed et in Austria sup. (KEISSLER).

28. **Leptothyrium talcahuense** Speg., Fungi Chilenses (1910) p. 173. — 7559

— Maculis nullis; pycnidiis epiphyllis superficialibus plus v. minus laxè gregariis, orbicularibus, dimidiato-scutatis, 100-150 μ . diam., astomis, atris, tenuiter membranaceis, centro parenchymaticis; sporulis cylindraceis, utrinque obtusis, rectis, 5-7 \times 1,75-2, hyalinis.

Hab. in foliis dejectis, adhuc vivis *Cryptocaryæ Bellotæ* in silvaticis Cerro Caracol de Concepcion Chile Amer. austr.

29. **Leptothyrium conigenum** Peyl, Lotos VII (1857) p. 66, tab. II, 7560

fig. 10. — Syll. III p. 632. — Pycnidiis scutiformibus, minutissimis, atris, nitidulis, margine leviter elevatis, centro minute papillatis, nucleo albido; sporulis fusoides, leviter curvis, minutissimis, hyalinis.

Hab. in squamis dejectis, inter Muscos putrescentibus, *Abretis albæ* in viridario, Kacin Bohemiæ.

30. **Leptothyrium pinophilum** Bub. et Kab. Hedw. L (1910) p. 43. — 7561

Maculis nullis; pycnidiis amphigenis, sparsis v. gregariis, interdum

confluentibus, ambitu rotundatis, scutiformibus, 150-250 μ . diam., nigris; contextu e cellulis radiatim et concentricè dispositis atrocastaneis formato, centro ostiolo irregulari obscuriori prædito; sporulis copiosis, bacteriformibus, $2 \times 0,7-1$, hyalinis, utrinque minute 1-guttulatis; sporophoris e strato proliferò minute celluloso-favaceo, dilute brunneo oriundis, longe ampulliformibus, 20 μ . long., dilute brunneolis.

Hab. in acubis *Abietis pectinatae* pr. Turnau Bohemiæ. — Contextu singulari radiato-zonato et sporulis exiguis prædistincta species.

31. **Leptothyrium radiatum** Ferdinands. et Winge, Bot. Tidsskr. 7562 XXVIII (1907) p. 255, fig. 5. — Pycnidiis superficialibus, orbicularibus v. polygonatis, applanato-scutatis, circa 250 μ . diam., nitentibus, contextu distincte celluloso-radiato, irregulariter plerumque radiatim dehiscentibus; sporulis copiosis, continuis, bacillaribus, $6,5-8,5 \times 1\frac{1}{4}$, hyalinis; sporophoris brevibus, nonnumquam ramosis, evanidis.

Hab. ad culmos sicclos *Junci squarroso*, prope Borris Jutlandiæ, Dania.

32. **Leptothyrium Caricis** Bondarzew, Acta Horti Petropol. XXVI 7563 (1906) p. 49. (extr.) — Pycnidiis amphigenis vagis v. gregariis, carbonaceis, scutiformibus, v. rotundatis, 100-160 μ . diam.; sporulis cylindraceo-fusiformibus v. falcatis, hyalinis, 16-20 \times 3-3,5; sporophoris brevibus, filiformibus, 4-5 \times 0,5.

Hab. in foliis vivis et emortuis *Caricis* sp. in ditione Kursk Rossiæ.

33. **Leptothyrium charticola** Vouaux, Bull. Soc. Myc. Fr. (1910) 7564 p. 154. — Pycnidiis sparsis superficialibus, dimidiatis, fuscis, membranaceis, contextu tenuissimo ex hyphis varie conglomeratis constante, circulo irregulari hiantibus, minimis, 70-100 μ . diam.; sporulis numerosissimis, fusoideis curvulisque, lunulæ formam habentibus, utrinque acutiusculis, plerumque multiguttulatis, rarius bi-v. uniguttulatis, $12-14 \times 3,5-4$, hyalinis, continuis, sporophoris nullis suffultis, sed e cellulis hyalinis emergentibusque parietis ipsius enascentibus.

Hab. in charta putrescente, Versailles Gallia (BOULY DE LEDAIN). — Ab aliis speciebus differt dimensionibus singularum partium; affine *L. Periclymeni* (Desm.) Sacc., cuius sporulae multo maiores sunt.

ERIOTHYRIUM Speg. — Syll. X p. 418.

1. **Eriothyrium? rosicola** Speg., Myc. Argent. V, p. 395, in Anal. 7565 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis v. folio infecto hinc inde leniter vaseve pallescente; pycnidiis amphigenis laxissime gregariis v. sparsis, superficialibus, orbicularibus, 120, μ . diam., dimidiato-scutatis, astomis, membranaceis, margine modice fimbriato-radiantibus, atris; sporulis ellipsoideis v. ovoideis utrinque plus minusve rotundatis, 4-5 \approx 1,5-2, eguttulatis, hyalinis.

Hab. ad folia viva Rosæ lucidæ in hortis La Plata Argentina Amer. austr.

2. **Eriothyrium cucurbiticola** Speg., Myc. Argent. V, p. 394, in Anal. 7566 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis v. foliis hinc inde obsolete pallescentibus; plagulis-amphigenis repando-orbicularibus, 5-7 mm. diam., atro-olivaceis ex hyphis tenuibus, 50-250 \approx 5, dense v. laxe intertextis, olivaceis efformatis; pycnidiis dimidiato scutatis, 100-250 μ . diam. margine inæqualibus, crenulatis, radiantim prosenchymaticis, nigro-olivaceis, ex hyphis conglutinatis dense septulato-articulatis, articulis 4-6 \approx 5, obscure olivaceis; sporulis cylindraceis utrinque obtuse rotundatis, saepius biguttulatis, 9-11 \approx 2, hyalinis.

Hab. vulgata ad folia viva Cayaponiæ citrullifoliæ in sepibus circa Tucumán Argentina America austr.

MELASMIA Lév. Syll. III p. 637, X p. 419, XI p. 555, XIV p. 994, XVI p. 989, XVII p. 793, XVIII p. 424.

1. **Melasmia falcata** Syd. Ann. Mycol V (1907) p. 362. — Stroma- 7567 tibus amphigenis, innatis, orbicularibus, planis, $1\frac{1}{2}$ -2 cm. diam., atris, opacis, flavo-marginatis; pycnidiis globulosis, immersis, subinde circulariter dispositis; sporulis filiformibus, valde curvatis, plerumque falcatis vel sublunulatis, hyalinis, continuis, acicularibus, 18-25 \approx $1\frac{1}{2}$; sporophoris subfiliformibus, hyalinis.

Hab. in foliis Diospyri, prov. São Paulo, Confins, Brasilia.

2. **Melasmia salicina** Lév. ap. Tul. Fung. Carp. III p. 119, t. XV, 7568 f. 15-17 (1865). — Pycnidiis disciformibus, epidermide atrata tectis et ex ea fere formatis poroque dehiscentibus, nigris, subinde leviter umbonatis v. demum plicatis, 130-160 μ . latis; sporophoris densissime stipatis bacillaribus, 16-23 μ . alt., stratum basilarem fungilli omnino formantibus; sporulis linearis-cylindricis copiosis-

simis, utrinque obtusis, rectis, 5-6 μ . longis, demum cirrose expulsis.

Hab. in foliis Salicis capreæ in tota fere Europa. — Sistit statum pycnidicum *Rhytismatis salicini*.

3. **Melasmia exigua** Syd. Ann. Mycol. VIII (1910) p. 41. — Stro- 7569 matibus hypophyllis, rotundatis vel elongatis, atris, 1-4 mm. longis, 1-2 mm. latis, opacis, maculiformibus; sporophoris numerosis, dense gregariis, minutissimis ca. 100 μ . diam.; sporulis numerosissimis, bacillaribus, hyalinis, continuis, 2-3 \approx 0,5-0,8

Hab. in foliis Loranthi spec., Mt. Pulog, prov. of Benguet, Luzon, in insulis Philipp. (CURRAN, MERRITT et ZSCHOKKE).

ACTINOTHECIUM Ces. — Syll. III p. 638.

1. **Actinothecium patagonicum** Spieg., Myc. Argent. V, pag. 394, in 7570 Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis sed foliis infectis totis pallescentibus v. subarescentibus; pycnidiis amphigenis innato-superficialibus, numerosis sed non constipatis, orbicularibus, dimidiato-scutatis, 60-90 μ . diam., ostiolatis, atris, opacis, contextu indistincto, margine repando-denticulato; sporulis cylindraceo-ellipsoideis utrinque rotundatis, 4-4,5 \approx 1,5, rectis v. leniter inaequilateralibus, hyalinis, eguttulatis.

Hab. ad folia languida Acænæ adscendentis ad ostia Rio Chubut Argentina Amer. austr.

2. **Actinothecium callicola** Spieg., Fungi Paulist, Rev. Mus. La Plata 7571 t. XV, p. 39 (1908). — Maculis eximie orbicularibus 1-3 mm. d., ad epiphyllum convexulis pallescentibus bene determinatis, ad hypophyllum non manifestis sed bulloso-concaviusculis; pycnidiis dimidiato-scutatis 80-120 μ . diam., matrici arcte adnatis, membranaceis, contextu prosenchymatico radiante, fuligineo, ambitu subintegerrimo; sporulis rectis utrinque acutiuscule rotundatis, 10-14 \approx 2-2,5, continuis, non v. obsolete guttulatis, hyalinis.

Hab. ad folia viva Eugeniarum in hortis Ipiranga Brasilia (USTERI).

3. **Actinothecium melanopotamicum** Spieg., Myc. Argent., V, p. 394, 7572 in Anal. Mus. Nac. Buenos Aires XX (1910). — Pycnidiis superficialibus dense constipatis, crustulam atram efficientibus, repando-orbiculatis, 75-120 μ . diam., stellatim dehiscentibus, nigris, glabris, fragilibus, contextu subpellucido dense prosenchymatico; sporulis obovatis, 8-10 \approx 6-7, crassiuscule tunicatis, hyalinis, levibus, grosse 1-guttulatis, in strato proligero mucoso constipatis, non catenulatis.

Hab. ad folia viva *Ballotæ* nitidæ in silvis andinis Rio Negro Argentina America austr.

4. **Actinothecium guaraniticum** Speg., Myc. Arg. V, p. 394, in Anal. 7573 Mus. Nac. Buenos Aires XX (1910). — Stromatibus sparsis, amphigenis, 1-2 mm. diam., superficialibus, suborbicularibus, plus minusve colliculosis, dimidiato-scutatis, atris, glabris, contextu prosenchymerico parum distincto; loculis pusillis 50-70 μ . diam., difformibus, subconfluentibus atque minute dehiscentibus; sporulis late ellipsoideis, utrinque rotundatis, 6-7 \times 3-4, muco minute subconglutinatis, levibus, hyalinis.

Hab. ad folia viva *Aspidospermatis* guaranitici in silvis prope Puerto Léon Misiones, Argentina.

5. **Actinothecium ? chilense** Speg., Fungi Chilenses (1910) pag. 173, 7574 cum icon. — Pycnidiis superficialibus orbicularibus, dimidiato-scutatis, magnitudine variabilibus (in *Ætoxico* 200-300 μ . diam., in *Boldoa* 400-500 μ .), in sicco collabescens, centro stellatim rimosis, ambitu integerrimis, atris, glabris coriacellis, contextu per grosse parenchymatico-hexagono; sporulis fusoideo-arcuatis, hyalinis, apice altero truncato et denticulato, in *Ætoxico* 12-16 \times 2, in *Boldoa* 20 \times 2.

Hab. frequens in foliis coriaceis dejectis putrescentibus *Ætoxicí* et *Boldoæ* in silvaticis Cerro Caracol de Concepción Chile Amer. austr.

6. **Actinothecium ? quercinum** Arnaud, Ann. École nat. d'Agricult. 7575 de Montpellier 2 sér., t. IX, fasc. 4 (1910) p. 287, tab. IV. — Stromate phyllogeño, subcuticulari, nigro, lobato-stellato, ramis irregularibus; pycnidiis inclusis, cavitate secundum stromatis formam, varie efformata, per rimas irregulares dehiscente; sporulis sessilibus breviter fusoideis, utrinque acutiusculis, flavo-fuscidulis, 22-23 \times 6.

Hab. in foliis vivis *Quercus Ilicis* et *Q. cocciferæ* in Gallia australi. — Teste auctore est forma pycnidica *Trabutiae quercinæ*.

LEPTOSTROMA Fr. — Syll. III p. 639, X p. 420, XI p. 555, XIV p. 994, XVI p. 990, XVIII p. 426.

1. **Leptostroma Cumingi** Speg., Fungi Chilenses (1910) pag. 174. — 7576 Maculis ellipticis longitudinalibus, 5-20 mm. long., 2-5 mm. lat., cinerescentibus, indeterminatis; pycnidiis innato-erumpentibus laxè gregariis, linearibus, 0,5-1 mm. long., 100-180 μ . lat., non dimi-

diatis, rima longitudinali dehiscentibus, utrinque acutis, atris, subcarbonaceis; sporulis ellipsoideis, non v. obsolete subnavicularibus, utrinque obtusiusculis, 10-12 \approx 4, grosse biguttulatis, hyalinis.

Hab. in caulis siccis subputrescentibus Chusqueæ Cumingi, Cerro Alegre de Valparaiso, Chile Amer. austr.

PLATYCARPIUM Karst., Acta Soc. pro Faun. et Fl. fenn. XXVII, 4 (1905) p. 10 (Etym. *platys* latus, planus et *carpos* fructus). — Pycnidia dimidiata, subsuperficialia, membranacea, effusa, astoma, rufa; sporulæ continuæ, falcatae, hyalinæ.

1. **Platycarpium fructigenum** Karst., l. c. p. 10. — Pycnidiis effusis, 7577 capsulas ambientibus, raro punctiformibus, obscure rufis; sporulis falcatis, 20 \approx 4-5; sporophoris sporula longioribus.

Hab. in capsulis vivis Salicis myrtilloidis prope Kuopio Fenniae (LÖNNBOHM).

LOPHODERMOPSIS Speg., Fungi Chilenses (1910) p. 175 (Etym. *Lophodermium* et *opsis* aspectus). — Pycnidia hypodermica, hysteroidea, non dimidiata, nigra; sporulæ cylindraceæ, catenulatae. — A *Leptostromate* differt pycnidiis semper hypodermicis et præcipue sporulis catenulatis.

1. **Lophodermopsis hysteroides** Speg., l. c. pag. 175, cum icon. — 7578 Pycnidiis ellipsoideis v. subdiscoideis, 150-200 μ . long., 150 μ . d., coriacellis, opacis, rima angusta dehiscentibus; sporulis rectis, utrinque subtruncatis, 4-6 \approx 1, hyalinis, eguttulatis, in catenulas simplices, 40-50 μ . long. digestis.

Hab. in foliis dejectis subputrescentibus Lardizabalæ bibernatæ in silvis Cerro Caracol de Concepción, Chile Americæ austr. — Est status pycnidicus *Lophodermii hysteroidis* (Pers.) Sacc.

Sect. 2. Phæosporæ.

PIROSTOMA Fr. — Syll. III p. 653, XIV p. 996, XVIII p. 429.

1. **Pirostoma tetrapsecadiosporium** Da Camara, Mycetæ aliquot Theo- 7579 bromæ Cacao in Sancti Thomæ Insula, Lisboa (1910) p. 5, tab. VI, fig. 8-11. — Pycnidiis dimidiatis, hemisphæricis, excipulo crasso aterrimoque, sparsis, raro gregariis, initio ostiolo cuticula velato demumque libero, 500-650 μ . diam.; sporulis cylindraceis v. elli-

psoideis, continuis, rectis, utrinque rotundatis, fuligineis, plerumque quatuor-guttulatis, 25-30 \approx 15-18; sporophoris non visis.

Hab. in cortice *Theobromæ Cacao* in ins. St. Thomé. (J. J. DE ALMEIDA et CANNAS MENDES).

ASTEROSTOMELLA Speg. — Syll. X p. 423, XVIII p. 430.

1. **Asterostomella dispar** Speg., Myc. Argent. V, pag. 397, in Anal. 7580 Mus. Nac. Buenos Aires XX (1910). — Subiculo tenuissimo matrici arcte adnato glabro, ex hyphis rectiusculis 5-6 μ . cr. dense intertextis fuligineis atque hyphopodiis breviter cylindraceis alternis ornatis composito; pycnidiiis subiculo insidentibus laxe gregariis scutato-dimidiatis, 100-120 μ . diam., atris, opacis, margine fimbriatulis, stellatim dehiscentibus; sporulis obovatis, 24-26 \approx 16-18, per grosse 1-guttulatis, fuligineis, levibus, subopacis.

Hab. ad folia viva *Styracis leprosa* in silvis prope Puerto Léon Misiones Argentina America austr. — Sistit statum pycnidicum *Asterinæ disparis* Speg.

2. **Asterostomella Caperoniæ** Speg., Myc. Argent. V, p. 396, in Anal. 7581 Mus Nac. Buenos Aires XX (1910). — Plagulis minutis gregariis, confluentibus, 1-10 mm. diam., atris, setulis pusillis 50-75 \approx 5, pluriseptatis, apice conidium cylindraceum fere semper 3-septatum, 15-30 \approx 4-5 gerentibus ornatis; pycnidiiis scutato-dimidiatis, 90-100 μ . diam., medio plagularum laxe insidentibus, centro stellatim dehiscentibus, margine denticulato-fimbriatis, subopace fuligineis; sporulis obovatis, 18-22 \approx 10-12, saepius grosse 1-guttulatis levibus, subopace fuligineis.

Hab. ad folia viva *Caperoniæ palustris* in pratis prope Bompland Misiones, Argentina America austr. (P. JORGENSEN).

3. **Asterostomella Strophanthi** P. Henn., Engl. Jahrb. XXXVIII (1905) 7582 p. 125. — Pycnidiiis centro pellucidis, dehiscentibus, ad marginem radiato-stellatis; sporulis ovoideis, breve pedicellatis, atro-castaneis, continuis, 16-22 \approx 10-14.

Hab. in foliis *Strophanthi hispida*, Lome Togo Africæ centr. — Status pycnidicus *Asterinæ Strophanthi*.

4. **Asterostomella africana** Syd., Englers Bot. Jahrbüch. 45 Bd. (1910) 7583 p. 264. — Pycnidiiis amphigenis, in mycelio ex hyphis repentibus varie ramosis anastomosantibus parce septatis 3,5-4,5 μ . cr. hyphopodia alternantia 1-septata stipitata c. 8-14 \approx 4-7 gerentibus, brunneis composito insidentibus, aggregatis, radiatim contextis, centro perforatis, stellatim dehiscentibus, atris, 70-110 μ . diam.;

sporulis ellipsoideis v. piriformibus, continuis, levibus, brunneis, 13-20 \approx 10-15.

Hab. in foliis *Tylachii africani*, Kibwezi Africa trop. Britannica (SCHEFFLER). — Est probabiliter status pycnidicus *Asterrinæ* cujusdam.

5. **Asterostomella Tremæ** Speg., Myc. Argent. V, p. 397, in Anal. 7584 Mus. Nac. Buenos Aires XX (1910). — Plagulis suborbicularibus atris, 2-5 mm. diam., tenuiter fibrillosis ex hyphis gracilibus olivaceis 4-5 μ . cr., septulatis, alterne ramulosis et hyphopodiatis constitutis; pycnidiis laxe gregariis, dimidiatio-scutatis, 60-100 μ . diam., astomis, margine denticulatis glabris; sporulis ellipsoideis, 20-22 \approx 10-12, saepius grosse biguttulatis, subopacis, fuligineis.

Hab. ad folia viva *Tremæ micranthæ* prope Puerto Léon Misiones Argentina Amer. austr.

Sect. 3. Phæodidymæ.

PELTISTROMELLA von Höhnel, Ergebni. Bot. Exp. Südbrasil. 1901, Denk. k. Ak. d. Wiss. Wien Bd. LXXXIII (1907) Extr. p. 35 (Etym. a *pelte* scutum et *stroma* v. potius a gen. *Peltistromate*, cui affine). — Stroma depresso scutatum, superficiale, radiosum, membranaceum, plures ostiolatum loculigerum; sporulae brunneæ, biloculares; sporophora simplicia, brevia, apice monospora. — Gen. *Peltistromati* et *Phragmopelti* affine.

1. **Peltistromella brasiliensis** v. Höhnel, l. c. — Stromatibus superficialibus, irregulariter rotundatis, plures ostiolato-verrucosis; ostioli irregulariter rotundatis v. elongatis usque ad 100 μ . diam., 0,5-2 mm. latis, 5-10-locularibus, membranaceis; sporulis paucis, elongatis v. ovoideis, supra rotundatis, infra leviter cuneato-obtusis, bilocularibus, obscure brunneis, ima basi hyalinis, 32-36 \approx 14-16; sporophoris simplicibus, 16 \approx 3-5.

Hab. in folio arboris cujusdam « Fazenda Bella Vista » in districtu urbis S. Cruz ad flumen Rio Pardo, Sao Paulo Brasilia, Amer. austr.

Sect. 4. Hyalodidymæ.

LEPTOTHYRELLA Sacc. — Syll. X p. 426, XI p. 557, XVIII p. 432.

1. **Leptothyrella Ilicis** P. Henn., Engl. Jahrb. XXXVII (1905) p. 164. 7586

— Maculis fuscidulis v. atris; pycnidii hypophyllis gregarie sparsis v. confluentibus, discoideis, rotundatis, radiato-membranaceis, atris, c. 1 mm. diam.; sporophoris hyalinis, filiformibus c. 2 μ . cr.; sporulis oblonge fusoideis, utrinque obtusiusculis, curvulis, continuis, guttulatis, dein medio 1-septatis, hyalinis v. flavidulis, 15-25 \times 3-4.

Hab. in foliis Ilicis geniculatæ, Mt. Yanare prov. Tosa Japoniæ (YOSHINAGA).

2. **Leptothyrella Epilobii** von Höhnel in Strasser, III, Wien Nachtr. 7587

Pilze Sonntagb., Verh. zool. bot. Gesell. (1905) p. 619. — Pycnidii immersis, depressis, dimidiatis, c. 200 μ . latis, nigris; parietibus obscure brunneis, grosse pseudoparenchymaticis, astomis, irregulariter se lacerantibus; sporophoris brevibus; sporulis bilocularibus, rectis v. curvulis, hyalinis, elongato-piriformibus v. subclavulatis, loculo superiori duplo longiore, 19-26 \times 7.

Hab. in caulis Epilobii angustifolii, Sonntagberg, Austria inf.

Sect. 5. Hyalophragmiæ.

DISCOSIA Lib. — Syll. III p. 653, X p. 426, XI p. 557, XIV p. 996, XVI p. 992, XVIII p. 434.

1. **Discosia Blumencronii** Bubák in Handel-Mazzetti Bot. Reise Pont. 7588

Randgeb. in Ann. Naturhist. Hofmus. Wien XXIII (1906) p. 106, t. V, f. 3 a-d. — Pycnidii amphigenis, dispersis v. irregulariter aggregatis, reniformibus vel late falcatis, subepidermicis, deinde epidermidem protrudentibus, atris, nitidis, 180-360 μ . longis, contextu atro, in uno latere concavis ibidemque poro conico apertis; sporulis cylindricis v. fusoideis, parum curvatis, utrinque rotundatis, 20-38 \times 3-4, pallide olivaceo-brunneolis, 3-septatis, guttulatis, utrinque 1-ciliatis; loculis extimis multo brevioribus quam intimis; setis brevibus v. dimidium sporularum æquantibus; sporophoris cylindricis, rectis, 7-11 \times 1,5-2, hyalinis.

Hab. in foliis emortuis Rhododendri pontici in montibus Ponticis Anatoliæ (BLUMENCRON).

2. **Discosia Rhododendri** Speschn., Monit. Jard. bot. Tiflis (1906) 7589 fasc. 4, p. 10. — *Disc. Theæ* Cav. affinis, a qua differt pycnidiis minutis usque ad 70 μ . cr.; sporulis 4 μ . cr.

Hab. in foliis Rhododendri, Zichidziry prope Batum Caucasia.

3. **Discosia Thesii** Hollós, Ann. Mus. Nat. Hungar. V (1907) p. 466. 7590 — Pycnidiis sparsis, superficialibus, disciformibus, late apertis, fuscis, 600-700 μ . diam., contextu celluloso; sporulis subfalcatis, vertice acutis, inferne rotundatis, biseptatis, non constrictis, granulosis v. pluriguttulatis, hyalinis, 26-30 \times 3-4, vertice setula 20-30 μ . longa auctis, deorsum sub apice setula breviore auctis; sporophoris cylindraceis 30 μ . longis.

Hab. in caulis siccis Thesii linophylli prope Nagy-Körös Hungariæ.

4. **Discosia Artocreas** (Tode) Fr. — Sacc. Syll. III, p. 653. -- var. 7591 **Juglandis** C. Mass. Osserv. fitol. in Madonna Verona v. II (1908) Extr. p. 10. — Sporulis cylindraceo-allantoideis, triseptatis, subchlorinis, 16-20 \times 2-3, utrinque sub apice rotundato setigeris, setulis 10-12 μ . long.

Hab. in foliis marcescentibus Juglandis regiae prope Trengago Verona Italiæ boreali. — Var. **sibirica** Sacc., Myc. Sibir. pug. III in Malpighia X (1896) pag. 22 extr., tab. 6, fig. 3. — — Pycnidiis oblongis, dein umbilicatis; sporulis 15 \times 3, olivaceis, 3-septatis, setulis 12-15 \times 0,5. — In caulis emortuis Geranii sp. ad fl. Tibek Sibiriæ asiaticæ.

5. **Discosia Pini** Heald, Mycologia I (1909) pag. 216, tab. XIV. — 7592 Pycnidiis sparsis v. subgregariis, superficialibus, applanatis, nigris, opacis, glabris, ostiolo subpertusis; ellipsoideis v. leniter lobulatis, 225-362 \times 120-165; sporulis oblongo-fusiformibus, 3-septatis, hyalinis v. leniter fumosis, 12-20 \times 2,6, 2-ciliatis, ciliis 10-12 μ . longis.

Hab. ad hypocotylem viventem Pini ponderosæ, Forest Reserve, Halsey, Nebraska Amer. bor.

Sect. 6. Scolecosporæ.

HYSTERIDIUM Karst., Acta Soc. pro Fauna et Fl. fenn. XXVII, 4 (1905) p. 10 (Etym. *Hysterium*, cui habitu subsimile). — Pycni-

dia dimidiata, lanceolata; sporulæ fusoideo-bacillares, 3-septatæ, e hyalino lutescentes, muticæ.

1. **Hysteridium Phragmitis** Karst., l. c. p. 10. — Pycnidiis sparsis, 7593 hysterioideis, atris, minutis; sporulis rectis, 20 \approx 3.

Hab. in culmis aridis Phragmitis prope Kuopio Fennia.

MELOPHIA Sacc. — Syll. III p. 658, X p. 428, XI p. 557, XIV p. 997, XVI p. 992.

1. **Melophia Eugeniae** Ferd. et Winge, Botanisk Tidsskr. XXIX (1908) 7594 p. 20, tab. II, fig. 9. — Stromatibus epiphyllis, minutis, applato-convexulis, orbicularibus, rugulosis, usque ad 4 mm. diam., aterrimis, nitidis, zonula angusta rufo-brunnea cinctis, in hypophyllo maculas convexo-depressas, dilute brunneas formantibus; loculis in stromate singulo pluribus, immersis, applanatis, magnitudine varia, inferne strato nigrefacto limitatis, superne epidermidem convexam levantibus, nondum apertis; sporulis allantoideo-filiformibus, falcatis, nonnullis vermiformibus, 6-13 \approx 1-1,5, hyalinis.

Hab. ad folia viva Eugeniae sp. in insula St. Thomas Indiae occ. (RAUNKIAER).

LEPTOSTROMELLA Sacc. — Syll. III p. 625, X p. 420, XI p. 555, XIV p. 994, XVI p. 990, XVIII p. 426.

1. **Leptostromella Hirtellæ** P. Henn, Hedw. XLVII (1908) p. 270. 7595 — Pycnidiis epiphyllis gregariis, dimidiato-scutellatis, atris, radiato-cellulosis, margine fibrosis, poro pertusis, 300-500 μ . c. cr.; sporulis filiformibus utrinque acutis, pluriguttulatis, hyalinis, 25-35 \approx 1.

Hab. in foliis Hirtellæ americanæ Aubl., Amazonas, Juruá-Miry, Brasilia.

2. **Leptostromella nivalis** R. Maire, Champ. Asie Mineure, Bull. Soc. Sc. de Nancy (1906) Extr. p. 8. — Pycnidiis applanatis, nigris, opacis, oblongis v. ellipsoideis, plus minusve irregularibus, subinde confluentibus, rima saepius obsoleta; sporophoris simplicibus, hyalinis, rectis, dense stipatis, 13-18 \approx 1,5-2; sporulis acrogenis, hyalinis, levibus, solitariis, cylindraceis, 8-11 \approx 1,5-2.

Hab. in culmis aridis Alopecuri textilis, in M. Argæo, 3000 m. alt., Anatolia. — Verisimiliter status pycnidicus *Hadotia nivalis* R. Maire.

ACTINOTHYRIUM Kunze — Syll. III p. 658, X p. 428.

1. **Actinothyrium callicola** Speg., Fungi Paulist., Rev. Mus. La Plata 7597

t. XV, p. 40 (1908). — Maculis epiphyllis callosis determinatis subiculo nullo; pycnidiis dimidiato-scutatis 30-60 μ . diam. membranaceis, contextu parenchymatico radiante fuligineo, ambitu vix denticulatis; sporulis arcuatulis utrinque acutatis 10-25 \approx 1, hyalinis, non v. 1-septatis.

Hab. ad folia languida Eugeniarum socio *Actinothecio callicola*, Ipiranga Brasilia (USTERI).

2. **Actinothyrium Drimydis** Speg., Fungi Chilenses (1910) p. 176. — 7598

Maculis epiphyllis orbicularibus determinatis calloso-convexulis, 2-7 mm. diam., sordide pallescentibus; pycnidiis centro macularum 2-10-insidentibus, orbicularibus, scutato-dimidiatis, 75-100 μ . d., coriaceis, stellatim dehiscentibus; sporulis filiformibus utrinque obtusis, 30 \approx 1,25, hyalinis, continuis, e sporophoro minutissimo communi geminatim v. ternatim oriundis.

Hab. in foliis vivis Drimydis Winteri prope Ciudad de Valdivia, Chile Amer. austr.

3. **Actinothyrium minutum** v. Höhnel, Fragm. Mykol. VIII (1909) 7599

p. 78. — Pycnidiis hypophyllis, sparsis, dimidiato-scutatis, superficialibus, rotundatis, nigris, 120-150 μ . latis; membrana suprantum evoluta, olivaceo-flavo-brunneis, ad marginem pallidiore, ex cellulis 3-4,5 μ . latis rameo seriatis partim forinata et pycnia substellata fingentibus; margine integro v. breviter fimbriato in membranam subicularem tenuem, hyalinam, ex hyphis 1-2 μ . cr. transeunte; basi tenui minute parenchymatico; sporophoris brevissimis; sporulis hyalinis, acicularibus, rectis v. leniter curvulis, supra angustatis acutatisque, infra obtusis, demum 4-7-loacularibus, contextu minute granuloso, 33-52 \approx 2-3.

Hab. in foliis vivis Paratropiæ in nemoribus Tjibodas Java.

CYLINDROTHYRIUM Maire, Bull. Soc. Bot. Fr. LIV (1907) p. CLXXXIX

(Etym. *cylindros* et *thyrium* pro *Leptothyrium*). — Pycnidia superficialia, clypeata, facile secedentia, astoma, irregulariter dehiscentia; sporulæ bacillares, continuæ, hyalinæ, leves, solitarie in sporophoris cylindraceis acrogenæ. — Est *Leptothyrium* scolecosporum ed in tabulis (Syll. fung. XIV, p. 45) occupabit n. 9.

1. **Cylindrothyrium subericola** Maire, l. c. p. CLXXXIX. — Maculis 7600

nullis; pycnidiis nigris, rugosis, ambitu anguloso, contextu membranaceo; sporulis bacillaribus, rectis v. curvulis, hyalinis, levi-

bus, utrinque rotundatis v. basi truncatis, 15-30 \approx 2-3; sporophoris hyalinis, cylindraceis, 15-18 \approx 2,5.

Hab. in pagina inferiori foliorum aridorum *Quercus Suberis*, inter Tlemcen et Hafir Africæ bor.

Fam. 4. Excipulaceæ Sacc.

Sect. 1. Hyalosporæ.

EXCIPULA Fr. — Syll. III p. 665, X p. 432, XI p. 558, XVI p. 999, XVIII p. 437.

1. **Excipula Dictamni** Fairm. Ann. Myc. VIII (1910) p. 325. — Pycnidia 7601 superficialibus, glabris, globosis, cupulatis, ostiolo minuto præditis; sporophoris hyalinis?; sporulis ellipsoideis, utrinque rotundatis, continuis, hyalinis, 6-8 \approx 3.

Hab. in caule Dictamni Fraxinellæ cult., Lyndonville N. Y. Amer. bor.

GODRONIELLA Karst. — Syll. III p. 665, XIV p. 999, XVIII p. 436.

1. **Godroniella ? argentinensis** Speg., Myc. Argent. V, pag. 398, in 7602 Anal. Mus. Nac. Buenos Aires XX (1910). — Excipulis patellari- bus 200-350 μ . diam., inferne convexulis atro-olivaceis subsessili- bus, superne planiusculis pallidioribus, superficialibus, sparsis vel laxe gregariis; margine minute denseque fimbriatulis; sporulis e globoso subcuboideis, primitus eximie catenulatis, hyalinis.

Hab. ad folia arida putrescentia Tillandsiae cujusdam in hortis La Plata Argentina America austr.

NEOPATELLA Sacc. in Sydow Ann. Mycol. VI (1908) p. 530 (Etym. a *neos* novus, et *Patella* pro *Heteropatella*). — Pycnidia erumpenti-superficialia, globoso-depressa, membranaceo-subcarbonacea, nigra, mox centro umbilicata et late subcirculariter dehiscentia; sporulæ eximie falcatae, subsessiles, continuæ, muticæ, hyalinæ. — Ab affini *Heteropatella* sporulis muticis sporophoris brevissimis subnullis imprimis dignoscitur. Prof. v. Höhnel, Fragm. Myk. VII, p. 73, autumat hoc genus cum versiformi *Dothichiza* collidere, sed habitus et sporulæ contrarium docent.

1. **Neopatella Straussiana** Sacc., Ann. Mycol. VI (1908) pag. 530, 7603

t. XXVI, fig. 3. — Pycnidiis gregariis, 200-280 μ . diam.; contextu distincte celluloso, cellulis anguloso-rotundatis, 8-9 μ . diam., atro-fuligineis; sporulis copiosis, falcatis, utrinque acutis, 17-19 \times 3, subsessilibus, granuloso-farctis, hyalinis.

Hab. in caulis emortuis *Dianthi scoparii*, Berg Raswend Persiae occ. (STRAUSS).

AGYRIELLOPSIS v. Höhn. — Syll. XVIII p. 438.

1. **Agyriellopsis difformis** v. Höhn., Fragm. Mykol. II, in Sitzb. k. Ak. 7604 Wiss. Wien CXV, Abt. I (1906) p. 29. — Pycnidiis nigris, opacis, rotundato-verruciformibus v. elongatis, superficialibus, astomis, demum supra irregulariter disruptis, 100-300 μ . latis, 150 μ . circ. altis; parietibus circ. 10 μ . cr. minute parenchymaticis; nucleo ex fasciculis 6-8 hypharum simplicibus v. ramosis verticalibus brevioribus v. longioribus et partim operculum attingentibus formato; hyphis brunneis breviter articulatis 4-5 μ . cr.; fasciculis æque ac parietibus pycnidiis hyphis sporophoris hyalinis v. dilute brunneis fasciculatim ramosis 8-12 μ . long. tenuissimis præditis; sporulis numerosissimis, hyalinis, continuis, 2-3 \times 1.

Hab. in ligno nudo sicco Tiliæ Hinterhallbach, Reisalpe Austriae inf.

DOTHICHIZA Lib. — Syll. III p. 671, X p. 432, XI p. 559, XIV p. 1000, XVIII p. 437.

1. **Dothichiza Pini** Sacc., Ann. Myc. III (1905) p. 168. — Pycnidiis 7605 hinc inde dense gregariis, erumpenti-superficialibus, punctiformibus, aterrimis, lenticularibus, 200-250 μ . diam., tandem concavisculis et ore lato margineque eroso apertis; contextu membranaceo, atro-fuligineo; sporulis oblongis, curvulis, utrinque obtusulis, 4-5 \times 2, eguttulatis, hyalinis, acro-pleurogenis; sporophoris parallele stipatis, e strato proligero fuligineo oriundis, bacillaribus, sursum breviter et parce denticulato-ramulosis.

Hab. ad corticem *Pini silvestris*, Tamsel in Marchia, Germania (P. VOGEL). — Forte huc spectat *Dendrophoma Pini* Richon imperfecte descripta.

2. **Dothichiza exigua** Sacc., Ann. Mycol. VI (1908) p. 562, t. XXIV, 7606 fig. 7. — Pycnidiis laxe gregariis, acicolis, erumpenti-subsuperficialibus, globulosis, totis nigris, 300-350 μ . diam., deorsum dein incrassato-substipitatis, initio subclausis demum cupulato-apertis; contextu eximie celluloso, fuligineo, cellulis 9-11 μ . diam.; sporu-

lis ellipsoideis e latere reniformibus, e fronte 6-8 \approx 4, e latere 2,5 μ . cr., hyalinis; sporophoris prælongis sæpius iterato-furcatis, filiformibus, 75-85 \approx 1,5.

Hab. in acubus Pini Strobi morientibus, Tamsel Germaniae (P. VOGEL). — *Doth. ferruginosæ* subaffinis. Verisimiliter st. pycnidicus Cenangiaceæ cujusdam.

DISCULA Sacc. — Syll. III p. 674, X p. 433, XVIII p. 438.

1. **Discula Ceanothi** Bub. et Kab., Hedwigia XLVII (1908) p. 362. 7607

— Pycnidii sparsis v. raro subgregariis, quandoque confertis confluentibusque, epidermide pustulata tectis eamque demum disrumpentibus, poro v. rima apertis, contextu supra parenchymatico brunneo infra incompleto; sporulis ex elongato cylindraceis, subfalcatis, raro rectis, 13-18 \approx 2,5-3,5, utrinque angustatis vel raro rotundatis, contentu granuloso; sporophoris simplicibus, basi cæspitoso-intricatis, cylindraceis, 10 \approx 2, hyalinis.

Hab. in ramis siccis Ceanothi americanæ prope Turnau Bohemia (KABAT).

SPORONEMA — Desm. Syll. III p. 677, X p. 434, XIV p. 1000.

1. **Sporonema Robiniæ** Sacc. — Ann. Mycol. VI (1908) p. 566. — 7608

Pycnidii laxè gregariis vel subsparsis subcutaneo-erumpentibus, minutis, nigris, plano-scutellatis, rima oblonga, rimosa dehiscensibus, 150 μ . diam., membranaceis, contextu inæqualiter parenchymatico fuligineo; sporulis ex ovato breve fusoideis, utrinque acutulis, 8-9 \approx 2,5-3, plasmate bipartito, 1-septatis, non v. vix constrictis, hyalinis, sessilibus.

Hab. in parte exter. leguminum subputrescentium Robiniæ Pseudacaciæ, Lyndonville N. Y. Amer. bor. (FAIRMAN).

2. **Sporonema epiphyllum** (Fr.) Shear, Bull. Torr. Bot. Club XXXIV (1907) p. 309. — Ita distinguendum *Sporonema obturatum* (Fr.) Sacc. var. *epiphyllum* (Fr.) Sacc. — Syll. III, p. 678 — seu *Sphaeria obturata* var. *epiphylla* Fr. — Pycnidii sparsis erumpentibus, globosis, astomis, primo levibus, deinde rugoso-verruculosis, contextu inferne pseudoparenchymatico, superne convergenti-prosenchymatico, corneis, atris, majusculis; sporophoris vix simplicibus, longitudine varia; sporulis 1-3-acrogenis, cymbiformibus v. subrectis, medio obsolete septatis v. plasmate utrinque retracto, 10-12,5 \approx 2-2,5 (Starbäck).

Hab. in foliis Vacciniorum in Suecia, Britannia, Amer. bor.

— Cfr. Starbäck, *Sphær. imperf. cognitæ*, p. 57 (*Clinterium obturatum* Fr.) et Shear l. c.

3. **Sporonema pulvinatum** Shear, Bull. Torr. Bot. Club XXXIV (1907) 7610
pag. 308, Cranberry Dis. p. 46, tab. 5, fig. 25-28. — Pycnidiis amphigenis, epidermide circumdatis, obscure brunneis, pulvinatis, sæpe collabescentibus, 300-420 μ . diam., 100-150 μ . cr., unilocularibus; ostiolo nullo; sporulis inæquilateris v. subcurvulis, continuis, 6-8 \times 2-2,5, hyalinis v. in massa leniter viridi-flavis; sporophoris simplicibus, basi quandoque expansis; sporulis maturis leniter longioribus.

Hab. in foliis Vaccinii macrocarpi in America bor.

4. **Sporonema Oxycoeci** Shear, Bull. Torr. Bot. Club XXXIV (1907) 7611
pag. 308, Cranberry Dis. p. 41, tab. V, fig. 17-19. — Pycnidiis excipuliformibus, basi incrassatis, supra gradatim attenuatis, epidermide circumdatis et demum erumpentibus, depresso globosis, gregariis v. sparsis, amphigenis, 50-100 μ . diam., quandoque collabescentibus, irregulariter erumpentibus; sporophoris simplicibus, oblongis v. subglobosis, brevissimis; sporulis hyalinis, cylindraceis, angustis, continuis, rectis, 17-19 \times 3-4, contentu homogeneo.

Hab. in foliis dejectis Vaccinii macrocarpi, in Amer. bor.

5. **Sporonema rameale** Desm. — Syll. III, p. 678 — var. **crassisporum** Moesz, Gomb. Budap. I (1909) pag. 22, t. II, f. 5 a-b (Bot. Közlem.). — A typo differt sporulis crassioribus nempe 12-18 \times 6-6,5.

Hab. in ramis siccis Sambuci nigræ prope Budapest Hungariæ.

6. **Sporonema laricinum** Saccardo, Not. Myc. VI, Ann. Myc. v. III 7613
(1905) pag. 513. — Pycnidiis gregariis erumpenti-superficialibus, subdisciformibus, supra depressis, 300-400 μ . diam., glabris, nigris, centro rimose v. radiatim dehiscentibus; nucleo farcto griseo-atro; contextu crassiusculo minute parenchymatico, fuligineo; sporulis sessilibus, ellipsoideis, utrinque acutulis, 4 \times 2,5, rectis, eguttulatis, hyalinis.

Hab. in ramis corticatis non omnino emortuis, Laricis europææ, Agordo, Belluno, Ital. bor. Aug. 1905 (DOM. SACCARDO).

DINEMASPORIELLA Speg., Myc. Argent. V, p. 366, in An. Mus. Nac. Buenos Aires XX (1910) (Etym. a *Dinemasporium*, cuius est analogum genus, sed calvum). — Pycnidia innato-erumpentia, minuta,

atra, glabra, ostiolata, coriacella; sporulæ subcylindraceæ medio 1-septatæ, utrinque 1-ciliatæ, hyalinæ.

1. **Dinemasporiella poiophila** Speg., l. c. p. 366, cum icon. — Pycni- 7614
diis gregariis saepius seriatis, parenchymate innatis, epidermide tectis dein erumpentibus et plus minusve exertis, lenticulari-ellipsoideis, 130-150 \approx 90-100, demum subhysterioideo-hiantibus; sporulis leniter curvulis utrinque subrotundatis, 18-20 \approx 2-2,5, uniseptatis ad septum non constrictis, setulis 10-15 \approx 0,5 concoloribus arcuatulis.

Hab. ad folia arida Chloridis distichophyllæ, Colonia Libertad Entre Rios Argentina Amer. austr.

DINEMASPORIUM Lév. — Syll. III p. 683, X p. 438, XI p. 560,
XIV p. 1001, XVIII p. 440.

1. **Dinemasporium hispidulum** (Schr.) Sacc. — Syll. III pag. 685 — 7615
var. **brachychætum** Speg., Myc. Arg. V, p. 399, in An. Mus. Nac.
Buenos Aires XX (1910). — A typo differt sporulis 16 \approx 1,5 sed præcipue setula minima 2-3 \approx 0,5 armatis.

Hab. ad palos diu intemperiis expositos Robiniae Pseud-
acaciæ, La Plata Argentina Amer. austr.

2. **Dinemasporium intermedium** Speg., Myc. Argent. V, pag. 399, in 7616
Anal. Mus. Nac. Buenos Aires XX (1910). — Excipulis subpatellaribus solitariis v. laxè gregariis ligno denudato cinerescenti insidentibus, 0,4-1 mm. diam., extus atris, setosis, intus pallide olivascentibus; setulis erectis sursum sensim attenuatis atque acutatis, simplicibus, 250-1000 \approx 10-20, nigris opacis basi non bulbosis; sporulis subnavicularibus utrinque subacutiusculis, 10 \approx 2,5, atque in setam ipsas æquantem obliquam productis, hyalinis, eguttulatis v. minute biguttulatis.

Hab. ad ramos languidos v. emortuos Citri Aurantii pr.
Bella Vista Argentina Amer. austr. (J. M. HUERGO). — *D. decipienti* (De Not.) Sacc. valde similis species sed sporulis duplo majoribus distincta.

3. **Dinemasporium decipientis** (De Not.) Sacc. — Syll. III, p. 685 — 7617
var. **Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires t. XVII (1908)
p. 137. — Cupulis sparsis orbiculari-ellipsoideis, 0,5-1 mm. diam., nigris, margine setulis patulis continuis acutis v. obtusulis, atris, subopacis, 50-150 \approx 6-8 ornatis; sporulis subnavicularibus, 5-8 \approx 2-3, utrinque setigeris setula supera lateraliter patente, quam infera duplo breviore, setula infera sporulam æquante, erecta.

Hab. in disco truncorum excæsorum Ilicis paraguariensis in silvis Misiones Argentinæ.

4. **Dinemasporium argentinense** Speg., Myc. Argent. V, pag. 398, in 7618 An. Mus. Nac. Buenos Aires XX (1910). — Excipulis laxe gregariis v. solitariis elliptico-elongatis 300-400 \approx 120-150, longitudinaliter rimose dehiscentibus, coriacellis, contextu indistincto, setulis subrigidulis vix flexuosis apice subacutiusculis basi non v. vix incrassatis 150-180 \approx 4-5, continuis v. 2-3-septatis, fuligineis, pellucidis vestitis; sporulis subcylindraceis utrinque rotundatis, 18-20 \approx 5, non v. vix lateraliter angulatis, leniter curvulis, setula supera valde obliqua longiore 12-15 \approx 0,75-1, infera recta brevi 6-8 \approx 1, ornatis, continuis hyalinis.

Hab. ad culmos aridos Stipæ caudatæ in pratis Fuerte Argentina Amer. austr.

5. **Dinemasporium Oryzæ** I. Miyake, Pilze Reispfl. Japan, (Journ. College Agricult. II (1910) p, 261, t. XIV, f. 64-67. — Pycnidiis superficialibus, 5-20 setulis nigris rectis, crassis, 2-3 v. usque ad 5-6 μ . diametra pycnidii superantibus vestitis, inverse hemisphæricis, 140-160 μ . diam., nigris; sporophoris simplicibus filiformibus, inferiori parte nascentibus, hyalinis, 15 \approx 1,5; sporulis ellipsoideis v. ovoideis, curvulis, hyalinis, utrinque setula sporulâ longiore præditis, 7,5-9 \approx 2,5-3,5.

Hab. in foliis Oryzæ sativæ Gifu Japonia.

6. **Dinemasporium microsporum** Saccardo — Syll. III, p. 684 — *D. 7620 **pusillum** Saccardo, Not. Myc. VI, Ann. Myc. III (1905) p 514. — Pycnidiis $\frac{1}{4}$ mm. diam., excipulo angustissime prosenchymatico brunneo; setis 120-140 \approx 4-5, septulatis, aterrimis; sporulis allantoideis, 6,5-8 \approx 2, hyalinis, utrinque setula 6-7 \approx 1, obliqua auctis.

Hab. in foliis putrescentibus graminum, Selva, Treviso Ital. bor. (ANTONIA SACCARDO).

7. **Dinemasporium Geasteris** Hollós, Ann. Mus. Nat. Hung. V (1907) 7621 p. 284. — Pycnidiis sparsis, superficialibus, cupulato-hemisphæricis, 210-240 μ . d.; setulis rigidis, atris, acutis, ezeptatis, 120-240 \approx 6-8; sporulis continuis, cylindraceis, falcato-curvulis, eguttulatis, hyalinis, 10-14 \approx 2-2,5, utrinque setulâ 10-14 μ . longa obliqua auctis.

Hab. in stratu interno exoperidii Geasteris pseudolimbati, prope Kecskemét Hungariæ.

SIREXIPULA Bubák, Myc. Beitr., Hedw. Bd. XLVI (1907) p. 295 (Etym. *seiros* catena et *Excipula*). — Pycnidia globosa, subepider-

moidea, dein superficialia, coriacea, nigra, primum clausa, dein poro rotundato aperta, demum pezizoidea; sporophora cylindracea, arcte conferta, simplicia, hyalina; sporulæ apicales, catenulatæ, breviter cylindraceaæ, hyalinæ.

1. **Sirexcipula Kabatiana** Bubák, Myc. Beitr. Hedwigia Bd. XLVI 7622 (1907) pag. 295. — Pycnidiis amphigenis, maturis superficialibus pezizoideis, ex obscure brunneis nigris, opacis, coriaceis 300–400 μ . diam.; contextu parenchymatico, intus pallidiori; sporulis breviter cylindracea, apice obtusis, rectis, 4-6 \approx 3-3,5, hyalinis, grosse guttulatis; sporophoris cylindracea, apice subconoideis, 12-18 \approx 2-3, hyalinis, distincte guttulatis.

Hab. in foliis putrescentibus Fungiæ Sieboldianæ, prope Turnau Bohemia (KABAT). — A *Siropatella* differt sporulis unilocularibus.

Sect. 2. Phæosporæ.

CHÆTODISCULA Bub. et Kab., Hedw. L (1910) p. 44. (Etym. *chæte* seta et *Discula*, h. e. *Discula setulosa*). — Pycnidia hysterioideo-rimosa, innato-erumpentia demum oblongo- v. orbiculari-discoidea, margine fimbriata, nigra, carbonacea, parte libera cellulis olivaceo-brunneis, crasse tunicatis formata. Sporulæ continuæ, fusoidæ, olivaceo-brunneæ, sporophoris bacillaribus fultæ. — Est quasi *Discula setosa*. — Genus, ut nobis videtur, inter *Chætomellam* et *Chætostroma* fere medium.

1. **Chætodiscula hysteriformis** Bub. et Kab. Hedw. L (1910) p. 44, 7623 tab. I, f. 1-8. — Pycnidiis gregariis, nigris 0,3-0,7 mm. long., interdum nitidulis, margine setoso-fimbriatis, setis rectis v. subcurvulis, 60 \approx 4, olivaceo-brunneis, sursum septatis, pallidioribus; sporulis breve fusoideis, utrinque obtusulis, olivaceis, 19-23 \approx 4-5,5, crasse 1-2-guttulatis granulosisque; sporophoris cylindricis ad 28 μ . longis, erectis v. leniter convergentibus, nigro-virentibus.

Hab. in foliis emortuis Typhæ latifoliæ pr. Münchengrätz Bohemiæ.

SCHOENBORNIA Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) p. 483 (Etym. ab AD. von SCHÖNBORN). — Pycnidia primum subepidermica, globosa, clausa, dein nuda, planata, infra setulosa, mollia; contextu extus nigro-virescenti, intus pallide flavescenti sub-

inde olivaceo-brunneo; sporulæ ex ellipsoideo fusoideæ, olivaceo-nigricantes; sporophora longa, cylindracea, unilocularia, pallide flavo-brunnea, apice subconoideo-constricta, subcircinnata, obscure olivaceo-brunnea.

1. **Schoenbornia basidio-annulata** Bubák, l. c. p. 484, tab. 5, fig. 1-4. 7624
— Setulis parcis, 60-90 \approx 6,5-7, crassis, subrectis, parce septatis, pallide brunneis; pycnidiis 330-450 μ . latis, nigro-viridibus, molibus, basi plectenchymaticis, pallide flavidis, hyphis longis prædictis; sporulis 9-11 \approx 4-4,5, supra rotundatis, basi sæpe obtusatis, guttulatis; sporophoris 90 \approx 2, confertis, rectis v. curvis, apicem versus multiguttulatis.

Hab. in ramulis emortuis Spartii juncei prope Ulcinj Montenegro. — Gen. *Phæodisculæ* et *Coniothyrellæ* affine.

PHÆODISCULA Cub. — Syll. X p. 439, XVIII p. 441.

1. **Phæodiscula pezizoides** (Rabenh.) Sacc. et Trav. — Syll. XX, 7625 p. 325 — *Tymanis pezizoides* Rabenh. in Hoffm. Ic. anal. fung. p. 97, t. 23, f. I, 1-5 (1865). — Pycnidiis sessilibus initio globulosis dein patellatis, majusculis, superficialibus, gregariis ambitu ex orbiculari ellipticis, tenuiter marginatis, 4-6 mm. long., disco appanato atro-nitente, margine atro-brunneo; strato proligerò minute cellulo, crassiusculo; sporulis ellipsoideis, 8-9 \approx 4 brunneis, biguttatis simulateque 1-septatis; sporophoris filiformibus, fasciculatis, sporulâ multo longioribus.

Hab. in ramis decorticatis emortuis dejectis Quercus prope Gross-Geran Germaniæ, socia *Zignoëlla sinapisperma* (Rabenh.) Sacc. et Trav.

Sect. 3. Hyalodidymæ.

DISCELLA B. et Br. — Syll. III p. 687, X p. 440, XI p. 560, XIV p. 1002, XVI p. 993, XVIII p. 442.

1. **Discella Betulæ** B. R. S. in Saccardo, Not. Myc. VI, Ann. Myc. 7626 III (1905) pag. 509. — Pycnidiis subepidermicis, disciformibus, astomis, epidermide fissa cinctis, nigricantibus, glabris intus pallide griseis, 500-600 μ . diam; sporulis fusoideis, utrinque acuminatis, rectiusculis, medio 1-septatis, non constrictis 12-17 \approx 2,5-3, hyalinis, in sporophoris dense fasciculatis, filiformibus arrecto-ramosis, 40-50 μ . long. acrogenis.

Hab. in ramis junioribus emortuis corticatis Betulæ albæ, Houffalige Belgii (MARIA ROUSSEAU).

2. **Discella populina** Sacc., Ann. Myc. VI (1908) p. 562, tab. XXIV, 7627 fig. 4. — Pycnidiis hinc inde dense gregariis et pustulas elevatas, 2 mm. latas peridermio rupto cinctas generantibus, inæqualiter discoideis, sæpe suboblongis, 200 μ . diam., demum subcupulato-apertis margineque subinde lobulato præditis, totis nigris; sporulis fusoideis v. clavulatis, utrinque acutulis, 16-17 \times 5, hyalinis, sub medio 1-septatis, non constrictis; sporophoribus fasciculatis bacillaribus, hyalinis 14-15 \times 2.

Hab. in ramis subvivis Populi albæ var. Bolleanæ, Tam-sel Germaniæ (P. VOGEL). — Ob pustulas peculiares, quasi myco-cæcidia, species vere notabilis.

PSEUDOLACHNEA Ranojevic, Ann. Mycol. VIII (1910) pag. 393

(Etym. *pseudes* falsus et *Lachnea*). — Pycnidia immersa, erumpentia, sed basi semper immersa, peziziformia, setulis rigidis, ex hyphis flavo-brunneis parallele orientibus tecta; sporulæ biloculares, utrinque rostellatae, hyalinæ; sporophora dichotomice ramosæ.

— Gen. setulis et rostellis insigne, *Pseudopatellæ* proximum.

1. **Pseudolachnea Bubakii** Ranojevic, Ann. Mycol. VIII (1910) p. 393, 7628 fig. 6-11. — Pycnidiis primo globosis, conoideis, dein rotundatis v. elongatis, peziziformibus, demum late apertis, solitariis v. crebre distributis, 1,5 mm. diam., nigris; setulis crebris, rectis, sub-incurvatis, brunneis, nigro-brunneis, demum nigris, apice pallidioribus, continuis, usque ad 465 μ . long., 5-11,5 μ . crassis; sporulis fusoideis, curvatis, medio septatis, non constrictis, 10-14,5 \times 1,5-2, rostellis usque ad 2 μ . long. præditis, hyalinis, fortiter congestis; sporophoribus rectis v. subcurvulis, 1-3 dichotomice divisis, septatis, usque ad 52 μ . long., 1,5-2 μ . cr., hyalinis, fortiter congregatis.

Hab. in ligno Quercus et Tiliæ argenteæ, nec non in ramis dejectis Robiniae, Cytisi, Juglandis, Pinii, Laricis et in caulinis Cardui acanthoidis, Helianthi annui, pr. Belgrad Serbia.

Sect. 4. Hyalophragmiæ.

EXCIPULINA Sacc. — Syll. III p. 688, X p. 441, XI p. 560, XIV p. 1002, XVIII p. 443.

1. **Excipulina Lauri** Alm. et Cam., Revista Agronom. IV (1906) 7629 p. 222, tab. IV, fig. 1-2; Bol. Soc. Brot. XXV (1908-1909) Extr. p. 56. — Pycnidiis primum sublenticularibus clausisque, dein patellatis, late apertis; sporulis elongato-fusoideis, hyalinis, rectis v. curvulis, triseptatis, utrinque rostellatis, 20-22 \approx 2,5-3.

Hab. in foliis siccis Lauri nobilis, socia *Pleospora herbarum* (Pers.) Rbh. Cerca de Bento pr. Coimbra Lusitania (A. MOLLER). 7630

2. **Excipulina rostrata** Syd., Ann. Mycol. IV (1906) p. 344. — Pycnidiis sparsis, subsuperficialibus, glabris, primo sphæroideo-clausis, dein late apertis et cupuliformibus, 300-400 μ . diam., atris, molliusculis, contextu radiato, subprosenchymatico; sporulis fusideo-elongatis, indistincte 2-septatis, hyalinis, leniter curvulis, 16-21 \approx 2 $\frac{1}{2}$ -3 $\frac{1}{2}$, apice in rostrum filiforme curvulum longissimum usque ad 30 μ . longum sensim abeuntibus, ad septa non constrictis; sporophoris brevibus.

Hab. in caulinis emortuis Aquilegiæ leptoceratis, Big Cottonwood Canyon, Utah Americæ bor. (A. O. GARRETT).

JAPONIA v. Höhn. Fragm. Mykol. VII (1909) p. 67 (Etym. a patria *Japonia*). — Pycnidia superficialia, discoidea, infra breviter obconica tenuiterque insidentia. demum epidermidem rumpentia; extus carbonacea, parenchymatica intus molli-carnosa, ex hyphis radiantibus constituta; sporophora ramoso-cæspitosa; sporulæ solitariæ, hyalinæ, clavato-fusoideæ, pluri-septatæ, infra angustato-subpedicellatæ.

1. **Japonia Quercus** v. Höhn., l. c., p. 68. — Sporulæ magnitudine 7631 variæ, 2-4-cellulares, 30-60 \approx 6.

Hab. in foliis Quercus glaucæ Japonia (YOSHINAGA). — St. pycnid. alter *Yoshinagaiæ*, cuius asci maturi, teste v. Höhn. nondum innotuerunt.

Sect. 5. Scolecosporæ.

PSEUDOCENANGIUM Karst. — Syll. X p. 445, XIV p. 1003, XVIII p. 446.

1. **Pseudocenangium septatum** Jaap, Ann. Myc. VI (1908) p. 219. — 7632 Pycnidiis sparsis, primo emergentibus postremo superficialibus, scutellatis, applanatis, margine laciniato, brunneis 0,3-0,6 mm. cr., disco decolorato; sporulis filiformibus, curvulis, guttulatis, distincte

septatis, 30-60 \approx 1,5-2, apice attenuatis, hyalinis; sporophoris brevissimis, indistinctis.

Hab. in foliis emortuis Pini montanæ prope Tschechischen Hütte in Karawanken, Tirolia.

. *Fam. 5. Melanconiaceæ CORDA em.*

Sect. 1. Hyalosporæ

HAINESIA Ell. et Sacc. — Syll. III p. 698, X p. 446, XI p. 562, XIV p. 1004, XVI p. 995, XVIII p. 447.

1. **Hainesia Kolæ** Speg., Myc. Argent. V, p. 400, in Anal. Mus. Nac. 7633 Buenos Aires XX (1910). — Maculis orbicularibus, 5-15 mm. diam., subdeterminatis, sordide fuscescentibus; acervulis numerosissimis confertis circinantibus, sublenticularibus, 75-100 μ . diam., erumpentibus, subtremelloideis fusco-albescensibus, conidiis subcylindraceis v. lenissime subclavatulis, utrinque obtuse rotundatis, 16-20 \approx 4-5- saepe ad medium leniter coarctatulis, rectis v. vix inaequilateralibus, nubilosis, hyalinis.

Hab. ad cotyledones vivos Sterculiae acuminatae (*Kola*) ex Dakkar Africa cultæ in La Plata Argentina America austr.

2. **Hainesia oleicola** Speg., Myc. Argent. V, p. 400, in Anal. Mus. 7634 Nac. Buenos Aires XX (1910). — Maculis obsoletis, suborbicularibus, 3-7 mm. diam., depresso-rugulosis subconcentrice zonatis vix pallescentibus; acervulis circinantibus confertis, erumpentibus, 100-130 μ . diam., sordide pallideque rufescentibus, subceraceis; conidiis e lanceolato subclavatulis, 20 \approx 5-6, continuis, rarius subdiblastis, hyalinis, nubilosis.

Hab. in epicarpio fructuum adhuc pendulorum Oleæ europeæ in hortis Buenos Aires.

3. **Hainesia Feurichii** Bubák, Ann. Mycol. IV (1906) p. 119. — Maculis foliicolis parvis, angulosis, nervis limitatis, demum plus minusve confluentibus, utrinque visilibus, brunneis v. sordide brunneis, raro flavo-alutaceis, supra griseis, arescentibus; acervulis hypophyllis, nigris, depresso-applanatis, gregariis et saepe confluentibus, epidermide tectis, dein nudatis, circ. 350 μ . latis; conidiis variabilibus, ex ovoideo elongatis 3-4 \approx 1-1,5, rectis v. curvulis, utrinque rotundatis, hyalinis; conidiophoris filiformibus, apice angustatis, usque ad 20 \approx 1-1,5, hyalinis.

Hab. in foliis vivis Pruni Padi prope Göda Saxonia (FEURICH). — Socium adest *Cylindrosporium Padi*.

4. **Hainesia Palmarum** v. Keissl., Ann. Mycol. VII (1909) p. 292. — 7636
 Maculis nullis; acervulis subcuticularibus, mox erumpentibus, lineari-oblongis, (rarius punctiformibus) sordide aurantiacis, subtremelloideis, gregariis (interdum subconfluentibus) 0,4-0,6 \approx 0,1-0,2 mm.; conidiophoris dense cæspitosis, filiformibus, rectis, brevibus, hyalinis, c. 20 \approx 3; conidiis oblongis, apice rotundatis, hyalinis, c. 12-15 \approx 6.

Hab. in fructu Arecæ Rechingerianæ in insula Salomon Bougainville prope Kieta (RECHINGER).

5. **Hainesia Tellingsii** Koord., Botan. Untersuch. Java (1907) p. 215, 7637
 fig. 32. — Acervulis amphigenis, erumpentibus, præsertim hypophyllis, gregariis v. sparsis, 20-40 μ . diam., albescensibus, in maculis pururascentibus irregularibusque insidentibus; conidiis ellipsoideis, utrinque rotundatis, continuis, hyalinis, 5-5,5 \approx 2, rectis; conodiphoris continuis, simplicibus v. ramosis.

Hab. in foliis vivis Musæ (*Physocaulis*) sp. cultæ in Purworedyo Java (KOORDERS).

6. **Hainesia Maxillariæ** Speg., Myc. Argent. V, p. 400, in Anal. Mus. Nac. Buenos Aires XX (1910). — 7638
 Maculis diffusis inderterminatis sæpius apicalibus subcinerescentibus; acervulis sublenticularibus 150-200 μ . diam., densiusculæ gregariis erumpentibus succineis; conidiis subellipsoideis inæquilateralibus v. leniter curvulis, utrinque obtuse rotundatis, 12-18 \approx 7-8, hyalinis, levibus, nubilosis.

Hab. ad folia languida Maxillariæ rufescens in silvis prope Bompland Misiones Argentina Amer. austr. (P. JORGENSEN).

GLÆOSPORIUM Desm. et Mont. — Syll. III p. 699, X p. 446, XI p. 562, XIV p. 1004, XVI p. 996, XVIII p. 448.

1. **Glæosporium Thalictri** Davis, Trans. Wisconsin Ac. of Sc. XVI (1909) p. 760. — 7639
 Maculis e circulari oblongis, brunneis, margine angusto obscuro præditis, 5-10 mm. diam.; acervulis hypophyllis, sparsis, obscure brunneis; conidiis ex ellipsoideo oblongis, hyalinis, 4-6 \approx 2-3.

Hab. in foliis Thalictri dasycarpi, Mellen Amer. bor.

2. **Glæosporium Sisymbrii** Moesz, Gomb. Budap. I (1909) pag. 23, 7640
 tab. I, fig. 8 a-b. (Bot. Közlem.) — Maculis sparsis, oblongis, 50-430 \approx 30-85, fusco-nigris; acervulis epidermide tectis, dein erumpentibus, strato proligero minute parenchymatico dilute fuligeneo,

cellulis superficialibus, hyalinis, 7-10 \times 3, vertice apiculato conidigeris; conidiis elongato-ellipsoideis, 7-13 \times 2-3 eguttulatis, hyalinis.

Hab. in caulis emortuis *Sisymbrii strictissimi* prope Budapest Hungariæ.

3. **Glæosporium sordidum** Spegazz., Fungi Paulist. Rev. Mus. La Plata 7641 t. XV, p. 41 (1908). — Maculis irregularibus repandulis 5-25 mm. diam., ad epiphyllum saepius subdeterminatis, areola angustissima lateritia cinctis, ad hypophyllum evanescentibus; conidiis utrinque obtusissimis, 15-16 \times 5-6, saepè medio leniter coarctatulis, saepius eguttulatis, hyalinis.

Hab. ad folia subcoriacea ignota (*Menispermaceæ?*) Ipiranga Cambucy, Brasilia (USTERI)

4. **Glæosporium Evonymi** Briosi et Cav. Funghi parass. essicc. n. 396, 7642 c. ic. (1889). — Maculis exaridis, cinerescentibus, lateque expansis, irregularibus, nigro-cinctis; acervulis pustuliformibus, conicis, subtusom stromate proligero donatis; conidiis cylindraceis v. oblongis v. clavulatis, utrinque obtusis, hyalinis, 9-12 \times 2-3.

Hab. in foliis vivis *Evonymi japonicae*, Cagliari Sardinia.

5. **Glæosporium Theæ-sinensis** Miyake, Bot. Mag. Tokyo XXI (1907) 7643 p. 44, cum icon. — Maculis latis, rufo-brunneis, demum cinerescentibus; conidiis ex ovoideo fusoideis, hyalinis, 4-6 \times 2.

Hab. parasitice in foliis *Theæ sinensis* in Japonia.

6. **Glæosporium fagaricola** Speg., Myc Argent. V, p. 402, in Anal. 7644 Mus. Nac. Buenos Aires, XX (1910). — Maculis amphigenis, determinatis, cinerescentibus, saepè marginalibus, majusculis, areola destitutis; acervulis epiphyllis, hinc inde gregariis, sublenticularibus, erumpentibus, 90-110 μ diam., pseudopycnidio rudimentario, eximie ostiolato-pertuso fuscidulo tectis; conidiis rectis, utrinque obtuse rotundatis, non v. vix coarctatulis, 16-18 \times 5-6, saepius nubilosis, v. bi-guttulatis, hyalinis, levibus.

Hab. ad foliia viva v. languida *Fagaræ (Xanthoxyli) cujavensis*, Puerto León, Misiones, Argent.

7. **Glæosporium meliicola** Speg., Myc. Argent. V, p. 403' in Anal. 7645 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis primo orbicularibus dein confluendo repando-difformibus, 1-5 mm. diam., candicanticus, exareolatis; acervulis hypodermicis, epiphyllis, laxè gregariis, atris, lenticularibus, 75-120 μ . diam.; conidiis ellipsoideis utrinque obtusiuscule rotundatis, non v. leniter inæquilateralibus 12-14 \times 6-7, saepius grosse biguttulatis, primo hyalinis dein dilute chlorinulis.

Hab. ad folia viva Meliæ Azedarach in Orán Salta Argentina Amer. austr.

8. **Glœosporium sarmenticola** Speg., Myc. Argent. V, p. 404, in Anal. 7646 Mus. Nac. Buenos Aires XX (1910). — Maculis parum manifestis subcinerescentibus subellipticis, 10-15 mm. long.; acervulis densiuscule gregariis epidermide vestitis, valde depresso-depressis, orbicularibus 250-400 μ . diam., irregulariter dehiscentibus, pseudoperithecio sordide fusco, contextu indistincto tectis; conidiis e cylindraceo subellipsoideis v. obsoletissime subclavatulis, utrinque obtuse rotundatis, 15-18 \times 7-8, rectis v. leniter inæquilateralibus, nubilosis, hyalinis.

Hab. ad sarmenta languida v. emortua Vitis ripariæ in hortis La Plata Argentina Amer. austr.

9. **Glœosporium Garciniæ** Koord., Botan. Untersuch. Java (1907) p. 217, 7647 fig. 33 I. — Maculis maximis irregularibus, fuscescentibus; acervulis laxe gregariis, amphigenis, præsertim epiphyllis, nigris, c. 200 μ . diam.; conidiis continuis, hyalinis, cylindraceis, rectis v. curvulis, utrinque rotundatis v. obtusis, 10-18 \times 4-6; conidiophoribus cylindraceis, hyalinis, 8-10 \times 4.

Hab. in foliis vivis Garciniæ dulcis cultæ in Purworedjo prov. Kedu, Java (KOORDERS).

10. **Glœosporium leptostromoides** Bubák, Fünft. Beit. Pilz. Tir. in Ber. naturw.-med. Ver. Innsbruck XXX Jahrg. (1905-1906) Extr. p. 16. — Acervulis dense gregariis caulem late obtegentibus, depresso-depressis, subrotundo-ellipticis, atro-brunneis, leniter nitidulis, sæpe confluentibus, subepidermicis, dein nudis, hypostromate castaneo-brunneo, parenchymatico, 10-20 μ . cr.; conidiophoribus breviter cylindraceis dilute olivaceis, apicem versus tenuatis et pallidioribus; conidiis inæqualiter ellipsoideis, oblongis v. cylindraceis, 12-18 \times 4,5-7, utrinque rotundatis, rarius uno polo acutatis, subinde medio leniter coarctatis, dilute fumosis.

Hab. in caulibus Abutilonis sp. (adhuc viventibus?), in calidariis, Meran in Tirolia cisalpina (CERNY).

11. **Glœosporium Ribis** (Lib.) Mont. et Desm. — Syll. II p. 706 — 7649 var. **Parillæ** Jancz. et Namylowski in Anz. Akad. Wis. Krakau (1910) p. 791 et Bot. Centralbl (1911) I p. 498. — A typo dignoscitur acervulis sæpe biformibus; conidiis in aliis pustulis majoribus, 20 \times 4 inque aliis minoribus, vix 4 \times 1; interdum in pustula singula utriusque magnitudinis mixtis.

Hab. in foliis specierum nonnullarum subgeneris Parillæ

- gen. *Ribis*, e. g. *R. integrifolii*, *R. polyanthi*, *R. magellanici*, *R. chrysanthi* cultarum in Rossia (?). — Sec. Laubert in Centralbl. f. Bakt. II Abt. (1906) p. 82, in forma typica conidia sunt 18-30 \approx 7,3-9, non tantum 10 \approx 5-6 uti certe ex errore habetur in Fung. Ital. fig. 1036.
12. **Glœosporium Eriobotryæ** Speg., Myc. Argent. V, p. 402, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis sparsis orbicularibus v. confluendo difformibus, 2-10 mm. diam., cinerescentibus, eximie limitatis exareolatis; acervulis irregulariter sparsis erumpentibus lenticularibus, 180-200 μ . diam., fusco-atris; conidiis ellipsoideis grosse 2-guttulatis, 8-10 \approx 2,5-3.
Hab. ad folia viva *Eriobotryæ japonicæ*, Lezama pr. Buenos Aires Argentina.
13. **Glœosporium album** Osterw., Centralbl. f. Bakter. etc. II Abt. XVIII (1907) p. 826, fig. 2-5. — Acervulis albidis, concentrice dispositis, 90-830 μ . diam.; conidiis hyalinis cylindraceis, curvulis, apice utrinque rotundatis circ. 24 \approx 3; conidiophoris magnitudine variabilibus sed plerumque brevioribus quandoque e basi furcatis.
Hab. in fructibus *Piri communis* et *Piri Mali*, Wädenswil Helvetia.
14. **Glœosporium Cratægi** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7652 p. 368, tab. IX, fig. 34. — Acervulis subepidermide dense gregariis, epidermide dehiscente superficialibus, lenticularibus, nigris, 210-310 μ . diam.; conidiis ellipsoideis, continuis, granulosis, guttulatiisque, hyalinis, 22-28 \approx 6-10.
Hab. in fructibus *Cratægi monogynæ* prope Kecskemét Hungariæ.
15. **Glœosporium armeniacum** Speg., Myc. Argent. V, p. 404, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis sparsis candidis orbicularibus, 2-7 mm. diam., areola subpurpurascente saepe cinctis, per ætatem deciduis, ac folium perforatum relinquenter, acervulis laxè gregariis subcircinantibus, 100-150 μ . diam., nigris pseudoperithecio spurio subostiolato tectis; conidiophoris conoideo-elongatis, 10-15 \approx 2-3, hyalinis monosporis; conidiis ellipsoideis v. oblanceolatis, 25 \approx 7-8, hyalinis, levibus, continuis, saepe guttulatis.
Hab. ad folia viva *Pruni Armeniacæ* in hortis prope Tucumán Argentina Amer. austr.
16. **Glœosporium Cerasi** Lindau in Kabát et Bubák, Fungi imperfecti exsiccati n. 573 (1909). — Maculis subrotundis, circ. 2-3 mm.

in diam., subroseis, in sicco difficile visilibus; acervulis in maculis cæspitosis, densissimis, confluentibus, ceraceis, nudis; conidiophoris densissimis, simplicibus, eseptatis, teretusculis, apice subacutis, 34-40 \approx 3,8; conidiis acrogenis, oblongis, utrinque subacutis, nel subfusoideis, rarius inæqualibus, hyalinis, 11,5-15,5 \approx 3,5-4.

Hab. in fructibus acidis Pruni Cerasi pr. Stargard Pomeraniæ (C. WARNSTORF).

17. **Glœosporium Pruni** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7655 p. 535. — Acervulis subcutaneis, dense gregariis, lenticularibus, atro-violaceis, 140-180 μ . diam.; conidiis ellipsoideis, utrinque acutis v. rotundatis, continuis, granulosis, hyalinis, 10-12 \approx 4-5; conidiophoris filiformibus, hyalinis, conidio duplo longioribus.

Hab. in fructibus Pruni spinosæ prope Felsö-Nyáregyháza Hungariæ. — A *Glæosp. Beguinoti* Sacc. conidiis minoribus præcipue diversum.

18. **Glœosporium Citri** Massee, Kew Bull. (1910) p. 4. — Maculis 7656 amphigenis, numerosissimis, minutis, primo fuscis, dein arescendo albidis, postremo frustulatim deciduis ac folium perforatum relinquenteribus; acervulis subcutaneis, lenticularibus vix perspicuis, 40-50 μ . diam.; conidiis cylindraceis utrinque rotundato-clavatis, hyalinis, 14-17 \approx 5-6, in cirros salmoneos eructatis.

Hab. in foliis emortuis Citri Aurantii, Trinidad Indiæ occid. (I. H. HART).

19. **Glœosporium? Holocalicis** Spég., Myc. Argent. V p. 403, in Anal. 7657 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis albescenscentibus linea angusta purpurascenti limitatis; acervulis, sparsis v. laxe gregariis, erumpentibus, fuscidulis, lenticularibus 100-200 μ . diam.; conidiis cylindraceis rectis v. curvulis 15-16 \approx 6, grosse biguttulatis, hyalinis, conidiophoris æquilongis paulo gracilioribus fuscidulis solitarie acrogenis.

Hab. ad folia languida Holocalycis Balansæ in silvis Santa Fé Argentina Amer. austr.

20. **Glœosporium Orobi** Karst., Acta Soc. pro Fauna et Fl. fenn. 7658 XXVII, 4 (1905) p. 15. — Maculis amphigenis, irregularibus, fuscescenscentibus; acervulis irregularibus, plano-disciformibus, saturate fuscis, minutis.

Hab. in foliis vivis Orobi verni in regione Sortavalensi Fenniæ (LÖNNBOHM).

21. **Glœosporium Pithecolobii** Koord., Botan. Untersuch. Java (1907) 7659

pag. 216. — Maculis maximis, irregularibus, griseo-fuscescentibus; acervulis epiphyllis 70-130 μ . diam.; conidiis continuis, hyalinis, rectis v. curvulis, cylindraceis, utrinque obtusis v. rotundatis, 16-20 \times 5-6.

Hab. in foliis vivis *Pithecolobii lobati* culti prope Purwo-redjo prov. Kedu Java (KOORDERS).

22. **Glæosporium corallinum** (Peyl) Sacc. et Trav. — *Myxosporium 7660 corallinum* Peyl, Beschr. einig. neuer Pilze in Lotos VIII (1858) p. 30 t. I, f. 15. — Acervulis vivide corallinis, nunc discretis, nunc late confluentibus, gelatinosis, (dēmum superficialibus?); conidiis copiosissimis, globosis, majusculis, diaphanis, solutis hyalinis.

Hab. in interiore leguminum frigore necatorum nondum plene maturorum *Phaseoli lunati* sero autumno in Bohemia.

23. **Glæosporium tricolor** Lind, Ann. Mycol. V (1907) p. 277. — 7661 Maculis sparsis, rotundatis, 4 mm. diam., centro nigro-brunneis, pallide griseo marginatis extusque in epiphylo rubro-brunneo zonatis; acervulis sparsis, subepidermicis, minutis, in hypophyllo erumpentibus; conidiis elongatis, unilocularibus, hyalinis, utrinque acutatis, subcurvulis, 30-42 \times 5-6.

Hab. in foliis vivis *Viciæ Craccæ* prope Borgholm in Ins. Oeland Suecia.

24. **Glæosporium Bignoniacearum** Spegazz., Fungi Paulist., Rev. Mus. 7662 La Plata t. XV, p. 40. (1908) — Acervulis lenticularibus 75-100 μ . diam., epiphyllis, sparsis, maculis parvis 1-5 mm. diam., albescenti-cinerescentibus insidentibus; conidiis rectis v. inaequilateribus e saepe medio coarctatulis, utrinque rotundatis, 12-14 \times 5-6, bигuttulatis, hyalinis, in conidiophoris subconoideis 10 \times 4-5 e strato proligero fuscidulo exsurgentibus solitarie acrogenis.

Hab. ad folia viva Bignoniaceæ cujusdam, Ipiranga Cambucy Brasilia (USTERI).

25. **Glæosporium microstromoides** Moesz, Gomb. Budap. I (1909) 7663 p. 23, t. II, f. 7 a-b. (Bot. Közlem). — Maculis cinereis; acervulis sparsis, epidermide tectis, dein erumpentibus; conidiophoris clavatis, cylindraceis v. ovatis, hyalinis, 10-30 \times 5-9, ex hyphis coniothecioideis flavo-fuscis oriundis; conidiis 2-8, plerumque 6-8 in apice conidiophorum, frequenter anulariter ordinatis, obovatis, ad basim saepe attenuatis, hyalinis, 5,8-6,6 \times 3-5.

Hab. in capsulis maturis *Catalpæ bignonioidis*, prope Budapest Hungariæ.

25. **Glæosporium Solani** Osterw., Centralbl. f. Bakter. II Abt. XVIII 7664

(1907) p. 826. — *Acervulis* sæpe concentrice dispositis, nigricantibus; conidiis hyalinis, cylindraceis v. ovoideo-clavatis, v. etiam incurvatis 13,5-17 \approx 3,6-4,8; conidiophoris plus vel minus cylindraceis 19-31 \approx 2,4-3,05 e pseudoparenchymate nigricante ortis.

Hab. in fructibus *Solanum Capsicasteri*, Wädenswil Helvetica.

26. **Glœosporium Kawakamii** Miyabe, Bot. Mag. Tokyo XIX (1905) 7665
p. 213. — Maculis pallide brunneis, obscurius marginatis, in foliis, petiolis ramulisque sitis; conidiis linearis-oblongis v. clavulatis, subirregularibus, rectis curvulisve, hyalinis, 10-13 \approx 2,5-3, in massulas subrotundatas, salmonicolores exsilientibus.

Hab. in plantulis *Paulowniae* tomentosæ, quas maxime et late vexat et serius deformat in Japonia. — In culturis lignuntur chlamydosporæ ovato-ellipsoideæ, continuæ, leves, 7-16 \approx 5-7, obscuræ. Plantulæ folia sæpe fungillo perforatur.

27. **Glœosporium Pouteriae** Speg. Myc. Argent. V, p. 404, in Anal. 7666
Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis elliptico-difformibus, 5-10 mm. long. 3-7 mm. latis, determinatis sordide, albescensibus, subareolatis, linea angusta ferruginea limitatis; acervulis epiphyllis hypodermicis, erumpentibus, conferticolis, lenticularibus 100-150 μ . diam., fuscis; conidiophoris subconoideis v. sublageniformibus 10-20 \approx 7-8, constipatis, obtusis, monosporis, hyalinis; conidiis obovatis, nubiloso-guttulatis, 14-18 \approx 5-7.

Hab. ad folia languida *Pouteriae Sellowianæ* in Horto Botanico Municipali Bonaërensi Argentina America austr. (E. AUTRAN).

28. **Glœosporium lagenarium** (Pass.) Sacc. et Roum. — Syll. III 7667
p. 719 — var. **Citrulli** Potebnia, Myc. St., Ann. Myc. v. V (1907)
p. 20, tab. 3, fig. 40 et Trav. Soc. Nat. Univ. Kharkow XXXXIII
(1907). — Maculis impressis 0,5-5 cm. latis; cæspitulis initio roseo-rubris dein brunneis; conidiis hyalinis, congregatis, pallide roseo-rubris, 14 \approx 5; conidiophoris fusoideis, 20-30 \approx 5.

Hab. in epicarpio *Citrulli vulgaris* quem valde vexat in Rossia austr. ubi valde diffusum.

29. **Glœosporium coffeicola** Speg., Myc. Arg. V, p. 402, in Anal. 7668
Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis irregularibus repandis, 5-10 mm. diam., determinatis, centro subcinerescentibus ambitu subrufescensibus, exareolatis; acervulis epiphyllis subcircinantibus sublenticularibus, 100-150 μ . diam., erumpentibus, atris; conidiis ellipsoideis utrinque rotundatis 12-14 \approx 7-8,

intus granulosis v. grosse 1-guttulatis, primum mucoso,—vestitis demum nudis, hyalinis, levibus.

Hab. ad folia languida Coffeæ arabicæ prope São Paulo Brasilia Amer. aust. (C. GIROLA). — A *G. coffeano* Del. nec non a *Colletotricho coffeano* Del. longissime recedens nec quidem comparandum.

30. **Glœosporium bokense** P. Henn., in Fl. du Bas- et Moy. Congo, 7669 in Ann. Mus. du Congo, v. II, fasc. III (1908) p. 228. — Maculis effusis, cinereo-fuscis, zona rufo-brunnea circumdati; acervulis epiphyllis gregariis, immersis, subcupulatis, rotundatis, atro-cellulosis, c. 80-100 μ . diam.; conidiis ellipsoideis, nubilosus, 2-guttulatis, 7-10 \times 4-5, hyalinis; conidiophoris brevibus.

Hab. in foliis Coffeæ sp., Boko Congo (VANDERYST).

31. **Glœosporium Spegazzinii** Sacc. et Trott. — *Glœosporium apiosporum* Spegazz., Fungi Paulist. in Rev. Mus. La Plata t. XV, p. 40, (1908) non Sacc. — Maculis repando-orbicularibus 1-4 mm. diam. sordide testaceis, ad epiphyllum areola purpurascente cinctis, ad hypophyllum areola destitutis; acervulis sparsis erumpentibus 60-80 μ . diam. epidermide infuscata diu tectis; conidiis utrinque obtusis 14-16 \times 7 continuis v. obsolete diblastis, hyalinis, in conidiophoris conicis 10-15 \times 5, concoloribus solitarie acrogenis.

Hab. ad folia languida Coffeæ cujusdam in Horto botanico São Paulo Brasilia (USTERI).

32. **Glœosporium minus** Shear, Bull. Torr. Bot. Club, XXXIV (1907) 7671 p. 315, Cranberry Dis. p. 40, tab. III, fig. 10-11. — Acervulis amphigenis, parvis, sparsis, in maculis distinctis v. non, insidentibus; conidiis massas pallide rubras glutinosas efformantibus, oblongo-ellipsoideis v. subcylindraceis, quandoque inæquilateralibus v. subclavatis, plerumque guttulatis, 6-9 \times 3-4; conidiophoris simplicibus, supra leniter conoideis, sesqui- v. duplo longioribus; setulis non observatis.

Hab. in foliis fructibusque Vaccinii macrocarpi, in America boreali.

33. **Glœosporium apiosporum** Saccardo, Microm. Amer. novi, Journ. of Myc. v. XII (1906) p. 51. — Maculis angulosis v. subcircularibus, amphigenis, brunneo-alutaceis, 6-8 mm. diam., saepè confluentibus, nervis obscuratis limitatis; acervulis plerumque hypophyllis, innatis, crêberrimis, punctiformibus, brunneis; conidiis obpiriformibus, apice rotundatis, 8 \times 2,5, crasse 1-2-guttatis, ses-

silibus, in cirros filiformes, tortuosos, copiosissimos, alutaceos, demum totas maculas obtegentes protrusis.

Hab. in foliis languidis *Arctostaphyli* tomentosæ vulgo Madrono de arbol, in territorio Mexici (BONANSEA). — *Gl. alpino* affine, Conidiophora nulla v. brevissima.

34. **Glœosporium anceps** Sacc., Ann. Mycol. VI (1908) p. 556. — Maculis minutis amphigenis, anguloso-orbicularibus, utrinque, præsertim inferne, elevatis, atropurpureis, 1 mm. circ. diam.; acervulis exiguis, punctiformibus, vix erumpentibus, fuscis; conidiis globulosis 4 μ . diam., initio, ut videtur, catenulatis, hyalinis; conidiophoris brevissimis ellipsoideis, sporomorphis, hyalinis.

Hab. in foliis vivis *Arbuti Unedo*nis, Villa Favorita, Palermo, Sicilia (J. H. MATTEI). — Fungillus, anceps, ulterius inquirendus.

35. **Glœosporium Oleandri** Sacc., Ann. Mycol. VI (1908) p. 556. — 7674 Maculis nullis v. obsoletis; acervulis epiphyllis dense gregariis, epidermide stellatim fissa tectis, dein erumpentibus, 250 μ . diam., fuscis; conidiis ellipsoideo-oblongis, utrinque rotundatis, intus granulosis, 14-15 \times 5, subinde plasmate bipartito, hyalinis; conidiophoris fasciculatis, bacillaribus, subhyalinis, 14-15 \times 2, e strato proligero chlorino nascentibus.

Hab. in foliis languidis *Nerii Oleandri*, Giardino Inglese Palermo, Sicilia (J. H. MATTEI). — Accedit ad *Gl. affine* sed satis distinguitur.

36. **Glœosporium Holstii** P. Henn., Engl. Jahrb. XXXVIII (1905) 7675 p. 17. — Maculis rotundatis, pallidis, exaridis, zona rufofusca cingulatis; acervulis epiphyllis sparse gregariis, lenticularibus, atris, c. 100-120 μ . diam.; conidiis oblonge ellipsoideis, rectis v. subcurvulis, obtusis, nebulosis, hyalinis, 10-14 \times 5-6.

Hab. in foliis *Tabernæmontanæ Holstii*, Wilhelmstal Ost-Usambara Africæ (ZIMMERMANN). — A *Gl. Tabernæmontanæ* diversum.

37. **Glœosporium Roaldii** Lind, Vidensk. Selskab. Skrif. Math. Naturw. Kl. Christiania (1909) n. 9 X Extr. p. 20, tab. I, fig. 14. — Acer- vulis numerosis, sparsis, in macula vasta arida foliorum v. in foliis emortuis, erumpentibus, nigrescentibus, hypophyllis, c. 80 μ . diam.; conidiis elongato-ellipsoideis, utrinque attenuatis seu clavulatis, curvatis, hyalinis, intus granulosis, 20-26 \times 3,5-5.

Hab. in foliis *Erigerontis grandiflori* et *Polemonii borealis*, Herschell Island, Amer. bor. arctica.

38. **Glæosporium Bischofiæ** Koord., Botan. Untersuch. (1907) p. 215. 7677

— Maculis atris, circularibus irregularibusve, zona purpurea cinctis, c. 10 mm. diam.; acervulis 80–160 μ . diam., erumpentibus, amphigenis; conidiis continuis, hyalinis, longe cylindraceis v. fusiformibus, plerumque 20 \times 5, apice rotundatis, basi obtusis, rectis v. curvulis; conidiophoris continuis, indivisis, hyalinis, longe cylindraceis, 12–15 \times 3–4.

Hab. in foliis vivis Bischofiæ javanicæ prope Sapuram prov. Kedu Java (KOORDERS).

39. **Glæosporium Heveæ** Petch, Ann. Roy. Bot. Gard. Peradenya 7678

III Pt. I, (1906) p. 8. — Acervulis pallido-brunneis, sparsis, erumpentibus, irregularibus, applanatis, epidermide rupta cinctis, 0,1–0,25 mm. diam., amphigenis, conidiis oblongis, utrinque rotundatis, hyalinis, continuis, 12–17 \times 3,5–5, guttam pallido-brunneam ejectis; conidiophoris 20–34 \times 2.

Hab. in foliis plantularum mox secedentibus Heveæ brasiliensis, in ins. Ceylon.

40. **Glæosporium albo-rubrum** Petch, Ann. Roy. Bot. Gard. Peradenya 7679

III (1906) Pt. I, p. 8. — Ztschr. f. Pflanzenkr. XVIII (1908) p. 87. — Acervulis 150–200 μ . diam., nigris, epidermidem irregulariter lacerantibus; conidiis hyalinis, oblongis, utrinque rotundatis, rectis v. leniter curvatis, 15–20 \times 3–4, in cirrum crassum albidum v. puniceum ejectis.

Hab. in ramis vivis Heveæ brasiliensis, Ceylon.

41. **Glæosporium Ricini** Maubl., Bull. Soc. Myc. Fr. XXII (1906) 7680

p. 67. — Maculis nullis; acervulis epiphyllis, sparsis, pallide roseis, erumpentibus, minutissimis, 90–140 μ . diam.; pseudopycnidio fere superficiali, contextu celluloso, nigricante; conidiophoris simplicibus, continuis, brevibus, 15 μ . long.; conidiis acrogenis, oblongis, obtusis, leniter granulosis, continuis, hyalinis, 12–14 \times 3–4.

Hab. in foliis languidis Ricini communis, Sao Paulo Brasiliæ (PUTTEMANS)

42. **Glæosporium Muehlembeckiæ** Briosi et Cav., Funghi parass. essicc. 7681

n. 397 (1905) c. ic. — Acervulis gregariis v. sparsis in macula albicante lata insidentibus, primo epidermide tectis dein erumpentibus, globosis v. globoso-conicis; stromate nigro, pseudoparenchymatico ad basim præditis; conidiis e strato proligero oriundis, hyalinis, continuis, oblongis, rectis v. parum incurvatis, 15–16,5 \times 6,5.

Hab. in cladodiis languentibus *Muehlenbeckia* platycladæ, in horto botanico Pavia, Ital. bor.

43. **Glœosporium Vogelianum** Sacc., Ann. Mycol. VI (1908) p. 562, 7682 tab. 24, fig. 6. — Acervulis epiphylli sgregariis interdum in maculis brunneis (propriis?) insertis, subcutaneo-erumpentibus, disciformibus, subochraceis, 200-300 μ . diam.; conidiis allantoideis eximie arcuatis, utrinque obtusulis, 12-14 \times 2,5-3, hyalinis, guttulatis.

Hab. in foliis languidis *Coryli Colurnæ*, Tamsel Germaniae (P. VOGEL). — Conidiis valde curvatis imprimis dignoscitur.

44. **Glœosporium inconspicuum** Cavara, Fungi Longob. exsicc. fasc. V 7683 (1894) n. 249 cum iconе et in Briosi e Cavara, Funghi parass. n. 350 (1900). — Maculis foliicolis magnis circularibus, flavo-ochraceis margine indeterminatis; acervulis epiphyllis, sublente quoque ægre visilibus, hyalino-ceraceis; conidiophoris cylindraceis constitutis monosporis, 8-10 μ . long.; conidiis subellipsoideis, ovoideis v. cylindraceis, hyalinis 1-2 μ . cr.

Hab. in foliis languidis *Ulmia americanæ*, Pavia Italia bor. — Var. **campestre** Dorogin in Zeitschr. f. Pflanzenkr. XX (1910) p. 262, fig. 1-2. — Maculis initio annularibus ochraceis, deinde suborbicularibus confluentibus brunneis; acervulis, sub lente quoque non perspiciendis, conico-depressis, hyalinis; conidiophoris filiformibus, dense stipitatis, 14-18(-28) \times 1-2; conidiis minutis cylindraceis, bacteriformibus, 3-6(-9) \times 1-2, hyalinis. — In foliis vivis *Ulmia campestris*, Lesnoj prope Petropolim Rossiæ. — Ob conidia et conidiophora multo majora probabiliter a typo specificè distinguendum.

45. **Glœosporium leptothyrioides** Kab. et Bub., Myc. Beitr., Hedwigia 7684 Bd. XLVI (1907) p. 296. — Maculis amphigenis, usque ad 3 cm. long. et 1 cm. latis, irregularibus, subindeterminatis, e pale bruneis obscure bruneis, non v. anguste brunneo-rubro v. flavo-brunneo marginatis; acervulis amphigenis v. hypophyllis plus minusve confertis, saepe confluentibus, rotundatis v. elongatis, depressis, epidermide tectis, dein late apertis, ex obscure bruneis nigrescentibus, opacis; conidiis subfusoideis v. cylindraceis utrinque subangustatis, obtusulis, rectis v. raro curvulis, 5-8 \times 2-3, hyalinis; conidiophoris ampulliformibus conidia subæquantibus v. longioribus, basi 6 μ . cr. pallide olivaceo-bruneis.

Hab. in foliis vivis *Betulae albæ* prope Turnau Bohemia

(KABAT). — A *Gl. Betulæ* (Lib.) et *Gl. betulino* Westend. omnino diversum.

46. **Glæosporium salicinum** Karst., Acta Soc. pro Faun. et Fl. fenn. 7685 XXVII (1905) 4, p. 11. — Acervulis epiphyllis, sparsis, rarius confertis, sub epidermide nidulantibus pulvinatis, rotundatis v. irregularibus, nitidis, rufis, minutis; conidiis non visis.

Hab. in foliis languidis *Salicis viminalis* in horto Mustialensi Fennia. — Specie, conidiis ignotis, omnino dubia.

47. **Glæosporium amentorum** (Delacr.) J. Lind, Ann. Mycol. III (1905) 7686 p. 431, *Fusarium amentorum* Delacr. — Syll. XI p. 650. — Conidiis ovoideo-ellipticis 14-20 v 5-8.

Hab. in amentis *Salicis auritæ*, *S. cinereæ*, *S. viminalis*, *S. pedicellatae* etc. in Norvegia, Suecia, Dania, Germania, Austria, Gallia, Algeria. — Sequentes species amenticolæ ita, sec. Lind, distinguendæ.

48. **Glæosporium deformans** (Schröt.) J. Lind, Ann. Mycol. III (1905) 7687 p. 432, *Fusarium deformans* Schröt. — Syll. IV p. 717. — Conidiis inæquilateralibus, plano-convexis, 20-25 v 5-10.

Hab. in amentis *Salicis capreæ* et *S. caprea-cinereæ* in Fennia Suecia, Dania, Silesia, Gallia.

49. **Glæosporium øelandicum** J. Lind, Ann. Mycol. III (1905) p. 432. 7688 — Conidiis ut in *G. deformante* sed majoribus, 28-36 v 5-10.

Hab. in amentis *Salicis undulatae* in Ølandia.

50. **Glæosporium Lapponum** J. Lind, Ann. Mycol. III (1905) p. 432. 7689 — Conidis fortiter falcato-curvis, 21-33 v 5-10.

Hab. in amentis *Salicis Lapponum*, *S. nigricantis*, *S. phyllicifoliae*, et *S. repentis* in Norvegia et Suecia.

51. **Glæosporium intumescens** Bub. et Kab. Hedw. L (1909) p. 45, 7690 cum iconœ. — Acervulis hypophyllis, nervicolis, subepidermicis, 100-130 µ. lat., dense gregariis v. confluentibus, pallidis dein brunneis; conidiis in massulas breve elevatas sordide albas eructatis, fusoides vel oblongis, uno apice acutatis vel cuneatis 13-21 v 5,5-7,5, rectis curvulisve; conidiophoris basi cæspitose junctis, rectis curvulisve, hyalinis, variæ longitudinis, conidio brevioribus v. longioribus.

Hab. in foliis vivis demum decoloratis *Quercus Cerris* pr. Grosse Skal Bohemiæ. Cl. auctores intumescentias lineares nervisequias, quibus fungillus innascitur, tribuunt *Glæosporio* sed revera sunt gallæ a *Cecidomyæ* specie generatae.

52. **Glæosporium cecidophilum** Trotter, Micromic. delle galle, Ann. 7691

Myc. v. III (1905) p. 524, fig. 3, 3 a. — Acervulis punctiformibus in maculas pallidas insidentibus; conidiis irregulariter ellipsoideis v. ovatis, pallide olivaceis, 1-2 v. indistincte guttulatis, 12-16 \approx 6-8; conidiophoris brevibus 10 μ . c. longis.

Hab. in superficie gallarum Neuroteri vesicatoris, in pagina inferiori foliorum Quercus pedunculatae, Bosco Fontana prope Mantova, Neuroteri baccarum, in foliis Quercus sessilifloræ amphigenis, Fano Marche, Ital. sup.

53. **Glœosporium Usteri** Spegazz., Fungi Paulist. Rev. Mus. La Plata 7692 t, XV, p. 42 (1908). — Maculis primo suborbicularibus dein confluendo difformibus pallidescentibus obsoletis; acervulis innato-erumpentibus lenticularibus 100-200 μ . diam.; conidiis rectis v. leniter inaequilateralibus utrinque obtusis, 14-20 \approx 5-6 non v. grosse 1-guttulatis hyalinis in conidiophoris brevissimis papilliformibus e strato proligero fuscidulo oriundis acrogenis.

Hab. ad folia subcarnosa languida plantæ ignotæ cujusdam in Horto botanico Sao Paulo Brasilia (USTERI).

54. **Glœosporium paulistanum** Spegazz., Fungi Paulist. Rev. Mus. 7693 La Plata t. XV, p. 40 (1908). — Maculis sparsis 5-10 mm. diam. repando-suborbicularibus, areola angusta lateritia callosula cinctis, centro sordide testaceis, ambitu pallescentibus per ætatem secendentibus ac folium perforatum relinquenteribus; acervulis lenticularibus 75-100 μ . diam., dense gregariis epiphyllis, saepe subcircinantibus; conidiis rectis v. inaequilateralibus utrinque arctiuscule rotundatis, 4-6 \approx 1,5-2, eguttulatis.

Hab. ad folia plantæ cujusdam ignotæ in Horto botanico Sao Paulo Brasilia (USTERI).

55. **Glœosporium phyllachoricola** Spegazz., Fungi Paulist. Rev. Mus. 7694 La Plata t. XV, p. 41 (1908). — Acervulis lenticularibus 50-80 μ . diam., epidermide tectis e dorso stromatum Phyllachoræ cujusdam serius erumpentibus; conidiis utrinque obtusis 12-14 \approx 7-8 hyalinis, in conidiophoris gracilioribus 8-10 \approx 2-2,5 e strato proligero fuscidulo oriundis acogene insidentibus.

Hab. ad folia coriacea languida arbusculæ cujusdam, Ipiranga Brasilia (USTERI). — An *Phyllachoræ* statum conidicum sistens? An in *Phyllachora* parasitans?

56. **Glœosporium Musarum** Cooke et Massee — Syll. X p. 461 — 7695 var. **importatum** Laubert in Gartenflora LIX (1910) p. 412, tab. fig. 1 (habitus) et p. 414, f. 1-2. — Conidiis, quam in typo, majoribus, nempe 9-24 \approx 5-7 (nec 10-12 \approx 4).

Hab. in fructibus Musæ sepientum cultæ, Berolini. — Fructus superficie late nigro-maculantur et acervuli sat crebri gignuntur; conidia dein in verruculas incarnatas exsiliunt. Fructus Musæ maxime vitiantur.

57. **Glœosporium Agaves** Syd., Ann. Mycol. V (1907) p. 362. — 7696

Acervulis amphigenis, subepidermicis, planis, sparsis vel aggregatis, saepe irregulariter confluentibus, atris, variæ magnitudinis; conidiis cylindraceis, utrinque rotundatis, rectis vel rarius leniter curvulis, hyalinis, continuis, intus granulosis, 20-30 × 7-9 µ.; conidiophoris brevibus.

Hab. in foliis Agaves spec. Prov. Sao Paulo, Campinas, Brasilia.

58. **Glœosporium colubrinum** Saccardo, Fungi aliquot africani, Bol. 7697

Soc. Broteriana, v. XXI (1904-905) p. 8. — Maculis nigricantibus subcircularibus angulosisque, vix 1 mm. diam., saepe confluentibus, matricem quasi colubrinam reddentibus; acervulis innatis, pulvinatis, 0,5 mm. diam., operculo epidermico circumscisso, subcirculari, demum secedente velatis, fuscis; strato conidico crasso duriusculo ex conidiophoris bacillaribus, septulatis dense stipatis, 55-70 × 5,5-7, fuligineis, sursum pallidioribus apiceque obsolete denticulatis formato; conidiis oblongo-cylindraceis, rectis curvulisve, utrinque rotundatis, 25-28 × 8-8,5, ex hyalino dilute olivascentibus, farctis.

Hab. in foliis emortuis Sansevieræ cylindraceæ ex Angola Africæ occid. (A. MOLLER). — Maculis colubrinis, operculis epidermicis vere peculiaribus, conidiis majusculis species mox distinguenda.

59. **Glœosporium triviale** Spégazz., Fungi Paulist. Rev. Mus. La 7698

Plata t. XV, p. 41 (1908). — Maculis subellipticis 5-15 mm. longis diffusis indeterminatis centro subarescentibus, ambitu pallescentibus; acervulis subcircinantibus lenticularibus 75-100 µ. diam. fuscidulis prominulo-erumpentibus; conidiis utrinque acutiuscule rotundatis 14-16 × 5-5,5 rectis v. leniter inæquilateralibus, non v. grosse 2-3-guttulatis, hyalinis.

Hab. ad folia languida Amaryllidaceæ cujusdam, Quedaserto de Caminas Brasilia (USTERI)

60. **Glœosporium polymorphum** Trinchieri, Rend. R. Acc. Sc. Napoli 7699

(1909) fasc. 8-12, Extr. p. 6. — Maculis permagnis, totum fere folium occupantibus, utrinque visilibus, ferrugineis vel cinerescentibus, hic et illic albicantibus, castaneo-marginatis, 19-44 cm,

longis, 3-6 cm. latis; acervulis epiphyllis, rarius amphigenis, densissime aggregatis, epidermide velatis, dein erumpentibus, convexulis, subrotundis, nigris, 122-208 μ . diam., 98-147 μ . altis; conidiophoris nunquam visis; conidiis forma variis, cylindricis, clavatis, ovatis, ossiformibus, utrinque rotundatis vel ellipsoideis, uno apice acutulis, rectis curvulisve, 1-2-3 vel pluriguttulatis vel dense granulosis, hyalinis, 12-22 \times 4,5-7.

Hab. in foliis adhuc vivis *Dracænæ fragrantis* Ker-Gawl.; quandoque socio *Colletotricho Dracænæ* in Horto regio botanico neapolitano Ital. austr. (TRINCHIERI).

61. **Glœosporium Crini** Sacc., Ann. Mycol. VI (1908) p. 556. — Ma- 7700 culis minutis versiformibus, supra elevatis, alutaceis; acervulis pulvinatis, erumpentibus, flavidis, 150 μ . diam.; conidiis ellipsoideis utrinque obtusatis, 11-11,5 \times 5-5,5, intus granuloso-farctis, hyalinis; conidiophoris fasciculatis, obclavatis, 20 \times 4, e hyalino luteolis.

Hab. in foliis languidis *Crini* sp. in Horto botanico panormitano, Sicilia, socia *Phyllosticta Crini* (J. H. MATTEI).

62. **Glœosporium Bomplandii** Speg., Myc. Argent. V, p. 401, in Anal. 7701 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus, 1-2 mm. diam., determinatis, centro albescensibus ambitu fusco-ferrugineis; acervulis saepius epiphyllis solitariis vel paucis gregariis, erumpentibus, 120-150 μ . diam., fuscidulis; conidiis subcylindraceis utrinque obtuse rotundatis, 12-14 \times 5-6, saepius ad medium subcoarctatulis, continuis, hyalinis.

Hab. ad folia viva *Dioscoreæ?* in silvis prope Bompland Misiones Argentina Amer. austr. (P. JORGENSEN).

63. **Glœosporium anthuriophilum** Trinchieri, Rend. R. Ac. Sc. Fis. 7702 Mat. Napoli, fasc. 3-4, marzo-aprile (1909) p. 93. — Maculis amphigenis, rotundis, nunquam confluentibus, exaridis, cinerescentibus vel pallide brunneis, distincte lateque fusco-zonatis et margine definito, prominulo, castaneo circumscriptis, 1-2 cm. diam.; acervulis amphigenis, evidentibus, aggregatis, sublenticularibus, epidermide albicante tectis, nigris, 245-294 μ . diam., 122-137 μ . altis; conidiophoris nullis; conidiis cylindricis, utrinque obtusis quandoque uno apice leniter acutis, intus granuloso-farctis, continuis, hyalinis, 12-22 \times 4,5-7.

Hab. in foliis vivis *Anthurii crassinervii*, culti in calidario Horti regii botanici neapolitani Ital. austr. (TRINCHIERI). — A *Gl. minimo* et a *Gl. Anthurii* satis distincta species.

64. **Glœosporium Phaji** Maubl., Bull. Soc. Myc. Fr. XXI (1906) p. 67. 7703

Maculis rotundatis primum luteolis, dein nigricantibus, demumque exaridis albidisque; acervulis in cellulis epidermicis evolutis, primum cuticula tectis, dein nudis, plerumque epiphyllis, minimis; conidiis ovoideis, saepe subpiriformibus, utrinque rotundatis, rectis v. paululum reniformibus, 1-2 guttulatis granulatisque, hyalinis v. chlorinis, 20-22 \approx 6,5-7; conidiophoris cylindraceis, crassis, 12 \approx 4-4,5.

Hab. in foliis vivis Phaji sp. in calidariis Parisiis Galliæ.

65. **Glœosporium Vandopsisidis** v. Keissl., Ann. Mycol. VII (1909) 7704 p. 293. — Amphigenum; maculis nullis; acervulis sparsis, ellipsoideis parvis rotundatis, fuscis; epidermide exarida tectis, demum rima oblonga perforantibus, c. 500 \approx 300; conidiophoris dense gregariis, rectis, brevibus, fuligineis, c. 25-30 \approx 3; conidiis oblongis, rectis, apice obtusis, hyalinis, eguttulatis, c. 12 \approx 5.

Hab. in foliis languidis Vandopsisidis sp. in insula Salomon Bougainville prope Kieta (RECHINGER).

66. **Glœosporium Sobraliae** Maubl., Bull. Soc. Myc. Fr. XXII (1906) 7705 p. 68. — Maculis apicalibus, magnis, sordide ochraceis, linea atro-fusca limitatis; acervulis sparsis amphigenis, epidermide dealbata primum tectis, linea obscura circumdatis, dein epidermide fissa v. perforata subnudis, $\frac{1}{4}$ mm. diam.; pseudopycnidio appланato, dilute fusco; conidiis ovoideo-elongatis, ad basim plerumque attenuatis, granulatis, hyalinis, 16-19 \approx 5-6; conidiophoris rectis, 1-2-septatis, saepe sub conidio acrogeno inflatis, usque ad 35 μ . long., 5 μ . crassis.

Hab. in foliis Sobraliae sp. in calidariis Parisiis Galliæ.

67. **Glœosporium Dendrobii** Maubl., Bull. Soc. Myc. Fr. XXII (1906) 7706 p. 68. — Maculis magnis, pallide ochraceis, vix limitatis, extremam partem foliorum occupantibus; acervulis numerosis, interdum transverse seriatis, nigris, epiphyllis, minutis, 175 μ . diam.; pseudopycnidio dilute fusco, in cellulis epidermicis evoluto; conidiis oblongis, utrinque rotundatis, sed ad basim saepe attenuatis, rectis v. paululum curvulis, granulatis, hyalinis, 15-20 \approx 5-7; conidiophoris cylindraceis, basi dilute fuscis, septatis, 35 μ . long.

Hab. in foliis Dendrobii Farneri in calidariis Parisiis Galliæ. — *Gl. Sobraliae* affine sed maculis conidiisque diversum.

68. **Glœosporium Pteridis** (Kalchbr.) Bub. et Kab., Fünft. Beitr. Pilzfl. 7707 Tir. in Ber. naturw.-med. Ver. Innsbruck XXX Jahrg. (1905-1906) Extr. p. 15. Ita vocandum *Fusidium Pteridis* Kalchbr. — Syll. IV, p. 31.

GLÆOSPORIOPSIS Spég., Myc. Arg. V, p. 404, in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. *Glæosporium* et *opsis* aspectus). — Acervuli innato-erumpentes, pseudopycnidio rudimentario vestiti, fusci, minuti; conidia ellipsoidea, catenulata, hyalina. — Est *Glæosporium* conidiis catenulatis.

1. **Glæosporiopsis Vinal** Spég., l. c., pag. 405, cum icon. — Maculis 7708 amphigenis suborbicularibus, 2-5 mm. diam., determinatis, ex albo pallescentibus, linea angusta callosula ferruginea limitatis; acervulis epiphyllis innato-erumpentibus orbicularibus, 120-150 μ . diam., atris; conidiophoris bacillaribus ellipsoideis, dense constipatis 10-15 \approx 2-2,5 acrogenis, fumosis; conidiis ellipsoideis 12-14 \approx 6, dense granulosis, levibus, in catenulas 3-5-meras digestis.

Hab. abunde ad folia viva *Prosopidis ruscifoliæ* prope Formosa Argentina Amer. austr.

VANDERYSTIELLA P. Henn., in Fl. du Bas- et Moy.-Congo, in Ann. Mus. du Congo v. II, fasc. III (1908) p. 229 (Etym. a cl. VANDERYST collectore mycologo in Africa). — Acervuli subepidermide erumpentes, disciformes, atro-cellulosi. Conidia subfusoideo-quadrangularia, continua, hyalino-fuscidula; conidiophora brevia, hyalina.

1. **Vanderystiella leopoldvillianæ** P. Henn., in Fl. du Bas- et Moy.- 7709 Congo, in Ann. Mus. du Congo, v. II, fasc. III (1908) p. 229, fig. 2. — Maculis rotundatis pallide exarescentibus, zona fusca circumdatis; acervulis amphigenis plerumque hypophyllis sparse gregariis sæpe concentrice dispositis, rotundato-disciformibus, angularis, atris, 60-130 μ . diam.; conidiophoris brevibus, hyalinis; conidiis fusoideo-tetraedricis, acutis, hyalino-fuscidulis, 10-14 \approx 5-7.

Hab. in foliis Derridis sp., Leopoldville Congo (VANDERYST).

MYXOSPORIUM Link — Syll. III p. 722, X p. 464, XI p. 568, XIV p. 1013, XVI p. 1004, XVIII p. 459.

1. **Myxosporium acerinum** Peck, Bull. Torr. Bot. Cl. XXXVI (1909) 7710 p. 338. — Acervulis minutis in cortice nidulantibus, sparsis, griseis; conidiis exslientibus et massas minutis inæquales albidas formantibus, maximis, oblongis, sæpe infra attenuatis, intus granulosis, hyalinis, 24-40 \approx 8-12.

Hab. in ramis Aceris saccharini, River Forest Illinois Amer. bor. (E. T. et S. A. HARPER).

2. **Myxosporium Camelliæ** Peyl, Lotos VII (1856) p. 27, fig. 3. — 7711

Acervulis gregariis, epidermide erupta rimose erumpentibus; conidiis cylindraceis utrinque rotundatis, subrectis, in tænias gelatino-sas, flexuosas, pallide incarnatas eructatis.

Hab. in ramis Camelliæ japonicæ in calidariis uidis, Kacin Bohemiæ (PEYL).

3. **Myxosporium longisporum** Edgert., Ann. Mycol. VI (1908) p. 53, 7712 cum icon. — Acervulis erumpentibus subcorticalibus, magnitudine variabilibus, usque ad 1,5 mm., sparsis v. gregariis; conidiophoris e stromate tenui pseudoparenchymatico orientibus, brevissimis; conidiis rectis v. curvulis, hyalinis, continuis, 30-48 \approx 12-15.

Hab. in ramis Liriodendri Tulipiferae, Poughkeepsie N. Y. Amer. bor.

4. **Myxosporium rhoinum** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7713 pag. 535. — Acervulis dense gregariis, subcutaneo-erumpentibus, albidis, carnosulis, 1 mm. crassis; cirris globuliformibus, albis; conidiis ellipsoideis, continuis, hyalinis, 1-2-guttulatis, 28-32 \approx 12-14; conidiophoris fasciculatis, hyalinis 16-20 \approx 2.

Hab. in ramis emortuis Rhois glabræ, Kecskemét Hungariæ. — A *Myx. Rhois* Sacc. differt conidiis majoribus, angustioribus.

5. **Myxosporium necans** Peck, N. York State Mus. Bull. n. 122 (1908) 7714 p. 33 et 160. — Acervulis in lineis longis sub epidermide nidulantibus, erumpentibus, intus albidis; conidiis oblongo-ellipsoideis, in massas albas v. flavid-albas cirrosas, expulsis, saepe binucleatis, 6-10 \approx 2-3.

Hab. in cortice Pruni virginianæ quam valde vexat, North Greenbush Amer. bor.

6. **Myxosporium Pruni-Mahaleb** D. Cruch. in Moreillon M. Schweiz. Zeitschr. für Forstwesen LXI (1910) p. 152-155, cum icon. — Acervulis pustuliformibus innato-erumpentibus, brunneis, dein nigricantibus, ambitu subcircularibus, disco plano dein umbilicato, circ. 100-500 μ . diam.; conidiis ovoideis dein cylindraceis, utrinque rotundatis, rectis, subinde medio leviter angustatis, 15-20 \approx 9, hyalinis, intus nubilosis; conidiophoris fasciculatis, clavulatis, longitudine variis, 8-16 \approx 4, hyalinis.

Hab. in ramis, quos vexat et deformat, Pruni Mahaleb, Waadtländer Juræ Helvetiæ. — Socia adest *Cucurbitaria Pruni-Mahaleb* Allesch., quoque pathogena. Ejusdem ascii nondum descripti — cfr. Syll. IX, p. 917 — ex cl. Cruchet l. c. fig. 2, sunt ovoideo-elongati 75 \approx 27, sporidia subdisticha, oblongo-ovoidea, ir-

regulariter 5-septato-muriformia, utrinque obtuse acutata, hyalina, 20-22 \vee 9-10. — Ob sporidia achroa species *Catharinia Pruni-Mahaleb* (Cruch.) Sacc. nuncupanda.

7. **Myxosporium corticola** Edgert., Ann. Mycol. VI (1908) pag. 48, 7716 cum icono, *Macrophoma Malorum* Paddok N. Y. Agr. Exp. St. Bull. 163 (1899) p. 203. — Acervulis subcorticis, erumpentibus, 1-2 mm. diam., sparsis; conidiophoris brevissimis e stromate basiliari pseudoparenchymatico orientibus; conidiis rectis v. curvulis, cylindraceis, hyalinis, continuis, dense granulosis, 18-32 \vee 6-9.

Hab. in ramis cancerosis Piri et Mali, Mexico New York Amer. bor.

8. **Myxosporium depresso** Sacc., Ann. Mycol. VI (1908) p. 566. — 7717 Acervulis laxe gregariis, corticolis, innato-erumpentibus, aplana-to-pulvinatis, cortice rimoso cinctis, $\frac{1}{3}$ - $\frac{1}{2}$ mm. diam., sordide carneis, dein fuscescentibus, excipulo proprio omnino nullo; conidiis fusoideis, deorsum magis acutatis, 9-10 \vee 2-3, eguttulatis, hyalinis; conidiophoris bacillaribus, dense fasciculatis, hyalinis, 20-25 \vee 1,3, e strato proligero celluloso, fuligineo oriundis.

Hab. in ramis subemortuis Syringæ vulgaris, Yates, Orleans County, N. Y. Amer. bor. (FAIRMAN). — Forte status primigenus *Phomæ depresso*.

9. **Myxosporium Roumegueri** Sacc. — Syll. III, p. 722 (ut subspec. 7718 *Myx. incarnati*) — fm. *coryleum* Sacc., Ann. Mycol. VII (1909) p. 436. — Pallide incarnatum; conidiis oblongo-ellipsoideis, 26-28 \vee 8-10; conidiophoris bacillaribus 18-25 \vee 3-4, apice incrassatis.

Hab. in cortice Coryli Avellanæ, Rangsdorf pr. Zossen Germaniæ (H. SYDOW).

10. **Myxosporium castaneum** Peck, N. Y. St. Mus. Bull. 131 (1909) 7719 p. 24. — Acervulis gregariis, orbicularibus, $\frac{1}{2}$ - $\frac{3}{3}$ mm. lat., in cortice nidulantibus, epidermide rupta circumscriptis, pallidis vel subgriseis; conidiis oblongis v. ellipsoideis, hyalinis, 6-10 \vee 3-4; conidiophoris filiformibus, sporulis æqualibus v. longioribus.

Hab. ad ramos emortuos Castaneæ dentatæ, Queens Co., Amer. bor. (J. MICKLEBOROUGH).

11. **Myxosporium quercinum** Lasch in Kl. Herb. viv. mycol. n. 1076 7720 (1846) [nomen nudum].

Hab. in ramis quercinis in agro Driesen.

12. **Myxosporium Balmoreanum** Speg., Myc. Argent. V pag. 409, in 7721 Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; acervulis dense gregariis subcircinantibus suborbicularibus 10-15 mm.

diam. succineis; conidiophoris fasciculatis, ramulosis, 30-50 \approx 2-3, hyalinis; conidiis cylindraceis utrinque rotundatis 22-26 \approx 5-7, rectis v. curvulis, continuis, hyalinis.

Hab. ad rhachides languentes Kentiæ Baltimoreæ cultæ, Buenos Aires Argentina Amer. austr. (E. AUTRAN).

NÆMOSPORA Pers. — Syll. III p. 746, X p. 507, XIV p. 1018, XVIII p. 462.

1. **Næmospora Jasmini** Griff. et Maubl., Bull. Soc. Myc. Fr. XXV 7722 (1909) p. 60, cum icon. — Acervulis subepidermicis, applanatis, 1-2 mm. diam., aurantiacis, hymenio undulato; conidiis minutis, irregulariter ovoideis cylindraceis v. subpiriformibus, non v. vix arcuatis, hyalinis, coacervatis pallide roseis, 4-7 \approx 2-2,5; conidiophoris acicularibus, 1-2-verticillato-ramosis, 30 μ . longis.

Hab. in ramulis siccis Jasmini officinalis, Rigny-sur Arroux Galliæ (FLAGEOLET). — Ab omnibus congeneribus forma conidiorum diversa.

2. **Næmospora Castaneæ** Bres., Fungi gall., Ann. Myc. VI (1908) 7723 p. 47, *Tubercularia Castaneæ* Pers.? — Acervulis dense gregariis, subcutaneis, mox in cirrum gelatinosum, tuberculosum, demum tortuoso-circinatum, aurantio-carneum, erumpentibus; conidiis subclavatis vel subfusoideis, hyalinis, 8-9 \approx 2 $\frac{1}{2}$ -3; conidiophoris ramulosis, 30-40 μ . longis, basi 3 μ . crassis suffultis.

Hab. in capsulis dehiscentibus Castaneæ vescæ, Dessau Germania (STARITZ).

3. **Næmospora Plantaginis** Ces. in Klotz. Herb. viv. mycol. n. 1664 7724 (1852) (nomen nudum).

Hab. in ?caule Plantaginis in agro Vercellensi Ital. bor. — Socia *Phoma occulta* Ces. (= Ph. subordinaria Desm.) — Auctor ita speciem indicat: *Næmosp.* (*Myxosporium*) *Plantaginis*, sed verisimiliter ab utroque genere discrepat.

MELANOSTROMA Corda — Syll. III p. 728, XI p. 569.

1. **Melanostroma Tozziae** Maire, Oesterr. Bot. Ztschr. LVII (1907) 7725 p. 423. — Caulicola v. epiphylla; stromate ex hyphis brunneo-olivaceis contexto, maculas nigras, inflatas, rotundatas v. irregulares, usque ad 5-6 μ . latas efformante, acervulis in stromate sparsis, rotundatis, subcuticularibus, 300-600 μ . diam.; conidiophoris dense stipatis, simplicibus, cylindricis, dilute olivaceis, 25 \approx 2; conidiis solitariis acrogenis, hyalinis, levibus, oblongo-cylin-

draceis v. cylindraceis, utrinque obtusis, rectis v. curvulis, 4-6 v. 1,5-2.

Hab. in caulis foliisque vivis Tozziae alpinæ prope Mau-rach 1600 m. alt. Tirolia transalp.

MYXOSPORELLA Sacc. — Syll. III p. 729.

1. **Myxosporella Populi** Jaap, Weit. Beitr. Pilzfl. nordfries. Ins., Schrif. 7726 Naturw. Ver. Schlesw.-Holst., Bd. XIV (1907) Heft 1, p. 30. — Acervulis rotundatis 0,5-1 mm. latis, epidermide lacerata cinctis, subimmersis, albis v. roseo-albis; conidiis catenulatis, mox secedentibus, ellipsoideis, ovoideis v. elongatis, 7-14 v. 3,5-5, raro ovoideo-globosis 4-5 μ . longis, hyalinis, rotundatis v. subtruncatis, unilocularibus, saepe guttulatis, rectis v. curvulis; conidiophoris simplicibus, usque ad 15 μ . long., hyalinis.

Hab. in ramis siccis Populi albæ prope Borgsum in ins. Föhr Frisia.

BLENNORIA Fr. — Syll. III p. 730, X p. 466, XVIII p. 461.

1. **Blennoria Acantholimonis** P. Henn. in Kabát et Bubák Fungi imp. 7727 exs. n. 529 (1909). — Acervulis pulvinatis, erumpentibus, epidermide laciniata cinctis, sparsis vel gregariis, fuscis; conidiophoris parce ramosis, filiformibus, hyalinis, ca. 2 μ . crassis; conidiis catenulatis, cylindraceis, utrinque obtuso-rotundatis, eguttulatis, 8-13 v. 2-3.

Hab. in foliis siccis Acantholimonis glumacei in horto bot. Dahlem Germaniae.

2. **Blennoria Lawsoniana** Sacc., Ann. Mycol. VII (1909) p. 436. — 7728 Sporodochiis cortice innatis, dein erumpentibus, hinc inde gregariis, pulvinatis, 0,4-0,5 mm. diam., sordide albis, compactiusculis sed subfragilibus et pruinulosulis, senio collabescendo incavatis; conidiophoris fasciculatis, filiformibus, simplicibus, varie furcatis, 18-24 v. 1,7, hyalinis; conidiis cylindraceis, utrinque obtusis, rectis, 10-12 v. 2, catenulatis sed facile secedentibus, hyalinis.

Hab. in ramulis morientibus Chamæcypris Lawsonianæ cultæ, pr. Tamsel Germania (P. VOGEL). — Videtur affinis *Blennoriæ albæ*.

TRULLULA Ces. — Syll. III p. 731, X p. 467, XVI p. 1005, XVIII p. 462.

1. ***Trullula atro-fuliginea*** Speg., Myc. Arg. V, pag. 407, Anal. Mus. 7729

Nac. Buenos Aires XX (1910). — Matrice infecta quandoque macula pallida indeterminata notata, quandoque tota concolor sordide grisea; acervulis hinc inde densiuscule gregariis, primo epidermide tectis dein nudis, planiusculis v. vix convexis, orbicularibus, 200-350 μ . diam., atro-fuligineis; conidiophoris bacillaribus 20-25 \times 1,5-2, fasciculatis v. e basi ramosis superne obtusiusculis subnodulosis monospermis, deorsum hyalinis, sursum fumosis, margine acervulorum paraphysibus filiformibus duplo triplo longioribus 50-80 \times 2 cincto; conidiis ellipsoideis utrinque subacutiuscule rotundatis, 6-10 \times 3-6, eguttulatis, obscure fuligineis.

Hab. ad sarmenta arida subputrescentia *Vitis viniferae*, La Plata Argentina Amer. austr. — *Tr. olivascenti* Sacc. certe cognata, sed conidiis duplo crassioribus obscurioribusque distincta videtur.

2. ***Trullula nigerrima*** Speg., Myc. Argent. V, p. 407, in Anal. Mus. 7730

Nac. Buenos Aires XX (1910). — Maculis saepè totam matricem ambientibus, sordide cinerescentibus; acervulis gregariis amphigenis erumpentibus, hemisphaericis v. subconoideis, 200-250 μ . diam., compactiusculis, aterrimis; conidiophoris filiformibus 75-80 \times 2, deorsum coalescentibus sursum liberis, apice acutiusculis, monospermis; conidiis ellipsoideis, utrinque subacutiusculis, rotundatis 8-10 \times 4-4,5, saepius biguttulatis, levibus, subopace fuligineis.

Hab. ad cladodia arida *Rhypsalidis Lorentzianæ*, La Plata Argentina Amer. austr.

COLLETOTRICHUM Corda — Syll. III p. 735, X p. 468, XI p. 569, XIV p. 1015, XVI p. 1006, XVIII p. 462 *).

1. ***Colletotrichum Canangæ*** Koord., Bot. Unters. Java (1907) p. 220, 7731

fig. 33 III. — Acervulis foliicolis, sparsis, epidermide erumpentibus, 0,1 mm. diam.; setulis fuscis, rigidis, continuis v. 1-2-septatis, haud raro articulatis, 60-80 μ . longis, rectis v. curvulis, apice acutis; conidiis cylindraceis, rectis v. subrectis, hyalinis, utrinque rotundatis, 13-15 \times 4-5; conidiophoris brevissimis.

Hab. in foliis vivis Canangæ odoratæ in Purworedjo prov. Kedu Java (KOORDERS).

*) Non immerito forsitan cl. prof. Voglino, in Ann. R. Accad. Agric. Torino, XLIX (1907) p. 24-25 extr. dicit *Vermiculariam trichellam* et *Verm. circinantem* ad genus *Colletotrichum*.

2. **Colletotrichum Vitis** Istvánffii, Mitt. k. Hungar. Ampel. Central- 7732

Anst. II (1902) p. 239, t. XXIV, f. 206-209. — Acervulis gregariis 240-400 μ . diam., ramicolis, pulvinatis, flavidobrunneis v. atris, epidermidem rumpentibus ejusdemque fragmentis demum cinctis, basi cellulis parenchymaticis contextis; setulis in pseudoconceptaculum congregatis, copiosis, rectis, hinc inde arcuatis, cylindraceo-conicis, cuspidatis, atro-brunneis, subcompressis, basi rariissime 1-2-septatis et leniter inflatis, 140-160 \approx 6-9; conidiis fusiformibus, arcuatis, utrinque acutis, hyalinis, 21-25 \approx 2,5, uni-nucleatis; conidiophoris intra setulas dense fasciculatis, filiformibus.

Hab. in sarmenis Vitis viniferae in Hungaria. — Ab affinibus *Coll. lineola* et *C. ampelino*, hinc conidiis fusoideis, illinc acervulis non seriatis imprimis distinctum.

3. **Colletotrichum ampelinum** Cav. — Syll. X, p. 470 — fm. ramicola 7733
Voglino, Atti R. Acc. Sc. Torino XLIII (1907-1908) p. 96 (250). — Maculis oblongis, griseis; acervulis latis, setulis rigidis, rectis, 1-septatis, fuligineo-olivaceis, basi incrassatis, pallentibus; conidiophoris cylindraceis, 17 \approx 7; conidiis oblongo-fusoideis, 17-20-22 \approx 4-5.

Hab. in ramis Vitis in Instituto Valsalice, Torino Italiae bor. (TONELLI).

4. **Colletotrichum anonicola** Speg., Myc. Argent. V, p. 406, in Anal. 7734
Mus. Nac. Buenos Aires XX (1910). — Maculis subamphigenis suborbicularibus dein confluendo difformibus repandis, centro subcinerescentibus ambitu sordide fuscescentibus per ætatem rimulosis atque frustulatim deciduis; acervulis sparsis v. laxe gregariis innato-erumpentibus, sublenticularibus, 90-150 μ . diam., atris, setulis marginalibus paucis opace fuligineis 40-60 \approx 5; conidiis subcylindraceis, rectis, 14-16 \approx 4-5, nubilosis v. guttulatis, hyalinis.

Hab. ad folia viva Anonæ Cherimoliæ in hortis prope Tucuman Argentina, Amer. austr.

5. **Colletotrichum Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires XVII 7735
(1908) p. 137. — Maculis suborbicularibus 5-15 mm. diam., superne albescens v. cinerescentibus inferne fuscescentibus, margine undulato-repandulis, linea obscuriore angusta saepius limitatis; acervulis epiphyllis in maculis hinc inde laxe gregariis vix convexulis, 100-150 μ . diam., primo epidermide velatis dein erumpentibus, margine tunica flexuosa subprosenchymatica fumoso-subviolascenti vestitis, setulis paucis 1-2-cellularibus, cylindraceoconoideis, acutis, 10-30 \approx 4-5, concoloribus ornatis; conidiophoris

cylindraceis constipatis, 8-10 \approx 4-5, hyalinis, monospermis; sporulis e cylindraceo ellipsoideo-obovatis, hyalinis, utrinque obtusis, eguttulatis, 10-12 \approx 5-7.

Hab. ad folia languida Ilicis paraguariensis in dumetis prope San Pedro Misiones Argentina.

6. **Colletotrichum Dictamni** Hollós, Ann. Mus. Nat. Hung. VI (1908) 7736 pag. 536. — Maculis irregulariter orbicularibus, ferrugineis, 3-5 mm. diam., margine obscurioribus; acervulis gregariis epiphyllis, erumpentibus; setulis paucis, erectis v. leviter curvulis, continuis, basi 4-5 μ . cr., sursum angustioribus, 60-80 μ . longis, pallide fuscis, apicem versus paullulum decoloratis; conidiis oblongo-cylindraceis, utrinque acutulis, continuis, granulosis, 2-3-guttulatis, hyalinis, 20-22 \approx 4-5; conidiophoris fasciculatis, hyalinis 8-10 μ . long.

Hab. in foliis vivis Dictamni Fraxinellæ prope Nagy-Körös Hungariæ.

7. **Colletotrichum Durionis** Koord., Bot. Untersuch. Java (1907) p. 218, 7737 fig. 33 IV. — Acervulis epiphyllis, sparsis, erumpentibus 90-150 μ . diam., in maculis latis irregularibus fuscis insidentibus; setulis 20-36 μ . longis, fuligineis, continuis v. obscure 1-septatis, subrectis v. curvulis, apice acutis, pro maxima parte periphericis, haud fasciculatis; conidiis continuis, hyalinis, rectis v. curvulis, utrinque rotundatis, 10-16 \approx 3-6, plerumque 15 \approx 5; conidiophoris continuis, brevissimis, hyalinis, vix 3 μ . longis.

Hab. in foliis vivis Durionis zibethini prope Purworedjo prov. Kedu Java (KOORDERS).

8. **Colletotrichum luxifilum** v. Hall et Drost, Rec. Trav. Bot. Néerl. IV 7738 (1908) p. 243, tab. IX-XXV, extr. pag. 37 (diagn.). — Acervulis solitariis, suborbicularibus, pallidis v. leviter roseis, 100-300 μ . d. (in culturis usque ad 2,5 mm.); setulis raris filiformibus sursum tenuatis obtusulis, 2-4-septatis, nigricantibus, 50-120 \approx 3,5 - 4,5, apice 1,2-2 μ . cr.; conidiophoris dense fasciculatis, continuis, hyalinis, bacillaribus, conidium longitudine subæquantibus; conidiis ovoideo-oblongis, 13-19 \approx 4-5, subinde medio leniter constrictis, utrinque rotundatis, levibus, hyalinis, granulosis, vacuolum valde refringens medio sæpe continentibus.

Hab. in ramulis, gemmis, fructibus Theobromæ Cacao, quam maxime vexat, Surinam et Demerara in Ind. occid. — Cladomanias peculiares (*Krulloten*) generat. Cfr. eximiam et fusam monographiam coll. van Hall et Drost s. c.

9. **Colletotrichum Cradwickii** Bancroft West Ind. Bull. X (1910) n. 5 7739

et Handb. Diseas. West India plants (1910) p. 44, t. VI, f. 2-3. Acervulis erumpentibus, primum flavidis dein rubescens; conidiophoris hyalinis conidia magnitudine superantibus; conidiis hyalinis, in massa rubidis, elongatis, medio constrictis, 14-17 \approx 5; setis rectis, rigidis, apice acutis, 2-3-septatis, purpurascens, 70-100 \approx 4-6.

Hab. in ramis Theobromæ Cacao, in Jamaica.

10. **Colletotrichum Grossulariæ** Jacz., Bull. Soc. Myc. Fr. XXII (1906) 7740 p. 124, cum icon. — Maculis orbicularibus v. indeterminatis, confluentibus, brunneis; acervulis erumpentibus, subcutaneis, disciformibus, minutis, brunneis, setulis numerosis, atro-brunneis, erectis, apice tenuatis vestitis; conidiophoris hyalinis, cylindraceis, 10-12 μ . long.; conidiis subhyalinis v. olivaceis, cylindraceis, unicellularibus, 20-25 \approx 4-6.

Hab. in fructibus Ribis Grossulariæ, in Rossia orientali.

11. **Colletotrichum fructus** (Stevens et Hall) Sacc., Volutella fructus Stevens et Hall, Journ. of Mycol. XIII (1907) p. 97, cum icon. — Acervulis copiosis, concentrica dispositis, subcuticulari-erumpentibus, elevatis, nigris, 150-400 μ . diam., mycelio albo (culto in substantiis carbo-hydratis nigricante); setis in tota superficie sporodochii nascentibus, nigris, continuis v. 1-5-septatis, acutis, levibus, 100-400 \approx 5-8; conidiophoris elongatis, hyalinis, simplicibus 25-35 \approx 3; conidiis hyalinis v. dilutissime olivaceis, continuis, oblongo-fusoideis v. falcato-fusoideis, 17-23 \approx 2,5-3,5.

Hab. in fructibus Piri Mali in Carolina sup. — Ob setas nigras et acervulos initio subcutaneos ad gen. *Colletotrichum* proprius accedit.

12. **Colletotrichum Erythrinæ** Koord., Bot. Unters. Java (1907) p. 219, 7742 fig. 33 II. — Acervulis sparsis, epiphyllis, erumpentibus, in maculis circularibus griseo-fuligineis insidentibus; setis paucis 50 μ . circ. longis, fuscis, obscure septatis, subrectis v. flexuosis, apice acutis; conidiis continuis, hyalinis, rectis, utrinque truncatis vel rotundatis 15-16 \approx 4,5-5.

Hab. in foliis vivis Erythrinæ ovalifoliæ prope Penung-galan prov. Kedu Java (KOORDERS).

13. **Colletotrichum Trifolii** Bain., Journ. of Mycol. XII (1906) p. 193. 7743 — Maculis atris v. fuscis, sœpe depresso; acervulis erumpentibus, sparsis v. gregariis; conidiophoris hyalinis cylindraceis v. fusoides, conidiis prope æqualibus; conidiis hyalinis, rectis, utrinque rotundatis, 11-13 \approx 3-4; setulis inter conidia orientibus, continuis

v. uniseptatis, paucis v. numerosis, fuligineis, ad apicem pallidioribus, 39-62 \approx 4-7, sæpe sinuosis v. nodulosis.

Hab. in petiolis caulinibusque vivis, rarissime in foliis, Trifolii pratensis et Medicaginis sativæ, in Amer. bor. pluribus locis.

14. **Colletotrichum hedericola** Laub. in Arbeiten Kais. Biolog. Anstalt für Land- u. Forstwirtschaft, V (1907) p. 503. — Acervulis amphigenis, in maculis orbicularibus brunneis 1-8 mm. latis insidentibus, rarius petiolicolis vel ramicolis, dense gregariis; setulis rectis, atris, septatis, basi 7 μ . crassis, usque ad 140 μ . longis; conidiis continuis, hyalinis, oblongis, subfusiformibus, parum curvatis, 17-25 \approx 3 $\frac{1}{2}$, plerumque guttatis.

Hab. in foliis petiolis ramulisque Hederae Helicis quam vexat, Wiener-Neustadt Austriæ.

15. **Colletotrichum Ixoræ** Griff. et Maubl., Bull. Soc. Myc. Fr. XXV (1909) p. 59, cum icon. — Maculis majusculis, sæpe marginalibus, pallidis, exsiccatis, linea angusta rufo-cinctis; acervulis amphigenis, inordinatis, rotundatis vel ellipsoideis, nigris, usque ad 0,75 mm. latis; stromatibus appianatis, brunneis, mycelio septato guttulato 4-9 μ . cr. adnexis; conidiophoris cylindraceis, basi septatis, 10-15 \approx 5,5-6; conidiis elongatis v. clavatis, hyalinis, 1-2-guttulatis, 14-16 \approx 5-7; pilis raris, conidiophoris immixtis, brevibus, usque ad 55 μ . longis, 1-2-septatis, flexuosis, brunneis, superne subacutis pallidioribusque.

Hab. in foliis vivis Ixoræ albæ in calidariis Grignon Galliæ.

16. **Colletotrichum Briosii** Turconi, in Atti R. Ist. bot. Pavia XI (1905) p. 314-318, t. XXII, fig. 1, 4-6. — Maculis apicalibus totum folii apicem occupantibus, avellaneis, deorsum margine fusco limitatis; acervulis hypophyllis v. amphigenis, magnis, 400-500 μ . diam, irregulariter sparsis v. subgregariis, primo tectis, subepidermicis, demum epidermide lacerata erumpentibus, superficialibus, setulis rigidulis, erectis v. subflexuosis (parietes interdum subundulatas præstantibus) continuis v. uniseptatis, fuligineis, subcæspitosis, acervuli parte media plerumque (rarissime margine) insitis, 150-170 \approx 4-6; conidiophoris dense fasciculatis, pallide fuscidulis, apice hyalinis, 25-32 \approx 4, cylindraceis, continuis; conidiis acrogenis, cylindraceis v. cylindrico-ellipsoideis, utrinque rotundatis, granulosis, 14-18 \approx 5-6,5, hyalinis.

Hab. in foliis Cinnamomi Burmanni culti in horto botanico, Pavia Italiæ borealis.

17. **Colletotrichum Cinchonæ** Koord., Bot. Unters. Java (1907) p. 220. 7747
 — Maculis pallidis foliicolis; acervulis sparsis, punctiformibus, epidermide erumpentibus, vix 0,1 mm. diam.; sporulis oblongis, subrectis v. curvulis, utrinque obtusis v. rotundatis, 9-18 \approx 3-5, plerumque 10-12 \approx 3,5-4, hyalinis; setulis paucis, fuscis, 1-pluri-septatis, subrectis v. curvulis v. flexuosis, 60-75 μ . longis, basi 4-7 μ . diam.; sporophoris cylindraceis, hyalinis, c. 10 μ . longis.
Hab. in foliis vivis Cinchonæ sp. cultæ prope Auggrong-gondok prov. Kedu Java (KOORDERS).
18. **Colletotrichum nigrum** Ell. et Halst., in Halsted New Jersey Agr. 7748
 Coll. Exp. Stat. Rep. Bot. Dep. (1895) p. 297. — Acervulis gregariis erumpenti superficialibus nigris; setulis filiformibus parce septatis nigricantibus, sursum cuspidatis pallidioribus basi incrassatis, subrectis; conidiis oblongo-cylindraceis utrinque rotundatis, intus granulosis hyalinis, majusculis, conidiophoris, bacillaribus dense stipatis, conidio duplo triplove longioribus.
Hab. in fructibus Capsici sp. edulis cui valde noxium. — Descriptio ex iconе tantum in l. c.
19. **Colletotrichum Lycopersici** Chester, Trans. Brit. Mycol. Soc. I 7749
 (1900) p. 156. — Acervulis copiosis, dense gregariis, e brunneo nigricantibus, applanatis, in areis depresso subcircularibus demum confluentibus nascentibus, 95-150 μ . diam.; setis abundantibus atro-brunneis, plerumque curvatis, rariis undulatis v. rectis, hinc inde subinde nodulosis, sursum tenuatis, septatis, 65-112 \approx 5; conidiis oblongis, utrinque subacutis, 18-20 \approx 4; conidiophoris brevibus, gracilibus, ex hypostromate crassiusculo oriundis.
Hab. in fructibus Solani Lycopersici prope Worcester et Lythe Britanniae.
20. **Colletotrichum Heveæ** Petch, Ann. Roy. Bot. Gard. Peradeniya 7750
 III Pt. I (1906) p. 8. — Acervulis nigris, sparsis, epiphyllis, 0,1-0,25 mm. diam., setis violaceo-nigris, uni-vel bi-septatis, obtusis, ad 90 μ . longis cinctis; conidiis oblongis, utrinque rotundatis, hyalinis, granulatis, 18-24 \approx 7,5-8; conidiophoris 20-30 \approx 6-7, apice in-crassatis.
Hab. in foliis plantularum Heveæ brasiliensis, in ins. Ceylon.
21. **Colletotrichum Vincæ** Speg., Myc. Argent. V p. 408, in Anal. 7751
 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis determinatis orbicularibus, 2-5 mm. diam., pallide cinerescentibus areola angusta livescente cinctis; acervulis epiphyllis erumpenti-

bus paucis in quaque macula, lenticularibus 80-90 μ . diam., atris, pseudopycnidio stellatim dehiscente tectis; setulis continuis flexuoso-sulis, 40-50 \approx 4-5, basi non v. vix incrassatulis, subopace fuligineis; conidiis ellipsoideo-cylindraceis 16 \approx 7, rectis, biguttulatis, hyalinis.

Hab. ad folia languida *Vincæ majoris* in hortis Santa Catalina prope Buenos Aires Argentina Amer. aust.

22. **Colletotrichum Acanthosyridis** Speg., Myc. Argentinens. V, pag. 7752

405, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis subdeterminatis, centro candidis ambitu pallide rufescenscentibus; acervulis epiphyllis innato-erumpentibus orbicularibus, 200-250 μ . diam., atris, margine setulis fuligineis, 50 \approx 3, simplicibus, subobtusiusculis 1-2-cellularibus ornatis; conidiis subellipsoideis 14-16 \approx 7-8, nubiloso-farctis, hyalinis.

Hab. ad folia viva *Acanthosyridis falcatae* ad margines Rio Caramillo Salta Argentina Amer. austr.

23. **Colletotrichum Platani** Da Camara, Bol. Soc. Broteriana XXV 7753

(1910) Extr. p. 21. — Acervulis plano-convexusculis, oblongis, sparsis, subepidermicis, dein erumpentibus; setulis ceratiformibus nigricantibus, apice attenuatis, parce septatis, usque ad 200 μ . longis; conidiis acrogenis, fusoideis, hyalinis, curvulis, utrinque acutis, granulosis v. pluriguttulatis, 25-28 \approx 3-5.

Hab. in petiolis nervulisque *Platani orientalis*, horto botanico Coimbra Lusitaniæ (A. MOLLER).

24. **Colletotrichum Ficus** Koord., Botan. Untersuch. Java (1907) p. 19 et 7754

passim, tab. I, fig. 1-3. — Conidiis maturis rectis v. curvulis, utrinque obtusis v. acutiusculis, in massa pallide roseis v. roseis; setulis plerumque non fasciculatis plerumque 40-90 μ . long. v. raro usque ad 150 μ .

Hab. parasiticum in foliis *Fici elasticæ* et *F. Benjaminæ* quandoque etiam parasiticum v. saprophyticum in cortice ramorum, in insula Java. — In culturis setulæ non occurunt et tunc species *Glaeosporio* similis.

25. **Colletotrichum Caricæ** Stevens. et Hall, Ztschr. für Pflanzenkr. 7755

XIX (1909) p. 68, tab. II, fig. 1-8. — Cæspitulis brunneis, inde nigris, sphæroideis, numerosis, parvis, 85-250 μ . cr.; setulis nullis v. 1-12, elongatis, irregularibus, angustatis, acutis, obscuris, rigidis, septatis, 22-106 \approx 2-6, hyalinis; conidiis regularibus, elongatis, non septatis, hyalinis, 8,7-20 \approx 3,5-6.

Hab. in fructibus et foliis *Fici Caricæ*, North Carolina, in Amer. boreali.

26. **Colletotrichum echinatum** Massee, Kew Bull. n. 7 (1906) p. 257. 7756

Maculis indeterminatis, pallescentibus; acervulis laxe gregariis lenticularibus, mox erumpentibus, 350-400 μ . diam.; conidiis hyalinis v. chlorinis, cylindraceis, utrinque obtusis, 22-26 \approx 8-9, conidiophoris cylindraceis, sursum subattenuatis, pallide griseis 40-50 \approx 8 suffultis; setulis numerosissimis, rigidulis, fuligineis, cylindraceo-attenuatis, septatis, 100-120 \approx 8.

Hab. ad corticem arboris cujusdam ignotæ, Aburi Gold Coast Guineæ Africæ occ. (JOHNSON).

27. **Colletotrichum Dracænæ** Allesch. in Rab. Krypt. Flora, Pilze 7757

VII p. 560 (1904). — Acervulis amphigenis, sparsis v. gregariis, carneis dein nigris, epidermide lacerata tectis; setulis obscure brunneis, apice angustatis, obtusis, parum septatis, 40-60 \approx 2,5-3,5; conidiis elongato-cylindraceis, unilocularibus, utrinque rotundatis, guttulatis, subhyalinis, 14-18 \approx 5-7; conidiophoris confertis, brevibus, hyalinis.

Hab. in foliis languidis Dracænæ latifoliæ in calidario in Horti botanici München Bavaria (J. E. WEISS).

28. **Colletotrichum dracænicola** Sacc. et Trott. *Colletotrichum Dracæ-* 7758

næ Trinchieri Rend. R. Ac. Sc. Napoli (1909) fasc. 8-12, Extr. p. 7. — Maculis amphigenis, extremitatem foliorum occupantibus, rarius marginalibus, sinuosis, exaridis, deorsum linea elevata castaneo flava eximie limitatis, 5-10 cm. longis, 2 $\frac{1}{2}$ -4 $\frac{1}{2}$ cm. latit; acervulis epiphyllis vel hypophyllis, numerosissimis, dense gregariis, subcutaneis, punctiformibus, sublenticularibus, 110-196 μ . diam., 73-110 μ . altis; setulis continuis vel parce septatis, rectis vel curvulis, cuspidatis, fuligineis, 56-98 \approx 2-4,5; conidiophoris nunquam visis; conidiis cylindraceis, rarius clavatis, utrinque rotundatis, distincte 1-3-guttulatis, hyalinis, 12-19,5 \approx 2-7.

Hab. in foliis vivis Dracænæ fragrantis, aliquando socio *Glæosporio polymorpho* in Horto regio botanico neapolitano Ital. austr. (TRINCHIERI). — Forte status senescens Coll. Dracænæ Allesch.

29. **Colletotrichum Himantophylli** Kab. et Bub., Myc. Beitr., Hedwi-

gia, Bd. XLVI (1908) p. 297. — Maculis amphigenis, primum parvis, rubro-lateritiis forma irregularibus; acervulis amphigenis, sparsis, profunde immersis, prominentibus, epidermide tectis, nigris, rotundatis v. elongatis, 300 μ . diam.; setulis immersis rectis v. curvatis, obscure brunneis, basi plerumque fortiter incrassatis, apice angustatis nodulosis, basi 1-2-septatis, 100 μ . long. medio

4 μ . cr.; conidiis cylindraceis, utrinque rotundatis, rectis v. curvulis, 14-24 \approx 4-4,5, contextu granuloso, flavidulis; conidiophoris olivaceo-brunneis, subparallelis, multiseptatis, supra liberis pallidioribus.

Hab. in foliis *Himantophylli* miniati, prope Turnau Bohemia (KABAT).

30. **Colletotrichum Orthianum** A. Kostlan in Festschrift zum 70 Geburtstage v. A. Orth, Berlin. (1905) cum 3 tab. 7760

Hab. in cumpluribus Orchidaceis in *Cypripedium Cattleya*, *Cœlogynæ*, *Dendrobiun*, *Vanda* in tepidariis cultis Berolini, Germania. — Observante cl. Magnus in Bot. Centralbt. (1905) II p. 423, a *Coll. Orchidearum* et *Coll. roseolo* vix diversum, sed ipse diagnosim non vidi. Auctor in culturis quoque chlamydosporas eduxit.

31. **Colletotrichum Pothi** Koord., Botan. Untersuch. (1907) Javap. 219. 7761

— Acervulis foliicolis sparsis, in maculis griseis angulosis insidentibus, 80-200 μ . diam.; setulis numerosis, exertis, fuscis v. atris, curvatis, apice acutis, 60-80 μ . longis basi 4-5 μ . latis, continuis v. 1-2-septatis, irregulariter dispositis, haud fasciculatis; conidiis hyalinis continuis, breviter cylindraceis utrinque rotundatis v. truncatis, rectis v. curvulis, 8-10 \approx 3-3,5; conidiophoris cylindraceis continuis, 10 \approx 5.

Hab. in foliis Pothi in Purworedjo prov. Kedu Java (KOORDERS).

32. **Colletotrichum Metake** Sacc. Ann. Mycol. VI (1908) p. 557. — 7762

Acervulis epidermide cinerescente diu tectis, dein erumpentibus, longitrorsum parallele seriatis, elongatis, 0,5-1 mm. long., 0,2 mm. lat., nigricantibus, setis filiformibus, cuspidatis, parce septatis, fuligineis, 70-80 \approx 4,5, inter conidiophora confertiusculis; conidiis soblongis, utrinque præcipue basi obtusis, 22 \approx 5,5-6, intus granulosis, hyalinis; conidiophoris paliformibus dense fasciculatis, apice obtusis, brunneolis, 14-18 \approx 4,5.

Hab. in culmis morientibus *Arundinariæ japonicæ* (*Metake*) in viridario Zava, Costa, Vittorio Treviso (ALEX TROTTER). — A *Coll. lineola* mox dignoscendum; ab affiniori *Coll. versicolore* distinguitur setis apice acutis, conidiis utrinque obtusis, numquam medio angustatis majoribusque.

33. **Colletotrichum sublineola** P. Henn. in Kabat et Bubák Fungi imp. exs. n. 186 (1905). — 7763

— Acervulis sparsis vel subgregariis, atris, 200-250 μ . longis; setulis oblongis, obtusis, fuscis, 30-50 \approx 7;

conidiis, fusoideis vel subclavatis, rectis vel curvulis, hyalinis, pluriguttulatis, 15-25 \approx 4-5.

Hab. ad fructus *Sorghi vulgaris*, Togo Africæ (KERSTING).

— Affine *C. lineolæ*, differautem acervulis majoribus, setulis et conidiis minoribus.

34. *Colletotrichum? pamparum* Speg., Myc. Aegent. V, p. 406, in 7764

Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis sed foliis infectis totis pallescentibus; acervulis lenticularibus 200-300 μ . diam., primo epidermide tectis serius erumpentibus, nigris, margine setulis subflexuosulis, 100-200 \approx 4-5, continuis, atro-fuligineis, apice obtusis, fumosis pellucidisque dense fimbriatis; conidiis subnavicularibus utrinque subacute rotundatis, 20-22 \approx 5-6, sæpe nubilosis v. grosse 1-guttulatis, hyalinis.

Hab. ad folia arida *Panic Urvilleani* in sabulosis prope San Luis Argentina Amer. austr — An melius *Vermicularia?*

35. *Colletotrichum antarcticum* P. Henn., Deutsche Südpolar Exped. 7765

Bd. VIII (1906) Extr. p. 15, tab. II, fig. 23, a., b. — Acervulis innato-erumpentibus, oblonge discoideis, atris, interdum substriiformi-confluentibus, 150-220 \approx 80-100; margine setulosis, setulis erecte flexuosis, septatis, apice obtusis v. acutis, atrofuscis, 30-100 \approx 4-6; conidiis fusoideis, utrinque acutis, interdum obtusiusculis, falcatis v. subrectis, intus granulatis hyalinis, 15-30 \approx 3-4; conidiophoris varie longis, teretusculis, hyalinis.

Hab. in foliis Poæ Cookii, in insulis Possessionis (WERTH).

36. *Colletotrichum Janczewskii* Namysl., Bull. Ac. Sc. Cracovie, (1906) 7766

p. 254, tab. XI, fig. 1-8. — Pustulis præcipue culmicolis sparsis, nigris, planis v. concavis, rotundatis, usque ad 80 μ . diam.; setulis nigrescentibus apice pallidioribus acutiusculis, unicellularibus, 70-150 \approx 4, basi 8 μ . crassis; conidiophoris ovoideis, 8 \approx 6, adultis griseolis; conidiis fusoideis quandoque subfalcatis, unilocularibus 24-34 \approx 3-6, basi subapplanatis, grosse uniguttulatis.

Hab. in culmis et foliis Poæ trivialis, Cracovia.

37. *Colletotrichum Vermicularia* Sacc. et Dearn. in Sacc. Ann. Mycol.

X (1912) p. 313. — Maculis lanceolato-linearibus, brunneis, amphigenis; acervulis laxè gregariis mox erumpentibus, punctiformibus, vermiculariæformibus, vix 80-90 μ . diam., excipulo nullo, setulis dense fasciculatis sæpius incurvato-divergentibus, vix 1-septatis, 80-90 μ . long., basi 4. μ . cr. fuligineis, apicem versus pallidioribus; conidiis fusoideis, leviter falcatis, utrinque acutiu-

sculis, 20-22 \approx 4, intus granulosis hyalinis; conidiophoris brevissimis, hyalinis.

Hab. in foliis languidis *Bromi ciliati* var. *leviglumis*, London Ontario Amer. bor. (DEARNESS). — Affine *Colletotricho lineolæ*.

38. **Colletotrichum cereale** Manns in Selby et Manns, Ohio Agric. 7768 Exp. Stat. Bull. n. 203 (1909) p. 207, cum tab. et iconibus. — — Acervulis innato-erumpentibus, ex hyphis mycelicis septatis brunneis 2-7 μ . diam. orientibus, suborbicularibus v. ovatis, modo minutissimis vix 30 μ . diam., paucisetosis, nunc usque ad 1 mm. long. plurisetosis; setis atro-brunneis v. nigris, rectiusculis, basi 6-8 μ . diam., sursum tenuatis, 60-120 μ . long., continuis v. 1-2-septatis; conidiis fusoideis, curvulis, hyalinis, 2-pluriguttulatis, 18-26 \approx 3-4; conidiophoris brevissimis, obtusis, 2-6 \approx 1-2.

Hab. in foliis vaginisque graminum variorum: *Secale*, *Triticum*, *Avena*, *Hordeum*, *Dactylis*, *Phleum*, *Bromus*, *Poa*, Ohio in Amer. boreali. — Plantæ infectæ valde vexantur.

PESTALOZZIELLA Sacc. et Ell. — Syll. III p. 737, X p. 470, XIV p. 475.

1. **Pestalozziella ambigua** v. Höhnel, Fragm. z. Mykol. Sitzb. K. 7769 Ak. d. Wiss. Wien, Bd. CXVI Abt. I (1907) p. 145. — Sordide carneæ, rotundata v. elongata, 0,25-1 mm. longa, primum cortice immersa et clausa dein erumpenti-aperta; stratu peripherico 20-40 μ . cr. ex hyphis plectenchymaticis constituto, molli carneo-gelatinoso, hyalino, extus pallide rubescenti; conidiophoris hyalinis, simplicibus 20-30 μ . long., tenuibus; conidiis apicalibus elongato-cylindraceis, unilocularibus, tenuiter tunicatis, apice plerumque rotundatis rectisque, 28-48 \approx 12, utrinque 2-5 setulis curvulis, obtusis v. rectis, 20-40 \approx 1,5 præditis.

Hab. in caulinis siccis *Artemisiæ vulgaris*, Donaukanal prope Wien Austriæ.

Sect. 2. Phæosporæ.

MELANCONIUM Link — Syll. III p. 749, X p. 471, XI p. 571, XIV p. 1018, XVI p. 1008, XVIII p. 469.

1. **Melanconium Cydoniæ** Schulz. z. Mügg. in Verh. zool. bot. Ges. 7770 Wien (1871) p. 1220, tab. 13, fig. 2. — Acervulis subcutaneis

dein erumpentibus, subglobosis v. late conoideis 400-500 μ . cr. intus sæpe pseudo-locellatis nigris; conidiis obovoideis, fuligineis, 18-24 μ . long., levibus; conidiophoris bacillaribus brevissimis.

Hab. in ramis corticatis *Cydoniæ vulgaris* in Hungaria.

2. **Melanconium myriosporum** Sacc. in Ann. Mycol. IX (1911) p. 254. 7771
— Acervulis subsparsis, epidermide velatis, vix prominulis, subcircularibus, $\frac{1}{2}$ - $\frac{2}{3}$ mm. diam., nigris, trans epidermidem visilibus, cito erumpentibus et matricem nigro-inquinantibus; conidiis copiosissimis, globosis, minutis, 3 μ . diam., levibus, atro-fuligineis, pallide 1-guttulatis; conidiophoris acicularibus, parallelis, 15-18 \approx 2, fuligineis.

Hab. in caulinis *Urticæ dioicæ* morientibus in prov. Jaroslaw Rossiæ (SEREBRIANIKOW).

3. **Melanconium Cernaiewi** A. Potebnia, Ann. Mycol. VII (1910) p. 85, 7772 f. 37:7. — Strato sporigeno 1-2 mm. lato; conidiis 18-24 \approx 11-14, ellipsoideis v. piriformibus, obscure brunneis; conidiophoris erectis, brunneis, 32-37 \approx 3.5.

Hab. sub cortice ramulorum *Quercus*, Charkow Rossiæ. — Ob colorem peculiarem conidiorum species prædistincta dicitur.

4. **Melanconium Castaneæ** Salvi, Sopra alcuni Micromiceti osservati 7773 sul Castagno, Pisa Tip. Simoncini (1909). — Acervulis depresso irregularibus effusis, stratis peridermicis interjectis, hypostromate fuligineo donatis, sursum decoloratis, hyalinis, hyphis gracilibus constitutis; ramusculis conidiophoris apice plus minusve incrassatis; conidiis ovoideis v. oblongis, apice obtusis basi papillatis, 18-21 \approx 9-12 fuligineo-pellucidis. — Var. **subcutaneum** Salvi l. c. — Acervulis subcutaneis, dein emersis; conidiis angustioribus 4-6 μ . latis, 18 μ . longis, sæpe medio leniter constrictis.

Hab. species et varietas, in ramis emortuis Castaneæ sativæ prope Barga in agro Lucensi Italiae.

5. **Melanconium hysteroides** P. Henn., Etat indép. du Congo, Mission Laurent, fasc. IV (1907) p. 363. — Acervulis sparsis v. gregariis, oblongis, innatis, epidermide tectis, dein rima longitudinaliter fissis, atris; conidiis oblongis, obtusis, fuscis, 8-12 \approx 3.5.

Hab. in culmis Graminaceæ cujusdam, Yabingo Congo Africæ trop.

BOTRYOCONIS Syd., Ann. Mycol. IV (1906) p. 344. (Etym. *botrys*, racemus, ob conidia botryoso-aggregata et *conia*, pulvis). — Acervuli primo subcutanei (ut videtur), demum erumpentes, pulvi-

nato-effusi. Conidia in capitula unita vel botryoso-aggregata, colorata, continua. — *Drepanoconi* Schröt. et P. Henn. videtur affinis.

1. **Botryoconis Saccardoi** Syd. l. c. p. 344. — Acervulis tumores 7775 irregulares $\frac{1}{2}$ -3 cm. latos sæpe profunde incisos efficientibus, totam tumorum superficiem pulvere ferrugineo æque obtengentibus; conidiis compluribus (6-10) botryoso-conjunctis, solitariis ovato-oblongis, continuis, levibus, flavo-brunneolis, 10-16 \times 5-7 μ ., rectis vel subinde leniter curvulis.

Hab. in ramis Canellin hæ? (genus ignot. an Canellæ sp.?) Sao Leopoldo prov. Rio Grande do Sul Brasiliæ (J. RICK).

2. **Botryoconis pallida** Syd., Ann. Myc. V (1907) p. 340. — Acer- 7776 vulis fructus pulvere sordide et pallide ochraceo omnino obtegentibus; conidiis compluribus (2-6) botryoso-conjunctis, singulis ovatis subinde piriformibus, continuis, levibus, flavidis, 9-14 \times 5-7.

Hab. in fructibus Ocoteæ puberulæ, pr. Sao Paulo Brasiliæ (A. USTERI). — A *Botr. Saccardoi* conidiis pallidioribus et facilius secedentibus dignoscitur.

Sect. 3. Hyalodidymæ

MARSONIA Fisch. — Syll. III p. 767, X p. 476, XI p. 573, XIV p. 1020, XVI p. 1010, XVIII p. 472.

1. **Marsonia perforans** Ell. et Ev. ap. Selby in Ohio Agric. Exper. 7777 Stat. Bull. 73 (1896) p. 224 et Bull. 111 (1899) p. 12. — Maculis minutis forma irregularibus 1-2 mm. diam., pallidis facile circumscisso-deciduis; acervulis 100-120 μ . diam. v. confluendo amplioribus; conidiis copiosis, clavato-cuneatis, hyalinis, tenuiter uniseptatis 11-15 \times 2,5-3, rarissime usque ad 20 μ . long.

Hab. in foliis Lactucæ sativæ in frigidariis cultaæ, Ohio Amer. bor. (D. SELBY). — Species valde perniciosa.

2. **Marsonia Larreae** Speg., Myc. Argent. V, p. 408, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis biformibus amphigenis determinatis, primo parvis suborbicularibus serius fere totum folium ambientibus; acervulis paucis sparsis, epiphyllis, erumpentibus, lenticularibus, 150-250 μ . diam., fuscescentibus; conidiis cylindraceis, utrinque rotundatis, 20-40 \times 5-6, rectis v. flexuosis, medio 1-septatis non constrictis, ex hyalino leniter chlorinis.

Hab. ad folia viva Larreae divaricatae in montanis Potrerillos prope Mendoza Argentina Amer. austr.

3. **Marsonia Mali** P. Henn., Engl. Jahrb. XXXVII (1905) p. 164 7779 et Bot. Mag. Tokyo XXI (1907). — Maculis suborbicularibus interdum confluentibus, fuscidulis, atro-purpureo cingulatis; acervulis innatis, convexis, atris, 150-200 μ . diam.; conidiophoris bacillaribus, hyalinis, 5.8 \approx 1.5-2; conidiis clavatis v. subfusoideis, utrinque obtusis, pluriguttulatis, medio 1-septatis, constrictiusculis, hyalinis, 14.20 \approx 4.5-6.

Hab. in foliis Piri Mali, Rokugo, Tokyo Japoniae (MIYAKE).

4. **Marsonia Coronariæ** Sacc. et Dearn. in Sacc. Ann. Mycol. X 7780 (1912) p. 313. — Maculis versiformibus, ex orbiculari angulosis, 1-2 mm. diam., interdum confluentibus, ex olivaceo brunneis, amphigenis; acervulis punctiformibus, 100-150 μ . diam., epidermide diu tectis, brunneis; conidiis oblongis, incurvatis, 1-septatis, constrictis, 16-18 \approx 5-6, apice rotundatis basi incurvo-acutatis, intus guttulato-granulosis, hyalinis, loculis senio facile secedentibus.

Hab. in foliis languidis Piri coronariæ, London Ontario Amer. bor. Fungillus diversis locis temporibusque observatus (DEARNESS).

5. **Marsonia Potentillæ** (Desm.) Fisch. — Syll. III p. 770. — Var. 7781 **Helleri** Peck, Bull. Torr. Bot. Cl. XXXIII (1906) p. 219. — Maculis parvis, inconspicuis, angulosis, pallidis; acervulis irregularibus, singulis v. 2-3 in quaque macula, nigris; conidiis oblongis 20-24 μ . long., 4 μ . cr., eguttulatis, loculo superiori abrupte oblique angustato.

Hab. in foliis vivis Drymocallis glandulosæ, prope Los Gatos California, Amer. bor. (HELLER).

6. **Marsonia? Tricyclæ** Spieg., Myc. Arg. V, p. 408 cum icon., in 7782 Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; acervulis amphigenis, erumpentibus, solitariis v. paucis laxe gregariis, planiusculis, orbicularibus, 250-500 μ . diam., fuligineis; conidiis cylindraceis utrinque rotundatis flexuosis 25-40 \approx 5-6, medio 1-septatis, non constrictis, loculis minute 2-3-guttulatis primo hyalinis serius e chlorino rufescentibus.

Hab. ad folia viva Tricyclæ spinosæ in montuosis prope Cacheuta Mendoza Argentina Amer. austr.

7. **Marsonia obtusata** Maubl., Bull. Soc. Mycol. France XXII (1906) 7783 p. 69. — Maculis amphigenis, elevatis, in parte decolorata foliorum disseminatis, minimis, 1-4 mm. latis, primum ochraceis de-

mum atro-fuscis, linea elevata pallidiori cinctis; acervulis oculo nudo vix visilibus, epidermide velatis, 1-3 in quaque macula; conidiis numerosis, ovoideis v. saepius claviformibus, plerumque arcuatis, apice obtusis, prope basim 2-septatis, chlorino-hyalinis, granulatis, 19-22 \times 6-9; conidiophoris brevibus.

Hab. in foliis adhuc vivis *Daphnes Laureolæ* prope Alençon Galliæ (LEMÈE). — A *M. Daphnes* (Desm. et Rob.) distincta.

8. **Marsonia valpellinensis** Trav. in Bull. n. 8 Société Flore Valdô- 7784 taine, pag. 31 extr. (1912). — Maculis hypophyllis, fuligineo-purpurascentibus, initio minutis, subcircularibus, 1-3 mm. diam., dein confluentibus, immarginatis; acervulis paucis, subepidermico-erumpentibus, albidis, 150-250 μ . diam.; conidiis ellipsoideo-cuneatis dein hamato-incurvis vel falcatis, utrinque attenuato-rotundatis vel uno apice acutiusculis, granuloso-farctis, varie guttulatis, initio continuis dein infra medium septatis, hyalinis, 14-16 \times 4-6; conidiophoris distinctis nullis visis.

Hab. in foliis languidis *Salicis reticulatæ*, ad glaciem æternam Faudery, Valpelline, Valle d'Aosta, Ital. bor. alt. 2500 m. — A ceteris speciebus salicicolis facile dignoscitur, ut videtur, ob colorem macularum et præcipue quia hypophylla, non epiphylla. Ad genus *Marsonia* ducenda est etiam *Septoria didyma* Fuck. et cum aliis speciebus comparanda.

9. **Marsonia Matteiana** Sacc., Ann. Mycol. VI (1908) p. 557, tab. 7785 XXIV, flg. 11. — Maculis arescendo cinerescentibus, versiformibus, amphigenis; acervulis hypophyllis dense gregariis, 100-130 μ . diam., ochraceo-fuscis, innato erumpentibus; conidiis cylindraceis, utrinque obtusis, eximie curvatis, medio 1-septatis, 14-15 \times 2, non constrictis, hyalinis; conidiophoris... non visis.

Hab. in foliis languidis *Quercus Roboris* in Horto botanico Panormitano, (J. H. MATTEI, cui dicata species). — Ad gen. *Phleosporam* nutat. A speciebus *Marsoniæ* et *Phleosporæ* quercicocolis omnino diversa.

ANAPHYSMENE Bubak, Ann. Mycol. IV (1906) p. 124 (Etym. *anaphyo* cresco et *mene* luna). — Acervuli rima longitudinali aperi; stroma tuberculiforme, infra pseudoparenchymaticum, supra e cellulis verticaliter seriatis efformatum, subepidermicum; conidiophora simplicia, hyalina; conidia plus v. minus incurvata, bilocularia, hyalina, acrogena.

1. **Anaphysmene Heraclei** (Lib.) Bub. l. c. cum icon. Huc ducenda est. 7786
Labrella Heraclei (Lib.) Sacc. — Syll. III p. 648, X p. 421.

SEPTOMYXA Sacc. — Syll. III p. 766, X p. 476, XI p. 573, XIV p. 1020, XVI p. 1009, XVIII p. 473.

1. **Septomyxa Tulasnei** (Sacc.) v. Höhn. — Syll. XVIII, p. 474. — 7787
 * **S. Vogelii** Sacc. Ann. Mycol. VII (1909) p. 436. — A typo differre videtur conidiis brevioribus, nempe 13-15 \approx 2,5-3, conidio-phorisque obsoletis.

Hab. in ramis ramulisque languidis Aceris Ginnalæ, Tamsel Germaniæ (P. VOGEL).

2. **Septomyxa exulata** (Jungh.) Sacc. Syll. III p. 767. — Var. **indigena** 7788
 Bresadola in Strasser Verh. k. k. zool. bot. Ges. Wien Bd. LX (1910) p. 324. — A typo differt præcipue conidiis et conidio-phoris majoribus; conidiis 1-septatis, ellipsoideo-fusoideis, hyalinis, 12-16-(-20) \approx 2.

Hab. in ramis Salicis sp. Sonntagberg Austria.

Sect. 4. Phæodidymæ

DIDYMOспорIUM Nees -- Syll. III p. 763, X p. 475, XI p. 572, XIV p. 1020, XVI p. 1009.

1. **Didymosporium argentinense** Speg., Myc. Argent. V, p. 409, in 7789
 Anal. Mus. Nac. Buenos Aires XX (1910). — Matrice tota sordide fuscescente v. obsolete pallescente; acervulis dense gregariis sæpe subcircinantibus erumpentibus, orbicularibus, lenticularibus, 90-120 μ . diam., atris; conidiophoris conoideis v. sublageniformibus dense constipatis, 5-6 \approx 2, hyalinis, monosporis; conidiis ellipsoideo didymis, utrinque plus minusve rotundatis, 20-22 \approx 9-10, ad medium non v. modice constrictis, loculis grosse 1-guttulatis æquilibus subopace fuligineis.

Hab. ad caules dejectos putrescentes Fœniculi piperiti in hortis Santa Catalina prope Buenos Aires Argentina in America australi.

2. **Didymosporium australe** Sacc. et Trott. in Ann. Mycol. X (1912) 7790
 p. 514. — Maculis amphigenis pallescentibus irregulariter rotundato-sinuosus elongatisque subdeterminatis, 1-2 cm. long., extus obscurioribus; acervulis sæpius hypophyllis, gregariis, innato-erumpentibus, minutis, plerumque confluendo elongato-subseriatis,

nigris; conidiis subovoideis v. subellipsoideis utrinque fortiter rotundatis, medio septato-constrictulis, obsolete bi-guttulatis, bruno-fuligineis, 6-10 \times 4,5-6.

Hab. in foliis languidis v. emortuis *Phænicis dactyliferæ* Gargaresc prope Tripoli Africæ bor. (A. TROTTER). — Affine *Did. striolæ* a quo imprimis differt forma conidiorum utrinque rotundata non subcuneata.

PHÆOMARSONIA Speg., Anal. Mus. Nac. Buenos Aires XVII (1908) p. 138 (Etym. *phaios* obscurus et *Marsonia*). — Omnibus notis cum *Marsonia* conveniens; conidiis æque didymis sed fuligineis distinctum.

1. **Phæomarsonia Yerbæ** Speg. l. c. p. 138. — Maculis amphigenis 7791 orbicularibus calloso-elevatulis, eximie definitis, superne per ætam erosulo-denudatis subcinerescentibus; acervulis in centro macularum 3-7 gregariis, per epidermidem disruptam conidia protrudentibus, conoideis 80-100 μ . diam., pallide olivaceis, ægre perspicuis; conidiis ellipsoideo-subobovatis, 1-septato-constrictulis, utrinque obtusis, 12 \times 5-6, loculis æquilongis non v. grosse uniguttulatis, fuligineis.

Hab. ad folia languida Ilicis paraguariensis in silvis circa Campo Grande Misiones Argentina.

Sect. 5. Hyalophragmiæ

SEPTOGLŒUM Sacc. — Syll. III p. 801, X p. 496, XI p. 581, XIV p. 1020, XVI p. 1009, XVIII p. 473.

1. **Septoglœum erythræum** Sacc. Ann. Mycol. VIII (1910) p. 339. — 7792 Maculis laxe gregariis, amphigenis, minutis, subcircularibus, 0,5-1 mm. diam., atris; acervulis in centro maculæ solitariis, initio epidermide velatis, albis, 0,3 mm. diam.; conidiis fusoideis v. tereti-fusoideis, inæqualibus, sæpe curvulis, utrinque obtusulis, 16-22 \times 2,7-3, raro 11-12 \times 4, tri- (raro bi-) septatis, non constrictis, hyalinis; conidiophoris fasciculatis, filiformibus, 11-14 \times 2,5, sæpe tortuosis, hyalinis, coacervatis chlorinis.

Hab. in foliis languidis Bosciæ angustifoliæ, loco Acerur (Acchelé-Guzai), alt. 1870 m. in Erythræa (Hadr. Fiori) Africa. — Ad gen. *Phleosporam* nutat. Conidia in massulas albidas sæpe eructata.

2. **Septoglœum Limoniæ** Petch, Ann. R. Bot. Gard. Peradeniya IV 7793
Pt. V (1909) p. 306. — Pustulis minutis, gregariis, nigris, in maculis aridis pallide brunneis hypophyllis insidentibus; conidiis leniter clavatis, rectis v. curvis, 4-5-septatis, hyalinis, apice obtusis, 36-45 \approx 3-4.

Hab. in foliis Limoniæ crenulatæ, Dikwella in ins. Ceylon.

3. **Septoglœum linicola** Speg., Myc. Argent. V, p. 409, in Anal. 7794
Mus. Nac. Buenos Aires XX (1910). — Maculis diffusis pallenscentibus v. lutescentibus; acervulis plus minusve laxe gregariis globoso-depressis, 50-60 μ diam., per ætatem erumpentibus, pseudopycnidio tenuissimo fuxidulo tectis, fusco-succineis; conidiis cylindraceis utrinque rotundatis 12-28 \approx 1,5-3, rectis v. curvulis, primo continuis nubilosis, dein uniseptatis, postremo 3-septatis, non constrictis, semper hyalinis.

Hab. ad caules nec non ad folia viva Lini usitatissimi in cultis Entre Rios Argentina Amer. austr. — An status metageneticus *Phlyctœnæ? linicola* Speg.?

4. **Septoglœum hirudinisporum** Spegazz. Fungi Paulist., Rev. Mus. La Plata t. XV p. 42 (1908). — Maculis orbicularibus amphigenis, 1-5 mm. diam., superne callosis rimulosis cinerescentibus, areola atro-cyanescente cinctis, inferne sanguineis subindeterminatis; acervulis epiphyllis parvis fuscis, primo epidermide tectis dein denu-datis, sublenticularibus 50-200 μ . diam., fuscidulis; conidiis apice obtusis rotundatis postice attenuato-acutatis hirudiniformibus 7-9-pseudo-septatis, 20-35 \approx 5-6, polyblastis, hyalinis.

Hab. ad folia languida Eugeniæ cujusdam, Ipiranga Cambucy, Brasilia (USTERI).

5. **Septoglœum Lathyri** Lind, Ann. Mycol. V (1907) p. 277. — Maculis amphigenis, magnis, confluentibus, rotundatis, non marginatis, pallide rubidis; acervulis subepiphyllis, sparsis, flavidis, pallidis, excipulo parentibus; conidiophoris cylindraceis, simplicibus, subparallelis; conidiis subcylindraceis, rectis v. curvulis, triseptatis, constrictis, utrinque parum angustatis, obtusis, tenuiter tunicatis, hyalinis v. nubilosis, 50-60 \approx 3-5.

Hab. in foliis vivis Lathyri silvestris, prope Kopenhagen, Dania (M. L. MORTENSEN).

6. **Septoglœum aureum** Syd. Ann. Mycol. VIII (1910) p. 41. — Acer-vulis innato-erumpentibus, sparsis vel aggregatis, rotundatis vel ellipticis, epidermidis laciniis cinctis, tandem pulverulentis et applanatis, $1\frac{1}{4}$ - $1\frac{1}{2}$ mm. diam., amœne aureis; conidiis cylindraceo-

fusiformibus, curvulis, apice obtusis, basi acutatis, hyalinis, 4-8-septatis, 70-105 \times 4-5; conidiophoris papilliformibus.

Hab. in ramis Hopeæ acuminatæ, Mount Mariveles, prov. Bataan, Luzon ins. Philippin (E. D. MERRILL).

7. **Septoglœum Anisophylleæ** P. Henn., in Fl. du Bas- et Moy. Congo, Ann. Mus. du Congo v. II, fasc. II, (1907) p. 102. — Maculis epiphyllis, gregariis, angulato-rotundatis confluentibusque, sanguineis; acervulis sparsis, lenticularibus, epidermide dein fissa tectis; conidiophoris filiformibus, hyalinis, 30-40 \times 2,5-3, conidiis cylindraceis, curvatis, utrinque obtusis hyalinis, 1-3-septatis, 40-70 \times 8-12.

Hab. in foliis Anisophylleæ, Dembo Congo Africa (VANDERYST).

8. **Septoglœum Elasticæ** Koord., Botan. Untersuch Java (1907) p. 220, 7799 fig. 35. — Maculis expallescens subcircularibus; acervulis epiphyllis biogenis, numerosissimis, aggregatis, irregulariter (haud concentrica) dispositis, subepidermicis, erumpentibus, griseo-albescentibus, 100-150 μ . diam.; conidiis cylindraceo-fusiformibus, falcatis, initio continuis, dein 1-3-septatis, utrinque acutis, hyalinis, 20-32 \times 3-4 plerumque, 30 \times 3,5; conidiophoris cylindraceis indivisis, apice rotundatis, continuis, hyalinis, 10-12 \times 3-3,5.

Hab. in foliis vivis Fici elasticæ in Purworedjo prov. Kedu Java (KOORDERS).

9. **Septoglœum sulphureum** Syd., Ann. Myc. VIII (1910) p. 493, Myc. Germ. n. 934. — Acervulis sparsis, innato-erumpentibus, 1 mm. diam., rotundatis, sulphureis, peridermii laciniis cinctis; conidiis falcatis, utrinque acutis, 3-5-septatis, hyalinis v. flavo-hyalinis, 50-70 \times 5.

Hab. in ramis Abietis pectinatæ in silva prope Schiessrotried regionis montis Hohneck Vogesorum, Germania.

10. **Septoglœum concentricum** Syd., Engler's Bot. Jahrb. 45 Bd. 7801 (1910) p. 265. — Acervulis amphigenis, in greges rotundatos v. ellipticos usque ad 1,5 cm. longos concentrica dispositis, 300 400 \times 150-200, in sicco atris, pariete proprio parentibus sed contextu matricis mutato et atrato insidentibus, in sicco planis, in udo massam conidiorum griseam expellentibus; conidiis elliptico-oblongis, v. oblongis, primo continuis dein 1-septatis, tandem 2-3-septatis, utrinque rotundatis, hyalinis, 18-23 \times 4-7; conidiophoris 12-20 μ . l.

Hab. in foliis Sansevieriæ guineensis, Keren Erythraea Africa trop. (STEUDER).

PESTALOZZINA Sacc. — Syll. III p. 800, XI p. 580, XVIII p. 475.

1. **Pestalozzina Cordylines** Spieg., Myc. Argent. V, p. 372 cum icon., 7802
in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis linearibus, determinatis, arescentibus, fusco-cinerescentibus, areola purpurascenti limitatis; pycnidiis amphigenis innatis, atris, sublenticularibus 150-200 μ . diam., obsolete lateque ostiolatis, contextu indistincto opaco; conidiis e fusoideo subclavulatis, plerumque 4-septatis (raro 3), deorsum attenuatis sursum subrotundatis, 20-24 \times 6, hyalinis, loculis extimis minoribus, basi breviter pedicellatis (pedicello 5-10 \times 1) superne abrupte triarisitatis, aristis horizontalibus 10-15 \times 1.

Hab. ad folia languida *Cordylines dracænoidis* in hortis La Plata Argentina Amer. austr.

*Sect. 6. Phæophragmiæ***STILBOSPORA** Pers. — Syll. III p. 771, X p. 480, XI p. 575,
XVIII p. 475.

1. **Stilbospora nigra** H. Karst., Botan. Untersuch. I (1865) p. 66, tab. 7, 7803
f. 1 (absque diagnosi). — Syll. XX p. 903 (sub *S. atra*). — Acervulis
foliicolis innato-erumpentibus, sparsis, prominulis, atris; conidiis
concoloribus, ellipsoideo-oblongis, utrinque rotundatis, plerumque
tri septatis, raro biseptatis, non constrictis, conidiophoro bacillari
brevissimo suffultis.

Hab. in foliis Pini sp. in Germania. — Folia affecta are-
scunt et vitiantur.

2. **Stilbospora Cacao** Massee, Kew. Bull. n. 7 (1906) p. 257. — 7804
Stromate subcutaneo-erumpenti, corticola, sparso, conico-truncato,
nigro; conidiis subcylindraceis, olivaceis, 1-demum 3-septatis, ad
septum subconstrictis, 19-24 \times 7-9; conidiophoris simplicibus, hya-
linis, obverse clavulatis, 40-50 \times 1,5-2.

Hab. in ramis Theobromæ Cacao, Trinidad Indiæ occ.
(HART).

3. **Stilbospora Cordæana** v. Höhn, Sitzb. k. Ak. d. Wiss. Wien 7805
CXV, Abt. I (1906) p. 36. — Ita vocandum *?Didymosporium*
macrosporum Cda. — Syll. III p. 765.

CORYNEUM Nees — Syll. III p. 774, X p. 481, XI p. 576, XIV
p. 1022, XVI p. 1012, XVIII p. 476.

1. **Coryneum Berkeleyi** Cooke, Fung. Pests (1906) p. 197, tab. 18, 7806
fig. 43. — *Sarcostroma Berkeleyi* Cooke, Q. Journ. M. S. 1871,
pl. 1. — Ita dicatur *Hendersonia foliicola* (Berk.) Fuck. — Syll.
III p. 430 — nam teste Cooke pycnidium deest. Conidia plerum-
que 3 raro 5-septata, 30 \times 8.
2. **Coryneum Vogelianum** Saccardo, Not. Myc. VI, Ann. Myc. v. III 7807
(1905) p. 514. — Acervulis longitrorsum dispositis, sublinearibus,
1 mm. longis et confluendo 3-5 mm. long., vix 0,5 mm. lat.,
tectis, mox rimose erumpentibus, nigris; conidiis ellipsoideo-oblon-
gis, 2-septatis, utrinque obtusulis, 16-20 \times 8, ad septa non con-
strictis, subinde vero (ex exsiccatione) ad medios loculos leviter
constrictis, dilute fuligineis, loculo inferiore dilutiore; conidiopho-
ris bacillaribus, subhyalinis, 25-30 \times 2-2,5, utrinque obtusis, fasci-
culatis.
Hab. ad ramulos emortuos corticatos Aceris campestris,
Tamsel prov. Brandenburg, Germania (P. VOGEL). — A *Cor-*
Negundinis imprimis conidiophoris simplicibus dignoscenda species.
3. **Coryneum psilosporioides** (Schulz.) Sacc. et Trav. - Syll. XIX p. 306, 7808
(*Clasterosp.*) *Apotemnoum psilosporioides* Schulzer v. Mügg. Verh.
zool. bot. Ges. Wien (1871) p. 1238, tab. 13, fig. 17. — Acer-
vulis subcutaneo-erumpentibus, pulvinatis, depressis, 400-500 μ .
diam.; conidiis fusoideis, rectis, curvulisve, 3-septatis non con-
strictis, utrinque obtusulis, 18-20 \times 5, umbrino-brunneis, pedicello
filiformi hyalino triplo-quadruplove longioribus.
Hab. in ramis corticatis Cydoniæ vulgaris in Hungaria.
4. **Coryneum Missionum** Speg., Myc. Argent. V, p. 410, in Anal. 7809
Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; acervulis
hypophyllis sparsis v. laxe gregariis orbicularibus 150-200 μ .
diam., planiusculis, innato-erumpentibus, atris; conidiis dense con-
stipatis e fusoideo cylindraceis, rectis v. arcuatis, utrinque rotun-
datis, 25-30 \times 7-8, saepius 5-septatis, olivaceis, cellulis extimis pal-
lidioribus atque longioribus, ad septa non v. vix constrictis, e
cellulis prolieris ovoideis 8-10 \times 5, fumosis, dense constipatis im-
mediate oriundis.
Hab. ad folia viva Pithecolobii contortisiliqui in silvis
prope Puerto Leon Misiones, Argentina Amer. austr.
5. **Coryneum Cassiopes** Rostr., Rep. Second Norweg. arctic. Exped. 7810
Fram., (1906) p. 9. — Acervulis sparsis, atris, applanatis, epi-
phyllis; conidiis clavatis, v. piriformibus, 3-septatis, fuscis, locu-
lo infimo hyalino, 20-21 \times 7-8.

Hab. in foliis *Cassiopea tetragonæ*, E. Bedford Pim Island Norvegiæ.

6. **Coryneum perniciosum** Briosi et Farneti, Atti R. Ist. bot. Pavia 7811 ser. II, v. XIII (1909) p. 296; tab. VII, v. XIV et p. 49. — Acervulis pulvinatis erumpentibus, atris; conidiis clavatis v. clavato-fusoideis, fuscis, 40-50 \approx 13-15; conidiophoris filiformibus, fasciculatis, paraphysibus intermixtis conidia superantibus.

Hab. in cortice *Castaneæ* parasiticum, morbum «Moria dei Castagni» vel «Male dell'inchiostro» provocans in Etruria, Liguria, Pedemontio Italiæ. — Socia adsunt *Fusicoccum perniciosum* et *Melanconis perniciosa*, de quibus cfr. suo loco.

TOXOSPORIUM Vuill. — Syll. XIV p. 1030.

1. **Toxosporium camptospermum** (Peck) Maubl., Bull. Soc. Myc. 7812 Fr. XXIII (1907) p. 173. — Ita vocanda *Pestalozzia camptosperma* Peck — Syll. X p. 495 = *Toxosp. abietinum* Vuill., — Syll. XIV p. 1030 = *Coryneum bicorne* Rostr. — Syll. XVI p. 1013.

PESTALOZZIA De Not. — Syll. III p. 784, X p. 485, XI p. 578, XIV p. 1024, XVI p. 1013, XVIII p. 479.

1. **Pestalozzia Canangæ** Koord., Botan. Untersuch. Java (1907) p. 224. 7813 — Acervulis atris erumpentibus, amphigenis, præsertim epiphyllis, 80-150 μ . diam.; conidiis fusiformibus 4-septatis, loculis 3 interioribus fuscis, extimis hyalinis, 20-25 \approx 6-9, apice 2-3 aristatis; setis 6-15 μ . longis, hyalinis.

Hab. in foliis vivis Canangæ odoratæ in Purworedjo prov. Kedu Java (KOORDERS).

2. **Pestalozzia valdiviana** Speg., Fungi Chilenses (1910) p. 178. — 7814 Maculis suborbicularibus, amphigenis, determinatis, 3-15 mm. diam., inferne tabacinis, superne sordide cinerescentibus, linea angustissima callosa prominula limitatis; acervulis hypodermicis epiphyllis circinatim marginantibus 120-150 μ . diam., conidiis clavatulis 5-septatis non v. vix constrictis, 20 \approx 8, loculis 4 internis olivaceis, mediano supero crassiore saturatioreque, extimis conoideis minutis hyalinis, supremo longiusculo 3-setuloso, setulis 10 \approx 1, infimo breviter pedicellato 5 \approx 1.

Hab. in foliis vivis *Drymidis Winteri* prope Ciudad de Valdivia, Chile Amer. austr.

3. **Pestalozzia Clusiæ** Griff. et Maubl., Bull. Soc. Myc. Fr. XXV 7815 (1909) p. 239, tab. XXVII, fig. 1-3. — Maculis amplis, versifor-

mibus, amphigenis, albidis, linea elevata ochracea marginatis; acervulis numerosis, epiphyllis, punctiformibus, subcutaneo-erumpentibus, 200-300 μ . diam., oblongis rotundatisve, nigris; conidiis oblongo-ovoideis, saepe gibbis et inaequilateralibus, 4-septatis, 20-25 \times 8-10, loculis 3 mediis fuscis, extimis hyalinis; setulis terminalibus 3, raro 4, divergentibus, flexuosis, 20-30 μ . long.; pedicello filiformi, hyalino, 5 μ . longo.

Hab. in foliis vivis Clusiæ in calidariis pr. Parisios Galliæ.

4. **Pestalozzia pampeana** Speg., Myc. Argent. V, p. 412, in Anal. 781 Mus. Nac. Buenos Aires XX (1910). — Maculis arescentibus determinatis; acervulis sparsis cortice innatis, erumpentibus, sublenticularibus, 200-250 μ . diam., atro-olivaceis; conidiis ellipsoideis v. subfusoideis, 3-septatis, ad septum medium fere tantum constrictis, 20 \times 8-9, loculis 2 internis olivaceis, extimis hyalinis, setulis apicalibus 3 longiusculis, 20 \times 1, divaricatis, pedicello basali flexuoso 35-40 \times 1.

Hab. ad ramulos vivos Discariæ americanæ in pratis prope Córdoba Argentina Amer. austr.

5. **Pestalozzia Trevoæ** Speg., Fungi Chilenses (1910) pag. 178. — 781 Acervulis sublenticularibus, 150-300 μ . diam., primo cortice tectis eaque secedente denudatis atque superficialibus, atris; conidiis subcylindraceis quandoque leniter subfusoideis v. subclavulatis, 4-septato-constrictulis, 25-30 \times 8-10, loculis 3 internis fuligineis subopacis, 2 extimis breviter conoideis hyalinis, supero longe 2-3-ciliato (ciliis 15-20 \times 1) infero in pedicellum, 30-50 \times 1 hyalinum producto.

Hab. copiose in ramulis emortuis subputrescentibus Trevoæ trinervis in collibus San Bernardo prope Santiago Chile America austr.

6. **Pestalozzia pycnoides** Alm. et Cam. Rev. Agron. Port. IV (1906) 781 p. 60, tab. I, fig. 1-3; Bol. Soc. Brot. XXV (1908-1909), Extr. p. 61. — Acervulis ad instar pycnidii epiphyllis, solitariis, primum epidermide tectis, demum erumpentibus, subconoideis, 200-250 μ . diam.; conidiis fusoideis 4-septatis, ad septa constrictis, tribus loculis mediis castaneo-fuligineis, ceteris hyalinis, 18-25 \times 7-8, rostellis ternis achrois, 10-14 μ . long.

Hab. in foliis Lauri nobilis in horto Instituti Agronom. Lissboa Lusitania. — Socia adest *Phyllosticta laurina* Alm.

7. **Pestalozzia dichæta** Speg., Myc. Argent. V, p. 411, in Anal. Mus. 781 Nac. Buenos Aires XX (1910). — Maculis nullis; acervulis spar-

sis amphigenis, subglobosis, erumpentibus, nigris, 200-250 μ . diam.; conidiis subfusoideis 4-septatis, utrinque acutiusculis 20-22 \approx 6, ad septa leniter constrictis, loculis 3 internis obscure olivaceis ceteris hyalinis, supremo setulis 2 parum divaricatis, 10-15 \approx 1, prædicto, infimo in pedicellum brevem et gracilem, 5 \approx 1,5, attenuato.

Hab. ad folia coacervata putrescentia Lithreæ molleoidis Bella Vista Corrientes Argentina Amer. austr. — *P. funereæ* affinis sed conidiis apice semper et tantum bisetigeris distincta.

8. **Pestalozzia Torrendia** Alm. et Cam in Rev. Agron. Portug. III 7820 (1905) p. 254 t. XV, f. 4-5; Bol. Soc. Brot. XXV (1908-1909) Extr. p. 61. — Acervulis amphigenis, parvis, conicis, numerosis, atro-brunneis, primum tectis, demum erumpentibus; conidiis fusoideis, triseptatis, 27-30 \approx 10-11; loculis duobus intermediis majoribus, cuboideis, brunneis, ceteris achrois, utrinque acutissimis; rostellis plerumque 3, raro 2, hyalinis, simplicibus, 30-40 \approx 1; pedicello hyalino, 10-13 \approx 2-2,5, facile caduco.

Hab. in phyllodiis Acaciæ v. Mimosæ sp. prope Castello Branco Lusitania (C. TORREND).

9. **Pestalozzia sonsensis** P. Henn., in Fl. du Bas- et Moy. Congo, in Ann. Mus. du Congo, v. II, fasc. III, (1908) p. 229. — Maculis effusis, fuscis; acervulis minutis amphigenis, sparse gregariis, subcutaneis, atris; conidiis fusoideis 18-22 μ . longis, 4-septatis, cellulis mediis (3) fusco-atris, vix constrictis, 15-18 \approx 6-7, cellulis extimis conoideis hyalinis c. 4 μ . longis, vertice 3 setulis hyalinis 18-22 μ . longis, stipite filiformi hyalino, 18 \approx 1.

Hab. in foliis Ceratoniæ sp.? Sonso Congo Africa (VANDERYST).

10. **Pestalozzia congensis** P. Henn., in Fl. du Bas- et Moy. Congo, 7822 in Ann. Mus. du Congo, v. II, fasc. III (1908) p. 229. — Maculis effusis fuscidulis; acervulis epiphyllis, sparse gregariis, subcutaneis, discoideis, atris, epidermide fissa velatis, dein atro-effusis; conidiis fusoideis, 15-22 μ . longis, 4-septatis, cellulis mediis (3) atro-brunneis, constrictis, 15-18 \approx 6-10, cellula superiori papilliformi, hyalina, 2-3 μ ., setulis (3) filiformibus, hyalinis, c. 6-10 μ . cellula inferiori conoidea hyalina 3-4 μ ., stipite brevi, hyalino.

Hab. in foliis Parinarii sp. Kisantu Congo Africa (VANDERYST).

11. **Pestalozzia Byrsonimæ** v. Höhnel, Ergebniß Bot. Exped. Sübras. 7823 1901, Denk. K. Ak. d. Wiss. Bd. LXXXIII (1907) Extr. p. 36. — Maculis epiphyllis, numerosis, æque distributis, rotundatis, acu-

te limitatis, obscure brunneis, margine brunneo-nigris, 2-2,5 mm. latis; acervulis paucis 100 μ . cir. latis; conidiis ex ovoideo fusoides, 20-24 \approx 8-10, quinquelocularibus, loculis tribus mediis obscure brunneis, cæteris hyalinis; loculo basilari breviter conoideo, breviter hyalino-pedicellato, loculo apicali brevi, plerumque tribus ciliis irregulariter curvatis, 20-25 \approx 1-1,5, hyalinis.

Hab. in foliis *Byrsonimæ verbascifoliæ*, prope Sao Bernardo Sao Paulo Brasiliæ, Amer. austr.

12. **Pestalozzia Evansii** P. Henn., Engl. Bot. Jarhb. **XLI** (1908) 7824 p. 273. — Maculis amphigenis gregariis, rotundato-angulatis, atro-violaceis, acervulis erumpentibus atris; conidiis fusoideo-clavatis c. 15-28 μ . longis, 3-septatis, cellulis mediis 2, ovoideis, medio 1-septatis vix constrictis, atro-violaceis, c. 15-26 \approx 9-12, cellula superiori hyalina papilliformi c. 2 μ ., setulis 4 filiformibus, flexuosis, usque ad 30 μ . longis.

Hab. in foliis *Eugeniæ cordatæ* Hochst., Baiberton, Transvaal 1906 (EVANS).

13. **Pestalozzia Meneziana** Bres. et Torr., Broteria, Ser. Bot. t. VIII 7825 (1909) p. 142. — Amphigena, maculis nullis; acervulis gregariis v. sparsis, punctiformibus, nigris; conidiis subfusoideis, 4-septatis, loculis extimis hyalinis, interioribus fuligineis, 2 superioribus crassioribus, 25-27 \approx 8-9, apice setulis tribus 28-30 \approx 1, basi pediculo 3-5 \approx 2.

Hab. ad folia *Vitis viniferæ*, Porto Santo in Ins. Madeira (A. DE NORONHA).

14. **Pestalozzia Mágocsyi** Bubák, Beitr. Pilzfl. Ung. in Növénytani Közlemények (1907) Heft 4 Extr. p. 38. — Cæspitulis primum subepidermicis dein nudis, e rotundato elongatis, 200-300 μ . long., nigris, pulveraceis; conidiis ellipsoideis, fusoideis v. clavatis, quandoque curvulis, basi fortiter angustatis, 20-26 \approx 8-9, quinquelocularibus, loculis duobus mediis superioribus brunneis, tertio e flavido flavo-brunneo sæpe angustiore, loculis terminalibus parvis, conoideis, hyalinis, summo setulis 4-5 fortiter divergentibus usque ad 40, raro usque ad 50 μ . longis, hyalinis, curvulis prædicto; stipite brevi, cylindraceo, 10-15 μ . longo, hyalino

Hab. in caulinis emortuis *Seseli glauci*, Dunakeszi-Alag prope Budapest Hungariæ.

15. **Pestalozzia Comptospermæ** P. Henn., in Voeltzkow Reise Ostafrika III (1908) p. 32. — Maculis effusis, pallidis, exaridis; acervulis sparsis epiphyllis, lenticularibus, atris; conidiis, fusoideis 4-septa-

tis, cellulis mediis fuscis, 13-15 \approx 5-6, cellulis externis hyalinis papilliformibus, setulis 3 c. 10-14 μ . longis, stipite hyalino filiformi, c. 10 μ . longo.

Hab. in foliis *Comptospermæ nigrescentis*, Nossi-Bé Madagascar (J. M. HILDEBRANDT).

16. **Pestalozzia Mangiferæ** P. Henn., in Fl. du Bas- et Moy. Congo, 7828 Ann. Mus. du Congo, v. II, fasc. II, (1907) p. 102. — Maculis rotundato-angulatis amphigenis, gregariis, cinereo-fuscis, exaridis; acervulis hypophyllo-erumpentibus, lenticularibus, effusis, atris; conidiis clavato-oblongis, 20-24 \approx 4-6, 4-septatis, cellulis mediis 3 atris 14-18 μ ., cellulis extimis hyalinis conoideis, 4-5 μ ., apice setulis ternis, hyalinis, 15-18 μ ; stipite filiformi c. 10 \approx 1, hyalino.

Hab. in foliis *Mangiferae indicæ*, Kisantu Congo Africa (VANDERYST).

17. **Pestalozzia Coffeæ** Zimm., Pathol. Koffee (1904) p. 74, fig. 45. 7829 — Acervulis subcutaneo-erumpentibus, nigris; conidiis fusoidéo-oblongis, 5-cellularibus, 25 \approx 5-6, cellulis ternis interioribus fuligineis cum tertia inf. paullo pallidiore, ad septa leviter constrictis cellula suprema minima hyalina setulas 2 filiformes, 15-20 \approx 1, hyalinis divaricatas gerente, ima conoidea, minuta in stipitellum 4 μ . longum tenuata.

Hab. in foliis *Coffea arabicae* var. cultæ in ins. Java.

18. **Pestalozzia Elæagni** Alm. et Cam. Contrib. Myc. Lus. Cent. III- 7830 V, Bol. Soc. Brot. XXV (1908-1909) Extr. p. 59. — Acervulis epiphyllis, maculas fusco-cinctas foliorum cinerescentes occupantibus hemisphærico-lenticularibus, minutis, atris, primo epidermide tectis, demum liberis; conidiis subfusiformibus, rectis, utrinque acutatis, quinquelocularibus, cellulis extimis hyalinis, ceteris brunneis, vertice quatuor rostellis obsoletis, achrois, usque ad 15 μ . long., ad septa leniter constrictis, 20-22 \approx 7-8.

Hab. in foliis *Elæagni* sp. in horto bot. Coimbra (A. MOLLER).

19. **Pestalozzia Nicolai** Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) 7831 p. 485, tab. XV, fig. 14-15. — Acervulis sparsis, subcorticolis, primum globoso-clausis, depresso-depressis, dein erumpentibus, v. initio pulvinatis, 180-270 μ . latis, nigris; conidiis elongato-ellipsoideis, 18-26,5 \approx 6,5-8,5, trilocularibus, loculo inferiori parvo, trigono, hyalino, duobus superioribus obscure castaneo-brunneis ultimo apice setulis 5 (raro 4) 20-27 \approx 1, hyalinis, subrectis prædicto; conidiophoris filiformibus, usque ad 15 \approx 2, hyalinis.

Hab. in caulis siccis *Salviæ officinalis*, prope Rijeka Montenegro.

20. **Pestalozzia Bignoniæ** Da Camara, Bol. Soc. Broteriana XXV 7832 (1910) Extr. p. 21. — Acervulis lenticulari-subsphæroideis, atris, minutis, sparsis, immersis, primo tectis demumque epidermide fissa cinctis; conidiis fusiformibus, curvulis, 5-septatis, haud constrictis, loculis quatuor intermediis brunneis, duobus extimis conoideis, achrois parvulisque, 27-32 \approx 10, pedicellatis, vertice arista una, hyalina, filiformi, 5-8 \approx 1, stipite funiculiformi, 12-20 \approx 2.

Hab. in ramulis Bignoniæ jasminifoliae, in horto botanico Coimbra Lusitaniæ (A. MOLLER).

21. **Pestalozzia Conceptionis** Speg., Fungi Chilenses (1910) pag. 177 7833 cum icon. — Maculis nullis; acervulis lenticularibus, 100-120 μ . diam., atris, seriatis; conidiis ellipsoideis, 4-septatis, ad septa constrictulis 16-20 \approx 8-9, loculis 3 internis majusculis, centrali breviore, fuligineis, 2 extimis pusillis hyalinis, supero setulis 3 divaricatis, 20-25 \approx 0,75, conidio longioribus, infimo pedicello 10-15 \approx 1, conidio breviore donatis.

Hab. in caulis siccis subputrescentibus *Asterisci chilensis*, Cerro Caracol de Concepcion Chile Amer. austr.

22. **Pestalozzia Chrysanthemi** Hollós, Ann. Mus. Nat. Hung. IV 7834 (1906) p. 369, tab. IX, fig. 27. — Acervulis epidermide tectis, erumpentibus, depresso-globosis, nigris c. 0,5 mm. diam.; conidiis oblongo-ellipsoideis, initio hyalinis, continuis, dein 3-septatis, ad septula non constrictis, 16-22 \approx 7-9; cellulis duobus mediis magnis, flavidulis, dein fuscis, crasse 1-guttatis, extimis parvulis, achrois, deciduis, basi in pedicellum longissimum hyalinum, productis vertice ciliis 2-5 hyalinis, divergentibus, inæqualibus ornatis.

Hab. in caulis emortuis Chrysanthemi indici, Kecskemét Hungariæ.

23. **Pestalozzia sessilis** Sacc., in Ann. Mycol. VIII (1910) p. 339. 7835 — Maculis (propriis?) vagis, epiphyllis, alutaceo-pallidis, anguste nigro-marginatis; acervulis punctiformibus, disciformibus, subcuteaneis dein erumpentibus, nigris, 120-130 μ . diam.; conidiis sessilibus, elliptico-oblongis, 17-19 \approx 7, quadrisep-tatis, non v. vix constrictis, loculis tribus inter. fuligineis, extimis hyalinis, imo acutiore, part. color. 13-16 μ . longa; setulis apicalibus tribus, divergentibus, brevibus, hyalinis 6 \approx 1.

Hab. in foliis languidis v. emortuis *Diospyri mespiliformis*, Mareb a Chenafena, alt. 1550 m. (Acehle-Guzai) in Erythræa

(HADR. FIORI). — Affinis *Pest.* *brevisetæ*, sed conidiis sessilibus, et brevioribus distinguenda.

24. **Pestalozzia subsessilis** Speg., Myc. Argent. V, p 413, in Anal. 7836

Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus, 2-6 mm. diam., determinatis, albicantibus; acervulis paucis innato-erumpentibus, sublenticularibus, minutis, atris; conidiis subfusoideis v. subclavulatis, 20-30 \approx 8-11, fere semper 5-rarius 6-locularibus, loculis, intimis olivaceis cæteris hyalinis, supremo longiuscule 3-setigero, setulis valde divaricatis, 20 \approx 1, infero conoideo, pedicello 2-3 \approx 1 vix evoluto ornato.

Hab. ad folia viva Rivinæ levis, in dumetis prope Metán Salta Argentina Amer. austr.

25. **Pestalozzia Salicis** Hollós, Ann. Mus. Nat. Hung. IV (1906) 7837

p. 379, tab. IX, fig. 26. — Acervulis epidermide tectis, globulosis, peritheciiformibus, brunneis, 250-280 μ . diam.; conidiis elongato-fusiformibus, rectis, v. rarius curvulis, chloro-hyalinis, 3-septatis, 24-32 \approx 4-6, vertice ciliis 3-5 hyalinis, 20 μ . longis ornatis.

Hab. in ramis Salicis babylonicae dejectis, Kecskemét Hungariæ.

26. **Pestalozzia Elasticæ** Koord., Botan. Untersuch., Java (1907) p. 223. 7838

— Acervulis atris, amphigenis, erumpentibus, circularibus, sparsis v. gregariis; conidiis fusiformibus, quadri septatis, loculis 3 interioribus fuscis, extimis hyalinis, 25 \approx 6 (parte colorata); triariostatis, aristis filiformibus, hyalinis, apice subgloboso-incrassatis 32,5 μ . longis; basi stipite filiformi 5 μ . longo.

Hab. in foliis ab insectis corrosis Fici elasticæ prope Penuyangalan prov. Kedu Java (KOORDERS).

27. **Pestalozzia Hartigii** v. Tub. — Syll. X p. 490 — subsp. **Betulæ** 7839

Laub., Arb. K. biol. Anst. f. Land. K. Forstwirtsch. V (1906) p. 210.

— A typo differt conidiis setulis molto longioribus præditis (30-40 \approx 0,75) et forma loculi terminalis diversa, quæ est depressa et fere inconspicua.

Hab. in ramulis corticatis ægrotantibus Betulæ, Kreis Jerichow, Saxonia Germania. — Verisimiliter pathogena et morbum dictum «Einschnürungs-Krankheit» efficiens.

28. **Pestalozzia Myricæ** Koord., Botan. Untersuch. Java (1907) p. 224, 7840

fig. 33 V. — Acervulis amphigenis erumpentibus; conidiis oblongo-fusoideis, 4-septatis, 16-18 \approx 5-6,5, apice truncatis, inferne acuminatis, loculis 3 centralibus fuscis, extimis hyalinis, apice 2-3-

setigeris; setis 30-32 μ . longis apice truncato-dilatatis, hyalinis, curvatis v. flexuosis; pedicellis filiformibus hyalinis, continuis, fasciculatis, 60-75 μ . longis.

Hab. in foliis et ramulis Myricæ javanicæ in M. Sendoro prope Sigatok prov. Kedu Java (KOORDERS).

29. **Pestalozzia versicolor** Speg. — Syll. III p. 790 — var. **vagans** 7841 Spegazz., Fungi Paulist., Rev. Mus. La Plata t. XV, p. 42 (1908). — Conidiis fusoideo-clavulatis 20-30 \approx 8-10, 4-septatis non v. vix constrictis, loculis 3 internis fuligineis (intimo obscuriore) 2 extenis hyalinis, pedicello brevissimo 3-10 μ . suffultis, setulis 3 divaricatis 20 \approx 1, hyalinis coronatis.

Hab. ad folia languida arborum arbuscularumque plurimarum in hortis Sao Paulo Brasilia (USTERI).

30. **Pestalozzia funerea** Desm. — Syll. III p. 791. — Var. **macrochæta** 7842 Speg., Myc. Argent. V. p. 412, in Anal. Mus. Nac. Buenos Aires XX (1910). — A typo differt setulis longioribus 30 \approx 1.

Hab. ad acus dejectas subputrescentes Pinis silvestris Villa Elisa Argentina Amer. austr. — Var. **eusora** Sacc., in Ann. Mycol. VI (1908) p. 568. — A typo differre videtur acervulis magis regularibus, compactiusculis, epidermide adhærente cinctis, 250 μ . diam.; conidiis omnibus partibus paullo minoribus, nempe 20-22 \approx 5,5-6; pedicello 6 \approx 1,3; setulis subternis 11 \approx 1,3. — In pag. inferiore foliorum languentium Heptapleurii Barteri, Roça Sandade S. Thomé, alt. 700 m. (commun. A. D. MOLLER) — Media videtur inter *Pest. funereum* et *Pest. microsporam*. — Var. **Hedychii** Giuditta Mariani in Atti Soc. It. Sc. Nat. L (1911) pag. 171. — Conidiis 20-23 \approx 5,5-6, apice ciliis binis, rarius ternis v. quaternis. — In caulis foliisque Hedychii coronarii, in horto bot. Coimbra Lusitaniæ (MOLLER).

31. **Pestalozzia Thujæ** Hollós, Növényt. Közlemen. VI, (1907) Extr. 7843 p. 9. — Acervulis epidermide tectis, sparsis, fuscis, punctiformibus; conidiis cylindraceis, rectis v. plerumque curvulis, 3-septatis, ad septa non constrictis, chloro-hyalinis, 24-30 \approx 5-5,5, vertice ciliis 3-5 hyalinis, usque ad 20 μ . longis ornatis.

Hab. in ramis siccis dejectis Thujæ occidentalis, Kecskemét Hungariæ.

32. **Pestalozzia Shiraiana** P. Henn., Engl. Jahrb. Bot. XXXVII (1905) 7844 p. 164. — Maculis effusis, pallide fuscis; acervulis gregarie sparsis, punctiformibus epidermide fissa tectis, dein prorumpentibus, fuscis; conidiis oblonge fusoideis, 4-septatis, cellulis mediis (3) atris,

cellulis externis subpapillatis, hyalinis; 13-17 \approx 4-6, setulis (3) filiformibus c. 10-15 μ . longis. pedicello hyalino 6 μ . longo.

Hab. in foliis Cryptomeriæ japonicæ, Yoshino prov. Yamato Japoniæ (SHIRAI) — A *Pest. funerea* omnino diversa.

33. **Pestalozzia fuscescens** Sorauer, Pflanzenkrankh., 2a ed. vol. II, p. 7845 399-400, fig. 18-19 (1886) et 3 ed. v. II, p. 431-432. — Acervulis innatis dein erumpentibus, dense gregariis, nigris, minutis; conidiis elliptico-oblongis v. late fusoideis, 32-38 \approx 14-16, quinquelocularibus, loculis ternis interioribus coloratis, brunneis, centrali atro-brunneo, supremo minimo, anguste conoideo hyalino, imo in stipitellum brevem, conidio breviorem tenuato; ciliis apicalibus binis divaricatis, hyalinis, conidium dimidium subæquantibus.

Hab. in plantulis junioribus Coryphæ australis cultæ, quas denique occidit ex India orient.

34. **Pestalozzia Coperniciæ** Speg., Myc. Arg. V, p. 411, in Anal. 7846 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; acervulis sparsis v. gregariis, erumpentibus, lenticulari-conoideis, 100-200 μ . diam., nigris; conidiis clavulato-subfusoideis 4-septatis ad septa non v. vix constrictis, 25-30 \approx 5-6, loculis centralibus fuligineis subculoideis, extimis conoideis hyalinis, supremo modice rigideque biciliato, infimo pedicello basali breviusculo 5,15 \approx 1, hyalino prædito; setulis apicalibus divaricatis 10-15 \approx 1.

Hab. ad fructus nondum maturos subputrescentesque Coperniciæ ceriferæ, Puerto Leon Misiones Argentina Amer. austr.

35. **Pestalozzia pallidicolor** Speg., Myc. Arg. V, p. 412, in Ann. 7847 Mus. Nac. Buenos Aires XX (1910). — Acervulis sparsis erumpentibus, 100-150 μ . diam.; conidiis subclavulatis, 22-24 \approx 6-7, 4-septatis ad septa non v. vix subconstrictis, loculo supremo mucroniformi hyalino setulis tribus conoloribus patentiusculis tenuibus 12-15 \approx 0,75 ornato, infimo obconico hyalino in pedicellum hyalimum 5 \approx 1 attenuato, cæteris centralibus fumosis v. pallide olivaceis.

Hab. ad scapos aridos v. subputrescentes Synandrospadics vermitoxici in horto botanico La Plata Argentina America austr.

36. **Pestalozzia Aloës** Trinchieri, Rnd. R. Acc. Sc. Napoli (1909) 7848 fasc. 8-12, Extr. p. 8. — Acervulis majusculis, gregariis, epidermide fissa velatis, sublenticularibus, nigris, 171-245 μ . diam., 61-122 μ . altis; conidiis copiosissimis, fusoideis vel subpiriformibus, quandoque curvulis, 4-septatis, non vel vix constrictis, 19,5-24,5 \approx 4,5-7; loculis tribus mediis crassioribus, fuscidulis,

duobus extimis minutis, subtriangularibus, hyalinis, loculo supero setas ternas, longiusculas, filiformes, divaricatas apice acutulas, 17-24,5 \approx 1 gerente, infero in pedicellum hyalinum, 4,5-9,5 \approx 1 producto.

Hab. in scapo sicco Aloës virentis Haw., in Horto regio botanico neapolitano Ital. austr. — A *Pest. funerea* Desm., cui forte affinis, acervulis gregariis, conidiis brevioribus, setis semper ternatis et multo longioribus dignoscitur.

MONOCHÆTIA Sacc. — Syll. III p. 797, XI p. 579, XVIII p. 485. 7849

1. **Monochætia ampelophila** Spieg., Myc. Arg. V, p. 410, cum icon., in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; acervulis sparsis v. plus minusve dense gregariis, erumpentibus, hemisphærico-depressis, 150-250 μ . diam., sordide fusco-olivaceis; conidiis constipatis oblanceolatis, subclavulatis v. subfusoideis arcuatus, 24-30 \approx 6-8, 4-septatis ad septa constrictulis, loculis 3 centralibus chlorinis, extimis hyalinis, supremo setula fere horizontali recta v. arcuatula, 5-10 \approx 1 ornato, infimo conoideo in pedicellum setuliformem vel incrassatulum 5-10 \approx 1-3 concolorem producto.

Hab. ad sarmenta viva Vitis viniferæ. Villa Hojo del Agna, Santiago del Estero Argentina America austr.

2. **Monochætia osyridella** Bubák, Bull. Herb. Boiss. 2 sér., VI (1906) 7850 p. 484, tab. XV, fig. 5. — Acervulis subepidermicis, 120-150 μ . latis, rotundatis, nigris, demum erumpentibus; conidiis elongato-fusoideis, 18-29 \approx 5,5-6,5, rectis v. curvis, 5-locularibus, 3 (raro 2) mediis obscure castaneo-brunneis, loculo centrali minori; loculis terminalibus hyalinis, setula 12-15,5 \approx 1, hyalina præditis; conidio-phoris cylindraceis 15-18 \approx 2-2,5, hyalinis.

Hab. in ramulis siccis Osyridis albæ prope Ulcinj Montenegro. — Probabiliter species non v. vix diversa a *Monoch. osyrella* (Tassi 1904) Sacc. et D. Sacc. — Syll. XVIII, p. 486.

3. **Monochætia excipuliformis** Bubák, Ann. Mycol. IV (1906) p. 120. 7851 — Acervulis subcorticolis, dein erumpentibus, sparse gregariis, rotundatis v. elongatis, pustulatis v. discoideis, nigris, saepe confluentibus, hypostromate usque ad 50 μ . cr., flavo-brunneo; conidiis ex ellipsoideo fusoideis, 11-18 \approx 4-5,5, triseptatis, olivaceo-brunneis, cellulis terminalibus hyalinis v. coloratis, rotundato-angustatis, ciliolis hyalinis curvulis 18-30 \approx 0,5-1 præditis; loculo basilari pedicello recto v. curvulo 20-30 \approx 0,5-1 prædicto.

Hab. in ramis emortuis *Salicis* sp. prope Prag Bohemia. —
Habitus macroscopice excipulaceus.

4. **Monochætia mucronata** (Massee) Maire, Bull. Soc. Bot. Fr. LIV 7852 (1907) p. CLXXXVII. — Teste cl. Maire, l. c. ita vocandum *Coryneum mucronatum* Mass. — Syll. XI, p. 577.
5. **Monochætia Desmazierii** Sacc. — Syll. XVIII, pag. 485. — Huc 7853 spectat *Pestalozzia monochæta* Desm. — Voglino, Monogr. Pest. p. 29, t. X, f. 27 = *Pest. Saccardoi* Spieg. — Syll. III, p. 797.
6. **Monochætia Saccardiana** (Voglino) Sacc., *Pestalozzia Saccardiana* 7854 Voglino, Monogr. gen. Pest. p. 27, t. X, f. 32 (1885). — Huc spectat *Pestal. monochæta* Sacc. F. ital. fig. 1119 — Syll. III, p. 797 — non Desm.

Sect. 7. Phæodictyæ.

STEGANOSPORIUM Kunze et Schm. — Syll. III p. 803, X p. 508, 7855 XIV p. 1035, XVI p. 1022, XVIII p. 488.

1. **Steganosporium Sirokoffii** Bubák (nomen citatum una cum sequente, p. 533), *Thyrococcum Sirokoffii* Bubák, in Ber. Deutsch. bot. Gesell. Bd. XXVIII (1910) p. 533, t. XVI, *Steganosporium Kosaroffii* Turconi et Maffei, Atti Ist. bot. Pavia ser. II, v. XII, p. 334, t. XII, f. 3 (1910 serius), *Thyrostroma Sirokoffii* (Bubák) v. Höhn. — Acervulis subcorticalibus, dein erumpentibus, pulvinatis, gregariis, confluentibus, nigris, rugosis, opacis, demum subnitidis, firmis; hypostromate ex contextu pseudoparenchymatico v. partim ex hyphis contextis composito; conidiis in apice cellularum seriatarum insertis, typice clavatis v. ovoideis v. ellipsoideis irregularibusque 38-85 × 19-35, plerumque 3-6- rarius vero 8-9-septatis, valde constrictis, loculis fere omnibus longitudinaliter 1-3-septatis, brunneis; conidiophoris modo usque ad 40 × 10, distinctis, modo brevibus a ceteris cellulis non discretis.

Hab. in cortice Mori albæ, cui valde nocet, in Bulgaria (P. SIROKOFF et P. KOSAROFF). — Cum species sit primo subcorticalis inter Melanconiaceas manere potest et tunc genus *Thyrococcum* Höhn. non Sacc. (= *Thyrostroma* v. Höhn. serius) supervacaneum.

2. **Steganosporium piriforme** (Hoffm.) Cda. -- Syll. III, p. 803 — 7856 var. **majus** Ell. et Ev. in herb. Sacc. et ap. Noelli in Malp. XVII (1903) p. 415, f. 2. — Acervulis majoribus, tumidis, nigris, 4-5 mm. long., 3-4 mm. lat., 1 mm. alt., irregularibus; conidiis quam typi similibus, sed multo amplioribus, 43-55 × 26-29 (nec 21-24 × 12-14).

Hab. in ramis corticatis *Aceris saccharini*, London Canada.

3. **Steganosporium compactum** Sacc. — Syll. III, p. 804 — *Thyro-* 7857
stroma compactum (Sacc.) v. Höhn, Stzb. K. Ak. Wiss. Wien,
CXVI (1907) p. 154 — var. *Tiliæ* Sacc., in Potebnia Myc. Stud.
Ann. Myc. v. V (1907) p. 21, fig. 42 et Trav. Soc. Nat. Univ.
Kharkov XXXXIII (1907). — Cæspitulis sphæroideis; conidiis
50-55 \approx 15-16, clavatis, brunneis, 4-7-septatis, constrictis, loculis 1.
vel 2 medianis etiam longitudinaliter septatis; conidiophoris palli-
dioribus, 30-35 \approx 4,5.

Hab. in ramis *Tiliæ europææ* prope Kursk, Rossia.

4. **Steganosporium Mori** (Nomura) Sacc. et Trott. — Ita vocandum 7858
Coryneum Mori Nomura — Syll. XVIII, p. 478 — nam ex ob-
servationibus cl. Butler in Mem. Depart. Agric. in India II (1909)
p. 1-11, tab. 1-11, conidia sunt sæpe muriformia. Species nascitur
præter Japoniam quoque in Moris, Kaschmir, ubi pariter valde
noxia.
5. **Steganosporium curvatum** Corda, in Opiz Beiträge zur Nat. (1823- 7859
1825) p. 458 (Diagnosis desideratur).

Hab. in agro pragensi.

PHRAGMOTRICHUM Kze. et Schm. — Syll. III p. 806, X p. 509, XI
p. 585, XIV p. 1036.

1. **Phragmotrichum Flageletianum** Sacc., Ann. Mycol. VI (1908) 7860
pag. 560, tab. 24, fig. 8. — Acervulis laxe gregariis, pulvinatis,
nigris, $\frac{1}{2}$ mm. diam., compactiusculis, erumpentibus, epidermide
fissa cinctis; conidiis in catenas usque ad 150 μ . longas junctis,
isthmis nullis interjectis, ellipsoideo-oblongis, utrinque rotundatis,
3-5-septato-muriformibus, 15-20 \approx 8-10, fuligineis, levibus.

Hab. in ramulis languidis et emortuis Carpini Betuli, Ri-
gny sur Arroux Galliæ (FLAGELET). — Ob conidia isthmis nullis
connexa species hæc nec non *Phragm. Platanoidis* et *Phragm.*
Spirææ subgenus proprium (*Phragmotrichella* Sacc.) constituere
merentur.

Sect. 8. Hyalodictyæ.

THYRSIDINA v. Höhn., Ann. Mycol. III (1905) p. 337 (Etym. *Thyrsi-
dium* cuius est analogum genus). — Fungus vegetus coloratus, gel-
atinoso-carnosus, erumpens; stroma pallide coloratum, crassum ple-

ctenchymaticum, ex hyphis floccosis constitutum. Conidia hyalodictya, ad apicem hypharum singula, rotundata, primum stromate innata demum superficialia, conglutinata.

1. **Thyrsidina carneo-miniata** v. Höhn., Ann. Mycol. III (1905) p. 337. 7861

— Stromate e carnoso coccineo, udo carnoso-gelatinoso, sicco cereo, erumpenti, peridermio lacerato limitato, 0,5-2 mm. lato, 120-300 μ . cr., ex hyphis subparallelis, floccosis, plectenchymaticis, subgelatinosis, 3 μ . cr. efformato; conidiis pallide roseis, 16-20 μ . d.

Hab. in ramis Aceris Pseudoplatani, Wiener Wald, Austria. — Verisimiliter parasitica in *Diaporthe Platanoidis*.

Sect. 9. Scolecosporæ.

CYLINDROSPORIUM Ung. — Syll. III p. 737, X p. 498, XI p. 582, XIV p. 1032, XVI p. 1018, XVIII p. 491.

1. **Cylindrosporium Ribis** Davis, Trans. Wiscons. Ac. of Sc. XVI, 7862 Pt. II (1909) p. 759. — Maculis subcircularibus, luridis v. fuscis, margine obscuro angusto præditis, 2-6 mm. diam.; acervulis 30-50 μ . diam.; conidiis in epiphylo eructatis, curvis, apice distincte attenuatis, 50-80 \times 1,5.

Hab. in foliis Ribis tristis et R. prostrati, Racine Amer. bor.

2. **Cylindrosporium Lathyri** Bub. et Kab., Sechst. Beitr. Pilzfl. Tir. in Ann. Myc. V (1907) p. 44. — Maculis foliicolis amphigenis, irregulariter rotundatis v. angulosis, quandoque confluentibus, ochraceis, brunneo-purpureo-marginatis, demum pallescentibus; acervulis epiphyllis, sparsis v. gregariis, parvis, 50-100 μ . latis, primum subepidermicis, dein epidermidem lacerantibus et flocculos sordide flavidos ostendentibus; conidiis filiformibus, utrinque rotundatis, rectis v. varie incurvatis, 40-100 \times 2-3,5, 1-4-locularibus, hyalinis; conidiophoris subconoideis, usque ad 10 μ . long., 2 μ . circ. crassis, flavidis.

Hab. in foliis vivis Orobi (Lathyri) verni prope Madonna di Campiglio, in agro Tridentino. — Verisimiliter non diversum a *Phleospora Orobi* Potebnia.

3. **Cylindrosporium Pomi** Brooks, Bull. Torr. Bot. Cl. XXXV (1908) 7864 pag. 453, cum tab. et fig. — Acervulis pallidis subeffusis, primo subepidermicis, dein erumpenti-liberis; conidiis hyalinis, granulosis, filiformibus, rectis v. flexuosis, 15-80 \times 2-2,5.

Hab. in fructibus Piri Mali quos valde vexat Amer. bor.

4. **Cylindrosporium Fairmanianum** Sacc., Ann. Mycol. VI (1908) p. 566. 7865

— Maculis amphigenis minutis, orbiculato-angulosis, 1-2 mm. d., ochraceo-argillaceis, supra distinctioribus; acervulis innatis saepius epiphyllis ex hyphis filiformibus, hyalinis, tenuibus formatis; conidiis bacillaribus, saepius curvulis, continuis, 50-70 ≈ 1-2, hyalinis, dein in cirros dilutissime carneos minutos versiformes eructatis.

Hab. in foliis languidis Spirææ lanceolatae cultæ, Lyndonville N. Y., Amer. bor. (FAIRMAN). — A *Cylindr. Filipendulae* acervulis saepius epiphyllis, conidiis multo longioribus, continuis etc. differre videtur.

5. **Cylindrosporium malisoricum** Bubák, Bull. Herb. Boiss., 2 sér., VI 7866

(1906) pag. 485. — Maculis minutis, 1-2 mm. lat., subrotundis, centro arescendo albicantibus, anguste purpureo-marginatis, internerviis; acervulis epiphyllis, 50-150 μ. diam., subrotundo-lobatis, epidermide tectis et initio eam brunneo-punctulatam reddentibus; conidiophoris e strato flavo-brunneolo oriundis, 6-12 ≈ 1-1,5, sursum tenuatis, basi subfasciculatis; conidiis filiformibus, usque ad 65 ≈ 1,5-2, rectis curvulisve, obsolete 1-3-septatis, hyalinis, utrinque acutatis.

Hab. in foliis vivis Opopanaxis Chironii pr. Ulcinj Montenegro.

6. **Cylindrosporium septatum** Romell — Syll. X, p. 503 — fm. *Helosciadii* 7867 Sacc., Ann. Mycol. VI (1908) p. 560. — Conidiis filiformibus, 50-60 ≈ 3, deorsum saepè nonnihil crassioribus, 5-septatis, hyalinis.

Hab. in foliis languidis Helosciadii nodiflori prope Parisios Galliæ (P. HARIOT). — Fm. *Sii latifolii* Sacc., Ann. Mycol. VII (1909) p. 434. — Conidiis prælongis sursum acutatis, 60-80 ≈ 4, hyalinis, spurie 8-10-septatis. — In foliis *Sii latifolii*, Mery sur Seine Galliæ (P. HARIOT).

7. **Cylindrosporium Olivæ** Petri, Ann. Myc. V (1907) p. 324, fig. 1-5. 7868

— Acervulis sine ordine dispositis, subcutaneis, erumpentibus, albidis; strato conidiophoro initio involuto-clauso, demum explanato-aperto; conidiis elongatis, unicellularibus, bacillaribus, curvulis, flexuosis, hyalinis, 12-15 μ. longis, 1,5-2,5 latis; conidiophoris filiformibus, basi attenuatis, continuis.

Hab. in fructibus maturis vivis Oleæ europeæ, in Italia.

— Maculæ magnæ, depresso-pallidæ vel flavo-purpurascentes, atro-purpureo-marginatæ, ad basim fructuum orientes.

8. **Cylindrosporium Melissæ** Mass., Contrib. Micol. Veron. (1889) 7869

p. 103, t. 4, f. 23. — Maculis irregularibus, exaridis; acervulis subpunctiformibus, amphigenis, subcuticularibus, in cavitatibus subgloboso-conicis demum poro perviis inclusis, 50 \times 30; conidiis exiguis filiformibus, hyalinis, continuis, subfalcato-curvulis, 28-35 \times 1,8.

Hab. in foliis bracteisque *Melissæ officinalis* prope pagum Avesa. prov. Veronensis Ital. bor. — Observante ipso auctore, videtur *Septoria Melissæ* pycnidio carens.

9. **Cylindrosporium Eleonoræ-reginæ** Bub. et Malk. in Kab. et Bub. 7870

Fungi imp. exs. fasc. XI, n. 532 et in Ber. IV Versamml. böhm. Naturf. u. Ärzte (1909) p. 302 (sine diagnosi).

Hab. in foliis *Senecionis transsilvanici* ad Crno Jezero infra M. Musalla Bulgariæ. — Auctor nos monet se proxime diagnosim editurum esse.

10. **Cylindrosporium Betulæ** Davis, Trans. Wisconsin Ac. of Sc. XVI, 7871

P. II (1909) p. 759. — Maculis subcircularibus indefinitis, subtus brunneo-cinnamomeis supra obscurioribus, margine viridescenti, 3-8 mm. diam.; acervulis hypophyllis, pallide brunneis; conidiis bacillaribus, rectis v. curvulis, obtusis, 25-40 \times 1,5-2.

Hab. in foliis *Betulæ pumilæ*, Sullivan Amer. bor.

11. **Cylindrosporium Bambusæ** Miyake et Hara, Bot. Mag. Tokyo (1910) 7872

p. 355 (japonice).

Hab. in foliis *Bambusæ* in Japonia.

CRYPTOSPORIUM Kunze — Syll. III p. 740 X p. 506, XI p. 585,

XIV p. 1034, XVI p. 1019, XVIII p. 492.

1. **Cryptosporium acerinum** Bresad. in Kab. et Bub., Fungi imper- 7873

fecti exsiccati n. 581 (1909). — Acervulis subcutaneis erumpentibus, pallidis, 0,5-2 mm. latis; conidiis oblongo-ovoideis, subcurvatis v. curvatis, apice subrostratis, hyalinis, 18-24 μ . long., 6-7 μ . lat.; conidiophoris 25-40 μ . long., 2,5-3 μ . lat.

Hab. in ramis emortuis *Aceris tatarici*, Welwarn Bohemiæ (J. E. KABAT).

2. **Cryptosporium leptostromiforme** J. Kühn, Ber. des landw. Inst.

Halle (1880); Frank, Kampfb. geg. Schädl. t. 17, f. 14. — Maculis 7874

flavanticibus; stromatibus nigris, seriatis; loculis numerosis, foraminibus colliformibus præditis; conidiis continuis bacillaribus utrinque rotundatis, 7-8,5 \times 2, hyalinis, conidiophoris suffultis.

Hab. in caulis *Lupini* spp. quibus vere exitiosum, in Germania.

3. ***Cryptosporium Cydoniæ*** Schulz. v. Mügg. Verh. zool. bot. Gesell. 7875 Wien (1871) pag. 1234, tab. 13, fig. 12-13 *a-f.* — Acervulis seu stromatibus subcutaneo-erumpentibus globoso-conoideis, nigris, 300-600 μ . diam., intus pallidis; conidiis brevissime pedicellatis, ellipsoideo-oblongis, 7-8 μ . long., utrinque 1-guttulatis, hyalinis.

Hab. in ramis corticatis *Cydoniæ vulgaris* in Hungaria. — Var. **impressum** Schulz. v. Mügg., l. c. p. 1235, fig. 13 *g-l.* — Stromatibus pulvinatis, obtusis, nigris, intus loculo anulari praeditis, pallidis; conidiis plerumque teretiusculis, 2-guttulatis, hyalinis. — In ramulis tenellis *Cydoniæ vulgaris* in Hungaria.

4. ***Cryptosporium minimum*** Laubert, Centralbl. f. Bakter. II Abt. 7876 XIX (1907) p. 166. — Acervulis minutis, achrois, in cella pneumatophora dilatata insidentibus, pycnidiformibus, 150 μ . diam.; conidiis suballantoideis, 1-cellularibus, curvulis, hyalinis, 16-27 \approx 2,2-3,8 in cirros albos minutos ex stomatibus exslientibus.

Hab. parasitice in ramulos, frigore plus minus vexatos, Rosæ sp., verisimiliter R. multifloræ, pr. Dahlem, Berlin Germaniæ. — Fungillus nascitur gregarius in maculis matricis nigricantibus suborbicularibus, sæpe purpureo-marginatis, demum brunneo-cinerescentibus.

5. ***Cryptosporium Seselis*** Moesz, Gomb. Budap. I (1909), p. 23, t. II, 7877 f, 13 *a-b* (Bot. Közlem.). — Acervulis gregariis, discoideo-conicis, 143-430 μ . diam., sæpe confluentibus, nigris, sub lente fuscis, epidermide tectis, dein ore 13-33 μ . diam. pertusis; conidiis falcatis, utrinque acutiusculis, 22-25 \approx 1,5-2, hyalinis, continuis; conidiophoris fasciculatis, ramosis, ramis filiformibus.

Hab. in caulis siccis *Seseli glauci* prope Budapest Hungariæ.

6. ***Cryptosporium Euphorbiæ*** v. Höhn., Krypt. exs. Mus. Palat. Vin- 7878 do. n. 1181 (1906) et in Annal. Naturhist. Hofmus. Wien, Bd. XX (1905) p. 20. — Acervulis planis, rotundis, sparsis, 300-400 μ . latis, rufo-brunneis, demum ore pertusis, sub epidermide secedente nidulantibus; conidiis cylindraceis, utrinque rotundatis, curvulis, guttulis oleosis repletis, hyalinis, continuis, 22-26 \approx 2-4, plerumque 24 \approx 3, in conidiophorum simplicium brevium apicibus.

Hab. in caulis *Euphorbiæ palustris* in silva Schorwald pr. Szentgyörgy in Hungaria (A. ZAHLBRUCKNER).

7. ***Cryptosporium Ipirangæ*** Spegazz., Fungi Paulist., Rev. Mus. La 7879

Plata (1908) t. XV, p. 42. — Maculis suborbicularibus amphigenis 1-4 mm. diam. nitidulis, limitatis, areola infuscata opaca cinctis; acervulis epiphyllis, in centro macularum paucis, primo lenticularibus fuscidulis epidermide tectis, dein scutellatis 50-80 μ . diam., strato proligero fusco-parenchymatico donatis; conidiis rectis v. arcuatis utrinque acutiuscule rotundatis, 20-25 \times 1, triseptatis, hyalinis.

Hab. ad folia coriacea arboris cujusdam ignotæ in hortis, Ipiranga Cambury Brasilia (USTERI).

8. **Cryptosporium rhodocyllum** Mont. in litt. Cfr. Alm. et Cam., Bol. 7880 Soc. Brot. XXV (1908-1909), Extr. p. 43, *Phyllosticta hæmatocystica* Berk., Alm. et Cam. Rev. Agron. II, p. 249, tab. II, fig. 3-4. — Maculis latissimis, irregularibus, pallidis, rufo-cinctis; acervulis numerosis, sparsis, plano-pulvinatis, subinde discoideo-lenticularibus, primo tectis demumque, epidermide lacerata, centro erumpentibus, irregulariter undulatis, 150-300 μ . longis; conidiophoris clavatis, 20-30 μ . longis; conidiis subclaviformibus, raro cylindraceis, saepius inæquilateralibus, hyalinis, continuis, homogeneis aut uni- v. plerumque biguttulatis, 17-22 \times 7-8.

Hab. in foliis *Phormii tenacis*, cult. in hort. bot. Olyssiponensi ad Ajudam Lusitania (leg. WELW. hyeme 1842-1843). — Cfr. Syll. III, p. 61.

PHLEOSPORA Wallr. — Syll. III p. 577, X p. 398, XI p. 550, XIV p. 981, XVI p. 975, XVIII p. 488.

1. **Phleospora castanicola** (Desm.) D. Sacc. Mycoh. ital. Cent. I-II, 7881 n. 173 (1898). — Ita vocanda *Septoria castanicola* Desm. — Syll. III, p. 504.
2. **Phleospora Robiniæ** (Lib.) v. Höhnel, in Ann. Mycol. III (1905) 7882 p. 333, Potebnia in Ann. Mycol. VIII (1910) p. 71, f. 21. — Ita vocanda *Septoria Robiniæ* (Lib. sub *Ascochyta*, 1837) Desm. — Syll. III, p. 484 (= *Sept. curvata* Rabenh. et Braun — Syll. III, p. 484).
3. **Phleospora Caraganæ** Jacz. — Syll. XVI, p. 975 — var. **Lathyri** 7883 Poteb., Ann. Mycol. V (1907) pag. 19 et Trav. Soc. Nat. Univ. Kharkov, XXXII (1907). — Maculis pallidis, flavidis, magnis, nervis limitatis; acervulis sparsis, initio pallide flavo-brunneis, hemisphæricis, primo epidermide tectis dein erumpentibus; maturis nigris, globosis; conidiis 35-40 \times 3, 1-3-septatis.

Hab. in foliis *Lathyri pisiformis* prope Kursk, Rossia. —

St. magis evolutus typi videtur *Septoria Caraganæ* P. Henn. — Syll. XVIII, p. 377.

4. **Phleospora Orobi** Poteb., Ann. Mycol. V (1907) pag. 20 et Trav., 7884 Soc. Nat. Univ. Kharkov XXXXIII (1907). — Maculis indeterminatis, magnis, brunneo-marginatis; pycnidii pallidis; conidiis 45-52 \times 2, 1-3-septatis; conceptaculis vacuis obscure brunneis.

Hab. in maculis Orobi (Lathyri) verni prope Kursk Rossiae. — Ab hac specie forte non differt *Septoria orobicola* Sacc. seu *Cylindrosporium orobicola* (Sacc.) Bubák in Növényt. Közl. (1907) Heft 4, p. 38 (extr.), in Bohemia quoque lecta.

5. **Phleospora hungarica** Bubák, Beitr. Pilzfl. Ung., in Növénytani Közlemények (1907) Heft 4, Extr. p. 36. — Maculis rotundatis v. ellipsoideis, arescendo albido-griseis, parvis, 1-3 mm. latis, undulato-zonatis, definitis, areola angusta sordide rubro-carnea circumdatis, in folium sparsis v. raro gregariis et quandoque confluentibus; pycnidii (spuriis) epiphyllis, sparsis v. gregariis, flavo-ochraceis, subepidermicis, 80-100 μ . diam.; conidiis falcatis, 20-33 \times 2,5-3,5, utrinque fortiter angustatis, hyalinis, transverse uniseptatis; conidiophoris phialiformibus, 10-15 \times 3-4,5, hyalinis.

Hab. in foliis Vincetoxicici laxi, in M. Suskuluj prope Herculesfürdö Hungariæ.

6. **Phleospora borealis** Lind et Vleugel, Svensk Botan. Tidskr. Bd. 7886 II (1908) p. 383, fig. 4. — Maculis sparsis, minutis, 4 mm. circ. diam., subcircularibus, amphigenis, ochraceis, in pagina superiore foliorum obscurioribus, coriaceis; pycnidii (spuriis) 10-20 in centro paginæ inferioris macularum dense gregariis, vix prominulis, imperfectis, cellulis parenchymaticis sursum brunneis, deorsum (in textura folii) hyalinis; conidiis crassiusculis, cylindraceis, rectis, obtusis, 16-20 \times 3-4, 3-5-septatis, ad septa constrictis, hyalinis, cirro albido.

Hab. in foliis vivis Alni incanæ fm. borealis, Umeao Sueciæ (J. VLEUGEL).

7. **Phleospora taurica** Sacc. in Ann. Mycol. IX (1911) p. 254. — Maculis epiphyllis fusco-brunneis, angulosis, 2 mm. diam., nervis limitatis, saepe confluentibus; acervulis punctiformibus epidermide velatis, 60-70 μ . diam., subcircularibus, non prominulis, trans folium diaphane visilibus, pallidis; conidiis bacillaribus, utrinque obtusulis, saepius curvulis, typice 3-septatis, non constrictis, hyalinis, 30-36 \times 2,5-3; conidiophoris paliformibus, parallelis brevissimis.

Hab. in foliis subvivis Populi albæ in Tauria (SCHIRAEVSKY).

8. **Phleospora Hanseni** Bubák, Journ. of Mycol. XII (1906) p. 54. — 7888

Acervulis epiphyllis, sparsis, macula destitutis, 150-220 μ . latis, subepidermide bullata nidulantibus, primum clausis demum late apertis, subiculo pallide flavo-brunneo, ex hyphis subclavatis et acervulos paraphysioideos efformantibus constituto; conidiis e falcato sublunatis, raro rectis, 20-35 \times 2,5-3, utrinque angustatis, unilocularibus v. transverse distincte uniseptatis, hyalinis; conidiophoris papilliformibus, hyalinis.

Hab. in foliis vivis Quercus Morehi, Pine Grove Amador Co. California Amer. bor. (HANSEN).

9. **Phleospora callistea** Syd., Ann. Mycol. VII (1909) p. 439, My-

coth. germ. fasc. XVI-XVII, n. 785. — Maculis amphigenis, valde conspicuis, irregularibus, præcipue apicem foliorum occupantibus, linea obscuriore cinctis, flavo-brunneis; pycnidiis (?) epiphyllis, dense gregariis, depresso-globosis, epidermide tectis, flavo-brunneolis, 80-140 μ . diam., pariete ut videtur tantum e contextu matricis mutato formato; conidiis oblongis v. elongatis, utrinque obtusis, primo medio septatis, dein 2-3-septatis, hyalinis, 16-22 \times 3-4.

Hab. in foliis vivis Osmundæ regalis, pr. Müritz Germaniæ (SYDOW). — Socia adest *Sphærella callistea* Syd. ad quam verisimiliter spectat.

PSEUDOSTEGIA Bubák, Journ. of Myc. XII (1906) pag. 56 (Etym.

pseudes falsus et *Stegia*). — Acervuli depressi, rotundati, subepidermici, dein prominentes, demum applanati, ad marginem setulosi; conidia falcata, unilocularia, hyalina; conidiophora cylindracea, hyalina v. flavidula. — Gen. *Anaphysmene* proximum.

1. **Pseudostegia nubilosa** Bubák, l. c., p. 56, cum icono pag. 183 et 7890

in Fungi imp. exsicc. fasc. XI, n. 533. — Acervulis amphigenis sed plerumque epiphyllis, sparsis v. gregariis, sæpe inter nervos breviter subseriatis, depresso-globosis, rotundatis, 120-160 μ . latis, nigris, non nitidis, subepidermicis dein apertis, hypostromate circ. 55 μ . cr.; setulis castaneo-brunneis 45 \times 4, apice acutatis basi sæpe subinflatis; conidiis curvulis, utrinque angustatis v. etiam acutatis, 18-24 \times 2,5, unilocularibus, hyalinis; conidiophoris brevibus, cylindraceis, 8 μ . long., hyalinis v. flavidulis.

Hab. in foliis emortuis Caricis spec., Lexington Kentucky Amer. bor. (W. A. KELLERMAN). — Status conidicus probabiliter *Stegiæ Caricis* Peck.

LIBERTELLA Desm. — Syll. III p. 744, X p. 507, XI p. 585,
XIV p. 1034, XVI p. 1020, XVIII p. 493.

1. **Libertella prunicola** Atkins., Ann. Mycol. VI (1908), pag. 59. — 7891
Maculis transversalibus, albidis, minutis; acervulis gregariis inter-
dum confluentibus, erumpentibus, intus pallide stramineis; conidiis
longis, fusoideis, curvulis v. tortuosis, hyalinis, demum 1-3-septa-
tis, sæpe pluriguttulatis, 30-50 \times 1,5-2.
Hab. ad ramulos emortuos Pruni, Ithaca N. Y. Amer. bor.
2. **Libertella Paulowniæ** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 7892
p. 8. — Acervulis sparsis, subcutaneis, globulosis, nigris, 1 mm.
diam.; conidiophoris bacillaribus, fasciculatis, rectis, 50-60 \times 1; co-
nidiis filiformi-falcatis, continua, hyalinis, 30-35 \times 1, in cirros ge-
latinosos, dilute aurantiacos protrusis.
Hab. in ramis siccis Paulowniæ imperialis, Kecskemét
Hungariæ.
3. **Libertella ulcerata** Massee, Gard. Mag. Jul. 1898, Diseas. cult. 7893
plants (1910) p. 448. — Pustulis gregariis, copiosis, minutis, sub-
epidermicis, dein sæpe erumpentibus; conidiis fusoideis, apice acu-
tis, continua, curvulis, hyalinis, 55-60 \times 4.
Hab. in ramis Fici cult. in America bor.

HYPHOMYCETÆ Mart. em. Sacc.

1. **Chromosporium Formicarum** Ferd. et Winge, Botanisk Tidsskr. 7894
XXIX (1908) p. 21, tab. II, fig. 11. — Mycelio lignum cariosum
penetrante, tenuissimo; conidiis in ramulis curtis acrogenis, cum
pedicello hyalino secedentibus, globosis, guttulis oleosis 1-3 (ple-
rumque 1) repletis, 6-9 μ . diam., sub vitro aurantiaco-pellucidis,
superficiem ligni pulvere luteo-ochraceo obducentibus.

Hab. in ligno carioso in insula St. Jan Indiæ occ. (RAUNKIAER).
— Species habitatione prædistincta, cavernas a formicis in ligno
carioso fossas omnino obtegens, ibique solum, non extra crescens.

2. **Chromosporium pachyderma** Ferd. et Winge, Botanisk Tidsskr., 7895
XXIX (1908) p. 22, tab. II, fig. 12. — Conidiis globosis, subglo-
bosis v. angulatis, episporio usque ad 4 μ . cr., 15-20 μ . diam.,
viridi-pellucidis, supra lignum decorticatum crustam tenuem, æru-
gineam, late effusam formantibus; mycelio parcissimo, conidiopho-
ris nullis.

Hab. ad lignum decorticatum in insula St. Croix Indiæ occ.

TORULOPSIS Berl. — Syll. XVIII p. 495.

1. **Torulopsis rosacea** (van Hest) Sacc. et Trott., *Torula rosacea* J. 7896
J. van Hest, Centralbl. Bakt. 18 (1907) pag. 780, tab. I, fig. B,
tab. III, fig. 5-6. — Rosea; conidiis perfecte globosis, 9 μ . diam.,
levibus, nucleo majusculo sphæroideo 4-5 μ . diam. fœtis, congre-
gatis sed non connexis.

Hab. in fructibus Piri Mali, quibus odorem peculiarem affert, in Germania. — Notas biologicas in culturis cfr. l. c.

COCCOSPORA Wallr. — Syll. IV p. 9, X p. 511, XI p. 586.

1. **Coccospora rubiginosa** Speg. Myc. Argent. V pag. 413, in Anal. 7897 Mus. Nac. Buenos Aires XX (1910). — Acervulis innato-erumpentibus primo hemisphæricis, 250-500 μ . diam., dense gregariis, discretis dein confluentibus subgelatinosis, melleis; hyphis tenuissimis hyalinis brevibus mox diffluentibus; conidiis dense congregatis, 20-30 μ . diam., granulosis, levibus, rubiginosis.

Hab. ad truncum vetustum Passifloræ cæruleæ in horto Tucumán Argentina Amer. austr.

MALBRANCHEA Sacc. — Syll. IV, p. 11 — Synonymum est certe *Thermoidium* Miehe, Ber. Deutsch. Bot. Ges. XXV (1907) p. 515, nec a *Malbranchea pulchella* Sacc. et Penz. l. c. differt *Thermoidium sulfureum* Miehe, l. c. p. 515. — Hæc species præter Galliam reperta est in Germania et Italia.

SPORENDONEMA (Desm.) Oud. — Syll. X p. 515.

1. **Sporendonema Artemisiæ** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 7898 pag. 24, t. VI, f. 10-12. — Cæspitulis tumidulis albido-fulvis ex hyphis fasciculatis erectis, sursum divergentibus, 5-6 μ . cr., apice 8,5 μ . cr., septulatis, conidiophora pleurogene emittentibus; conidiophoris intus, divisione plasmatis, conidia gignentibus; conidiis diu catenulatim cohærentibus, cuboideis, 1,12-1,25 μ . diam., demum membrana tubuli secedente nudatis.

Hab. in caulinis emortuis Artemisiæ sp. in Gallia.

2. **Sporendonema Salicis** Bainier, in Bull. Soc. Myc. Fr. XXIII (1907) 7899 pag. 24, t. VI, f. 7-9. — Cæspitulis densis, flavo-fulvis; conidiophoris elongatis hinc inde irregulariter ramosis; conidiis intra conidiophora endogene generatis, cuboideis dein sphæricis, plerumque 4,2 μ . diam.

Hab. in truncis emortuis Salicis spp. in Gallia.

OOSPORA Wallr. — Syll. IV p. 11, X p. 512, XI p. 588, XIV p. 1037, XVI p. 1024, XVIII p. 496.

1. **Oospora scabies** Thaxt., in Ann. Rep. Conn. Agric. Exp. Stat. 7900 1890, Duggar Pl. Dis. p. 291 et 292, f. 127-128, Massee Dis. cult. Plants, p. 458. — Tenuissima, byssina, griseola, fugax; hyphis

filiformibus, septatis v. pseudoseptatis, vix 1 μ . cr., hyalinis, ramosis, exterioribus in articulos (conidia) spirilliformes abeuntibus.

Hab. in tuberibus Solani tuberosi, quæ rugosa seu scabiosa (*potato scab*) reddit, in America bor. et Britannia. — Culta pellucas scabiosas format et matricem profunde nigrificat. — An potius Bacteriacea?

2. **Oospora Wiesneri** (H. Zikes) Sacc., *Torula Wiesneri* H. Zikes Sit-zungsb. k. Akad. Wiss. Wien, Math. Naturw. Kl. CVIII (1909) p. 125. — Cæspitulis seu coloniis levibus, pro mediis culturæ variis ex albo griseolis; conidiis (catenulatis?) ellipsoideis 8-12 \times 3-4 (in gelatina), 4-7,5 \times 2,5-3 (in pane), 5-8 \times 2,5-3 (in agar), ætate provecta intus vacuolatis.

Hab. ad folia Lauri nobilis in Austria. — Species ex eo notabilis quod nitrogenium atmosphæricum assimilat. Ascis nullos edit.

3. **Oospora ovicola** (Zimm.) Sacc. et Trav. — Syll. XX, p. 234 — 7902 *Torula ovicola* O. E. R. Zimm. Verderb. d. Eier (1878) pag. 42, t. I, f. 2 (exclusa fig. 1). — Mycelio repente, filiformi, septato, 2 μ . cr., hinc inde ramulos brevissimos conidiophoros exerente; conidiis in catenulas longiusculas dispositis, elliptico-sphæroideis, 2-3 \times 1,7-2, hyalinis, levibus.

Hab. in ovis gallinaceis corruptis in Germania. — Dimensiones ex icono auctoris petitæ. Fig. 1 mycelium aliis fungi dematiacei non determinandi affert.

4. **Oospora ferruginosa** (Cda.) Sacc. et Trav. — Syll. XX, p. 232 — 7903 *Torula ferruginosa* Corda, in Sturm Deut. Fl. III, fasc. 8, p. 89, t. 41 (1829). — Cæspitulis effusis, irregularibus ferrugineis, 1-2 cm. long. hyphi ramosis; conidiophoris erectis; conidiis globosis, persistenter catenulatis, levibus.

Hab. in ramis decorticatis dejectis, Prag et Neuhof Bohemiæ.

5. **Oospora heteromera** Speg., Myc. Argent. V, p. 414, in Anal. Mus. Nac. Buenos Aires XX (1910). — Acervulis superficialibus effusis gossypinulatis, tenuissimis, primo albis dein obsoletissime roseis vel subcærulescentibus; hyphis repentibus, torulosis, articulis cylindraceis sensim abbreviatis, 20-40 \times 8-10, in conidiis subglobosis v. globosis, 5-9 μ . diam., hyalinis, levibus in catenulas abbreviatas simplices v. bifidas digestis transeuntibus.

Hab. in caryopsidibus Zeæ Maydis diu loco udo servatis, La Plata Argent. Amer. austr.

6. **Oospora Harzii** Sacc. *Oospora cretacea* Harz, Beihefte Botan. Cen-

tralbl. XVIII (1905) pag. 113, non Fr. Krüg. — Subochracea; hyphis sterilibus hyalinis, 1-5 μ . cr., guttulis oleosis farctis; conidiophoris simplicibus v. e basi ramosis; conidiis plerumque globosis, 5,5-6 μ . diam., levibus.

Hab. in pariete udo cellæ vinariæ et botulariæ prope *Merulium*, in Germania. — In culturis conidiophora interdum fasciculata fiunt ad instar *Stysani*. Affinis *Torulæ Sacchari* Corda et *Oosporæ otophilæ* Harz.

7. **Oospora necans** Sacc. et Trott. in Saccardo, Notæ Myc. VI, Ann. Myc. III (1905) p. 514 cum icon. — Cæspitulis candidis, byssino-velutinis, animalcula omnino obtegentibus; hyphis sterilibus repentibus, ramosis, intertextis, 2,7 μ . cr., continuis, minute granulosis, hyalinis; ramis fertilibus seu conidiophoris acicularibus, 12-18 \times 1, basi tenuiter inflatis, solitariis v. saepius binis-quaternis verticillatis, continuis, hyalinis; conidiis breve catenulatis, mox deciduis, oblongis, rarius ellipsoideis, 3-4 \times 0,7-1, hyalinis.

Hab. in toto corpore *Pemphigi bursarii*, quem occidit, intra gallas ab eo formatas ad ramulos *Populi nigræ*, Selva Treviso, Ital. bor. — Species Augusto 1905 valde diffusa et mortem innumeris insectis modo citatis causans. Gallæ vero optime evolutæ, magnæ, numerosissimæ, a Mucedinea minime vexatæ.

8. **Oospora Saccardiana** Am. Berlese in Redia III (1905) fasc. I, p. 14, 7907 tab. I. — *Intra corpus animalculi*: mycelio nullo; cellulis saccharomyctiformibus copiosissimis, liberis, oblongo-ovoideis, saepius utrinque acutatis v. fere apiculatis, gemmiferis, plerumque 6-7 \times 2-2,5; intus initio granulosis, hyalinis. *In gelatina culta*: mycelio copiosissimo filiformi irregulariter ramoso, flexuoso, septato, intus granuloso, hyalino, 1,8-2,5 μ . cr.; conidiis in ramulis brevibus acrogenis breviterque catenulatis, elliptico-ovoideis 5,3-6 \times 2-2,5; intus granulosis, hyalinis, episporio levi.

Hab. intra corpus *Ceroplastis Rusci* ex Coccidarum familia (et inde culta in laboratorio) in Italia media. — Quoad *Saccharomyces* endoparasiticos in insectis cfr. supra pag. 775-785.

9. **Oospora pulmonalis** Roger, Bory et Sartory ap Sartory in Bull. Soc. Myc. Fr. (1910) p. 394 et fig. 1-13 (p. 398). — Hyphis mycelii filiformibus, hyalinis, plasmate anulatim interrupto, 0,4-0,5 μ . diam., usque 1,5 mm. long.; conidiis tarde evolutis, globulosis usque 0,9 μ . diam. hyalinis, catenulatis.

Hab. in pulmonibus hominis broncho-pneumonite affecti, Paris Galliae. — Diagnosis ex fungillo culto.

10. **Oospora cutanea** (De Baurm., G. et V.) Sacc. *Oidium cutaneum* 7909

De Baurm., Goug. et Vauch. Les nouv. mycoses. p. 52, f. 4 (1910). Primum saccharomycetoidea, dein in culturis mucedinea velutina alba; hyphis filiformibus septatis, irregulariter ramulosis; ramulis in conidia catenulata globoso-ellipsoidea, subinde breviter conoidea abeuntibus; conidio supremo interdum ampliore.

Hab. in ulceribus cutaneis hominis, rarius, in Gallia. — An forma *Oosporæ lactis*?

11. **Oospora subtilis** (R. Blanchard) Sacc., *Oidium subtile* R. Blan-

chard ap. Guéguen, Champ. paras. pag. 244 (1904). — Mycelio repente; conidiophoris erectis, parallele fasciculatis, erectis, 6 µ. cr., dichotomis, septatis; conidiis ovoideo-oblongis v. subcylindricis, catenulatis, dein dilabentibus.

Hab. in ulcere fœminæ, in qua plagulas albas efficiebat, in Gallia. — Cuniculis pathogena.

12. **Oospora mycetomatis** Nicolle et Pinoy, C. R. Ac. d. Sc. Paris, 7911

CXLIV (1907) p. 397. — Cæspitulis subglobosis, endogenis, ex hyphis septatis, ramosis, floccosis formatis denique centro cavis; hyphis peripherice sæpe chlamydosporipheris et in catenulas conidiorum v. in conidia subsolitaria, 2-2,5 µ. diam. flavo-viridula abeuntibus.

Hab. intra pedem ægrum deformatum mulieris (ut in mycetomate) in Tunisia

13. **Oospora lingualis** Guéguen, Bull. Soc. Myc. Fr. XXV (1908) 7912

p. LXXVII (nomen nudum).

Hab. in lingua hominis morbo *nigro* affecta, in Gallia.

14. **Oospora bogoriensis-rubra** (E. de Kruyff) Sacc. et Trott., *Torula* 7913

bogoriensis-rubra E. de Kruyff, Ann. Jard. bot. Buitenzorg, ser. II, Supp. 3 (1910) p. 93. (Notæ plerumque chemico-biologicæ).

Hab. ex solutione mannitis in terram horti bot. Buitenzorg Javæ infusa. Fermentationes peculiares inducit.

FUSIDIUM Link — Syll. IV p. 25, X p. 515, XI p. 589, XIV p. 1040, XVIII p. 504.

1. **Fusidium Mæsæ** P. Henn., Engl. Jahrb. XXXVIII (1905) p. 117. 7914

— Late effusum, pallidum v. subcinereum, hyphis filiformibus, septatis, subramosis, hyalinis, 2-3 µ. cr.; conidiis concatenatis, fusoides v. clavatis, hyalinis, 5-10 v 2-2,5.

Hab. in foliis Mæsæ lanceolatæ, Ost Usambara Africæ trop. (ZIMMERMANN).

2. **Fusidium Betæ** Rabenh., ex Thümen, Boll. Soc. Adriat. Sc. Nat. 7915 Trieste III (1877) p. 440; Lindau, in Rabenhorst Kryptog.-Fl. Hyphomyc. p. 69. (Nomen nudum).
Hab. in pagina inferiore Betæ vulgaris, in Istria.
3. **Fusidium dendriticum** Riess, in Eisenach Uebersicht d. bisher in 7916 d. Umg. v. Cassel beob. Pilze, Cassel (1878); Lindau, in Rabenh. Krypt.-Fl. Hyphomyc. p. 69. (Nomen nudum).
Hab. in Corticio comedente, Cassel Germaniæ.
4. **Fusidium virens** Dillm. (?), Sauter, Mittheil. d. Gesell. f. Salzb. 7917 Landesk. XVIII (1879) p. 28, extr.; Lindau, in Rabenh. Kryptog.-Fl. Hyphomyc. p. 69. (Nomen nudum).
Hab. in foliis quercinis et fagineis in Salisburgia (STORCH). — Verisimiliter est *Cylindrium flavo-virens* (Ditm.) Bon.
5. **Fusidium Behenis** Thüm., VII Ber. d. Bot. Ver. zu Landshut 7918 (1879) p. 182; **F. Mœhringiæ** Thüm., l. c.; **F. Potentillæ** Thüm., l. c.; **F. Leonuri** Thüm., l. c.; **F. Hieracii** Thüm., l. c. — Species hæ v. ex genere *Fusidii* excludendæ v. omnino indescriptæ et incognitæ manent. Cfr. Lindau, Deut. Krypt. Fl. Pilze VIII, p. 69.

MONILIA Pers. — Syll. IV p. 31, X p. 516, XI p. 589, XIV p. 1041, XVI p. 1025, XVIII p. 501.

1. **Monilia Corni** Reade Ann. Mycol. VI (1908) p. 113. — Conidiis 7919 (chlamydosporis) ellipsoideis, 9-13 × 6-8, continuis, hyalinis, catenulatis, disjunctoribus præditis, in maculis effusis, albido-cinereis, pulvvereis.

Hab. in foliis Corni circinatae in silvis Ithaca N. Y. Amer. bor. — Status ascophorus adhuc ignotus (*Sclerotinia Corni* Reade loc. cit. ad inter.).

2. **Monilia Amelanchieris** Reade, Ann. Mycol. VI (1908) p. 144. — 7920 Conidiis (chlamydosporis) limoniformibus, continuis, hyalinis, 14-23 × 10-14, catenulatis, disjunctoribus præditis, in maculis effusis, albido-cinereis, pulvvereis.

Hab. in fructibus Amelanchieris canadensis, Junius et Malloryville, Am. Botryapii, Junius N. Y. Amer. bor. — Status ascophorus adhuc ignotus (*Sclerotinia Amelanchieris* Reade l. c. ad interim).

3. **Monilia Vaccinii-corymbosi** Reade, Ann. Mycol. VI (1908) p. 109. 7921 Cfr. *Sclerotinia Vaccinii-corymbosi* Reade, supra p. 639.

4. **Monilia Seaveri** Reade, Ann. Mycol. VI (1908) p. 112. Cfr. *Sclerotinia Seaveri* Reade, supra p. 638.

5. **Monilia Polycodontis** Reade, Ann. Mycol. VI (1908) p. 110. Cfr. 7923
Sclerotinia Polycodontis, Reade, supra p. 639.
6. **Monilia rosella** Mac Alp. Fung. Dis. Citrus p. 76, t. 14, f. 11-12 7924
 (1899). — Effusa, pallide rosea, 5-7 mm. lata, initio cuticula leviter
 elevata tecta, dein libera; hyphis sterilibus hyalinis, coacervatis
 vero rubellis, dense fasciculatis, intricatis, septatis, valde ramosis,
 crassitudine varia, 6-15 μ .; hyphis fertilibus septatis, parce ra-
 mosis, 2-3 μ . circ. crass.; conidiis catenulatis, facile secedentibus,
 ellipsoideis, 6-9 \times 3-4, ex hyalino flavidis.
Hab. in fructibus putrescentibus *Citri Limonis*, Stawell,
 Victoria, Australia.
7. **Monilia humicola** Oud. — Syll. XVIII, pag. 503 — var. **brunnea** 7925
 A. L. Smith, Trans. Brit. Mycol. Soc. 1908 III (1909) p. 120.
 — A typo recedit imprimis colore læte brunneo.
Hab. in ligno putrescente betulino, Divach Wood, Inverness
 Britanniæ.
8. **Monilia Avenæ** Peck, Bull. Torr. Bot. Club XXXIII (1906) p. 219. 7926
 — Minuta, amphigena; hyphis brevibus, circ. 8 μ . cr., in maculis
 oblongo-ellipticis, indefinitis, pallidis v. brunneolis sparse insertis,
 cinereis v. cinereo-brunneis; conidiis catenulatis oblongis v. elli-
 psoideis, leviter coloratis, 25-40 \times 12-15.
Hab. in foliis vivis v. languidis *Avenæ* sp. silvaticæ prope
 Los Gatos Californiæ (A. A. HELLER). — Species noxia.
9. **Monilia Arnoldi** Mang. et Pat., Bull. Soc. Mycol. Fr. XXIV (1908) 7927
 pag. 164, cum icon. — Hyphis repentibus laxe intricatis stratum
 byssino-floccosum efformantibus, septatis, hyalinis, cylindraceis 1-
 3,5 cr., apice assurgentibus, (10-20 μ . altis, 3,5 μ . cr., continua
 concoloribus, vage et parce ramosis, in catenam conidiorum (usque
 ad 30) desinentibus; conidiis subgloboso-citriformibus, episporio
 verrucis obtusis parce obsito, fusco-umbrinis (theobrominis) isthmis
 brevissimis inter se junctis, 6-7 μ . raro 5-8.
Hab. in caryopsibus *Tritici sativi* vulgo *latouang* dictis
 in Algeria (ARNOLD). — In culturis cæspituli hemisphærici plus
 minusve expansi (usque ad 5 mm.), albo-nivei, ex filamentis steri-
 libus hyalinis compositi, hinc inde sparsi, constanter adsunt. Sta-
 tus coremioideus non infrequens.
10. **Monilia ?dendrorrhœa** (Ludw.) Sacc. et Trav. — Syll. XX, p. 103 7928
 — *Rhodomyces dendrorrhous* Ludw. in Rev. Myc. 18 (1896) p. 115,
 t. 164, f. 1-2. — Fluxum arborum rubro-tingens; hyphis cylin-
 draceis parce ramosis; catenulis brevibus brevissimeque ramulosis,

torulosis; conidiis ellipsoideis, intus minute granulosis, levibus, hyalinis.

Hab. in fluxu mucoso arborum in Germania. — Conidia secedendo facile ad instar *Saccharomyctum* germinant. — Ex ipso auctore stirps ambigua.

11. **Monilia albo-lutea** Secretan, Mycogr. suisse, III p. 547, Fayod 7929 in Ann. Sc. Nat. Botan. (1885) p. 38, t. 2, fig. 13-18. — Effusa, ex albo lutescens; conidiophoris assurgentibus cylindricis 20-30 μ . cr., septatis, ex hyphis mycelicis repentibus multo tenuioribus evanatis; apice subverticillato-ramosis, ramis patentibus, basi 1-septatis sursum in catenulas conidiorum 3-6 divergentes digestis; conidiis plerumque tantum binis superimpositis, isthmo longiusculo angusto separatis, ovoideis, levibus, 15 \times 12, e flavo aurantiis.

Hab. in pileis Lactarii vellerei in Helvetia (SECRETAN) et pr. Esslingen Germaniæ (FAYOD). — Teste Fayod inter mycelii hyphas evolvuntur sclerotia versiformia oblonga, lobata, globulosa, rubro-aurantia 0,5-1,5 cm. longa, ex quibus ortum duceret *Peziza mycetophila* Fayod, nunc *Sclerotinia mycetophila* (Fayod) Vuill. — Syll. X, p. 6.

12. **Monilia ?Formicarum** Speg., Myc. Argent. V, p. 414, in Anal. 7930 Mus. Nac. Buenos Aires XX (1910). — Late effusa gossypinula tenuissima candida; hyphis sterilibus repentibus elongatis gracilibus 4-6 μ . diam., laxe septulatis, simplicibus v. fasciculato-subverticillatis, 30-40 \times 4-5; conidiis ad apicem ramorum fertilium in catenulas 3-5-meras digestis, acrogenis, subglobosis v. limoniformibus, 8-12 μ . diam., saepius grosse 1-guttulatis, hyalinis, levibus.

Hab. ad frustula vegetabilia fermentescentia in nidis Attæ histricis, in hortis La Plata Argentina Amer. austr.

13. **Monilia entomophila** Sacc., in Ann. Mycol. X (1912) p. 320. — 7931 Laxe effusa, tenuissime byssina, initio ex albo isabellina, demum dilute olivacea; hyphis sterilibus prælongis, laxe intricatis, subdecumbentibus, filiformibus, septatis, 2-4 μ . cr., diu hyalinis, fertilibus assurgentibus 300-350 \times 3-4, basim versus interdum usque ad 5 μ . cr. et saepè saturationibus, non raro in fasciculos laxe approximatis, sursum irregulariter iterato ramosis, septatis, apicibus acutiusculis v. obtusulis 2-3-denticulatis; conidiis e globoso ellipsoideis, plus minus longe catenulatis, utrinque demum subapiculatis, 4-6 \times 3-4, primo subhyalinis, dein flavo-olivascentibus, continuis, levibus, eguttulatis.

Hab. in Vespa (Poliste) gallica, quam forte necat, domi, Pa-

tavii Ital. bor. — Occupat superficiem corporis fere totius, sed mycelium pro certo ab interiore procedit. Ramuli ultimi saepius terni, mox secedunt, elongantur et pseudoconidia tereti-fusoidea, continua v. 1-3-septata, 10-15 × 4, nonnumquam usque ad 30 μ. longa fingunt. Habitus fungilli fere *Botrytum* entomophilarum, sed ob conidia, catenulata et ramulos ultimos saepe sporomorphos potius *Monilicæ* species.

14. **Monilia erubescens** (Ascher) Guég. Champ. paras. p. 244 (1904), 7932

Rhodomyces erubescens Ascher in Zeitschr. f. Hygiene XXXIV (1900) p. 475 — Syll. XVIII p. 504 (nomen). — Hyphis mycelii septatis; ramis in conidia minuta, subglobosa vel ovoidea, 4 μ. diam., catenulata et mox dilabentia abeuntibus.

Hab. in fœtu Caviæ Cobayæ in qua exsudatum flavidum inducit, in Germania. — Species imperfecte cognita.

Appendix ad gen. *Moniliam.*

PSEUDOMONILIA Geiger, Centralbl. f. Bakter. etc. II Abt., Bd. 27 (1910) p. 135 (Etym. *pseudes* falsus et *Monilia*). — Cæspituli (coloniæ) monilioidei, sed conidia nulla observata, hinc genus omnino dubium. Fungus initio gemmaceus, postremo ex hyphis mycelialibus longis, parce septatis non raro cellulas giganteas generantibus formatus. Quoad notas peculiares generis et specierum, imprimis chemico-physiologicas cfr. Auct. l. c.

1. **Pseudomonilia albo-marginata** Geiger, l. c. p. 135.

7933

Hab. (culta) in gelatina in Germania.

2. **Pseudomonilia rubescens** Geiger, l. c. p. 135.

7934

Hab. (culta) in gelatina in Germania.

3. **Pseudomonilia mesenterica** Geiger, l. c. p. 135.

7935

Hab. (culta) in gelatina in Germania.

4. **Pseudomonilia cartilaginosa** Geiger, l. c. p. 135.

7936

Hab. (culta) in gelatina in Germania.

MONILIOPSIS Ruhl., Arb. k. biol. Anst. f. Land- u. Forstwirth. VI (1908) Heft I, p. 76 et in Lindau in Kryptog. Fl. Deutsch. IX, pag. 723, cum iconе (Etym. a *Monilia*, quam simulat). — Mycelium pluricellulare, cellulis fibulatis nullis, arachnoideum, repens, rapide evolutum, sursum catenas ramosas, monilioideas conidiorum gerens; conidia (rectius pseudoconidia) numquam secedentia (et cito emorientia) irregulariter ovoidea, continua, hyalina dein

fuscescentia. Pseudosclerotia e cellulis pseudoconidialibus vacuis orientia. — Genus omnino ambiguum.

1. **Moniliopsis Aderholdi** Ruhl. l. c. — Catenulis brevibus ramosis, 7937 conidiophoro septato, angustiore suffultis; pseudo-conidiis ovoideis v. angulosis v. breviter ampullaceis, majusculis, 15-30 \times 11-17, intus reticulato-granulosis, levibus, primo hyalinis dein brunnescens-tibus; pseudosclerotis 1-3 mm. diam.

Hab. ad plantulas varias ex seminarii hortulanorum eductas, quas maxime vexat; valde frequens in Germania.

CYLINDRIUM Bon. Syll. IV p. 36, X p. 518, XI p. 589, XVI p. 1026, XVIII p. 504.

1. **Cylindrium strobilinum** Sacc., in Ann. Mycol. X (1912) p. 313. — 7938 Cæspitulis effusis, compactiusculis, coriacellis, candidis, maculiformibus; basi sporigera tenui, minute cellulosa; catenis conidiorum dense fasciculatis, bacillaribus, non ramosis, rectis, 90-100 \times 3-4, hyalinis, multi-articulatis, in fragmenta 15-25 μ . longa, 2-3-septata facile secedentibus, articulis singulis 7 μ . longis.

Hab. in squamis strobilorum Pini resinosaæ Lyndonville N. Y. Amer. bor. (FAIRMAN). — A *Cylindrio pulvinulato* Karst. distinguitur conidiorum catenis crassioribus, nunquam flexuosis, minus stipatis, loco etc.

POLYSCYTALUM Riess — Syll. IV p. 38, X p. 519, XIV p. 1040, XVIII p. 507.

1. **Polyscytalum Bomplandii** Speg. Myc. Argent. V, p. 414, in Anal. 7939 Mus. Nac. Buenos Aires XX (1910). — Maculis repando-difformibus subdeterminatis 2-5 mm. diam., sordide fusco-cinerescentibus, areola angusta purpurascenti limitatis; cæspitulis subpulverulentis hypophyllis confertis, candidis, pusillis; conidiis cylindraceis v. lenissime subfusoideis utrinque truncatis, 10-22 \times 2,5-3, continuis, levibus, hyalinis, catenulatis.

Hab. ad folia languida Iresines argentatae in silvis pr. Bompland Argentina Amer. austr. (P. JORGENSEN).

GEOTRICHUM Link — Syll. IV, p. 36, XI p. 589.

1. **Geotrichum coccophilum** Speg., Fungi Paulist. Rev. Mus. La Plata 7940 t. XV, p. 43 (1908). — Pulvinulis hemisphæricis, tenerrimis, tactu mox fatiscentibus 1-5 mm. diam., 0,5-1,5 mm. cr.; conidiis cylin-

draceis utrinque truncatis 5-10 \approx 2,5 eguttulatis, levibus, dense ramulose catenulatis, hyalinis.

Hab. ad *Cocos* emortuos in foliis *Cycadis* revolutæ in Horto botanico Sao Paulo Brasilia (USTERI). — Species formæ phylogenæ *G. candidi* Lk. simillima, conidiis tamen majoribus distincta.

OIDIUM Link — Syll. IV p. 40, X p. 520, XIV p. 1041, XVI p. 1025, XVIII p. 505.

1. **Oidium Clematidis** (Chittend.) Sacc. et Trav. — Syll. XX, p. 212 7941 — *Ovularia Clematidis* Chittenden, Gard. Chron. (1903) p. 299, Cooke Fung. Pests p. 20, fig. 4, Salmon in Journ. of Bot. (1905) pag. 42, t. 469, f. 2. — Cæspitulis epipetalis, albis, conspicuis, subcircularibus, 2-4 cm. lat.; hyphis sterilibus repentibus, hyalinis, ramosis; conidiophoris erectis, simplicibus 40-60 \approx 7, bi-triseptatis, apice in conidia breviter catenulata v. solitaria, cylindracea, utrinque rotundata, 28-42 \approx 14-16, levia abeuntibus.

Hab. in pag. sup. petalorum Clematidis sp. prob. Clem. Jackmanni, Chelmsford Britannia. — Ex iconæ evidentissime *Oidii* species.

2. **Oidium Crataegi** Grogn. in Roum. F. gall. n. 881, Oudem. Nederl. 7942 Kruidk. Arch. II, ser. II, p. 301 (1900). — Mycelii hyphis repentibus, effusis; conidiorum catenulis erectis, cellulis inferioribus cohærentibus, superioribus facile solutis; conidiis ellipsoideis, rotundatis, hyalinis, 23 \approx 12.

Hab. in foliis Crataegi monogynæ in Hollandia, Gallia, sæpe cum ejus status ascophoro: *Podosphæra Oxyacanthæ*.

3. **Oidium macrospermum** P. Henn., in Fl. du Bas- et Moy.-Congo, 7943 in Ann. Mus. du Congo vol. II, fasc. III (1908) p. 230. — Cæspitulis hypophyllis late effusis, albidis, hyphis septatis, hyalinis, 3-7 μ crassis; conidiis catenulatis oblongo-cylindraceis v. clavatis, utrinque rotundatis, hyalinis, intus granulosis, 50-80 \approx 15-20.

Hab. in foliis Leguminosæ sp., Kisantu Congo, Africa (VANDERYST).

4. **Oidium quercinum** Thümen — Syll. IV, p. 44 — var. **gemmaiparum** 7944 Ferraris, Ann. Mycol. VII (1909) p. 69, cum tab. I, *Oidium alaphitodes* Griff. et Maubl. Bull. Soc. Mycol. Fr. (1910) p. 137. — A typo differre videtur cæspitulis compactis et persistentibus, conidiophoris typice septatis et præcipue hyphis sterilibus gemmulas subconicas apice incrassatas 9,5-12 μ . diam. sursum gerentibus.

Hab. in foliis vivis *Quercus Cerris*, pedunculatae, sessiliifloræ, pubescentis, *Ilicis*, *Suberis*, *Tozzæ*, cocciferæ etc., raro in foliis *Q. rubræ* et *palustris*, in tota fere Europa, quam ab anno 1907 incredibili vi expansionis longe lateque parvasit. — Cfr. Sacc. in Ann. Mycol. VI (1908) p. 557 et VIII (1910) p. 345.

5. **Oidium Cyparissiæ** Syd. — Syll. XIV p. 1041 — var. **Euphorbiæ-Preslii** Massal. Nov. Fl. mycol. Veron. p. 52 (1902). — Conidiis utrinque subtruncato-rotundatis, plerumque 20-35 × 10-15.

Hab. ad folia, caules, fructus *Euphorbiæ Preslii*, Tregnago, Verona Ital. bor.

6. **Oidium Manihotis** P. Henn., in Fl. du Bas- et Moy.-Congo, in Ann. Mus. du Congo vol. II, fasc. III (1908) p. 230. — Cæspitulis epiphyllis late effusis, albidis; hyphis septatis varie crassis, hyalinis; conidiis ellipsoideo-cylindraceis, utrinque obtusis, intus pluriguttulatis, hyalinis, 16-24 × 9-13.

Hab. in foliis *Manihotis*, Kisantu Congo, Afr. (VANDERYST).

7. **Oidium erysiphoides** Fr. — Syll. IV, p. 41 — fm. **Cordiæ** Sacc. 7947 Ann. Mycol. VIII (1910) p. 339.

Hab. in foliis *Cordiæ* suboppositæ, Nefasit a Maha-bar, alt. 1600 m. (HAMASEN). — Socium adest *Cladosporium* (Demat.) *pullulans*. — Fm. **Cassiæ** Sacc., l. c. — In foliis *Cassiæ* occidentalis, Ghinda-Baresa alt. 830 m. (HAMASEN).

8. **Oidium fusisporioides** Fr., Syst. Myc. III, p. 431. — Recte observante cl. Lindau, Deutsch. Krypt. Fl. Pilze VIII, p. 88 complectitur plures *Ovulariæ* et *Ramulariæ* species.

9. **Oidium Anthemidis** Thüm., in VII Ber. des Bot. Ver. zu Lands- 7949 hut (1878-1879), (nomen nudum), Lindau, l. c. p. 88.

Hab. in *Anthemide tinctoria* in Austria.

10. **Oidium Leuckarti** H. Hoffm., Hedwigia I (1857) p. 119, tab. 16 7950 pr. p. 22-27. — Hyphis sterilibus parce ramosis; ramulis in catenulas conidiorum, dein secedentium abeuntibus; conidiis e globoso ellipsoideis, utrinque rotundatis v. subinde obtusatis, in qua- que catenula plurimis, hyalinis, intus sæpe granulosis, levibus, 18 × 11.

Hab. in ventriculo chymifico *Apis mellifica* ægrotæ in Germania (LEUCKART). — Ex ipso auctore status conidicus seu gemmifer *Mucoris melittophthori*.

11. **Oidium botryoides** Ces. in Kl. Herb. viv. mycol. n. 1671, Bot. 7951

Zeit. (1852) pag. 302. — Ab *Oid. monilioide* et *O. leucoconio* diversum.

Hab. in foliis *Spirææ Ulmariæ* in agro Vercellensi Ital. bor. — Verisimiliter st. conidiophorus *Erysiphaceæ*, forte *Sphærothecæ*.

12. **Oidium opuntiæforme** Ces., in Kl. Herb. Mycol. n. 1672, Bot. 7952

Zeit. (1852) p. 302 et Flora (1852) p. 398. — Filis ramosis, articulis obovatis proliferis, opuntiæformibus; conidiis minutissimis olivaceis.

Hab. in summo surculo foliisque, ab apice ad basin progre- diendo, *Jungermanniarum* in *Helvetia italica* et *Biella Pedemontii*. — Ex Tulasne probabiliter sistit non fungum sed gemmu- las muscorum.

13. **Oidium velutinum** Ces., in Kl. Herb. viv. mycol. n. 1670, Bot. 7953

Zeitung (1852) p. 302. — Obscure virens; conidiis inæqualibus ob- longis, minutis ex hypha pedicellari brevi deciduis.

Hab. in foliis *Æcidio* obtectis, *Euphorbiæ Cyperissiæ* in agro Vercellensi Ital. bor. — Cl. Lindau in Deut. Krypt. Fl. VIII, p. 88 in exemplari l. c. observavit conidia bicellularia, sub- hyalina, an *Fusicladii fasciculati*?

SPERMATOLONCHA Speg., Anal. Mus. Nac. Buenos Aires t. XVII

(1908) p. 139. (Etym. *sperma* spora et *lonche* lancea) — Hyphæ tenues hyalinæ septulatæ, steriles repentes, fertiles erectæ apice subcapitatæ pedicellis simplicibus v. duplicatis ornatæ; conidia in pedicellis pleurogena alterna, elongato-lanceolata, hyalina.

1. **Spermatoloncha maticola** Speg., l. c. p. 139 cum icon. — Hyphis 7954 sterilibus subiculo *Meliolæ* arcte adnatis, tenuibus, 4-5 μ . diam., obsolete septulatis, flexuosis, dense intertexto-intricatis; hyphis fertilibus erectis 80 \approx 4-6, subcontinuis apice modice incrassatis; pedicelli primariis ellipsoideis 10-15 \approx 4-5, secundariis subglobo- sis 5-6 μ . diam.; conidiis sursum attenuato-acutissimis postice ro- rundatis, 35 \approx 6, minute pedicellatis, papillatis.

Hab. in *Meliola* parasitans ad folia viva *Ilicis paraguaiensis* secus rivulum «Matto Queimado» Misiones in Rep. Ar- gentina.

BOTRYOSPORIUM Corda — Syll. IV p. 54, XIV p. 1043, XVI p. 1026, XVIII p. 510.

1. **Botryosporium diffusum** (Grev.) Corda — Syll. IV pag. 55. — 7955
 Huc pertinet *Peylia racemosa* Opiz in *Peyl, Lotos VII* (1857)
 p. 26, fig. 1.

CEPHALOSPORIUM Corda — Syll. IV p. 56, X p. 523, XI p. 591,
 XIV p. 1043, XVIII p. 510.

1. **Cephalosporium macrosporum** Rivolta, Parass. veget. delle malattie 7956
 ecc. p. 491, t. 7, fig. 206. — Entomogenum, albidum; hyphis sterili-
 bus laxe septatis et varia crassitudine, subinde subfasciculatis et
 contortis; ramulis fertilibus simplicibus v. furcatis nunc sparsis,
 nunc approximatis; conidiis ellipsoideis, levibus, hyalinis.

Hab. in corpore Locustæ sp. in vase servatæ in Italia cent.
 Frequens dicitur etiam in fœno. — Ob conidia (ex iconæ) solita-
 rie acrogena videtur potius *Acremonii* species.

2. **Cephalosporium subsessile** Sacc., in Ann. Mycol VIII (1910) 7957
 pag. 345. — Hyphis late effusis, mucidineis, hyalinis, coacervatis
 violascentibus (culturâ) parce ramosis, varie intricatis, rectis cur-
 vulsive, plerumque dense regulariter 1-seriato-guttulatis (quasi
 endogeno-sporuliferis), 4 μ . cr., remotiuscule septatis, ramulis te-
 nuioribus, 2-3 μ . cr., laxius guttulatis sæpe subtortuosus, hinc
 inde papillas raras conidiophoras, vix 1-3 μ . altas gerentibus; co-
 nidiis 4-6-fasciculato-capitatis, tereti-olongis, utrinque rotundatis,
 continuis, hyalinis, intus nubilosis, sæpius leniter curvis, 10-14 \times
 3, rarius 14 \times 3, diu cohærentibus et capitulum ellipsoideum for-
 mantibus.

Hab. in foliis Cymbidii aliarumque Orchidearum exoti-
 carum in calidariis horti botan. Heidelberg Germaniæ. — Pro-
 miscue cum *Fusario heidelbergensi* — Speciem descripsi sec
 exempl. culta in gelosio a cl. G. SELIBER in Instituto paris.
 Pasteur. Pro certo est forma metagenetica dicti Fusarii, ab aliis
 generis speciebus capitulis subsessilibus distinguenda. Analogam
 formam cum Fusario suo, ad *Neocosmosporam* ducendam, descrip-
 sit E. F. Smith (*Wilt disease of Cotton, Watermelon and Cowpea*
 in U. S. Dep. of Agricult. Bull. N. 17, Div. Veg. Phys. and
 Path. Washingt., 1899) nec non E. J. Butler. (*The Wilt disease*
of Pigeon-pea in Mem. of the Depart. of Agricult. in India, Bot.
 Ser. vol. II n. 9, Calcutta, 1910).

BUSELLA P. Henn. — Syll. XVIII p. 509.

1. **Busella Capparidis** P. Henn., Engl. Jahrb. XXXVIII (1905) pag. 7958

128. — Maculis rotundatis epiphyllis, fuscidulis; cæspitulis radia-
tis, hyphis sterilibus hyalinis septatis, 3-4,5 μ . cr., hyphis ferti-
libus erectis, basi sæpe fasciculatis, incrassatis, septatis, hyalinis
v. fuscidulis, c. 200-300 \times 15-25, apice vix incrassatis; conidii, ovo-
deis v. ellipsoideo-lunulatis, obtusis, viridi-guttulatis, levibus, 20-
25 \times 15-20; conidiophoris subfusoideis interdum inflatis, usque ad
15 \times 8.

Hab. in foliis Capparidis, Lome Togo Africæ (WARNECKE).
— *B. Stuhlmanni* affinis sed diversa.

HYALOPUS Corda — Syll. IV p. 51, XIV p. 1042.

1. **Hyalopus Yvonis** P. Dop in Bull. Scient. Fr. et Belg. XXXIX 7959
(1905) p. 135, Rev. Mycol. (1906) p. 18, t. 260, f. 13-15. — My-
celio hyalino, non septato, repente, parco, cæspitulos griseos effi-
ciente; conidiophoris erectis, non septatis, simplicibus, capitulo
conidiorum globoso nucilagineo terminatis; conidiis oblongis, hya-
linis 4 \times 1-1,5, dein conglomeratis, facile germinantibus.

Hab. in scutellis Aspidioti aNCYLI vel Forbesii aff. ad
folia Cocoës nuciferae in insule Martinica (SAINT-YVES).

RADAISIELLA Bainier, Bull. Soc. Mycol. Fr. (1910) p. 382, tab. XX
(Etym. a cl. M. RADAIS Cryptogamiæ prof. parisiensi) — Myce-
lium effusum, ramosum, hyalinum, septatum. Conidiophora assur-
gentia, filiformia, inter se approximata, et cæspites formanta, sep-
tata sursum ramulos sporigeros patulos, crebros, indivisos, race-
mum longum formantes gignentia; ramuli apice inflati ibique dein
3-4-lobulati; lobulis capitato-sporigeris. Conidia ovato-oblonga, con-
tinua, hyalina. — A gen. *Botryosporio* differt hypha primaria sim-
plici et conidiophorum apice plurilobulato.

1. **Radaisiella elegans** Bain. l. c. t. XX — Cæspitulis densiusculis, floc- 7960
cosis, albis, usque 1 cm. alt.; hypha primaria 11 μ . cr.; ramulis
100-106 μ . longis, æqualibus 3 μ . cr.; lobulis 18-20 \times 10-11, ipsis
in lobulos minores subternos rotundatos partitis; conidiis in his
lobulis minoribus sessilibus, capitatis, breviter fusoideis, 6 \times 3, hya-
linis.

Hab. in foliis emortuis Musæ paradisiacæ cultæ Parisis.

TRICHODERMA Pers. — Syll. IV p. 59, XVIII p. 512.

1. **Trichoderma Corfecianum** Sacc. in Ann. Mycol. XI (1911) p. 254. 7961
— Late effusam, amœne saturate virens, valutinum, margine (quia

serius evoluto) albicans; hyphis sterilius repentibus, parce septatis, usque ad 7 μ . cr., hyalinis; conidiophoris ascendentibus (non erectis) filiformibus, subcontinuis, 70-100 \approx 4.5-5, hyalinis, lateraliter apiceque ramosis, ramis simplicibus oppositis v. subalternis, sursum fusoideo-tenuatis, saepius leniter curvis, apice monosporis; conidiis ovoideis, apice rotundatis, 8-11 \approx 4-5, rectiusculis, levibus, intus granulosis et saepe 1-2-guttatis, contentu amœne viridi.

Hab. ad corticem Abietis in subterraneis fodinæ anthracitis, temp. usque ad 40 centigr., pr. Laval Galliæ, hieme 1910-1911 (P. CORFEC). — Species egregia, habitu *Trichodermatis lignorum*, sed conidiophora et conidia omnino diversa.

2. **Trichoderma hamatum** Bainier, Bull. Soc. Myc. Fr. XXII (1906) 7962 p. 133, t. VIII, f. 8-11, an *Pachybasium hamatum* (Bon.) Sacc. — Syll, IV p. 149? — Cæspitulis viridibus; hyphis et conidiophoris ut in *Trichodermate lignorum* sed his postremis in filamenta ramosa, eximie tortuoso-hamata elongata productis; conidiis capitulatis, ovoideis, 7 \approx 4, viridibus.

Hab. in peridiis putrescentibus Cyathi striati in Gallia. —

3. **Trichoderma minutum** Bain Bull. Soc. Myc. Fr. XXII (1907) 7963 p. 133, t. VIII, f. 12-15. — Characteribus omnibus cum *Tr. hamato* congruit.

Hab. in pileo Paxilli atro-tomentosi in Gallia.

ASPERGILLUS Mich. — Syll. IV p. 64, X p. 524, XI p. 591, XIV p. 1044, XIV p. 1027, XVIII p. 512.

1. **Aspergillus albidus** Eichelb., Verh. Naturw. Ver. Hamburg. 3 7964 Folge, XIV (1906) p. 35. — Teste auctore non differt ab *Asp. candido* Link. *St. ascophorus*: (*Eurotium albidum* (Eich.) Sacc.) peritheciis valde nitidis, albis, hyphis albis insidentibus, habitu et magnitudine *Eurotii herbariorum*: ascis sat persistentibus, subglobosis, 10 μ . diam.; sporidiis hyalinis, levibus, e globoso ovoideis, 4 \approx 3.

Hab. in foliis Nicotianæ male exsiccatis in Laboratorio Amani Africæ orient.

2. **Aspergillus Fischeri** Wehmer, Centralbl. f. Bakter, II Abt. XVIII 7965 (1907) p. 390. — Affinis quoad conidiophora et conidia *Aspergillo minimo* et *A. fumigato*; conceptaculis ascigeris copiosis, albo-griseis, pigmento parentibus, nudis; sporidiis ala latiuscula tenui cinctis.

Hab. in tuberibus Dahliæ variabilis in Helvetia.

3. **Aspergillus gracilis** Bainier, Bull. Soc. Mycol. Fr. XXIII (1907) 7966 p. 92, t. IX, f. 11-14. — Cæspitulis albis gossypinis dein margine cyanescentibus, 2-3 mm. diam., dein totis cyaneis et demum viridi-nigricantibus; conidiophoris fliformibus, tenuissimis, vix 2,8 μ . diam., raro 250 μ . long. superantibus; sursum inflato-clavatis, clava 24 μ . long., pseudobasidiis dense stipatis, oblongis, 5-6 μ . long. obtecta; conidiis diu ovoideis, demum sphæricis, circ. 3 μ . diam.

Hab. in fructu Pruni domesticæ putrescente et inde cultus, in Gallia. — E stirpe *Aspergilli clavati*.

4. **Aspergillus gigas** Speg., Myc. Arg. V, p. 434, in An. Mus. Nac. Buenos Aires XX (1910). — Cæspitosus maximus, testaceus; hyphis fertilibus erectis rigidulis 2-5-cæspitosis, 2-3 mm. long., 20 μ . cr., simplicibus, apice abrupte in vesiculam globosam 120 μ . diam., pallidissime rufescens minuteque papillosum productis; conidiis longissime catenulatis, globosis 5-6 μ . diam., eguttulatis, levibus v. subtilissime imperspicueque colliculosis, pallide isabellinis, capitulum sphæroideum maximum, 0,75-1 mm. diam. efficientibus.

Hab. ad folia subputrescentia Coffeæ arabicæ diu loco udo servata, La Plata Amer. austr.

5. **Aspergillus virens** (Link?) Eichelb., Verh. Naturw. Ver. Hamburg, 3 Folge XIV (1906) p. 34. — Conidiophoris 2-2,5 mm. altis, apicem versus 25 μ . cr.; conidiis globosis, levibus, virentibus, 4, 3 μ . diam.; st. ascophorus (**Eurotium virens** (Eich.) Sacc.): peritheciis semiglobosis, viridi-flavidis, 120 μ . diam., 90 μ . altis; ascis rotundis, octosporis, 12-13 μ . diam. sporidiis sphæricis, levibus, subhyalinis, 4 μ . diam.

Hab. in stromate putrescente Xylariæ polymorphæ, rarius, Amani Africæ orient.

6. **Aspergillus fumigatoides** Bain. et Sart. Compt. rend. Soc. Biol. Paris, LXVI, (1909) p. 22, et Bull. Soc. Mycol. Fr. (1909) pag. 111, tab. V. — Conidiophoro cylindraceo 150-310 \approx 5-6, continuo, sœpe tortuoso, sursum sensim leviter incrassato; vesicula 30-35 μ . diam.; pseudobasidiis plerumque hemisphærium superum vesiculæ tantum obtegentibus, hyalinis, 8-14 μ . longis, phialiformibus; conidiis catenulatis e globoso ovoideis, 2-3 \approx 2, obscure olivaceis, endogene formatis (teste auct.); status ascophorus (**Eurotium fumigatoides** Sacc.): peritheciis ex hyphis mycelii spiraliter convolutis oriundis, globulosis, plurimis conglomeratis, 65-92 μ . diam. excipulo 4-5-stratoso pseudoparenchymatico; ascis sphæroideis v.

ovoideis 20-26 \approx 12-18; sporidiis octonis, globosis, echinulatis, 3-3,5 μ . diam., (ex icono) lineola æquatoriali percursis.

Hab. in substantiis organicis in Gallia. — Pathogenus cuniculis et cobayæ. — Ab affini *A. fumigato* differt conidiis potius ovoideis, præsentia peritheciorum etc.

7. **Aspergillus malignus** Gedæst apud Lindt Archiv. f. exper. Pathol. 7970 XXV (1889), Guég. Champ. paras. p. 166, fig. 7. — Mycelio albo, crebro, septato; conidiophoris simplicibus, erectis, 1000 μ . long., in vesiculam piriformem 22-24 μ . lat. desinentibus; pseudobasidiis, vix tertiam superiorem partem vesiculæ obtengentibus, hyalinis, 10 \approx 4-4,5; conidiis sphæroideis, cyaneo-viridulis, 3-4 μ . diam., in catenas longas divergentes dispositis.

Hab. in auricula hominis in Germania. — An satis diversus ab *Asp. fumigato*? Cuniculis pathogenus.

8. **Aspergillus Foutoyonti** Guéguen, Compt. rend. Soc. biol. Paris 7971 XLVI (1909) p. 1052.

Hab. in nodis juxta-articularibus hominis ægroti in Indochina et Madagascar. — Multum variat et videtur affinis *Asp. Tokelau*. — In abscessibus et ulceribus occurrit tantum ut forma oosporica.

9. **Aspergillus cæsiellus** Saito, Untersuch. atmosph. Pilzkeime (1901) 7972 p. 49, t. III, f. 14. — Cæspitulis cæsio-cærulescentibus; hyphis sterilibus repentinibus, septatis, hyalinis, 2-4 μ . cr.; conidiophoris cylindraceis, brevibus, continuis, 100-200 \approx 4-6, sursum in vesiculam clavatam, 12-14 μ . cr. productis; pseudobasidiis simplicibus anguste phialiformibus, 12 \approx 3, hyalinis; conidiis elliptico-ovoideis cærulescentibus, 7 \approx 4, levibus.

Hab. (cultus) in gelatina ex conidiis per aërem volitantibus in Japonia.

10. **Aspergillus giganto-sulphureus** Saito, Unters. atmosph. Pilzkeime (1901) 7973 p. 48, tab. III, fig. 12. — Cæspitulis floccosis, albis dein lète flavis, demum brunneolo-flavis, hyphis sterilibus 4 μ . cr., conidiophoris usque ad 1 mm. alt., 6-12 μ . cr., plerumque simplicibus, raro ramosis, parce septatis, tunica levi et solidiuscula; vesicula subglobosa v. ovata 28-32 μ . diam.; pseudobasidiis paliformibus medio leniter coarctatis 24-28 \approx 7 non ramosis; conidiis globosis, levibus, dein aculeolatis, majusculis, 8-12 μ . diam., sordide flavis.

Hab. (cultus) in gelatina ex conidiis per aërem volitantibus, in Japonia. — Nonnullis notis cum *A. Ostiano* congruit.

11. **Aspergillus effusus** Tiraboschi, Atti Terzo Congresso pellagrologico 7974

italiano, Milano (1906), p. 18, Ann. di Botan. VII (1908) p. 16. — Cæspitulis late effusis, candidis dein sordidis, demum luteo-viridulis; conidiophoris 150-500 × 10-12, capitulo 70-80 µ. diam.; vesicula conidigera sphæroidea, 30-40 µ. diam., pseudobasidiis crebris, indivisis, fusoideis, breviusculis et inflatis, 10-13 × 5-6, omnino tecta; conidiis globosis, levibus, hyalinis v. luteolis 4,5-7,5 µ. diam.

Hab. in caryopsidibus corruptis *Zea Maydis* in Italia (TIRABOSCHI).

12. **Aspergillus fumigatus** Fres. — Syll. IV p. 65. — Var *tume-* 7975
scens Kral in Blumentritt, Ber. Deut. Bot. Ges. (1905) p. 422,
t. 19, p. p. — Mycelio minutissimo, albo-flocculoso, acute limitato,
centro tumescente; pseudobasidiis sæpe proligeris, cetera speciei.

Hab. (cultus) in laboratorio Kral, Prag Bohemiæ.

13. **Aspergillus Oryzæ** (Ahlbury) Cohn — Syll. XI p. 592. — Var. 7976
basidifer Const. et Lucet, An. Sc. Nat. sér. 9, II (1905) p. 119,
tab. 5, fig. 24 26, Coup. Atl. Champ. paras., tab. XL, fig. 15-17.
— Pseudobasidiis pseudosterigmata 1-2 gerentibus.

Hab. (cultus) in laboratoriis in Gallia. — Cuniculis pathogenus, non vero Gallinaceis.

14. **Aspergillus viridi-griseus** Costant. et Lucet An. Sc. Nat. sér. 9, 7977
II (1905) p. 119, tab. V, fig. 8-17, Coup. Atl. Champ. parasit.,
tab. 40, fig. 1-8. — E griseo virens; conidiophoris simplicibus
v. superne furcatis, apice in vesiculas ovoideo-sphæricas punctatas sensim dilatatis, cylindraceis, valde elongatis, septatis v. non; pseudobasidiis minutis conico-acutis; conidiis globosis levibus, viridulis, supremis paullo amplioribus, longiuscule catenulatis.

Hab. (cultus) in laboratoriis in Gallia. — Cuniculis pathogenus, non gallinaceis. — Affinis *Aspergillo fumigato*.

15. **Aspergillus Lignieresii** Const. et Lucet, An. Sc. Nat. sér. 9, II 7978
(1905) p. 119 tab. 5, fig. 18-23. — Coup. Atl. Champ. paras., tab. 38,
fig. 9-14. — Hyphis sterilibus paucis, radiculiformibus; conidiophoris erectis, sæpe leviter flexuosis, cylindraceis, continuis, sursum paulo crassioribus apiceque in vesiculam ovoideam punctulatam sensim dilatatis; pseudobasidiis obclavato-acuminatis; conidiis minutis, globulosis, breviter catenulatis.

Hab. in pulmonibus *Sphenisci* sp. (*Pinguino*), Gallia. — Cuniculis et gallinaceis pathogenus.

16. **Aspergillus japonicus** Saito, Bot. Mag. Tokyo XX (1906) p. 61 7979
(Diagnosis desideratur).

Hab. cultus ex conidiis in aëre volitantibus, in Japonia. — Af-
finis *Asp. luchuensi* Inui; efformat cæspitulos densos, primo albos
dein nigricantes.

17. **Aspergillus incrassatus** Spring, in Bull. Acad. roy. Belg. 19 7980
(1852) p. 558. — Est species dubia, probabiliter teratologica.
18. **Aspergillus Westendorpii** Sacc. et March. in Rev. Mycol VII 7981
(1885) p. 149 (absque diagnosi), Lindau Deutsch. Krypt. Fl. Pilze
VIII p. 152.

Hab. in fimo vaccino in Belgio (WESTENDORP). — Deest in
herb. meo; verisimiliter forma v. var. *Asp. clavati*.

19. **Aspergillus Synccephalis** Guég. Champ. paras. p. 165 (1904) fig. 6. 7982
— Mycelio albo dein griseo, laxe intricato, 2,5-4 μ. cr.; hyphis
festilibus erectis, subflexuosis, continuis, 300 ≈ 7-8 (basi), fuligi-
neis, superne atratis, in vesiculam subsphæricam 30-35 μ. diam.
inflatis; pseudobasidiis cylindraceis apice vesiculæ insertis; coni-
diis primo sphæricis glaucis, dein subovoideis, griseis, 3,3 ≈ 2,5,
levibus, fasciculum undulatum cylindraceum 90-100 μ. altum for-
mantibus.

Hab. in tela uda, socio *Chætomio pannoso* in Gallia.

STERIGMATOCYSTIS Cram. — Syll. IV p. 71, X p. 524, XI p. 593,
XIV p. 1046, XVI p. 1029, XVIII 516.

1. **Sterigmatocystis luteo-nigra** Lutz in Bull. Soc. bot. Fr. LIII 7983
(1906-1907) p. L. — Hyphis sterilibus lutescentibus, fertilibus
albis, plus minusve contextis, continuis; vesicula sphærica, 100 μ.
diam., fusca; pseudobasidiis clavatis radiantibus 10-30 μ. long.,
sæpe 4 pseudosterigmata 4-6 μ. longa gerentibus; conidiis globo-
sis 5 μ. diam., catenulatis, hyalinis, dein fuscis.

Hab. in seminibus Theobromæ Cacao fermentescentibus,
Roça de Boa Entrada, San Thomé. — A *Sterigm. nigra* impri-
mis mycelio sterili aureo et fertili albo dignoscenda.

2. **Sterigmatocystis dipus** Ferdinand. et Winge, Botanisk Tidsskr. 7984
XXX (1910) p. 220, fig. 6. — Hyphis repentibus septatis, 4-6 μ.
diam., hyalinis; fertilibus dipodibus, stricte erectis, non septatis
nec ramosis, circ. 1 mm. alt. 13-18 μ. cr., membrana 2 μ. cr.
præditis, superne vesiculoso-inflatis, hyalinis, capitulum conidio-
rum globosum fusco-nigrum, circ. 150 μ. diam. gerentibus; ve-
sica globosa, hyalina, 40-45 μ. diam., e pseudobasidiis affixs cre-
bre punctata; pseudobasidiis radiantibus, cylindraceo-clavatis, 15-25
μ. long., superne 5,5-7,5 μ. cr., granuloso-faretis, fuscidulis pseudo-

sterigmatibus plerumque 3 curte bacillaribus nec non subcuboideis, 7-9 \vee 5, concoloribus coronatis; conidiis catenulatis, inter se filamentis hyalinis, ad 5 μ . long. circ. $\frac{1}{2}$ μ . cr. conjunctis, globosis, 7-8,5 μ . diam., fuscis, verrucis echinatis, ad 1 μ . long., hyalinis, nonnumquam deciduis ornatis.

Hab. ad fructus semiputridos *Theobromæ Cacao*, socia *Stilbochalara dimorpha* Ferd. ad Winge, prope Las Trincheras Venezuela (H. LASSEN).

3. **Sterigmatocystis corolligena** Massee, Kew Bull. (1910) p. 5. — 7985
Hyphis sterilibus effusis, repentibus; fertilibus simplicibus, erectis, apice vesiculoso-inflatis, globosis; conidiis catenulatis, pseudobasidiis verticillato-ramosis suffultis, globosis, flavidis, verrucosis, 5-6 μ . diam., capitulum sulphureum formantibus.

Hab. in corolla *Impatientis* sp., Manipur Indiæ (I. D. HOOKER). — A *Sterigm. sulphurea* præcipue conidiis globosis, verrucosis dignoscitur.

4. **Sterigmatocystis ochroleuca** Speg., Myc. Argent. V, p. 434, in Anal. Mus. Nac. Buenos Aires XX (1910) — Cæspitulosa, tota ex albo sulphurea; hyphis fertilibus sæpius 3-8 cæspitosis, erectis simplicibus, 1-2 mm. long. 12-14 μ . cr., continuis, hyalinis, capitulo globoso compactiusculo coronatis; cellula apicali fertili globosa, 50 μ . diam., minutissime densiusculeque papillosa; pseudobasidiis cylindraceo-subclavulatis apice truncatis 25-30 \vee 6, pseudosterigmatibus apice rotundatis 8-10 \vee 2, omnibus hyalinis; conidiis globosis, 4 μ . diam., non v. grosse 1-guttulatis, catenulatis asperulis.

Hab. ad folia et caules *Galii* Relbun loco udo servatis, La Plata Argentina Amer. aust.

5. **Sterigmatocystis insueta** Bainier, Bull. Soc. Myc. Fr. XXIV (1908) p. 87 t. VIII el XVIII. — Tota fuliginea; mycelio ramosissimo, parce septato, tortuoso; conidiophoris filiformibus simplicibus, continuis, concoloribus apice in vesiculam subglobosam, levem, 11-16 μ . diam. desinentibus; pseudobasidiis breviter cylindraceis obtusis 8 \vee 5, pseudosterigmatibus verticillato-ternis phialiformibus; conidiis longiuscule catenulatis, globosis, demum muriculatis, fuligineis, 5 μ . diam.

Hab. in seminibus v. fructibus *Galii Aparines* germinantibus in Gallia — Conferenda cum aliis generis speciebus phæocephalis.

6. **Sterigmatocystis ochracea** (Wilhelm) Schröt. — Syll. X p. 527. 7988
— Var. **microspora** Tiraboschi, Ann. di Botanica VII (1908)

p. 14 (*Asperg.*). — Cæspitulis luteo-brunneis; conidiophoris luteis, 0,5-1,5 mm. long., 7-12 μ . cr., membrana crassiuscula verruculosa; vesicula subhyalina v. lutea, spheroidea, 30-40 μ . diam.; pseudobasidiis subhyalinis v. pallide luteis inverse conoideis, 20-32 \times 5-9, pseudosterigmatibus (3-5) 8-10 \times 3-3,5; conidiis globosis v. ovoideis hyalinis v. luteolis, levibus, plerumque 3-3,5 μ . diam.

Hab. in pane zeino nec non in caryopsidibus corruptis *Zeæ Maydis* in Italia (TIRABOSCHI).

7. **Sterigmatocystis bicolor** J. Ray, Variat. Champ. infér. pag. 53 7989 (Rev. génér. Bot.). — Mycelio albo-roseo, hypostromate ochraceo suffulto; hypha primaria, non septata, vesicula parva terminata; pseudobasidiis crebris, globulosis, pigmento rubro farctis, æque ac vasicula; pseudosterigmatibus brevibus; conidiis, globosis, spinulosis, viridibus, 2,5 μ . diam.

Hab. in radice Dauci Carotæ vitiata in laboratorio, Paris Galliæ.

8. **Sterigmatocystis quercina** Bain. in Bull. Soc. bot. Fr. (1881), Sar- 7990 tory in Bull. Soc. Myc. Fr. XXVI (1910) p. 352 cum icono sclerotii. — E fiavo lignicolor (ligni quercini colore) 1 cm. alta; mycelio ramoso haustoriis prædito; conidiophoris 20 μ . cr.; capitulo 88 μ . diam.; ramulis sporiferis primariis et secundariis circ. 10 μ . longis; conidiis globosis, levibus, 4-4,3 μ . diam.,; sclerotiiis subglobosis, flavo-paleaceis 0,5 cm. latis.

Hab. in substantiis organicis in Gallia. — In mediis culta optime evolvitur.

9. **Sterigmatocystis alba** (Wilhelm) Sacc. — *Aspergillus albus* Wilhelm 7991 Beitr. Kenntuiss Pilze, Asperg. p. 68, (1893) Wehmer Asperg. p. 97. — Cæspitulis albis; conidiophoris 0,5 mm. altis; hyalinis, levibus, 7 μ . cr., tunica crassa præditis; vesicula globosa usque ad 30 μ . diam.; pseudobasidiis ramosis; conidiis globosis, levibus, hyalinis, 2,7-3,5 μ . d., in catenulas longas persistenter dispositis.

Hab. in pane mucido pr. Strassburg (WILHELM) et pr. Breslau (BANDMANN). — An hujus speciei synonyma sint *Aspergillus candidus* Mich., *A. albus* Hall. *Monilia albicans* Pers. omnino dubium.

10. **Sterigmatocystis pseudo-flava** (Saito) Sacc. — *Aspergillus pseudo-flavus* Saito in Centralbl. f. Bakter. II Abt. 18 (1907) p. 34, tab. II, fig. 15-18. — Ab affini *Aspergillo flavo* Bref. imprimis pseudosterigmatibus plerumque compositis diversa; in culturis polychroma: in substantiis carbonio-hydratis flavo-virens vel atro-

virens, in peptonicis pallide v. saturate flava; conidiophoris 1-2 mm. long., 15 μ . cr., tunica 1-2 μ . cr.; vesicula 35-50 μ . lata, pseudobasidiis 15 \approx 7; pseudosterigmatibus 4 \approx 1,2, conidiis plerumque 6-7 μ . diam., minute verrucosis, flavidis.

Hab. (cult) in Batata (*Koji*) in Japonia — *Aspergillo Ostiano* quoque proxima.

11. **Sterigmatocystis Batatæ** (Saito) Sacc. — *Aspergillus Batatæ* 7993
 Saito, Centralblatt f. Bakter. II Abteil., XVIII (1907) p. 31,
 t. I-II, f. 1-14. — *Sterigmatocysti* nigræ affinis tam pseudobasidiis compositis, quam conidiis similibus, licet paullo majoribus; cæspitulis initio albis, dein fulvescentibus v. viridi-flavis, denique atro-brunneis; pseudobasidiis 24-40 \approx 8; pseudosterigmatibus 10 \approx 3,2; conidiis 4-5 μ . diam., levibus, brunneolis.

Hab. (cult) in Batata (*Koji*) in Japonia. — Quoad notas bio-chemicas cfr. l. c.

12. **Sterigmatocystis Okazakii** (Saito) Sacc. — *Aspergillus Okazakii* 7994
 Saito in Yagi, Centralbl. f. Bakter. Abteil., 19 (1907) p. 481,
 tab. 1-2. — Cæspitulis niveis, dein sulphureis; hyphis sterilibus repentibus, 2-4 μ . cr.; conidiophoris hyalinis, rectis v. curvis, crasse tunicatis, levibus v. asperulis, 200-500 \approx 8-12, tunica 2-3 μ . cr.; vesicula globosa 12-40 μ . diam., ubique pseudobasidiis clavatis 15-20 \approx 6-8 dense obducta, pseudosterigmatibus plerumque quaternis, 8-14 \approx 3,6; conidiis globosis, hyalinis, 2,5-5,4 μ . diam., levibus, saepe isthmis connexis; statu ascophoro nondum observato.

Hab. in fermento putrescente batato orizino (*Reiskoji*) in Japonia. — Optimam temperie 25-28 c.

13. **Sterigmatocystis nidulans** Eidam — Syll. X p. 524. — Var. 7995
Nicollei Pinoy C. R. Ac. d. Sc. Paris, CXLIV (1907) p. 396. — Conidiis et sclerotiis vesiculis obtectis cum typo concordat, sed dignoscitur ascis non evolutis et quia (in cuniculis inoculatus) non nocet.

Hab. ex pede ægro mulieris culturâ evoluta, in Tunisia Africæ septentrionalis.

14. **Sterigmatocystis polychroma** Ferr. Fl. it. crypt. Hyph. p. 640. 7996
 — *Aspergillus versicolor* Tiraboschi, Ann. di Botan. III (1908) p. 9. — *Sterigmatocystis versicolor* Vuill? in Mirsky, Sur quelques causes d'erreur dans la déterm. des Aspergillées, thèse, Nancy (1903). — Cæspitulis polychromis (roseis, luteis, griseis, incarnatis, viridulis etc.); conidiophoris septatis, 300-450 \approx 5-5,5,

apice capitulum subsphæricum 50-60 μ . diam. gerentibus; vesicula obovato-rotundata, 16-17 \approx 11-14, pseudobasidiis primaris inverse conoideis, brevibus, 5-6 \approx 3-4,5, pseudosterigmatibus (2-3 v. pluribus) ampulliformibus, 7-10 \approx 2-3; conidiis catenulatis 2,5-3 μ . diam., subhyalinis v. varie pallide coloratis.

Hab. in aëre domi e morbo *pellagra* dicto vitiato, in Apennino Reggio Æmiliae (CENI). — Observante prof. Ferraris, *St. versicolor* Vuill. parum recedit capitulis minoribus, 165 \approx 127, pseudosterigmatibus secundariis quoque minoribus etc.

XYLOCLADIUM Syd. (1900) Cfr. Syll. XVI p. 1089 — char. emend.

Höhn., *Ceratocladium* Pat., non Corda. — *Basidiobotrys* Höhn. Fragm. z. Myk VI, Stzb. K. Ak. d. Wiss. Wien, CXVIII Abt. I, 1909, p. 420. — Hyphæ parasiticæ repentes, septatæ, parce ramosæ. Conidiophora simplicia v. ad basim parce ramosa, assurgentia, apice cylindrico-clavata, clava tota pseudobasidiis brevisimis, pluridentato-sporigeris, patulis prædita. Conidia continua, ovato-ellipsoidea.

1. **Xylocladium Clautriavii** (Pat.) Syd. l. c. char. emend. — Syll. 7997 XVI p. 1089. — *Basidiobotrys Clautriavii* (Pat.) v. Höhn. l. c., fig. 29, char. emend. — Hyphis sterilibus 8-10 μ . cr.; clava cylindracea, continua 60-110 \approx 10-14, pseudobasidiis verruciformibus 3-4 \approx 2-3, apice obtuso 3-4-denticulato; conidiis elliptico-ovoideis, 5-6 \approx 3, hyalinis, facile deciduis.

Hab. in stromate Xylariæ furcatæ parasitice, Buitenzorg Javæ (CLAUTRIAU et v. HÖHNEL). — Teste v. Höhnel est species parasita, non st. conidicus *Xylariæ*; sed nihil obstat quominus nomen genericum *Xylocladium* Syd., charactere emendato, sit nobis servandum.

PENICILLIUM Link — Syll. IV p. 78, X p. 527, XI p. 593, XIV p. 1047, XVI p. 1030, XVIII p. 517 *).

*) His ultimis annis clari mycologi Dierckx, Bainier, Thom, Westling etc. innumeræ species novas *Penicillii* condiderunt, imprimis culturæ arte factæ opæ. Utrum sint bonaæ species an non in posterum est comprobandum. Id certum est quod, nisi in confusionem maximam labamur, necesse est ut prædictæ species sedulo et critice comparentur et inquirantur. Opus vero difficillimum quod non nisi monographi experiri poterunt.

E diligentissima monographia cl. CH. THOM (*Cultural stud. of Penicill.* in Bull. 118 Dep. of Agricult. Washingt. 1910) clavem analyticam sequentem excerptimus. Hic auctor nonnullas species anonymas reliquit, nempe: n. 12, 22, 24, 28, 33, 37 (et n. 29, 30, 31, 32, in gignendo sclerotia rubra simillima convenientes).

Clavis analytica specierum secundum notas ex cultura in gelatina et agar petitas.

A. Species typice coremia verticalia et distincta efformantes.

a. Coremia longa (3-15 mm.).

1. Massa conidiorum striote terminalis olivaceo-virens, fragrans.

Penicillium claviforme

2. Coremia in tertia sup. parte fertilia, conidia viridia. *P. Duclauxi*

aa. Coremia brevia.

1. Coremia definita, dense conferta, colonia subtus aurantiaca. *P. granulatum*

2. Coremia in culturis initio tantum e conidiis aggregatis indicata,
denique (in cult. vetustis) bene definita et in fructibus
Mali valde extensa. *P. expansum*

AA. Species in cultura non v. raro coremia efformantes.

B: Species constanter sclerotia v. massas ascigeras efformantes.

b. Massas ascigeras efformantes, flavas v. rubras. *P. luteum*

bb. Sclerotia in cult. vetustis massas albas formantes. *P. italicum*

bbb. Sclerotia rubra v. rosea, globosa v. ellipsoidea, usque ad 500 μ . d.

c. Fructificatio conidica columnata.

1. Columna densa, longa, sclerotia substrato partim immersa. *P. No. 30*

2. Columna ex catenulis laxis constans, sclerotia numerosa, emersa. *P. No. 29*

cc. Fructificatio conidia ex catenulis divergentibus constans.

1. Rapide liquefaciens, conidia globosa, 2,5-3 μ . *P. No. 31*

2. Lente liquefaciens, conidia ellipsoidea, 3,5-4 v. 2,5-3. *P. No. 32*

BB. Sclerotia nulla v. raro ex causis particularibus efformata.

C. Rapide liquefaciens (liquamen copiosum intra 5-12 dies).

D. Odor distinctus fortiter ammoniacalis.

1. Flavido-brunneo-avellaneum, conidia rugosa. *P. brevicaule*

2. Album v. cremeum, conidia rugosa. *P. brevicaule* var. *album*

3. Album v. cremeum, conidia levia. *P. brevicaule* var. *glabrum*

DD. Odor ammoniacalis nullus.

E. Color flavidus in gelatina liquefacta, non in parte inf. mycelii.

1. Colonia parva, conidiophoris 100-150 μ . long. *P. citrinum*

2. Colonia late effusa, conidiophoris 250-300 μ . long. *P. chrysogenum*

EE. In gelatina liquefacta non v. paroissime flavo-colorata.

2. *Viride, fructificatio conidica subcompacta, odore definite mucidino.* *P. commune*
- k. Massa conidica ex columna densa catenarum conidiorum constans.*
1. *Columna verticillo ramulorum singulo suffulta.* *P. spinulosum*
 2. *Columna verticillo ramulorum e cellulis verticillatis et catenulis efformata constituta.* *P. rubrum*
- kk. Columna nulla.*
- l. Conidia levia.*
1. *Viride, late effusum, conidia matura globosa, 4-5 μ .* *P. Roqueforti*
 2. *Viride, minus expansum, conidia ellipsoidea, substentaculum plerumque purpurascens.* *P. purpurogenum*
 3. *Griseum v. viride olivaceum, conidia 5-6 + 3-5.* *P. digitatum*
- ll. Conidia delicate rugulosa.* *P. rugulosum*

Clavis analytica specierum secundum matrices.

In caseo (Camembert et Brie).

1. *Floccosum, album immutabile, inodorum.* *P. Camemberti var. Rogeri*
2. *Floccosum, ex albo-griseo-viride, inodorum.* *P. Camemberti*
3. *Pulveraceum, albo-flavidum, conidia levia odore ammoniacali.* *P. brevicaule var. glabrum*
4. *Pulveraceum, albo-flavidum, conidia tuberculata, odore ammoniacali.* *P. brevicaule var. album*
5. *Areas flavidobrunneas efformans, conidia rugosa, odore ammoniacali.* *P. brevicaule*

In caseo (Roquefort).

1. *Massæ virides in interiore casei.* *P. Roqueforti*

In fructibus Citri.

1. *Coloniæ cyaneo-virides.* *P. italicum*
2. *Colonia olivaceo-griseæ.* *P. digitatum = olivaceum*

In fructibus Pomacearum (Pira, Mala etc.).

1. *Coloniæ cyaneo-virides, denique coremia efformantes.* *P. expansum*

In Polyporaceis (Boletus, Polyporus etc.).

1. *Coloniæ virides (viridi-flavæ) stoloniferæ.* *P. stoloniferum*

In ligno (Pini).

1. *Maculas ex aurantiaco rubras in ligno pineo efformans.* *P. pinophilum*

1. **Penicillium brevicaule** Sacc. — Syll. IV, pag. 84 — var. **album** 7998
 Thom, Cult. stud. of Penicill. Washingt. (1910) (Dep. of Agric.
 Bull. 118) p. 47, fig. 13. — A typo differt præcipue colore albo
 conidiorum et ob alias notas ex cultura.

Hab. in caseo Camembert indigeno et importato, in America boreali. — Var. *glabrum* Thom, l. c. p. 48, fig. 14. — A typo differt conidiis albis et levibus et productione sclerotiorum nigrorum in substrato. — In caseo in America boreali.

2. **Penicillium citrinum** Thom, Cult. stud. of Penicill. Washington 7999 (1910) (Dep. of Agricul. Bull. 118) p. 61, fig. 22. — Coloniis in gelatina v. agar Solani tuberosi aut Phaseoli cultis, æruginoso-viridibus, demum fuligineis; fructibus viridibus usque ad marginem gestis, i. e. margine sterili angustissimo; coloniis in gelatina rotundis, parvis, cito liquecentibus; in agarо latioribus; parte aërea ex conidiophoris et fructibus conidicis creberrimis composita, interdum cæspitibus paucis hypharum adscendentium in medio; reverso incolorato; conidiophoris (sine ramis) non longioribus 150 μ ., singulatim orientibus, aut paucis ex hyphis adscendentibus ramosis; fructibus conidicis 3-5 ramorum, 16-30 \times 3, apice 5 μ . incassatorum, in verticillo, basidia in verticillis compactis gerentium; utroque verticillo catenis conidiorum in columnas compactas 50-150 μ . longas adhærentibus; pseudobasidiis 6-7 \times 2-3; conidiis globosis, 2,4-3 raro 3,5 μ . diam., æruginoso-glaucis, granulatis intus, in catenis manentibus submersis. Coloniis, saccharo commixtis, substrata citrina colore efficientibus (unde nomen).

Hab. in caseo, pane, etc., commune in Amer. bor. — Cl. Auct. descriptsit l. c. pag. 63 et 64, fig. 23 duas *Penicillii* formas sub nn. 37 et 12 dubie ad *P. citrinum* pertinentia.

3. **Penicillium chrysogenum** Thom, Cult. stud. of Penicill. Washingt. 8000 (1910) (Dep. of Agric. Bull. 118) pag. 58, fig. 20. — Coloniis in gelatina v. agar Solani tuberosi aut Phaseoli cultis, griseo-viridibus, demum brunneolis, in substrato late crescentibus, margine sterili lato, in juvenilibus parte aërea ex conidiophoris et cæspitibus sparsis hypharum adscendentium composita; reverso incolorato; conidiophoris plerumque singulatim usque 300 \times 4 orientibus, raro brevibus ex hyphis assurgentibus ramosis; fructibus conidicis 100-200 μ . long. cum 1-2 ramis alternatis et divergentibus ramulos 1-2 verticillatos gerentibus; pseudobasidiis 8 \times 2,5 verticillatis ex apicibus ramulorum, catenas divergentes conidiorum gerentibus; conidiis primum cylindricis v. ellipsoideis, demum globosis, 3-4 μ . d., pallide glaucis, magnis vacuolis; coloniis gelatinam liquefacentibus, lacmi (*laccamuffa*) ope alcalinis lac, panem, gelatinam, aureo-colorantibus.

Hab. in caseo, pane etc., commune in America bor.

4. *Penicillium atramentosum* Thom, Cult. stud. of Penicill. Washingt. 8001 (1910) (Dep. of Agric. Bull. 118) p. 65, f. 24. — Coloniis in gelatina v. agar Solani aut Phaseoli cultis, viridibus, parte aërea plerumque ex conidiophoris singulatim orientibus, medio cum hyphis aëreis interspersis, margine albo ex hyphis fertilibus angusto; reverso incolorato v. parum ochraceo; substrato aut incolorato aut in substratis saccharinis et in lacte atro-brunneo tarde fere atro; conidiophoris 240-300 usque ad 400 μ . long.; fructibus conidicis 100-200 μ . long., ramis 1-2 verticillatis 2-4 inæqualiter longis in verticillo, in apice incrassatis; pseudobasidiis 8-10 μ . long., parallelis in verticillo; catenis conidiorum eodem verticillo in columnam compactis; conidiis ellipsoideis 3,5-4 (usque ad 4,8) \times 2,5-3 usque ad 3,5, lœvibus, viridibus, 6-7 μ . incrassatis et uno tubo germinantibus; coloniis gelatinam cito liquefacentibus, lacmi (*laccamuffa*) ope alcalinis; odore in lacte proprio, in substratis aliis nullo.

Hab. ex caseo cultum, Storrs Conn. Amer. bor. — Aliam formam descriptis auct. l. c. pag. 66, fig. 25 sub *Penicillium* n. 24 dubie ad speciem præsentem spectantem.

5. *Penicillium stoloniferum* Thom, Cult. stud. of Penicill. Washingt. 8002 (1910) (Dep. of Agric. Bull. 118) p. 68, fig. 26. — Coloniis in gelatina v. agar Solani tuberosi cultis, viridibus v. flavo-viridibus, demum griseo-viridibus v. griseis in agar sine saccharo, cum saccharo viridibus. floccosis, in culturis juvenilibus stolonibus aëreis citius quam hyphis submersis crescentibus, reverso incolorato v. in parte flavo; conidiophoris brevibus ex hyphis adscendentibus ramosis, usque ad 100 μ . long. aut singulatim orientibus (sine ramis) plus minus 300 μ . long.; fructibus conidicis 40-80 μ . raro usque ad 170 μ . longis, ex ramis brevibus compactis et pseudobasidiis verticillatis, in basi confertissimis, catenas conidiorum late divergentes gerentibus compositis (interdum ramus infimus tam divergens ut fructus duplex videatur); pseudobasidiis 10 \times 3; conidiis ellipsoideis v. pæne globosis, 2,8-3,4 μ . diam., pallide flavo-viridibus levibusque; coloniis gelatinam cito liquefacentibus, lacmi (*laccamuffa*) ope alcalinis.

Hab. in fungis putrescentibus, Boletis, Polyporis, Storrs Conn. Amer. bor. et Paris Gallia.

6. *Penicillium divaricatum* Thom, Cult. stud. of Penicill. Washingt. 8003 (1910) (Dep. of Agric. Bull. 118) pag. 72, fig. 29. — Coloniis in gelatina v. agar Phaseoli cultis, avellaneis, nunquam viridibus, in substrato late crescentibus; parte aërea ex hyphis fertilibus in-

tricatis, demum fere pulverulenta; reverso incolorato; hyphis fertilibus septatis, plerumque brevibus, repentibus v. adscendentibus; fructibus conidicis aut terminalibus aut lateralibus ex hyphis fertilibus repentibus ex verticillis sessilibus ramorum et basidiorum, irregulariter in hyphis fertilibus orientibus; pseudobasidiis 15-20 \approx 3; pseudosterigmatibus longis acuminatis in basi confertis, apice late divergentibus, catenas longas conidiorum gerentibus; conidiis ellipsoideis v. fusiformibus, 5-7 \approx 2,5-3, avellaneis, 10 μ . incrassatis, 2-3 tubis germinantibus; coloniis gelatinam non liquefacentibus, lacmi (*laccamuffa*) ope alcalinis.

Hab. in culturis, Storrs Conn. Amer. bor. (C. Thom).

7. **Penicillium lilacinum** Thom, Cult. stud. of Penicill. Washingt. 8004 (1910) (Dep. of Agric. Bull. 118) pag. 73, fig. 30. — Coloniis in gelatina v. agaro Phaseoli cultis, albis v. ex albo demum pallide lilacinis imprimis in saccharo officinarum commixto, floccosis; hyphis aëreis ramosis, adscendentibus, septatis, 3 μ . cr., ramos fertiles brevissimos gerentibus; reverso incolorato; fructibus conidicis usque ad 100 μ . long., e pseudobasidiis sessilibus, solitariis v. verticillatis, aut, e ramis brevissimis v. apicibus hypharum aërearum, 1,2,3, verticilla ramulorum et pseudobasidiorum, catenas longas et divergentes conidiorum gerentium; pseudobasidiis basi incrassatis, apicibus acuminatis et divergentibus, 7-10 μ . long.; conidiis 2,5-3 \approx 2, ellipsoideis, lœvibus, pallide lilacinis; coloniis gelatinam lente liquefacentibus, lacmi (*laccamuffa*) ope alcalinis.

Hab. in culturis Ithaca N. Y. Amer. bor. (G. F. ATKINSON et C. W. EDGARDTON).

8. **Penicillium Camemberti** Thom, U. S. Dept. Agric. Bur. animal 8005 Industry, Bull. 82 (1906) et Cult. stud. Penicill. Washingt. (1910) p. 50, f. 16. — Cæspitulis viridibus; hyphis 3-4,2 μ . cr., septatis, articulis 30-40 μ . longis; conidiophoris tenuissime tunicatis, sæpe geniculato-anastomosantibus, sursum ramo laterali crassiusculo auctis, apiceque tam hoc quam hypha primaria verticillato-ramosis; pseudosterigmatibus, 8-11 \approx 2,4-3; conidiis primo cylindricis demum globulosis 5 μ . diam., flavo-viridulis.

Hab. in caseo Brie et Camembert in Amer. bor. et Germania. — Var. **Rogerii** Thom, l. c. pag. 52, fig. 17, *Pen. Epsteinii* Lindau, Krypt. Fl. Pilze VIII, p. 166? — A typo differt colore albo immutabili nec ex albo virescente aliisque notis ex cultura. — In caseo in Amer. bor. et Germania.

9. **Penicillium funiculosum** Thom, Cult. stud. of Penicill. Washingt. 8006

(1910) (Dep. of Agric. Bull. 118) pag, 69, fig. 27. — Coloniis in gelatina vel agar Solani tuberosi aut Phaseoli cultis, atro-viridi- bus, late crescentibus, floccosis; parte aërea ex hyphis decumben- tibus, ramosis, cæspitosis, late intricatis et fasciculatis, conidiopho- ra brevia gerentibus interdum hyphas secundarias albas floccosas lente evolente; reverso rubescente demum atro-vinoso; substrato (aut lacte aut gelatina) vino; conidiophoris (sine ramis) 20-80 usque ad 100 μ . long., plerumque ex hyphis repentibus vel fasciculatis, interdum singulatim orientibus; fructibus conidicis usque ad 125-160 μ . long., cum 1-2 ramis alternatis, dein ramulis verticillatis, pseudobasidiis in verticilos densos 10-14 \approx 2-3, parallelis in verti- cillo, acuminatis; catenis conidiorum parallelis; conidiis primum cylindricis, demum fusiformibus v. ellipsoideis, 3-4 \approx 2-3, viridibus; conidiorum catenis fatiscentibus submersis; coloniis gelatinam non liquefacentibus, lacmi (*laccamuffa*) ope acidis, siccantibus sene- scentibusque interdum coremia pauca evolventibus.

Hab. in culturis Storrs Conn., Amer. bor. (comm. E. A. Bes- sey, ex Miami Flo.).

10. **Penicillium pinophilum** Thom, Cultur. Stud. Penicill. p. 38, f. 6, 8007
 (1910) *Penicillium aureum* Hedgcock, Mo. Bot. Gard. Rep. 17 (1906)
 p. 105, non Corda. — Coloniis in Solano tuberoso, agar, lacte
 cultis, e viridi v. flavo-viridi aureis; conidiophoris 100-200 μ . altis,
 parte conidigera 120 μ . long. verticilli primarii ramis 10-16 \approx 2-
 2,5, pseudobasidia 13-15 \approx 2-2,5 verticillata acuminata gerentibus;
 catenis parallelis, non tamen columnaribus; conidiis ellipsoideis
 3-3,6 \approx 2, levibus, pallide griseo-flavidis; coloniis gelatinam obso-
 lete liquefacentibus, lacmi (*laccamuffa*) ope reactionem neutram
 v. acidam efficientibus.

Hab. in ligno Pini, quod intese colore aureo tingitur, in Amer-
 ica bor.

11. **Penicillium intricatum** Thom, Cult. stud. of Penicill. Washingt. 8008
 (1910) (Dep. of Agr. Bull. 118) p. 75, f. 31. — Coloniis in gelatina
 v. agar Phaseoli cultis, albis, griseis, griseo-glaucis, demum griseis,
 lente fere fuligineis, floccosis, zonatis; parte aërea usque ad 1-3
 mm. cr., ex hyphis aëreis ramosis dense intricatis; reverso inco-
 lorato v. sulphureo interdum lente avellaneo; substrato sulphureo-
 colorato; conidiophoris interdum terminalibus plerumque ex hy-
 phis aëreis brevibus 30-50 μ . ramosis; fructibus conidicis 50-100
 μ . usque ad 140 μ . long. multo longioribus in substratis saccha-
 rinis; ex verticillo pseudobasidiorum v. ex 1-3 verticillis pseudoba-

sidiorum in ramis divergentibus v. ex verticillis ramulorum et pseudobasidiorum eodem verticillo, catenis conidiorum sæpe in columnam laxe convergentibus; pseudobasidiis 8-10 \approx 2-2,5, paucis (4-10); conidiis ellipsoideis v. globosis, hyalinis v. pallide glaucis 2,5-3 μ . diam., levibus, leptodermis, intus granulosis, in catenis manentibus submersis; coloniis gelatinam non liquefacentibus, lacmi ope alcalinis.

Hab. in culturis ex humo, Storrs Conn. Amer. bor. (W. M. ESTEN).

12. **Penicillium decumbens** Thom, Cult. stud. of Penicill. Washingt. 8009 (1910) (Dep. of Agric. Bull. 118) pag. 71, fig. 28. — Coloniis in gelatina pura v. agar Solani tuberosi aut Phaseoli cultis, griseo-glaucis, griseis, demum brunneolis, sparsis; in saccharo officinarum commixto densioribus, glaucis; parte aërea ex hiphis decumbentibus s. stoloniformibus conidiophora brevissima gerentibus, demum cæspitulis albis densis hypharum sterilium secundariarum, conspersis; reverso incolorato; conidiophoris 20-100 \approx 3, pseudobasidiis 7-9 \approx 2-3, in uno verticillo denso gerentibus; fructibus conidicis ex catenis conidiorum primum in columnam usque ad 100 μ . longam digestis, mox in capitulo conglomerato, solutis; conidiis globosis, 2,5-3 μ . vacuolatis, levibus, primum pallide glaucis demum brunneolis; coloniis gelatinam non liquefacentibus, lacmi ope alcalinis, saccharophilis, odorem in saccharo evolventibus.

Hab. cultum ex Miami Flo. Amer. bor. (Com. P. H. ROLFS). 8010

13. **Penicillium biforme** Thom, Cult. stud. of Penicill. Washington (1910) (Dep. of Agric. Bull. 118) p. 54, f. 18. — Coloniis in gelatina cultis, albis, lente glaucescentibus, densius floccosis, margine sterili lato, aut in agar Solani tuberosi cultis, albis glaucescentibus, mox avellaneis v. fere olivaceis, parte aërea ex conidiophoris brevissimis et creberimis fructibusque conidicis composita; conidiophoris (sine ramis) 60-150 μ . in agar, v. longioribus ramosis ex hyphis floccosis in gelatina cultis; fructibus conidicis 100-200 μ . long., plerumque 1-2 alterne ramosis, ramis convergentibus v. divergentibus, ramulis verticillatis pseudobasidia apice verticillata gerentibus; pseudobasidiis 8-10 usque ad 13 \approx 3; conidiis primum ellipsoideis v. cylindricis demum globosis, 4-4,3 \approx 3,2-3,5 v. 4 μ . diam., in catenis manentibus submersis; coloniis copiosis in saccharo lactis, gelatinam partim lente liquefacentibus, lacmi ope alcalinis, odore mucido.

Hab. in caseo ex Gallia. — *P. Camemberti proximum.*

14. **Penicillium commune** Thom, Cult. stud. of Penicill. Washingt. 8011 (1910) (Dep. of Agric. Bull. 118) pag. 56, fig. 19. — Coloniis in gelatina v. agar Solani tuberosi aut Phaseoli cultis viridibus, demum brunneolis, in substrato late crescentibus, zonatis; marginis crescentis parte aërea ex conidiophoris centri atque ex hyphis plus minusve floccosis composita; reverso et substrato incolorato; conidiophoris plerumque 300 µ. raro usque 700 µ. longis; fructibus conidicis 100-200 µ. longis, cum ramis alternatis et verticillatis confertis; pseudobasidiis 8-9 ÷ 3, cum apicibus brevibus acutis, catenas conidiorum longas parallelas gerentibus; conidiis primum cylindricis vel ellipsoideis, demum globosis, 3-4 µ. diam., ad 5-6 µ. incrassatis germinantibus, levibus, viridibus, in catenis manentibus submersis; coloniis in gelatina partim lente liquefacentibus; odore mucido.

Hab. in lacte, caseo etc. Storrs, Conn. Amer. bor. — Sub *Penicillium n. 22* describit Auctor aliam formam ad *Pen. commune* proximam.

15. **Penicillium spinulosum** Thom, Cult. Stud. of Penicill. Washingt. 8011* (1910) (Dep. of Agric. Bull. 118) p. 76, fig. 32. — Coloniis in gelatina v. agar Phaseoli cultis atro-viridibus, demum fere atris, cito et late in substrato crescentibus, margine sterili lato in juvenibus; parte aërea ex conidiophoris et ex hyphis floccosis sparsis composita; reverso incolorato; conidiophoris 105-300 ÷ 3-3,5 vel longioribus, apice 5 µ. cr., verticillum pseudobasidiorum 9,5-11 ÷ 2-3 gerente; fructibus conidicis in columna densa 300 usque ad 500 ÷ 15-30 ex catenis conidiorum composita; conidiis piriformibus v. globosis 3,2-3,5 ÷ 3,6-4, leptodermis, primum levibus demum minutissime spinulosis; coloniis gelatinam lente liquefacentibus, lacmi ope acidis.

Hab. in cultura in laboratorio, Hannover Germaniæ. — Cl. Auctor l. c. p. 77, fig. 33, describit sub n. 28 aliam forma dubitanter ad hanc speciem spectantem.

16. **Penicillium Roqueforti** Thom, U. S. Dept. Agric. Bur. animal Industry Bull. 82 (1906) et Cultural stud. of Pencill. Washingt. (1910) p. 34, f. 4. — Cæspitulis viridulo-cyaneis; hyphis 3,6-5 (sæpius 4,2) µ. cr., septatis, articulis 35-45 µ. long.; conidiophoris modice ramosis, sæpe furcatis; pseudosterigmatibus clavatis v. cylindraceis, summo apice coarctatis; conidiis globosis 4-5 µ. diam.

Hab. in caseis Roquefort et Gorgonzola in Amer. boreali et Germania.

17. *Penicillium rugulosum* Thom, Cult. stud. of Penicill. Washingt. 8013 (1910) (Dep. of Agric. Bull. 118) p. 60, f. 21. — Coloniis in gelatina v. agarico Phaseoli cultis, flavo-viridibus, dein viridibus, demum atro-viridibus, late crescentibus in agarico; parte aërea ex conidiophoris creberrimis et hyphis aëreis et paucis composita; reverso luteo et in parte aurantiaco imprimis in tubero Solani; conidiophoris 100-200 \approx 2,5-3, singulatim v. ex hyphis aëreis prope substratum orientibus; fructibus conidicis 100-150 μ . long. (in saccharo multo longioribus) ex ramis 10-15 \approx 2,5, compacte verticillatis, verticillos pseudobasidiorum v. ramulorum et pseudobasidiorum eodem verticillo gerentibus; pseudobasidiis 9-12 \approx 2, acuminatis, catenas longas et divergentes conidiorum gerentibus; conidiis 3,4-3,8 \approx 2,5-3, ellipsoideis, viridibus, uno apice incrassato, maturis verruculosis, in catenis manentibus submersis, 5 μ . diam., incrassatis germinantibus; coloniis non (v. solum in parte et lente) gelatinam liquefacentibus.

Hab. in culturis, commune, Storrs, Conn. Amer. bor.

18. *Penicillium vesiculosum* Bainier, Bull. Soc. Myc. Fr. XXIII 8014 (1907) p. 10, tab. II *). — Racemis conidiophoris sæpe formam vesiculosam imitantibus; conidiis sphæricis, 3,7 μ . diam.; pseudosterigmatibus 7 μ . long.

Hab. in tuberibus udis Solani tuberosi in Gallia.

19. *Penicillium virescens* Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8015 pag. 12, t. II. — Atro-virens; pseudosterigmatibus 8,4 μ . long.; conidiis sphæricis 2,8 μ . diam.

Hab. in substantiis . . . non indicatis in Gallia.

20. *Penicillium erectum* Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8016 p. 18, t. III. — Cæspitulis cyaneo-cinereis; conidiis minutissimis, globosis, 2,8 μ . diam.; pseudosterigmatibus 19 \approx 5-6.

Hab. in fragmentis ligneis putrescentibus in Gallia.

21. *Penicillium aspergilliforme* Bainier, Bull. Soc. Myc. Fr. XXIII 8017 (1907) p. 14, t. III. — Habitu fere *Aspergilli abnormis*, viride; conidiis sphæricis 2,8-5.

Hab. in substantiis . . . non indicatis in Gallia.

*) Cl. BAINIER l. c. plurimas *Penicillii* species novas iconibus et descriptiōnibus fusis illustravit, sed absque diagnosibus comparativis. Verisimiliter plerique hæc species cum illis ab auctoribus collidunt. Earum pucas notas hic rettuli, studiosus utilius icones Bainierianas comparabit.

22. **Penicillium Urticæ** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8018
 p. 15, tab. IV. — Albo-virens dein griseo-virens; conidiis globosis, 2,8 μ . diam.; pseudosterigmatibus 8-9 μ . long.
Hab. in caulis emortuis Urticæ sp. in Gallia.
23. **Penicillium puberulum** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8019
 p. 16, tab. 4, fig. 6-12. — Viridi-cærulescens, demum sordide virens; hyphis fertilibus rectiusculis, 5-6 μ . cr., puberulis; conidiis sphäricis, 4,2 μ . diam.
Hab. in substantiis . . . non indicatis in Gallia.
24. **Penicillium asperulum** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8020
 p. 17, tab. IV, fig. 13-18. — Albo-cærulescens, demum sordide virenti-cyanum; hyphis fertilibus sinuoso-undulatis 5-6 μ . cr., granulosis; conidiis sphäricis, 4,2 μ . diam.
Hab. in substantiis . . . non indicatis in Gallia.
25. **Penicillium elongatum** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8021
 p. 17, t. V, fig. 1-7. — Pallidissime cyanum dein pallide virens; conidiis distincte ovoideis, 2,8 \approx 1,4-1,6.
Hab. in fragmentis ligneis uidis in Gallia.
26. **Penicillium albicans** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8022
 p. 18, tab. V, fig. 8-9. — A *Pen. rubescente* differt conidiis ovoideis, paullo amplioribus, colore diu albido, demum flavidо-rufescente.
Hab. in palea graminearum humida in Gallia.
27. **Penicillium patulum** Bainier, l. c. p. 208, Bull. Soc. Myc. France 8023
 XXII (1906) et XXIII (1907) p. 18, t. V, fig. 10-16. — Conidiophoris filiformibus tortuosis, parce (ad dichotomias) septatis, supra medium patenter dichotome ramosis; ramis sursum laxe ter verticillato-ramulosis, ramulis ultimis phialiformibus; conidiis catenulatis globosis, exiguis, levibus, 2,8 μ . diam. (colore non indicato).
Hab. in exrementis ovinis in Gallia.
28. **Penicillium Varioti** (Bain.) Sacc., *Paecilomyces Varioti* Bainier, 8024
 Bull. Soc. Mycolog. Fr. XXIII (1907) pag. 27, tab. VII. — Cæspitulis tenuibus e fulvo viridulis; conidiophoris cylindraceis, septatis sursum inæqualiter ramosis, ramis sæpe tumentibus et apicibus inæqualiter penicillatim bis-quater verticillato-ramulosis, ramulis ultimis seu pseudosterigmatibus elongatis obclavato-phialiformibus; conidiis longe catenulatis, ovoideis, levibus, 6 \approx 3.
Hab. in ramis emortuis salicinis in Gallia. — Videretur *Penicillii* species irregulariter evoluta.
29. **Penicillium rubellum** (Bain.) Sacc., *Scopulariopsis rubellus* Bai- 8025

nier, Bull. Soc. Mycolog. Fr. XXIII (1907) pag. 104, tab. XII, f. 6-11. — Cæspitulis rubellis; conidiophoris brevibus, parce septatis, mox in ramos ternos-quinos divaricatos subtortuosos divis, ramis ultimis seu pseudosterigmatibus elongato-obclavatis circ. 28 μ . long.; conidiis irregulariter globosis v. ellipsoideis 8,5-11 \times 5,5, nonnullis basi truncatis.

Hab. in fungis majoribus putrescentibus in Gallia. — Ex stirpe *Pen. brevicaulis* quod pariter a cl. Bainier ad *Scopulariopsis* dicitur.

30. **Penicillium rubescens** Bainier, Bull. Soc. Mycol. Fr. XXII (1906) 8026 p. 207. — Mycelio, albo copioso, septato repente; conidiophoris hyalinis brevissimis, cylindraceis, sursum ter-quater verticillatim penicillato-ramosis, ramulis ultimis phialiformibus; conidiis longe catenulatis, oblongis, utrinque rotundatis, 5,6 \times 2,8. diu albis hyalinis, dein, coacervatis, roseis demumque brunneo-rubentibus.

Hab. in fragmentis *Tuberis* sp. in Gallia (BOULANGER).

31. **Penicillium Paxilli** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8027 p. 95, t. X, f. 1-4. — Viridi-cyaneum; hyphis conidiophoris parce septatis 1 mm. circ. altis, 2,8 μ . cr., apice laxiuscule 4-8-penicillato-ramosis, ramulis ultimis phialiformibus 8,4 μ . longis; conidiis longe catenulatis, sphæricis, viridibus, 2,8 μ . diam.

Hab. in pileo *Paxilli* sp. Montgeront Galliæ.

32. **Penicillium insigne** Bainier, l. c. p. 136, Bull. Soc. Myc. France 8028 XXII (1906) pag. 134. — Mycelio late effuso intertexto septato, hyalino; conidiophoris erectis basi haustoriis rosulatis præditis, initio brevibus, prope basim septatis, demum elongatis cylindraceis continuis 280 \times 11, apice verticillato 2-4-ramos; ramis bis verticillato-ramulosis; ramulis ultimis obclavato-phialiformibus 8-11 μ . longis; conidiis catenulatis, tereti-oblongis, utrinque rotundatis, hyalinis, levibus, 5-6 \times 2,8.

Hab. in pileo *Agarici campestris*, Argent-sur-Sauldre Galliæ.

33. **Penicillium exiguum** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8029 pag. 96, t. X, f. 5. — Mycelio candido, ramoso, septato, demum crassiusculo griseo-rubido; conidiophoris brevibus continuis, sursum laxe verticillato-ramosis, ramis et ramulis phialiformibus 8 μ . longis subternis; conidiis catenulatis cylindraceis, utrinque rotundatis, 4 \times 2, hyalinis.

Hab. in caseo ex Brie, Champagne Galliæ.

34. **Penicillium caseicola** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8030

p. 94, t. X, f. 6-10. — Totum candidum; hyphis conidiophoris usque ad 5 mm. altis, sursum laxe et irregulariter ramosis; ramulis ultimis verticillato-subternis, phialiformibus, 16-17 μ . longis; conidiis sphæricis, levibus, hyalinis 5,6 μ . diam.

Hab. in caseo udo in Gallia.

35. **Penicillium rufulum** (Bain.) Sacc., *Scopulariopsis rufulus* Bainier, Bull. Soc. Mycolog. Fr. XXIII (1907) pag. 105, tab. XII, fig. 1-5. — Affine *Penic. rubello*, sed ramis magis irregularibus, cæspitulis rufescensibus, pseudosterigmatibus magis elongatis; conidiis ovoideis dein sphæroideis 5,6-7 μ . diam.

Hab. in caseo et fungis subputridis in Gallia.

36. **Penicillium Costantini** Bainier, Bull. Soc. Myc. Fr. XXII (1906) p. 205, *Sympenicillium album* Cost. Bull. Soc. Myc. Fr. IV (1888) p. 62. — Mycelio copioso, albo, repente, parce septato, sursum conidiophora crebra emittente; conidiophoris cylindricis septatis hinc inde breviter arrecto-ramulosis, interdum laxe subfasciculatis, apice bis penicillatim verticillato-ramosis, ramulis ultimis phialiformibus; conidiis longiuscule catenulatis tereti-ovoideis, 6-13 \times 3-6, utrinque rotundatis, levibus, hyalinis.

Hab. in excrementis, paleis, chartis putridis in Gallia.

37. **Penicillium Scopulariopsis** Sacc., *Scopulariopsis communis* Bainier, Bulletin Soc. Mycolog. Fr. XXIII (1907) pag. 125, tab. XVI, p. 3-6, non *Penicillium commune* Thom. — Hyphis sterilibus repentibus, subinde fasciculatis, parce septatis, hyalinis; conidiophoris crebris, brevissimis, plerumque continua apice semel, raro repetitive verticillato-ramosis, ramulis ultimis (pseudosterigmatibus) plus minus elongatis obclavatis; conidiis ovoideis, minutis, levibus, hyalinis, 6-11 \times 3,6, longiuscule catenatis.

Hab. in substantiis . . . non indicatis (caseo, fungis carnosis?) in Gallia.

38. **Penicillium Bainieri** Sacc., *Scopulariopsis repens* Bainier, Bulletin Soc. Mycolog. Fr. XXIII (1907) p. 125, t. XVI, f. 1-2. — Hyphis sterilibus repentibus parce septatis; conidiophoris brevissimis mox bis verticillato-ramosis; ramulis ultimis (pseudosterigmatibus) obclavato-phialiformibus 14-28 μ . longis; conidiis perfecte sphæricis, longiuscule catenulatis, minute echinulatis, subavellaneis, 6-8 μ . diam.

Hab. in substantiis . . . non indicatis (caseo, fungis carnosis?) in Gallia.

39. **Penicillium niveum** Bainier, Bull. Soc. Myc. Fr. XXII (1906) 8035

p. 136, t. IX, f. 5-12. — Totum album; conidiophoris cylindricis, 650 \approx 12, pluriseptatis, apice quinques verticillato-ramosis, congesto-penicillatis, ramis ramulisque terno-quinis ramulis ultimis phialiformibus exiguis; conidiis cylindraceis 8,5-11 \approx 2,8-3, hyalinis.

Hab. in substantiis . . . non indicatis, Paris Galliæ.

40. *Penicillium Musæ* Weidemann, Centralbl. f. Bakter. etc. II Abt. 8036

XIX (1907) p. 687, cum icon. — Flavo-brunneum v. olivaceum, cæspitulosum, hyphis copiose ramosis, 2,5 μ . cr.; conidiophoris 3-3,2 μ . cr. ramulis lateralibus 1-2 auctis; ramulis iterum pari altitudine divisus et hyphæ primariæ parallele ascendentibus, latitudinem suam sexies superantibus et 5-9 sterigmatibus elongatis coronatis; sterigmatibus sursum sensim tenuatis; conidiis longe catenulatis, ellipsoideis v. fere globosis 2,2-2,8 \approx 2-2,3.

Hab. in fructibus Musæ, Kiel Germaniæ.

41. *Penicillium Sacchari* J. Ray, Variat. champ. infér. p. 61, t. XVI 8037

(1897). — Mycelio repente filiformi parce ramoso, albo, hypostromate indistincto; hypha conidiophora primaria erecta, continua, filiformi sursum (ex iconæ) verticilla bina remotiuscula superimposita gerente; ramis subquaternis cylindricis, pseudobasidiis tereti-obclavatis terno-quaternis verticillatis coronatis; conidiis ovoideis catenulatis, minutis 2 \approx 1 viridibus.

Hab. in culmo putrescente Sacchari officinarum, Paris Galliæ. — Species mediis variis culta satis variat. Conceptacula ascophora in mycelio serius generantur; asci ovoidei sporidia sena ellipsoidea in includentes. Cfr. l. c.

42. *Penicillium Benzianum* Sacc., *Penicillium insigne* Saccardo, Not. 8038

Myc. IX, Ann. Myc. V (1907) pag. 178, non Bainier (1906). — Cæspitulis albis dein roseolis, compactiusculis, pulvinatis v. confluendo effusis; hyphis sterilibus repentibus septatis, parce ramosis, 6-7 μ . cr., fertilibus, seu conidiophoris, adscendentibus, cylindraceis, brevibus, 50-60 \approx 7, parce septatis, sursum penicillato-ramosis, ramis iterato-ternis, arrectis (hinc condensatis), ultimis apicem versus obtuse tenuatis, ramo inferiori subinde solitario; conidiis ex apice ramulorum longissime catenulatis, subglobosis, majusculis, levibus, 9 \approx 8, vertice minute apiculatis, hyalinis, demum dilutissime roseis, per apiculos inter se connexis.

Hab. in foliis Citri Limonum dejectis et loco udo diu servatis, Patavii, ex agro Tarvisino a cl. prof BENZI missis. — Species conidiis levibus et per apiculos catenulatis a *Pen. coccophilo*,

cui conidiophoro primario brevi et conidiis majusculis accedit, mox dignoscitur.

43. **Penicillium gliocladoides** Speg., Myc. Arg. V, p. 433, in Anal. 8039 Mus. Nac. Buenos Aires XX (1910). — Minutissimum, ægre perspicuum, late sed laxe gregarium, capitulis horizontalibus v. pendulis; hyphis mycelialibus 2-3 μ . cr. hinc inde breviter ramulosis, ramulis erectis v. curvulis, septulatis, 30-100 \approx 3; ramulis fertilibus simplicibus v. sæpe bifidis apice abrupte subverticillatim 3-6-capitulato-ramuligeris; ramululis constipatis elliptico-cylindraceis 5-10 \approx 1-1,5; conidiis in capitulum pusillum subcylindraceum, 100-120 \approx 20, cinereum, compactiusculum diu conglobatis, ellipsoideis, 5-6 \approx 1, ægre dissilientibus, levibus.

Hab. ad folia coacervata diu loco udo servata Coffeæ arabicae, La Plata Argentina Amer. austr.

44. **Penicillium Juglandis** Weidemann, Centralbl. f. Bakter. II Abt. 8040 XIX (1907) p. 683, cum icon. — Atro-vireus, granulosum; hyphis 2,5-3 μ . cr., septatis, ex cellulis 20-33 μ . longis formatis; conidiophoris parce ramosis, 3-3,5 μ . cr., ramulis dilatatis pseudosterigmata sæpius terna v. quaterna gerentibus; pseudosterigmatibus angustis, 12 \approx 2,5-3, basi rotundatis et sensim sursum tenuatis; conidiis longe catenulatis, ellipsoideis, demum maturis subglobosis 2,5 \approx 2,3.

Hab. in nucibus Juglandis regiae Kiel Germaniae.

45. **Penicillium baculatum** Westling *) in Svensk Bot. Tidskrift IV, 8041 2, (1910) p. 143, cum ic. — Cæspitulis (coloniis) in gelatina pruni floccosis, albis, dein viridi-cæruleis, margine sterili, floccoso; hyphis sterilibus septatis, hyalinis, intricatis, 2-5 μ . cr.; conidiophoris apice ramoso-penicillatis, levibus, 3,5-6 μ . cr. ramulis I.^{mi} ord. (matulis), 10-14 \approx 4,5-6, ramulis II.^{di} ord. (pseudosterigm.) obclavatis 6,5-9 \approx 3-3,4, subternatis, apice catenigeris; conidiis ellipsoideis, catenulatis, levibus, 3,8-4,6 \approx 3-3,6; peritheciis flavis 100-250 μ . diam. tenui-tunicatis; ascis globosis v. ovoideis, hyalinis; sporidiis lenticularibus, margine subcanaliculatis, 5-6 \approx 4-4,8.

Hab. in foliis aliquot plantarum in Monte Areskutan in Jem-

*) De *Penicillii* speciebus e grege Virentium optimam monographiam figuris illustratam, titulo *Ueber die grünen Spezies d. Gatt. Penicillium*, concinnavit et R. WESTLING et in Arkiv for Bot. Stockholm, II, n. 1 (1911) edidit, speciebus novis pluribus auctam. Dolet hic non posse eas recipere quia volumen nostrum ad annum 1910 tantum pervenit.

tlandia. — Ex peritheciis flavis tenui-tunicatis videretur *Eurotii* (Aspergilli) spec., sed quomodo ex *Penicillio*?

46. **Penicillium vermiculatum** Dang., Botaniste X (1907) pag. 123, 8042 tab. 16-20 et tab. 89, fig. 1. — Mycelio flavo; hyphis sterilibus filiformibus vix 5-6 μ . cr., septatis, ramoso-anastomosantibus; conidiophoris ascendentibus, septatis, gracilibus, apice plerumque bis verticillato-ramosis, ramulis ultimis obclavato-cuspidatis, saepius ternis, sed etiam binis et non raro singulis; conidiis globulosis v. cuboideo-globosis, 2-3 μ . diam., supremis paullo amplioribus, catenulatis, facile secedentibus.

Hab. in culturis fungorum in laboratorio peractis, in Gallia. — Conceptacula ascophora facile evoluta, initio oblonga demum ellipsoidea: ascis sphæroideis 4-6-sporis; sporidiis ellipsoideis obtusis, spinulosis, hyalinis (dimensionibus non indicatis!). Contextus peritheciis fibrilloso-prosenchymaticus.

47. **Penicillium kiliense** Weidemann, Centralbl. f. Bakter. etc. II Abt. 8043 XIX (1907) pag. 680, cum icon. — Cæspitulis viridibus; hyphis sterilibus 2,4-3,5 μ . cr., septatis, ex cellulis 22-28 μ . longis formatis; conidiophoris tantumdem crassis, ramis terminalibus 10-12 \approx 3,5; pseudosterigmatibus modo phialiformibus, basi rotundatis, sursum tenuatis, modo æqualibus, 10 μ . long.; conidiis longe catenulatis isthmis angustis connexis, primo ellipsoideis, denique globosis, 3,3-3,8 \approx 3-3,3, sub microscopio dilute viridibus.

Hab. in substantiis organicis in laboratorio Kiel eductum. — Notis biologicis imprimis dignoscendum.

48. **Penicillium aromaticum-casei** Johan-Ols., Centralbl. f. Bakter. 8044 Abt. II, IV (1898) p. 164, tab. 4-9, p. p. — Hyphis sterilibus, copiosis, penetrantibus, laxe ramosis, continuis; conidiophoris breviusculis, ascendentibus, flexuosis, filiformibus, sursum saepè furcatis, apice pseudobasidiis fusoideis verticillatis paucis (3-4) terminatis; conidiis longiuscule catenulatis, globosis, subæqualibus, hyalinis, 2-2,5 μ . diam.

Hab. in caseo, cui odorem aromaticum communicat, in Norvegia. — Diagnosis ex iconibus auctoris desumpta!

49. **Penicillium cicadinum** v. Höhn, Stzb. K. Ak. der Wiss. Wien CXVIII, Abt. I (1909) p. 405. — Hyphis cæspitosis, breviter ramosis, tenuibus, hyalinis, 2-3 μ . cr.; conidiis in catenulas usque 100 μ . longas et ultra, inter se parallele glutinatis, dispositis, oblongo-ellipsoideis fere cylindraceis, utrinque rotundatis guttulatisque 5-6 raro 7 \approx 1,5-2.

Hab. in corpore, quod byssō alba obducit *Cicadæ* sp. in silvis Tjibodas Java. — Insecta vexat et necat. — Ex auctore species pari fere jure *Oosporæ* adscribi potest.

50. **Penicillium coccophilum** Saccardo, Not. Myc. IX Ann. Myc. v. 8046

V (1907) p. 178. — Effusum, parasiticum, carneolo-isabellinum, densiuscule mucedineum; hyphis sterilibus repentibus, parcis; fertilibus, seu conidiophoris, adscendentibus, brevibus, totis (cum ramis) 90-120 μ . altis, 5,5-6 μ . cr., parce septatis; ramis arrecto-penicillatis, imis oppositis v. solitariis, superieribus bis 3-4-verticillatis, ultimis sensim sursum tenuatis; conidiis globosis v. subglobosis, exquisite verruculosis, majusculis, 8-9 \approx 8, carneolo-isabellinis, catenulatis.

Hab. ad ramos Fici capensis, parasitice in scutellis Cero-plastis Rusci pervasis a Thoracantha cyanea in horto bot. Panormi, socio *Stilbo coccophilo* (prof. JOANN. HECT. MATTEI).

51. **Penicillium minimum** Siebenmann Die Schimmelmyk. d. mensch. 8047

Ohres (1889), Guéguen, Champ, paras. p. 175. — Mycelio hyalino, ramoso, 2 μ . cr.; conidiophoris erectis illis *Pen. crustacei* similibus sed minoribus; conidiis sphæricis levibus, brunneo-nigricantibus, 2,5-3 μ . diam.

Hab. in otite acuta hominis in Germania.

GLIOCLADIUM Corda. — Syll. IV p. 84, X 528, XI p. 594, XIV p. 1048, XVIII p. 521.

1. **Gliocladium elatum** Sacc., Ann. Mycol. VII (1907) p. 434. — Can- 8048 didum, gossypinum, laxum, breviter effusum; hyphis sterilibus repentibus paucis, conidiophoris omnibus arrectis, prælongis, 1500 \approx 4-5, filiformibus, septatis, apice capitatis, capitulis globoso-ovatis, muco interiore diu arcte conglutinatis et sub vitro opacis, acido acetico vero solutis; pseudobasidiis bis verticillatis, primariis et secundariis fasciculato-ternatis v. quaternatis; conidiis catenulatis exiguis, subglobosis, levibus, 2,5-3 \approx 2,5, hyalinis.

Hab. in pileis vestustis udis subputrescentibus Schizophylli communis in calidariis Horti botanici patavini, Apr. 1909 (AUG. NALESSO). — Affine *Gl. Hypomycetis* Sacc. (= *Penicillio Hypomycetis* Sacc. Syll. IV, p. 80), differt vero conidiophoris 4-5-plo longioribus, etsi angustioribus, conidis sphæricis, habitatione in Schizophyllo nec in Stereo.

2. **Gliocladium africanum** Eichelb., Verh. Naturw. Ver. Hamb. 3 8049 Flg. XIV (1906) p. 37. — Solitarium, sparsum; hyphis sterili-

bus matricem penetrantibus; conidiophoris erectis, rectis, 170-270-600 \approx 8-9, apice non incrassatis, diaphane flavidulis, remote septatis, sursum pallidioribus, penicillioideo-ramosis, verticillo inferiori tri-ramoso, ramulis valde confertis; conidiis acrogenis, solitariis, simul cum ramis ramulisque, strato mucoso obvolutis, hyalinis, levibus, ovoideis 4 \approx 2.

Hab. in ligno putrescente, socia *Tilmadoche* nutante, Amani Africæ orient.

3. **Gliocladium prolificum** Bainier, Bull. Soc. Mycol. (1910) p. 385, 8050 t. XXI. — Totum candidum; hyphis sterilibus repentibus septatis, hyalinis; conidiophoris ascendentibus brevibus cylindricis 1-3 septatis, 9-10 μ . cr., sursum 3-6-ramoso-penicillatis, ramis mox in ramulos arrectos obclavato-phialiformes iterato divisis; ramulis apice acutis conidigeris; conidiis copiosissimis, minutis, ex globo-
so ellipsoideis 6,3 \approx 4,2, initio, catenulatis, mox vero in capitulum mucoso-conglobatis.

Hab. in palea uda Graminacearum, Paris Galliæ. — St. ascophorus est *Cephalotheca prolifica* (Bain.) Sacc. et Trott., quam cfr. suo loco.

4. **Gliocladium roseum** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8051 p. 111, t. XV, f. 1-6. — Mycelio repente, septato, ramoso; conidiophoris hyalinis assurgentibus filiformibus, septatis, sursum repetito ramosis, ramulis (pseudosterigmatibus) obclavato-phialiformibus et mox muco conglutinatis viridi-roseis, ovoideis, levibus, 5-6 \approx 2,8, spicam elongatam demum formantibus.

Hab. in charta emporetica putri in Gallia

5. **Gliocladium luteolum** v. Höhn. Ann. Mycol. (1903) — Syll. XVIII 8052 p. 521. — Huc spectat, teste v. Höhn., Fragm. Myk. VI, p. 169, *Gliocladium piliforme* Boud. Ic. Mycol. III pl. 587, non *Stilbum piliforme* Pers., nec Corda.

BRIAREA Corda. — Syll. IV p. 85, XI p. 594.

1. **Briarea gigantea** Speg. Myc. Argent. V p. 415, in Anal. Mus. 8053 Nac. Buenos Aires XX (1910). — Cæspitulis tenerrimis sparsis v. vix. fasciculatis pallidissime chlorinis, erectiusculis; hyphis fertilibus erectis, 500-1500 \approx 20-25 \approx 10-12, septulatis apicem versus breviter ramulosis, deorsum chlorinis sursum hyalinis; conidiis ovoideo-subglobosis, chlorinis, 14-18 \approx 10-12, levibus, in catenulas simplices v. ramulosas, in ramululis acrogenas digestis.

Hab. ad anthodia subputrescentia *Zinniæ multifloræ* cultæ
in hortis La Plata Argent. Amer. austr.

HAPLARIA Link — Syll. IV p. 85, X p. 529, XVIII p. 522.

1. **Haplaria pallida** (Harz) Lindau, Deut. Kr. Fl. Hyphomycet. VIII 8054 (1905) p. 229. Ita potius vocandum *Acladium pallidum* Harz — Syll. IV, p. 87 — observante cl. Lindau l. c. nam ejus conidiophora fere regulariter dividuntur.
2. **Haplaria Citri** Briosi et Farneti, Atti Ist. Bot. Pavia X (Extr. 8055 1906) p. 22, tab. VIII, fig. 5-14. — Hyphis fertilibus valde ramosis, septatis, intus granulosis, 4-4,5 μ . cr., hinc inde papillosis ibique conidigeris, papillis excrescentibus et papillulas novas edentibus; conidiis in glomerulos 18 μ . diam. junctis, globosis v. ellipsoideis, continuis, hyalinis, intus granulosis, 6 \approx 4,5.

Hab. (cultæ) in gelatina cum aliis fungillis citricolis et hucusque numquam in fructibus Citrorum observata. Quoad ceteras notas biomorphologicas cfr. Auct. l. c. Revera species paradoxa et dubia.

HYPHODERMA Fries — Syll. IV p. 89, X p. 530.

1. **Hyphoderma effusum** Fuck. Symb. Mycol. p. 363, Fungi rhen. 8056 n. 241 (sine diagnosi).
2. **Hyphoderma sparsum** Fuck. Symb. Mycol. p. 363, Fungi rhen. 8057 n. 239 (sine diagnosi).

Hab. in thallo *Physciae parietinæ* et *Ph. stellaris*, socio *Illosporio roseo*, in Rhenogovia (FUCKEL).

2. **Hyphoderma sparsum** Fuck. Symb. Mycol. p. 363, Fungi rhen. 8057 n. 239 (sine diagnosi).

Hab. in thallo variorum Lichenum, socio *Illosporio aurantiaco*, in Rhenogovia. — Cl. Lindau in Deut. Krypt. Flora, Pilze VIII p. 218, speciem hanc et præcedentem excludenda declarat; sed ex exempl. Fuckelianis (quibus nos quoque caremus) notas nullas manifeste eruere potuit.

ACREMONIUM Link — Syll. IV p. 89, X p. 531, XVIII p. 523.

1. **Acremonium Vitis** Catt. Arch. Lab. Bot. critt. Pavia Vol. II-III, 8058 p. 60, t. VIII, f. 8-9 (1879). — Arachnoideum, albidum; hyphis repentibus varie ramosis, diaphanis, subtilissimis, obsolete articulatis, in telam araneæ sœpe longe lateque expansam laxè aggreditatis; ramulis conidiophoris subulatis deorsum crassiusculis, ver-

ticillatis, plerumque quaternis, singulis conidia quaterna apice gerentibus; conidiis ovoideis, continuis, hyalinis 3-4 μ . longis tardè dilabentibus.

Hab. in cortice putrescente arborum variarum imprimis *Vitis viniferae*, Casteggio Pavia, 1876 (A. MAESTRI).

2. **Acremonium griseo-velutinum** Speg., Myc. Argent. V, p. 416, in 8059 Anal. Mus. Nac. Buenos Aires XX (1910). — Tenuissimum, latissime effusum vix griseo-velutinum; hyphis superficialibus repentibus tenuibus hyalinis septulatis, ramulis erectiusculis continuis 50-75 \approx 5-6 non v. parce remoteque denticulatis ornatis; conidiis saepius acrogenis, solitariis, e cylindraceo subfusoideis, continuis vel medio obsolete 1-septatis, levibus, 20-40 \approx 6-8.

Hab. in fluxo gummoso Casuarinæ strictæ in hortis La Plata Argentina Amer. austr.

3. **Acremonium Sclerotiniarum** Appel et Laubert, Arb. k. Biolog. Anst. f. Land u. Forstwirtsch. V, Heft III (1905) p. 148, f. 3. — Effusum griseum; conidiophoris simplicibus v. pauci-ramosis; conidiis acrogenis, solitariis, hyalinis, ovoideis, 4,5-11 \approx 1,5-4,5.

Hab. parasitice in ascomatibus plus minusve deformatis Sclerotiniæ Libertianæ, in Germania.

4. **Acremonium Potronii** Vuill. in Bull. Soc. Sc. Nancy (1910) p. 19 8061 et tab. II. — Hyphis ramosis, septatis, vix 1 μ . lat., hyalinis, saepius in cæspitulos isariæformes (*Isariæ brachiatæ* ad instar) intricatis; conidiophoris simplicibus normaliter divaricatis, rarius ramosis, phialiformibus, sed basi non septatis; ramusculo ultimo conidifero, elongato, 15-20 μ . longo, sursum tenuato apiceque truncato; conidiis successive formatis et discretim expulsis, roseis, ovoideis, breviter basi apiculatis, 4-5 \approx 2-2,2.

Hab. e genu hydroperico extractum, in Gallia. In sero et dauco cultum, 37 C. optime viget; 10 C. pigre crescit.

5. **Acremonium araucanum** Speg., Fungi Chilenses (1910) p. 179. — 8062 Effusum, arctiuscule adnatum, gossypinulum, citinum; hyphis tenuibus, 25-100 \approx 5-7, confertiuscule ramulosis, densiuscule intertextis, obsolete septulatis; conidiis hinc inde vage insertis, ellipsoideis, hyalinis, grosse 1-2-guttulatis, 7-8 \approx 6.

Hab. frequens in Aspidioti sp. in pagina infer. foliorum Drymidis Winteri, Bahia de Corral Chile Amer. aust.

6. **Acremonium minutissimum** (Roze) Sacc. — Syll. XIX p. 10 — 8063 *Monoconidia minutissima* Roze, Bull. Soc. Myc. Fr. XIII (1897) p. 83, tab. VI, fig. 27. — Conidiophoris saepius furcatis, filifor-

mibus, sursum tenuatis, continuis, hyalinis, apice monosporis, circ. 40 μ . long.; conidiis ellipsoideis, 5 \times 3, hyalinis, levibus.

Hab. parasitice in plasmodio *Amylotrogi ramulosi* in Gallia. — Stirps dubia.

7. **Acremonium Bonordenii** Sacc. — Syll. IV p. 91. — Huc verisi- 8064
millime spectat *Menispora alba* Karst. Deutsche Fl. p. 61 (nomen)
et p. 65, f. 10.² (icon) æque in tuberibus Solani tuberosi in
Germania lecta.

RHINOTRICHUM Corda. — Syll. IV p. 91, X p. 531, XIV p. 1049.

1. **Rhinotrichum Sumstinei** Peck, Bull. Torr. Bot. Club XXXIV 8065
(1907) p. 103. — Diffusum, tenue, fusco-brunneum; hyphis re-
pentibus v. ascendentibus, parce ramosis, flavidis, septatis, arti-
culo ultimo v. penultimo denticulato, 8-12 μ . cr.; conidiis globo-
sis, hyphis concoloribus, 12-16 μ . diam.

Hab. in ligno emortuo decorticato, Pennsylvania Amer. bor.
(D. R. SUMSTINE).

SPOROTRICHUM Link — Syll. IV p. 96, X p. 532, XI p. 594,
XIV p. 1050, XVI p. 1031, XVIII p. 524.

1. **Sporotrichum anthophilum** Peck N. York State Mus. Bull. n. 105, 8066
(1906) p. 28. — Hyphis repentibus, intricatis, ramosis, continuis
v. parce septatis, latitudine ludibundis, 2-6 μ . cr., hyalinis, stra-
tum gossypinum laxum formantibus; conidiis globosis v. late ovoi-
deis, 4-7,5 μ . diam. in apice acuto ramulorum brevium insertis.

Hab. parasitice in petalis et staminibus *Dianthi Caryophylli*
quæ decolorantur, necantur et excidunt.

2. **Sporotrichum campyleum** Sacc. sp. n. — Cæspitulis byssinis, can- 8067
didis, pulvinatis, 0,5-2 mm. lat., laxe intertextis; hyphis sterili-
bus terrimis, filiformibus, prostratis, subcontinuis, parce ramo-
sis, 1 μ . cr., levibus, rectis v. undulatis, ramulis filiformibus con-
tinuis, 30-40 \times 1,5, plerumque distincte flexuosis v. sigmoideis v.
hamatis, apice tenuatis, modo sterilibus, modo conidiophoris; co-
nidiis acrogenis (semper?) typice oblongis et distincte curvatis,
4-6 \times 2-25, hyalinis, farctis, levibus, rarius subæquilateris et ra-
rissime obtuse trigonis.

Hab. in foliis, ramulis, floribusque (pro herbario male exsicca-
tis) *Epilobii Dodonæi*, Agordo 1905, omnino saprophytice.
— Species singularis, conidiis lunulatis ramulisque sæpius tor-
tuosis v. sigmoideis facile distincta, sed a typo recedens, et ob

hyphas tortas cum formis conidiophoris *Ctenomyctis*, *Eidamellæ* etc. comparanda.

3. **Sporotrichum Quercuum** Shear, Bull. Torr. Bot. Club. XXXIV 8068 (1907) p. 306; *Sp. sulfureum* Grev. f. *Quercuum* Thüm. M. U. n. 986 (absque diagnosi). — Cæspitulis subglobosis, flocculosis, gregariis v. sparsis, 120-1000 μ . diam. primo sulphureis dein viridulis, ex glomerulis globulosis conidiophorum constitutis et hyphis sterilibus ramosis, laxis, flavidis suffultis; conidiis viridulis (coacervatis), subglobosis, 1,5-2 μ . diam., in ramulorum apicibus acrogenis; ramulis ultimis 6 μ . longis.

Hab. in foliis emortuis *Quercus coccinea* et *Castanea dentata*, New Jersey (ELLIS) Maryland (SHEAR).

4. **Sporotrichum fumosellum** Bresadola in Jaap Ann. Mycol. VI 8069 (1908) p. 214 (nomen nudum).

Hab. in caulinibus putrescentibus *Aconiti* sp. Wolkenstein in alpibus Austriacis.

5. **Sporotrichum tenuissimum** Grev. Descript. seven new Scott. Fungi, in Mem. Werner. Soc. IV, part. II (1821-22) p. 2, t. V, f. 2 (extr.) — Candidum, latum, telæforme adhærens; hyphis (pilis) dense intertextis, tenuissimis, raro ramosis; conidiis globosis, minutis, inspersis.

Hab. in trunco emortuo, sicco imprimis in cortice, Braid Hermitage Scotiæ. — Pro notitia speciem attualimus sed ex diagnosi et icone vix definiri potest.

6. **Sporotrichum æruginosum** Schw. — Syll. IV p. 112. — Var. 8071 *microsporum* Karst., Act. Soc. pro Fauna et Fl. fenn. XXVII 4 (1905) p. 16. — Conidiis minoribus, nempe 1-2 μ . diam., a typo recedit.

Hab. supra Ditiolam radicatam prope Kuopio Fenniæ (LÖNNBOHM).

7. **Sporotrichum biparasiticum** Bubák, Bull. Herb. Boiss. 2 sér. VI 8072 (1906) p. 486, t. 15, f. 6-7. — Mycelio inter hyphas *Fusarii Sphaeriæ* inserto, repente, copiose septato, repetitive ramoso, 1-2,5 μ . diam., hyalino, apicibus conidigero, ibique colore pallide roseo suffuso; conidiis breviter cylindraceis, utrinque rotundatis, 4-6 \approx 1-1,5, hyalinis.

Hab. ad ramos emortuos Coronillæ Emeri pr. Ulcinj Montenegro, parasiticum in *Fusario Sphaeriæ* quod quidem parasitatur in *Valsaria rubricosa*.

8. **Sporotrichum antarcticum** Speg., Myc. Argent. V, p. 416, in 8073

Anal. Mus. Nac. Buenos Aires XX (1910). — Cæspitibus quandoque contractulis quandoque diffusis et arachnoideis, 2-10 mm. diam., candidis v. obsoletissime roseis; hyphis repentibus tenuibus, 1,5-2 μ . cr., dense ramulosis, ramulis brevibus, 10-20 \approx 1-1,5, saepius furcatis; conidiis acrogenis?, ellipsoideis, utrinque rotundatis, 4-6 \approx 2-3, hyalinis, levibus.

Hab. in thallo vivo Theloschistidis cujusdam ad saxa Orcadas australes Argentina, Amer. austr.

9. **Sporotrichum lanatum** Wallr. — Syll. IV p. 102. — Adde: co- 8074 nida globosa, albida, 5 μ . diam., sporophoris brevibus fulta, saeppe glomerulata prope ramorum apices.

Hab. quoque ad Halifax Britanniæ. — Cfr. A. L. Smith, Trans. Brit. Myc. Soc. III (1910) p. 223.

10. **Sporotrichum roseolum** Oud. et Beijerinck in Neder. Kruidk. Ark. 3 sér., II, p. 910 (1903). — Cæspitulis dilute roseis, late effusis; hyphis repentibus irregulariter ramosis, parce septatis, tenerrimis, ramulos fertiles seu conidiophora ascendentia simplicia v. ramosa emittentibus; conidiis terminalibus, globosis v. ovoides, subhyalinis, coacervatis roseolis, 3-5 μ . diam. v. 4-5 \approx 3-4, vacuolis et guttulis nullis.

Hab. in charta bibula uda, in laboratorio Delft Hollandiæ. 8076

11. **Sporotrichum expansum** Niessl, in J. Paul. Verh. naturf. Ver. in Brünn, XLVII Extr. p. 28 (1909). — Pannosum, intertextum; floccis simplicibus v. laxe ramosis, hyalinis, conidiis adspersis, oblongis subcylindraceis, obtuse rotundatis, 3 \approx 0,52, virescentibus.

Hab. in charta humente ex calce phosphorica, Schönberg Moraviæ.

12. **Sporotrichum Schenkii** Hektoen Perkins et Journ. of exper. Medic. (1900) p. 77, De Beurm. et Goug. Les sporotrichoses, Paris (1912) p. 47, fig. ad p. 49. — Mycelio filiformi, vase ramoso, hyalino, typice flexuoso, septato, 1,5-2 μ . cr.; conidiis nunc pleurogenis sessilibus nunc in apice ramorum numero vario conglomeratis, obovatis v. ellipsoideis, continuis, levibus, 3-5 μ . longis, hyalinis.

Hab. in ulceribus canis et muris et (inoculatum) quoque in Cavia et Cuniculis, in Britannia et Gallia. — Quoad biologiam, culturas et vim pathogenam cfr. De Beurm. et Goug. l. c.

13. **Sporotrichum Beurmanni** Matruch. et Ramond, C. R. Soc. Biol. Paris LIX (1905) p. 379. — De Beurmann et Gougerot, Bull. et Mem. Soc. Med. Hôpitaux de Paris (1908) 6 pp., De Beurm. et Goug. Les nouv. mycos. p. 128-129, fig. 13-14, et Les sporo-

trichoses, Paris (1912) p. 61, f. 4-21. — Mycelio repente, tenui, 2 μ . cr., septato, hyalino, copiose intricato-ramoso; conidiis copiosis, solitariis sed saepius conglomeratis et spiculas subcylindricas 10 μ . longas in ramis mycelii formantibus, initio subpiriformibus, subpedicellatis (pedicello 1-2 \approx 0,5) mox solutis ovoideis, hyalinis dein brunneis. 3-5 \approx 2-4.

Hab. in tumoribus subcutaneis interioribusque in toto corpore disseminatis hominis in quem morbum s. d. sporotrichosim inducit in Britannia, Italia, Gallia, Germania, America etc. — Chlamydosporæ adsunt. — Sec. cl. Gougerot ll. cc. c. iconæ, species rarius occurrit silvatica et saprophytica in plantis emortuis e. g. in caryopside Avenæ in Alpibus gallicis (Gougerot legit). Culta et inoculata in muribus, directe non pathogena evasit, sed de mure translata in murem pathogena fit et necatrix. — Var. **indicum** Castellani. Cfr. De Beurm. et Goug. Les sporotrichoses p. 143. — Hyphis paullo crassioribus 3-4 μ . cr. In hominibus quibus aliam sporotrichosim affert, Colombo Ceylon. — Var. **asteroides** Splendore. Cfr. De Beurm. et Goug. l. c. p. 138, fig. 22-23. Dignositur cystibus parasitariis globosis, 4-12 μ . diam. processibus bacillaribus, 4-10 μ . longis radiantibus præditis. — In morbo sporotrichosi peculiaris hominis in Brasilia.

14. **Sporotrichum Jeanselmei** Brumpt et Langeron, Bull. et Mem. Soc. Medic. des hôpitaux de Paris, (1910) p. 792, De Beurm. et Goug. Les sporotrichoses, Paris (1912) p. 144, fig. 24, p. 145. — Hyphis filiformibus, parcissime ramosis, continuis, 1,5-2 μ . cr., ramis hinc inde conidiophora brevissima pleurogene emitentibus; conidiis in conidiophori hyphæque primariæ apice vario numero conglomeratis, sphæroideis 2,5-3,5 μ . diam. interdum subpiriformibus, 3-3,7 \approx 2,5-2,8, subhyalinis, brevissime pedicellatis.

Hab. in homine sporotrichosi quadam ægro et (inoculatum) in muribus, in Gallia. — *Spor. Beurmanni* affine. Quoad differentias ab hac specie, biologiam, culturam, vim pathogenam etc. cfr. De Beurm. et Goug. l. c.

15. **Sporotrichum Gougeroti** Matruch. in Arch. de Parasitol. (1907-1910) De Beurm. et Goug. Les Sporotrichoses, Paris (1912) pag. 151, fig. 25 p. 152. — Hyphis filiformibus, septatis, parce ramosis, 2-3 μ . cr., subinde 5-6 μ . cr., articulis subinde inflatulis; conidiis acro-pleurogenis, solitariis v. saepius glomerulatis, ovoideis, rarius subpiriformibus, 4-8 μ . long., hyalinis, sessilibus, rarius brevi-pedicellatis.

Hab. in homine, jam phthisi et syphilide affecto cui sporotrichosim peculiarem attulit, in Gallia. — Quoad notas biologicas, pathogenas, culturas etc. cfr. De Beurm. et Goug. l. c. — *Sporotrichum Dori* De Beurm. et Gong. l. c. p. 161, fig. 26, p. 162 (ex Dor) sporotrichosim quoque generans, ex icone l. c. potius schizophyta videtur.

16. **Sporotrichum dispar** Vidal in Annal. Derm. et Syph. (1882) pag. 8081 22, Cattaneo et Oliva in Arch. Labor. Critt. Pavia V, p. 129. — Conidiis globosis, 1-3 μ . diam., hyphis mycelicis paucis, tenuibus intermixtis.

Hab. in homine, in quæm pithyriasim circinatam affert in Gallia. — Species perdubia.

17. **Sporotrichum corii** (Corda) Sacc. et Trav. Syll. XX pag. 872, 8082 *Chrysosporium Corii* Corda in Sturm, Deutschl. Fl. III fasc. 13, p. 85, t. 43 (1833). — Late effusum, aureum; hyphis prostratis ramosis, albis, continuis; conidiis sæpe pleurogenis, globosis, levibus, flavis, majusculis

Hab. in corio, præcipue bubalino sinensi, in Bohemia. — Quoad genus dubia species.

18. **Sporotrichum? fallax** (Schulzer) Sacc. et Trav. — Syll. XX 8083 p. 872. — *Miaenomyces fallax* Schulz. v. Mügg. in Verh. zool. bot. Ges. Wien (1871) p. 1257, t. 13, f. 37. — Hyphis sterilibus prostratis, intricatis, fertilibus erectis v. curvatis, hyalinis; conidiis pleurogenis, cylindraceis, copiosissimis, utrinque obtusulis, rectiusculis, hyalinis, 6-8 μ . longis.

Hab. in ramis Cydoniæ vulgaris, socia Diplodia Cydoniæ, in Hungaria — Forte *Tuberculariæ* forma depauperata et soluta.

MONOSPORIUM Bon. — Syll. IV p. 113, X p. 535, XIV p. 1051, XVIII p. 525.

1. **Monosporium apiospermum** Sacc. in Ann. Mycol. (1911) XI p. 254. 8084 — Cæspitulis albis, dein leviter fuscis, byssinis, densiusculis, 3-5 mm. latis (in culturis); hyphis mycelialibus repentibus, filiformibus, intricatis; conidiophoris decumbentibus (non erectis!) vase parcissimeque ramosis, parce septatis, 2,5-3 μ . cr. hyalinis, hinc inde guttulatis, ramis ascendentibus, sursum paullo tenuatis, monosporis; conidiis continuis piriformibus, oblongis, interdum obovatis ima basi acutatis truncatisque, 14 \times 5,6, interdum 11 \times 5,7, rarius subrotundis, intus varie guttulatis v. granulosis, extus le-

vibus, longioribus, sëpe infra medium leviter coarctatis, initio hyalinis demum dilutissime sordide roseo-flavidis.

Hab. cultum in tubere Solani ex foculis granulomatosis cutaneis nec non subcutaneis mollibus sed epidermide omnino integra tectis pedis humani, Jan. 1911, in nosocomio dermopathico universitatis Sassari Sardiniae (Prof. doct. Fr. Radaeli) — A typo generis Bonord. et Sacc. recedit habitu decumbente, non verticillioideo, in quo (dempta fructificatione secundaria) ad *Monosporium* (*Eidamia*) *acremonioides* Harz accedit. Cl. Prof. Radaeli speciem cum observationibus pathologicis descriptsit in Giornale Italiano delle malattie veneree e della pelle, anno 1911, fasc. I *).

2. **Monosporium meliolicola** Speg., Myc. Argent. V, p. 416, in Anal. 8085

Mus. Nac. Buenos Aires XX (1910). — Hyphis repentibus tenuibus, 3-4 μ . cr., flexuosis, ramulosis, arcte substrato adnatis; ramulis fertilibus quandoque sparsis et solitariis, quandoque geminatis v. ternatis spiniformibus rectis, 50 \times 2, acutis, monosporis; conidiis e cylindraceo-ellipsoideis, 6-8 \times 2,5-3, grosse biguttulatis, hyalinis, levibus.

Hab. ad setulas mycelii Meliolæ bidentatae in foliis vivis Bignoniacæ cujusdam prope Bompland Misiones Argentina Amer. austr. (P. JORGENSEN).

BOTRYTIS Mich. — Syll. IV p. 116, X p. 536, XI p. 596, XIV p. 1052, XVI p. 1032, et 1156, XVIII p. 526.

1. **Botrytis cinerea** Pers. — Syll. IV p. 129. — Var. **Dianthi** Voglino in Ann. R. Accad. Agric. Torino LII (1909) p. 303. — A typo præcipue distinguitur conidiophoris semper brevioribus; conidiis ellipsoideis, 8 \times 6, rarius usque ad 10-12 \times 6-8; sclerotis hemisphærico-applanatis, nigris v. brunneis, 0,5-2 mm. lat.

*) Postquam *Monosporii apiospermi*, a cl. prof. RADAELI accepti, diagnosim protuli (1911), cl. prof. JUL. TAROZZI Universitatis mutinensis, dissertationem suam titulo *Ricerche anatomo-patologiche, batteriologiche e sperimentalì sopra un caso di actinomicosi del piede*, Taurini jam ab anno 1909 editam, una cum exemplaribus ipsius fungilli originalibus, communicavit. Tam a descriptione et iconibus quam a speciminibus clare patet de eadem ac Radaeliana specie tractari. Observandum quoque utramque, ubi coacta sit in corporis interioribus cellulis, habitum *actinomycoticum* omnino sumere; qua de re tota quæstio de *Actinomycete* denuo, ut videtur, retractanda et inquirenda est.

Hab. ad basim plantularum *Dianthi Caryophylli* culti, qui maxime vexatur et tandem marcescit, in hortis, Torino, Piemonte, nec non in Germania (HILTNER). — Adsunt formæ **Ocymi** Voglino in Ann. R. Accad. Agricolt. Torino LI (1908) p. 32-33 extr. et **Punicæ** Voglino l. c., prima in plantis *Ocymi Basilici* altera in fructibus *Punicæ Granati* in Pedemontio.

2. **Botrytis Pæoniæ** Oudem. — Syll. XIV p. 1052. — Quoad dif- 8087 fusionem et nocumenta ejus in America bor. et ejus sclerotiorum generatione cfr. Flora Patterson, Charles et Veihmeyer, Un. St. Depart. of Agricult. Bur. of Plant. Ind. Bull. 171 (1910) pag. 11-12.
3. **Botrytis umbrina** Bonorden, Bot. Zeitg. (1853) pag. 288, tab. 7, 8088 fig. 9. — Cæspitulis ferruginoso-umbrinis; hyphis septatis sursum ramosis, ramulis brevibus, obtusis, subinde apice incrassatis; conidiis globoso-ovoideis umbrinis.

Hab. in ramis *Vitis viniferae* ex Italia. — Verisimiliter forma *Botr. vulgaris* v. *B. cinereæ*.

4. **Botrytis ampelophila** Spèg., Myc. Argent. V, p. 417, in Anal. 8089 Mus. Nac. Buenos Aires XX (1910). — Aspergilliformis, 3-5-cæspitosa, 1-5 mm. alt. 20-22 p. diam. bas. 10-16 p. diam. apice, cinereo-rufescens; hyphis erectis deorsum chlorinis simplicibus sursum hyalinis apiceque breviter alterne ramosis, ramulis patentiusculis sublobatis, 20-30 \times 5-6, sub vertice coarctatulis et sub coarctatione lobulis 2 obovatis retrorsis ornatis; conidiis in ramulorum apicibus capitatis, subglobosis, 8-14 \times 7-12, subhyalinis, levibus.

Hab. abunde ad sarmenta languida *Vitis ripariæ* in hortis La Plata Argentina Amer. austr.

5. **Botrytis Novaesii** Fr. Noak ap. C. Hugues in La Rivista Vit. 8090 Enol. di Conegliano (1910) p. 509. — Affinis *B. cinereæ*.

Hab. in maculis *Vitis viniferae* a *Cercospora viticola* generatis in Campo Novaes, Capoeira grande Brasiliæ. — Teste auctore species vivitur symbiotice cum *Cercospora*, cui putatur utilis.

6. **Botrytis parasitica** Cavara — Syll. X p. 536. — Var. **Colchici** 8091 Voglino in Annali R. Accad. Agric. Torino LII (1909) p. 302. — Alba, dein cinerescens; hyphis 400-1000 \times 20-24, ramosis, ramis 2-3-furcatis, ultimis spinuloso-sporigeris; conidiis ellipsoideis v. ovoideis plerumque 22 \times 16, nonnullis subpiriformibus, 28 \times 18, primo incoloribus, demum cinereo-pallidis; mycelio intramatricali

ramoso filiformi, nunc 3-4 μ ., nunc 6-7 μ . crasso, pluriarticulato; sclerotiis in partibus exsiccatis minutis nigris.

Hab. in foliis Cochici autumnalis quæ arescunt et conquentur, præcipue ad eorum apicem, Alpignano, Piemonte. — Conidiis majoribus a typo imprimis distinguitur. — *Var. Armeriæ* Voglino in Annal. R. Accadém. Agricolt. Torino LIII (1910-1911) p. 580. — Sclerotiis copiosis, nigris, ellipsoideis, convexis, 0,5-1,5 mm. longis; conidiophoris (medio udo evolutis) subfasciculatis, fuligineis, 200-320 \times 15-20; conidiis ellipsoideis v. ovoideis, 12-17 \times 8-12, illis *B. parasiticæ* similibus. — In scapis floralibus Armeriæ magellensis in hortulo alpino « Chanoussia » cultæ, Piccolo S. Bernardo Ital. bor. — Scapos juniores necat et putrefacit.

7. **Botrytis platensis** Speg., Myc. Argent. V, p 417, in Anal. Mus. 8092 Nac. Buenos Aires XX (1910). — Sparsa v. laxe gregaria; hyphis sterilibus repentibus laxis ramulosis subchlorinis hinc inde ramulos solitarios v. pauci-cæspitulosos erectos (1-3 mm. long. 10-15 μ . cr.) laxe septulatos deorsum subfumosos sursum hyalinos emittentibus; ramulis e cylindraceo subfusoideis 50-100 \times 5-7, sursum coarctatulis et apice modice ovato-capitatis 12 \times 1,5, levibus, hyalinis; conidiophoris crassis subcruciformibus, obtuse trilobis, 15 \times 1,5; conidiis ellipsoideis v. ovoideis 7-10 \times 4-5, hyalinis, levibus pseudosterigmate deciduo, 2-3 \times 1 suffultis.

Hab. vulgata ad folia caulesque plantarum cultarum in calidario, La Plata Argentina Amer. austr.

8. **Botrytis coccotrichoidea** Sacc. in Ann. Mycol. X (1912) p. 314. — 8093 Cæspitulis majusculis, pulvinatis, ambitu irregularibus, 2 mm. latis, sordide griseis, subvelutinis; hyphis fasciculatis, cylindraceis, prælongis, 8-9 μ . cr., septatis, subhyalinis, sursum irregulariter ramosis, 7 μ . cr., apicibus tenuiter denticulatis; conidiis ellipsoideis, utrinque rotundatis, 14 \times 12, basi saepius minute apiculatis, levibus, intus granuloso-farctis, isabellinis.

Hab. in cortice et ligno betulino, Blue Mountain Lake N. Y. Amer. bor. Aug. 1911 (Doct. et Domina FAIRMAN). — Affinis *Botryti coccotrichæ* a qua imprimis distinguitur conidiis dimidio minoribus, pallidioribus etc.

9. **Botrytis latebricola** Jaap, Verh. Bot. Ver. Prov. Brandb. L (1908) 8094 p. 47. — Cæspitulis floccosis, dein expansis, albis, senio flavescentibus; conidiophoris erectis, ramosis, septatis, hyalinis v. flavidis, 150 \times 7-10, apicibus plerumque clavato-incrassatis, denticu-

lis minutis sporigeris præeditis; conidiis ovoideis, ellipsoideis v. ovato-oblongis, levibus, hyalinis v. senio flavidulis, intus minute granulosis, juventute pluribus connexis, uno v. binis polis distincte apiculatis, 10-22 v. 9-12.

Hab. in truncis putridis *Alni glutinosæ* et *A. incanæ*, in truncis cavis *Fagi*, Hamburg, nec non in ligno *Piri Mali* pr. Triglitz (JAAP).

10. **Botrytis gigantea** Letellier Fig. de Champ. Suppl. Bull. t. 709, 8095 fig. 1 (1842) (sine diagnosi).

Hab. ad ligna in Gallia. — Ex icono: cæspituli ampli, depresso, albidi; hyphæ conidiophoræ elatæ a basi ad apicem bis ascendentæ-ramosæ, ramuli quam hypha primaria multo tenuiores; conidia in ramulorum apice plurimæ conglomeratæ, globosæ, hyalinæ. Species vix amplius extricanda.

11. **Botrytis ochracea** Letellier, Figur. Champ. suppl. in Bull. tab. 8096 709, fig. 2 (1842) (Diagnosis desideratur).

Hab. in ramis emortuis in Gallia. — Ex icono: cæspitulis hemisphærico-pulvinati, laxæ gregarii, fulvi; hyphæ conidiophoræ ascendentes semel v. bis parce ramosæ, fulvo-ochraceæ, æquales; conidia globulosa (?) in ramulis acrogena, glomerulata. — Hæc species certe diversa est ab homonyma posteriore (Cfr. Syll. IV p. 137) sed cum ea ex icono numquam sit extricanda, nomen posterioris non est mutandum.

12. **Botrytis Pistiæ** Baccarini, Bull. Soc. Bot. it. (1908) p. 31. — 8097 Mycelio tenui arachinoideo in foliorum parenchymate abscondito; hyphis erectis fertilibus per stomatum fissuras exsilentibus; hyphis fertilibus in cæspitulis tenuibus gregariis, remote septatis candidis, sursum ramosis; ramis sparsis, sub angulo recto patentibus, interdum inflato-rhomboideis, ad varicem ramosis, ramulis brevibus in vesiculam globosam muriculatam dilatatis; conidiis plurimis glomerulatis, ellipsoideis, 5,5-6,3 v. 3,2 achromis, pseudo-sterigmatum brevissimorum ope, vesiculis terminalibus infixis.

Hab. in foliis languentibus Pistiæ Stratiotis quæ enecat, in horto bot. florentino. — *Botr. acmosporæ* Sacc. affinis sed conidiis ellipsoideis nec sphæroideis præcipue diversa.

13. **Botrytis uredinicola** Peck, Bull. Torr. Bot. Cl. XXXVI (1909) 8098 p. 155. — Cæspitibus 1-2 mm. latis, hypophyllis, mollibus, niveis; hyphis breviusculis, sparsis, ramosis, septatis, ramis brevissimis; conidiis globosis, hyalinis, 8-10 μ . latis.

Hab. parasitica in soris Uredinis cuiusdam in foliis Panicis

virgati, Stockton Kansas Amer. bor. (E. BARTHOLOMEW). — *Botr. piluliferæ* Sacc. proxima sed habitu et conidiis minoribus diversa.

14. **Botrytis Melolonthæ** Sacc. in Ann. Mycol. X (1912) p. 320. — 8099
 Effusa, albida, densiuscula, submembranacea, vix velutina; hyphis filiformibus confertis, sursum irregulariter iterato-ramosis 2 p. cr., subcontinuis, hyalinis, parte fertili circ. 25–35 μ . alta; conidiis ad ramulos acrogenis, ellipsoideis, minutis, hyalinis, 2,5–3 \approx 1,5, continuis.

Hab. in superficie inferiore corporis *Melolonthæ vulgaris* in Horto bot. Patavino. Nov. 1898. — A *Botryte tenella* differt conidiis ovoideis, paullo majoribus.

15. **Botrytis pyogenes** Fayod, in Auché et Le Dantec, Arch. de Méd. exper. (1894) p. 853, Guéguen, Champ. paras. p. 249. — Mycelio pannoso, irregulariter septato; conidiophoris hyalinis alterne ramosis (non verticillatis) apicibus acuminatis conidigeris; conidiis plerumque binis rarius 1–3–4, hyalinis, ovoideis, 2 μ . long., strato mucoso obductis, utrinque fusco-guttulatis (?).

Hab. in pure abscessus hominis diabetici in Gallia.

16. **Botrytis polysperma** Kützing, Philos. Bot. II, p. 36 (1852) tab. 19, 8101 fig. 11. (nomem nudum).

Hab. ad vegetabilia in Germania. — Observante cl. Lindau, Deut. Krypt. Fl. Pilze VIII p. 304, ex iconè auctoris species verisimiliter collidit cùm *Botryte cinerea* v. affini.

17. **Botrytis? Rivoltæ** Sacc. — *Botrytis fusca* Rivolta, Parass. veget. 8102 p. stud. malatt. p. 487, tab. 7, fig. 197 (1873) non Sacc. — Arachnoidea, sordide fusca; hyphis copiosis, modo continuis guttulatis, modo septatis ex articulis ovoideis formatis; conidiis hinc inde glomeratis ovoideis v. sphæroideis, magnitudine satis varia, minute 1–2-guttulatis.

Hab. in citrato calcico in Etruria (T. PASSINARI). — Quoad genus dubia stirps.

GRAPHIDIUM Lindau in Rabenh. Krypt. Fl. Pilze IX p. 748 (1909). (Etym. a *graphidion*, parvus stilus). — Mycelium parasiicum endogenum; conidiophora erumpentia, copiose ramosa, ramis trichotomicis v. dichotomicis, ultimis cuspidatis sporigeris, hyalinis, tenuissimis; conidia oblongo-cylindracea, solitaria, continua, hyalina, muco parentia.

- 1 **Graphidium Corrensi** Lindau l. c. p. 748, cum icon. — Mycelio en- 8103

dogeno, septato, noduloso; cæspitulis vix conspicuis; conidiophoris ex stomatibus pluribus fasciculatim exeuntibus hypha prima-ria crassiore suffultis, ramulis ultimis cuspidatis; conidiis oblongo-teretiusculis, hyalinis, $3 \approx 1$ (ex iconе).

Hab. in floribus Cerastii pallentis, C. pumili, C. semi-decandri in quibus sterilitatem causat in Brandenburgia, Rhenogovia, Gallia et forte Dania (CORRENS).

OVULARIA Sacc. — Syll. IV p. 139, X p. 540, XI p. 597, XIV p. 1053, XVI p. 1034, XVIII p. 528.

1. **Ovularia minutissima** Syd., Mycoh. gem. fasc. XIV-XV n. 732 8104 (1908) Ann. Mycol VI (1908) p. 480. — Maculis amphigenis, orbicularibus vel ellipticis, ca. 3-6 mm. longis, brunneolis, plerumque purpureo-marginatis; cæspitulis hypophyllis, plus minus dense aggregatis, minutissimis, oculo nudo haud vel vix perspicuis, albidis; hyphis fasciculatis, non septatis, hyalinis, 20-40 \approx 2-4, apicem versus torulosis denticulisque paucis præditis; conidiis oblongo-ovoideis, utrinque rotundatis, continuis, hyalinis, 7-10 \approx 3-5.

Hab. in foliis Hyperici quadranguli, Riesengebirge Weisswassergrund Germaniae.

2. **Ovularia Vitis** Richon — Sacc. Syll. X p. 540. — Sec. Bubak 8105 Ann. Myc. VI (1908) p. 25, cum iconе, species ita dignoscitur: mycelio intermatricali, folium totum penetrante, hyphis hyalinis, intricatis 0,7-1 μ . cr. per stomata hypophylli exeuntibus et hypostroma tuberculiforme, 30-50 μ . diam. demum brunneum formantibus; conidiophoris ex hypostromate oriundis, hyalinis, continuis, sursum 4-denticulatis, cæspitulos minutos niveos formantibus, 15-25 \approx 2-3; conidiis ovoideis subinde fusoideis, rarius breviter cylindraceis, 5-11 \approx 3-4, basi rotundatis, apice acutis, hyalinis.

Hab. in foliis Vitis viniferæ in Gallia et Austria. — Species Richonii vix nomine nota, tamen eadem videtur, observante cl. Bubák.

3. **Ovularia tuberculiniformis** v. Höhn. Oest. Bot. Zeitschr. LV 8106 (1905) p. 187. — Maculis sordide flavidis, saepius minutis, confluentibus; cæspitulis hypophyllis, e pallido roseolis, internerviis, angulosis ex tuberculis numerosis subrotundis 20-120 μ . lat., firmis, crebris formatis; conidiophoris simplicibus, continuis, breviter clavulatis, 20 \approx 5-6, sursum denticulos 1-6 obscuros ferentibus;

conidiis exacte sphæricis, basi apiculatis, 10-13 μ . diam., hyalinis, tenui-tunicatis.

Hab. in foliolis *Astragali Ciceris* ad Klosterneuburg, pr. Vindobonam Austriæ. — Interdum cæspituli ex paucis conidiophoris efformantur, quæ tunc ex stomatibus erumpunt. — Ob tubercula majuscula firma species ad *Tuberculinam* nutat.

4. **Ovularia Rubi** Bubák, Beitr. Pilzfl. Ung., in Növénytani Közlemények (1907) Heft 4 Extr. p. 39. — Maculis epiphyllis, sparsis v. gregariis, rotundatis v. oblongis v. irregularibus, sæpe confluentibus, brunneis, medio alutaceis arescentibus, 2-4 mm. diam.; conidiis paucis fasciculatis ex stomatibus erumpentibus epiphyllis, breviter cylindraceis sursum conspicue tenuatis, ibique curvatis, deorsum sæpe inflatulis, continuis, hyalinis, 10-15 \approx 2,5; conidiis oblongo-cylindraceis, utrinque rotundatis v. ad basim acutatis, hyalinis, 9-13 \approx 2,5-3,5.

Hab. in foliis vivis Rubi sp. prope Orsova Hungariæ (BUBÁK).

5. **Ovularia Buxi** Oudem. in Ned. Kruidk. Arch. 2 sér. V, p. 173 (1888). — Cæspitulis minutissimis, albis; conidiophoris erectis, simplicibus, septatis, apice rotundatis, hyalinis, 120-140 \approx 5; conidiis ovoideis v. oblongis, 12-16 \approx 5-7, hyalinis.

Hab. in foliis Buxi sempervirentis pr. Nijkerk Hollandiæ (OUDEMANS).

6. **Ovularia Gunneræ** Speg., Fungi Chilenses (1910) p. 180 cum icon. — Maculis amphigenis angulo-so-orbiculatis, inferne tabacinis, superne e tabacino purpurascensibus, 3-25 mm. diam.; acervulis hypophyllis confertis penicilliformibus, candidis, ex 3-12 hyphis cylindraceis, gracilibus, 50-75 \approx 3-4, parce septatis, sursum 3-4-denticulatis efformatis; conidiis cylindraceis utrinque obtusis, rectis, magnitudine ludentibus, 4-20 \approx 2-3, hyalinis, unilocularibus.

Hab. frequens in foliis vivis Gunneræ chilensis, Huelque Valdivia Chile America austr.

7. **Ovularia Epilobii** Lindr. Mykol. Mitteil n. 15 in Acta Soc. pro Fauna et Fl. Fenniæ, XXVI (1904) p. 18. — Maculis amplis, plura cm. long., irregularibus, confluentibus et sæpe majorem folii partem occupantibus, griseis v. griseo-brunneis, cæspitulis hypophyllis, minutis, e paucis conidiophoris formatis, albis; conidiophoris erectis, hyalinis, continuis, rectis curvulisve, 1-3-denticulatis, 35-58 \approx 6 (basi); conidiis hyalinis, continuis, levibus, anguste ellipsoideis v. obovatis, 14-18 \approx 6-8.

Hab. in foliis *Epilobii palustris* in Tavastia australi Fenniæ. — Conidia germinando conidia secundaria minuta edunt.

8. **Ovularia Phyllactidis** Speg., Myc. Argent. V, p. 418, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis sub-determinatis, suborbicularibus, 5-15 mm. diam., centro fuscescens-tibus, ambitu rufescente; cæspitulis hypophyllis densiusculæ gregariis candidis, pusillis; hyphis cæspitosis bacillaribus apice vix denticulatis, deorsum non v. vix incrassatis 20-30 \approx 4-5, continuis, hyalinis; conidiis ellipsoideo-subfusoideis utrinque sæpe subapiculatis, 10-12 \approx 2,5-3, leniter inæquilateralibus, continuis, hyalinis, levibus.

Hab. ad folia viva *Phyllactidis salicariifoliae* in uliginosis, La Plata Argent. Amer. austr.

9. **Ovularia conspicua** Fautr. et Lamb. — Syll. X p. 1054. — Var. 8112 **Cardui** Kab. et Bub., Fünft. Betr. Pilzfl. Tir., in Ber. naturw.-med. Ver. Innsbruck, XXX Jahrg. (1905-1906) extr. p. 18. — Maculis amphigenis, subrotundis, 1-8 mm. latis, initio indistincte viridulis, dein arescendo albis v. sordide albis, plerumque zona brunnea cinctis; cæspitulis hypophyllis, æqualiter distributis; conidiophoris dense fasciculatim ex stomatibus exeuntibus, rectis curvulisve, continuis, hyalinis, apicem versus tenuatis et 1-4-den-ticulatis, 30-60 \approx 3-5; conidiis ovoideis v. ellipsoideis, basi obtusatis, hyalinis, 12-15 \approx 4-7.

Hab. in foliis *Cardui Personatae*, Zillertal (KABAT).

10. **Ovularia occulta** Sacc. in Ann. Mycol. X (1912) p. 313. — Ma- 8113 culis versiformibus brunneolis, amphigenis et caulinolis; cæspitu-lis inter pilos matricis abditis, fugacibus; hyphis fasciculatis, sim-plicibus, continuis, 30-40 \approx 4, sursum leviter denticulatis; conidiis obovatis, 15-16 \approx 9-10, hyalinis, levibus, intus guttulato-granulosis.

Hab. in foliis caulinisque *Solidaginis rigidæ*, London Ontario Amer. bor. Aug. 1910 (J. DEARNESS). — *Ovularia Vir-gaureæ* (Thüm. sub *Ramularia*) Sacc. Syll. IV p. 142 (ad *Ovu-lariæ* genus relata ex diagnosi imperfecta Thümenii), est vera *Ramularia* sec. exempl. originalia, uti descripta est in Syll. IV p. 209; hinc *Ovularia Virgaureæ* Sacc. delenda est.

11. **Ovularia Inulæ** Sacc. — Syll. IV p. 141. — Var. **Lampsanæ** 8114 Bäuml. in Verh. zool. bot. Ges. Wien XXXLIII (1888) p. 715. — Cæ-spitulis hypophyllis; conidiophoris, breviter ramosis, 35-40 \approx 3-6; ovoideo-oblongis, utrinque rotundatis, solitariis v. breviter cate-nulatis, 8-14 \approx 4-4,5, hyalinis.

Hab. in foliis *Lampsanæ communis* pr. Schemnitz Hungariæ (KMET).

12. **Ovularia Polliniæ** P. Henn., Engl. Jahrb. XXXVIII (1905) p. 165. 8115
Maculis flavidо-fuscis, rotundatis, confluentibus dein explanatis; cæspitulis hypophyllis subrotundis confluentibus, albido-cinereis; hyphis fasciculatis, septatis, ramosis, ad apicem denticulatis, 4-6 μ . cr., hyalinis; conidiis ovoideis, intus granulatis, hyalinis, 8-13 \times 6-7.

Hab. in foliis *Polliniæ imberbis*, Katakasa-mura, Tosa Japoniæ (T. YOSHINAGA). — Conidiophoris sæpe copiose ramosis a typo generis deflectit.

13. **Ovularia monosporia** (West.) Sacc. — Ita vocanda est *Ovularia obliqua* (Cooke) Oud. — Syll. IV p. 145 — nam *Oidium monosporium* West. est ex anno 1863 et *Peronospora obliqua* Cooke est ex anno 1865. 8116

PSEUDOVULARIA Speg. Myc. Arg. V, p. 418, in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. *pseudes* falsum et *Ovularia*). — Est *Ovularia* conidiis globosis pleurogenis et acrogenis donata.

1. **Pseudovularia Trifolii** Speg., l. c. p. 419 cum icon. — *Maculis suborbicularibus pallescentibus indeterminatis, 3-5 mm. diam., centro subcinerescentibus ambitu subrufescens; cæspitulis hypophyllis erumpentibus minutissimis albido-subcinereis, ex hyphis simplicibus septulatis hyalinis subdenticulatis, 500-700 \times 5-7 efformatis; conidiis solitarie acrogenis subglobosis deorsum minute papillulatis, 7-10 μ . diam., levibus, punctulato-nubilosus.* 8117

Hab. ad folia viva *Trifolii platensis* in uliginosis Lezama Argentina Amer. austr.

ASTEROPHORA Ditm. — Syll. IV p. 148.

1. **Asterophora angulata** (Catt.) Lind. Deutsch. Krypt. Fl. Pilze VIII p. 225, *Sporotrichum angulatum* Catt. in Arch. Labor. Critt. Pavia, II-III p. 124 (1879) t. XIV, fig. a-b. — *Hyphis araneosis, effusis, septatis, ramosis; conidiis (chlamydosporis) acrogenis irregulariter lobulatis, opacæ nigricantibus, 30 μ . diam., conglomeratis, cæspitulos nigrificantibus.* 8118

Hab. in plantulis junioribus *Oryzæ* in Italia sup. — Vix hujus generis et ob conidia opacæ nigricantia et ob locum.

PELLICULARIA Cooke — Syll. IV p. 149.

1. **Pellicularia chilensis** Speg., Fungi Chilenses (1910) p. 181. — 8119

Tenuissima, latissime effusa, albida, ex hyphis repentibus plus minusve ramosis 200-500 \approx 3-6, atque dense intertextis efformata; conidiis pleurogenis vage insertis, hyalinis, globosis, 4-8 μ . diam., papillulato-asperulis, tunica mucosa tenui obvolutis.

Hab. copiose in foliis languidis Rumicis crispi, Quinta Normal de Santiago, Chile Amer. austr.

MERIA Vuill. — Syll. XIV p. 431.

1. **Meria Laricis** Vuill. (1896). — Syll. XIV p. 431 — Huc spectat, 8120 teste cl. Vuillemin, *Hartigiella Laricis* (Hart. 1899) Syd. (1900). — Syll. XVI p. 1031. — De recto loco in systemate dubia adhunc supersunt. — Occurrit quoque et Larices vexat in Italiæ pluribus locis (HADR. FIORI!)

KABATIELLA Bubák, Myc. Beitr., Hedwigia Bd. XLVI (1907) pag.

297. (Etym. a cl J. E. KABAT, mycologo bohemico). — Acervuli subepidermici, ex stomatibus exeuntes, pallide colorati; conidio-phora conferta ramosa v. simplicia, parum septata, apice subclavata, ibique verruculosa, pseudosterigmata minuta ferentia; conidia elongata v. cylindracea, solitaria, unilocularia, hyalina.

1. **Kabatiella microsticta** Bubak, Myc. Beitr. Hedwigia Bd. XLVI 8121 (1907) p. 297. — Maculis amphigenis, magnis, plerumque elongatis, irregularibus, late confluentibus, subalutaceis v. brunneolis, siccis plerumque late purpureo-brunneo-marginatis; acervulis subepidermiciis, dein ex stomatibus exeuntibus, amphigenis, minutis, elongatis 40-150 μ . latis, flavidо-albis v. rubescensibus; conidiophoris crebre fasciculatis flavidis, basi parum ramosis et sparse septatis, supra divergentibus, apice plus minusve clavatis, 22-35 μ . long., apice 4-9 μ . cr. et aculeolato-verrucosis; conidiis ex-elongato cylindraceis, utrinque rotundatis, rectis v. curvulis, solitariis, 5-12 \approx 2,5-4, raro usque ad 18 \approx 5, hyalinis, plerumque grosse biguttulatis et sparse minuteque multiguttulatis.

Hab. in foliis vivis Convallariæ majalis cultæ prope Turnau, Bohemia (KABAT).

VERTICILLIUM Nees. — Syll. IV p. 150, X p. 545, XI p. 599, XIV p. 1056, XVI p. 1037, XVIII p. 533.

1. **Verticillium candidulum** Sacc. — Syll. IV p. 150. — Var. **Binotia-** 8122
Syll. fung. XXII (VII-1913)

num Sacc., Bull. Soc. Bot. de Belg. XXXV (1896) p. 129, tab. IV, fig. 4 f-g. — Cæspitulis candidis, sparsis v. perithecia *Nectriæ* circumdantibus; hyphis typi, sed deorsum dilutissime fuscellis, 4 μ . cr.; conidiis oblongis, 5 \times 2,5, hyalinis.

Hab. in foliis Orchidearum epiphytarum emortuis in Brasilia, socia et verisimilime metagenetica *Nectria Binotiana* (P. BINOT). — Var. **Solani** (Riv.) Sacc. Mich. II p. 637, *Spicaria Solani* Rivolta, Parass. p. 563 (1884) f. 304. — Conidiophoris 100-150 \times 3,5-4,5; conidiis 6-6,5 \times 3-3,5, hyalinis. — In tuberibus Solani putridis in Italia, Gallia et Hollandia.

2. **Verticillium compactiusculum** Sacc. — Syll. IV p. 151. — Var. 8123 **phylogenum** Sacc., Bull. Soc. Bot. de Belg. XXXV (1896) p. 128, tab. III fig. 3 e-f. — Cæspitulis candidis, nunc sparsis, nunc in stromate peritheciisqne *Nectriæ* orientibus, modo laxis, modo compactiusculis; hyphis typi, conidiis elliptico-oblongis v. subfusoides, 2-guttatis, 7-8 \times 2, rectis, hyalinis.

Hab. in foliis putrescentibus Monocotyledoneæ cujusdam (Orchidæ?) in Brasilia, socia et verisimilime metagenetica *Nectria phylogenæ*.

3. **Verticillium dendrodochoides** D. Sacc., Malpighia XII (1898) 8124 p. 19 extr., tab. 8, fig. 17. — Cæspitulis gregariis, superficialibus, pulvinatis, 1 mm. diam., compactis, dein radiatim diffractis, albis; hyphis fertilibus ascendentibus fasciculatis, parce septatis, 5 μ . cr., a medio sursum ramosis, ramis primariis solitariis v. binis, secundariis seu extimis subternis apice acutiusculis, monosporis; conidiis ellipsoideis, sæpe curvulis, 6-7 \times 3, hyalinis.

Hab. in cortice putri ramorum Ulmi etc., Vittorio Ital. bor. — Tam habitu quam conidiophoris ad *Dendrodochium* nutat.

4. **Verticillium discisatum** Sacc. et Fairm. in Saccardo, Microm. Amer. 8125 novi, Journ. of Myc. v. XII (1906) p. 50. — Minutissimum, confluendo effusum pruinam albam maculiformem in *Lachneæ* disco fingens; hyphis sterilibus repentibus, parcis, fertilibus seu conidiophoris brevibus, 50-80 \times 4, plerumque medio 1-septatis, sursum trifidis, ramis tereti-fusoideis apice ramulos seu pseudobasidia verticillato-terna v. quaterna cuspidata, sæpe curvula, 15-20 \times 3 μ . gerentibus; conidiis obovoideis, majusculis, continuis, hyalinis, eguttatis, 8,5-9 \times 5,5-6, in pseudobasidiorum apice solitariis.

Hab. in disco Lachneæ hemisphæricæ, Lyndonville, N. Y Amer. bor. — Affine *Verticillio epimyceti* sed colore albo, conidiis majoribus differt.

5. **Verticillium palmigenum** Speg. Myc. Argent. V, p. 419, in Anal. 8126 Mus. Nac. Buenos Aires XX (1910). — Pulvinulis tenerrimis nubilosso-pruinulosis cinereis repando-effusis, 5-25 mm. diam.; hyphis 1-5-cæspitosis, erectis, simplicibus, 100-250 \times 3-5, olivaceis, 4-7-septulatis, superne 3-4 verticillos pseudosterigmatum ornatis; conidiis subcylindraceis utrinque rotundatis, rectis, 4-5 \times 1,5-2, hyalinis, levibus, initio catenulatis? dein mucose subcapitulato-conglobatis.

Hab. ad rhachide putrescentes Phœnicis canariensis in horto La Plata Argentina Amer. austr. — An *V. africanum* (Dur. et Mont.) Sacc.?

6. **Verticillium album** Licop. Stor. Nat. Crittig. Vesuv. in Atti R. 8127 Accad. Sc. Napoli (1871) p. 19, t. III, f. 6 (sine diagnosi) — Hyphis mycelicis filiformibus in thallum lichenum penetrantibus; conidiophoris erectis pro more simpliciter dichotomis, sursum verticillato-ramulosis; ramulis ternis v. quaternis phialiformibus, sub inde iterum ternato-ramulosis; conidiis globosis, solitarie acrogenis.

Hab. in propagulis Stereocauli vesuviani, Vesuvio. Ital. austr. — Totum album.

7. **Verticillium Rivoltæ** Sacc. et Trav. — Syll. XX p. 1132 — *Vert. album* Riv. Parass. veget. (1873) p. 482, t. VII, f. 207, non Licop. — Cæspitulis albidis; conidiophoris brevibus, nodulosis, septatis; conidiis ovoideis basi acutatis, striolatis.

Hab. in fœno udo putrescente in Italia. — Species dubia.

8. **Verticillium æruginosum** Speg., Myc. Argent. V, p. 420, in Anal. 8129 Mus. Nac. Buenos Aires XX (1910). — Late effusum, primo laxiusculum candidum dein compactiusculum subcrustaceum glauco-olivascens, margine tantum albescens et fere substratum totum obtegens; hyphis densissime intertextis, septulatis, 5-8 μ . cr., hinc inde ternatim verticillato-ramulosis; pseudosterigmatibus elongato-ampulliformibus, 12-16 \times 2-3, acrogenis, ternatis, subhyalinis; conidiis cylindraceis utrinque rotundatis, 6 \times 2,5 eguttulatis, levibus hyalinis vix fumosis.

Hab. ad corpus Gromphas Lacordairei putrescens prope Jujuy Argent. Amer. austr.

9. **Verticillium Eriophytis** (Massee) Sacc. et Trott. — *Botrytis Eriophyes* Massee, in Taylor. Journ. of Econom. Biol. v. IV (1909) p. 5, tab. 2, et fig. — Maculis parvis niveis; hyphis sterilibus repentibus septatis, 2-3 μ . cr. vage ramosis; fertilibus erectis, ra-

mis ramulisque subverticillatis; ramulis tenuibus subquaternis apice acutiusculis; conidiis prope apicem ramulorum insertis, cylindraceis, hyalinis, continuis, erectis, $5\cdot8 \div 1\cdot5\cdot2$.

Hab. parasitica ad superficiem Acari *Eriophytis Ribis*, prope Reading Angliæ.

10. **Verticillium tumorum** Cke., *Grevillea* IV (1876) p. 114-64, fig. 14. 8131

— Elatum, erectum, hyphis fertilibus e basi furcatis, superne ter verticillato-ramosis, septatis; ramis ascendentibus, 3-5 in quoque verticillo, sursum tenuato-cuspidatis typice monosporis conidiis ellipsoideis, hyalinis, levibus.

Hab. in tumoribus in *Britannia* (Nullam discriptionem in *Grevillea* reperire potui).

ARTICULARIA v. Höhn. *Fragm. Myk.* VI in *Stzb. k. Akad. d. Wiss. Wien*, CXVIII, Abt. I (1909) p. 407 (Etym. *articulus*). — Hyphæ steriles hyalinæ cæspitulosæ-contextæ. Conidiophora simplicia, erecta v. flexa, ex articulis obconicis superpositis formata. Articuli 1-cellulares sed hyphis pluribus bacillaribus verticillatis, coalescentibus, divergentibus cincta, hinc superne truncati ibique margine ex apice hypharum denticulato-sporigero, acuto prædicti. Conidia fusoideo-oblonga, hyalina, continua, in corpus doliforme octona verticaliter coalescentia.

1. **Articularia quercina** (Peck) v. Höhn. l. c. p. 409, fig. 26, *Asco-8132 mycetella quercina* Peck — *Syll. VIII* p. 846 (sub *Cookella*) —

st. conid. — Hyphis sterilibus $1\cdot5\cdot2 \mu$. cr.; conidiophoris 0.5 mm. alt. et ultra, articulis 12-16 $\div 4$; conidiis fusoideis, curvulis, utrinque rotundatis $20 \div 3$, hyalinis, octonis in corpus elliptico-doliiforme 16-20 $\div 10\cdot11$ coalescentibus.

Hab. in pag. inf. foliorum *Quercus tinctoriae*, Illinois Amer. bor.

COEMANSIA v. Tiegh. — *Syll. IV* p. 162, *X* p. 547.

1. **Coëmansia erecta** Bainier, *Bull. Soc. Myc. France* XXII (1906) 8133

p. 220, tab. XIV, f. 9-12. — Conidiophoris filiformibus, 14 μ . cr., sursum in ramos binos, ternos prælongos usque ad 2-3 mm. divis; ramis longe crebro spicato-ramulosis, ramulis sporigeris ascendentibus, 8-septatis, 33 μ . longis, pseudosterigmatibus 5,6 μ . longis; conidiis fusiformibus 11-11,2 $\div 2,8$.

Hab. in substantiis... non indicatis in Gallia. — Affinis *Coëm. reversæ*. — Quoad species generis *Coëmansiae* cfr. Bainier l. c.

HARZIELLA Cost. et Matr. — Syll. XVI p. 1037.

1. **Harziella effusa** v. Höhn., Fragm. z. Mykol. III, in Sitzb. k. Ak. 8134 d. Wiss. Wien Bd. CXVI, Abt. I (1907) p. 149. — Cæspitulis 40-50 μ . altis, late effusis, marginem versus sensim tenuatis, albidis rubido-tinctis; hyphis sterilibus tenuibus, conidiophoris, 40-50 \times 2-3, tenui-tunicatis, non v. parce septatis, plerumque 2-3 ramulis lateralibus oppositis v. verticillatis, acutis, 20-30 \times 1,5-3; hypha primaria ramisque ad apices conidia solitaria sed copiosissima gerentibus; conidiis plerumque globosis, 1,5-3 μ . diam., hyalinis, coacervatis roseis, in capitula subglobosa demum irregularia 4-100 μ . diam. rubescens congregatae.

Hab. in caulis, lignis, corticibus, Muscis, quæ veluti pruina tenui subfarinacea obducuntur, pr. Pressbaum in Wienerwald Austriae (v. HÖHNEL).

2. **Harziella Castaneæ** Bainier, Bull. Soc. Myc. Fr. XXIV (1908) 8135 p. 90 tab. IX fig. 1-5. — Mycelio brunneo v. fuligineo, valde evoluto, filiformi, septato, ramoso; conidiophoris variæ longitudinis, plerumque brevibus, apice v. hinc inde glomerulos v. racemos densos pseudobasidiorum gignentibus; pseudobasidiis phialiformibus apice in capitula minuta conidiorum abeuntibus; conidiis sphæricis, albo-hyalinis, 5 \times 2,5 μ muco congregatae.

Hab. in interiore fructuum vitiatorum Castaneæ sativæ, ubi massas nigras format, in Gallia. — Vix Mucedinacea.

CLONOSTACHYS Corda — Syll. IV p. 165, X p. 574, XIV p. 1057, XVIII p. 537.

1. **Clonostachys cylindrospora** v. Höhnel, Fragm. z. Mykol., Sitzb. k. Ak. d. Wiss. Wien Bd. CXVI, Abt. I (1907) p. 147. — Cæspitulis candidis, flocculosis, 400-500 μ . alt.; hyphis densiusculis parallele ascedentibus, septatis, infra flavidis, sursum hyalinis, 200 \times 4-6; conidiophoris inferius ramos 1-2 alternos, superne 2-4 subverticillatos gerentibus; pseudosterigmatibus acrogenis singulis v. ternis, 8-12 \times 1,5, acutis; conidiis cylindraceis, saepius rectis, utrinque rotundatis, continuis, hyalinis, 4-5 \times 1,5-1,8 copiosissimis demum in spicas 200 \times 6-12 imbricatim congregatae.

Hab. in cicatriculis foliorum ad ramos dejectos Abietis pectinatae, Wienerberg pr. Pressbaum Austriae. — Subinde conidiophorum ramuli secundi et tertii ordinis occurunt.

2. **Clonostachys Simmonsii** Massee, Kew Bull. (1907) p. 242, fig. 9-10. 8137

— Hyphis sterilibus repentibus, simplicibus v. breve vase ramulosis, septatis, hyalinis; fertilibus erectis, simplicibus superne septatis, ad septa verticillato-ramosa, ramis ramulisque ternis v. quinis, ramulis attenuatis; conidiis ubique tectis spicam æmulantibus; conidiis ellipsoideis, hyalinis, spinulosis, 6-4.

Hab. in excrementis larvarum insecti Europterygis sambucariæ in hortis Kew Angliæ (A. L. SIMMONS). — A *Cl. Araucaria* imprimis conidiis spinulosis distinguitur.

SPICARIA Harz — Syll. IV p. 166, XVI p. 1038, XVIII p. 537. 8138

1. **Spicaria colorans** De Jonge, Rec. Trav. Bot. Néerl. VI (1909)

p. 12, tab. 2, fig. 6-8. — Mycelio hyalino, repente septato, anastomotico-ramoso; conidiophoris hyalinis, septatis, assurgentibus filiformibus sursum parce verticillato-ramosum, ramulis ternis v. binis, raro solitariis, ultimis tenuatis conidigeris; conidiis in catenulas longiusculas dispositis, ovoideis, levibus, hyalinis, 6-10,5 ≈ 4-5.

Hab. in cortice vivo Theobromæ, rarius in ligno, Surinam.

— Fungillus mediis alcalinis colorem violaceo-rubrum impertitur et saepe nascitur e germinatione conidiorum Fusari speciei.

2. **Spicaria valdiviensis** Speg., Fungi Chilenses (1910) p. 181. — 8139

Tenuissime effusa, candida; hyphis gracillimis, 25-50 ≈ 1, simplicibus v. bifidis, hyalinis, flexuosis, quandoque continuis; conidiis acrogenis catenulatis, cylindraceis, apice subtruncatis, 5-7 ≈ 1, hyalinis.

Hab. frequens in Heterosporio Tupæ in foliis vivis Lobeliæ Bridgesi prope Ciudad de Valdivia Chile Amer. austr.

3. **Spicaria Aphodii** Vuill. Bull. Soc. Sc. Nancy (1910) p. 24 et p. 22, 8140

fig. 1-12 (extr.) — Hyphis sterilibus ramosis, septatis, intricatis, hyalinis; fertilibus erectis subdecumbentibus; ramis verticillatis, rarius discretis, ultimis conidiferis, basi inflatis sursum tenuatis (phialis Vuill.); conidiis laxe catenatis, roseis, homogeneis v. 1-guttulatis, ovoideis levibus, breviter pedicellatis, 3,5-4 ≈ 1,5-1,7.

Hab. in corpore Aphodiorum (e Coleopteris) quos necat et momificat nec non in terra humosa in Gallia.

GONATORRHODIELLA Thaxt. — Syll. X p. 548.

1. **Gonatorrhodiella Highlei** A. L. Smith, Trans. Brit. Mycol. Soc. 8141

1907 v. III (1908) p. 36, tab. I, fig. 3. — Hyphis sterilibus repentibus, pallidis, fertilibus circ. 500 ≈ 12, subflavis; vesiculis

pœne sphæricis v. elongatis, 20-30 μ . cr.; conidiis ellipsoideis v. sphæricis, flavis, levibus, singulis v. in catenulas breves simplices v. ramosas dispositis, 12-15 \vee 10-12.

Hab. in bulbis Cæpæ, Londini Britanniæ.

2. **Gonorrhodiella eximia** v. Höhn, Fragm. z. Mykol, Sitzb. k. 8142 Ak. d. Wiss. Wien, Bd. CXVI, Abt. I (1907) p. 146. — Hyphis sterilibus parcis, subhyalinis, repentibus, tenui-tunicatis, septatis, 4-6 μ . cr.; conidiophoris pallide rubellis, parvis, cæspitulos densiores v. laxiores formantibus, erectis, indivisis v. rarius medio v. prope basim furcatis, semitunicatis 7-14, saepius 9-11 μ . cr., septatis, articulis 80-200 μ . longis præditis, 500 μ . altis, vesicula una apicali et binis v. ternis intercalaribus elliptico-ovoideis 24-36 \vee 20-30 præditis; vesiculis ubique spinuloso-catenuligeris; conidiis 10-12 in quaque catenula, pallide rubescensibus, ellipsoideis, 7,5-10 \vee 5,5-6, tunica sat tenui.

Hab. parasitice in *Tremella lutescente*, Wienerwald Austria (v. HÖHNEL).

GONATOBOTRYS Corda — Syll. IV pag. 169, XVIII pag. 539.

1. **Gonatobotrys lateritia** Peck, N. Y. St. Mus. Bull. (31) (1909) 8143 p. 21. — Effusa, lateritia, maculas efformans; hyphis erectis, 8-10 μ . cr., septatis, nodulis paucis globosis ovalibusve, nodulo terminali obscure dentigero, 30-40 μ . long.; sporulis ellipsoideis, 8-12 \vee 6-8.

Hab. in speciebus variis Poriæ, Star Lake, St. Lawrence Co., Amer. bor.

ACROSTALAGMUS Corda — Syll. IV p. 163, XI p. 600, XIV p. 1056, XVI p. 1037, 1156, XVIII p. 536.

1. **Acrostalagmus Vilmorinii** Guéguen, Bull. Soc. Myc. Fr. XXII 8144 (1906) p. 264, tab. XVI. — Mycelio albido v. griseo 1-4 μ . cr., parce septato, guttulato, sclerotia rotundata inæqualia, 20-70 μ . diam., brunnea passim formantæ; hyphis fertilibus rectis, rigidulis, inæqualibus, vix septatis, parce ramosis; ramis subsolitariis v. binatis v. pauci-verticillatis, apice tenuatis sub capitulis globosis; conidiis cylindraceis utrinque rotundatis, 5-7 \vee 2,5-3, albidis, levibus, mucilagineis, biguttulatis.

Hab. in collo radicis cuiusdam Asteris sp. quem necat, Les Barres in Gallia. — Ex iconè species omnino spuria videtur. —

Fm. *thomensis* Guéguen, Bull. Soc. Mycol. Fr. (1910) p. 294, tab. X et XI. — A typo differt mycelio stromatiformi, sine sclerotiis; conidiophoris altioribus; conidiis non guttulatis. — In tegumentis nigrescentibus seminis *Theobromæ Cacao*, San Thomé Africæ occid. Conidia 7 ≈ 3-4, in glomerulos 30-50 μ. diam. collecta.

2. **Acrostalagmus roseus** Bainier, Bull. Soc. Myc. Fr. XX (1905) 8145 p. 225, tab. XII. — Cæspitulis roseis, hemisphæricis; hyphis sterilibus septatis, repentibus, hinc inde fasciculatis; conidiophoris ascendentibus, 600-800 μ. altis, 20-40 μ. cr., parce septatis, sursum bis dichotome ramosis, ramis apice in ramulos plerumque verticillato-ternos v. quaternos, obclavatos, arrectos, conidigeros divis; conidiis acrogenis, minutissimis, ex ovoideo sphæricis, 2-6 ≈ 2-3, roseis, dein conglobatis.

Hab. in caryopsidibus *Panicum miliaceum* dejectis, udis, Paris Galliæ. — Interdum generatur forma altera ramis ramulisque omnibus relaxato-divaricalis. Cfr. fig. 6-7 l. c.

3. **Acrostalagmus nigripes** Bainier, Bull. Soc. Myc. France XXII 8146 (1906) p. 221. — Mycelio ramosissimo, nigro, articulato, articulis subglobosis; hyphis fertilibus erectis 500 μ. alt. 10-12-septetis, sursum verticillato-ramosis articulis inferioribus nigricantibus, superioribus hyalinis, ramis semel v. bis verticillatis, quinis-septenis, obclavatis, apice tenuatis, 30-33 μ. longis; conidiis ovoideis capitulato-glomeratis, acrogenis, hyalinis, 5,6 ≈ 2,8.

Hab. in fœno humido in Gallia.

4. **Acrostalagmus galeoides** A. L. Sm., Trans. Brit. Mycol Society 8147 (1906) p. 167. — Cæspitulis minutis, laxis, albis; hyphis sterilibus ramosis, septatis; conidiophoris erectis tenuibus, sursum plures verticillato-ramosis, ramulis 5-8 in quoque verticillo, 10-20 ≈ 2-3, sursum attenuatis, apiceque vero inflatulis et conidigeris; conidiis copiosis, capitulatis, facile deciduis, cylindraceis, 4-6 ≈ 1, hyalinis.

Hab. in Filice quadam putrescente, Epping Forest Britanniae (HUGHES).

5. **Acrostalagmus coccidicola** Guéguen, Champ. parasites de l'homme, 8148 Paris pag. 252, tab. XII, fig. 13 (1904). — Mycelio floccoso anastomotico-ramoso albo dein vitellino, parce septato, 3 μ. diam.; hyphis fertilibus cæspitosis, erectis, 3 μ. diam., cylindraceis, sursum tenuatis, parce septatis, ramosis; ramis sparsis, lateralibus subsolitariis, alternis aut subternis, acutis; conidiis cylindraceis

utrinque rotundatis, hyalinis, levibus, mucilagineis, pallide lutescentibus, 4-5 \approx 1, guttulam sphæricam mox dilabentem foventibus.

Hab. in corporibus Coccidum paginæ inferiori foliorum (Mikaniae ?) adfixis in calidariis, Paris Galliæ.

6. **Acrostalagmus murinus** Ces. in Kl. Herb. Mycol. II n. 74, Bot. 8149 Zeit. (1855) p. 599. — Cæspitibus griseis, diffusis; stipite nigro; conidiis albis.

Hab. in agro Vercellensi Ital. bor.

7. **Acrostalagmus cylindrosporus** Preuss, in Kl. Herb. Myc. n. 1380 8150 (1850) (nomen nudum).

Hab. in agro Hoyerswerda.

8. **Acrostalagmus persistens** Payer, Botan. Crypt. p. 74, fig. 337 (1850). 8151 — Syll. XIX p. 13. — Diagnosis et locus desunt. Verisimiliter species non diversa a vulgatissimo *Acrostalagmo cinnabarino*.

NEMATOGONIUM Desm. — Syll. IV p. 170, XVIII p. 539.

1. **Nematogonium album** Bainier, Bull. Soc. Mycol. Fr. (1905) p. 227, 8152 t. XIII. — Cæspitulis minutis, omnino albis; hyphis mycelii lignum penetrantibus, fructiferis erectis, laxe septatis, 400-600 \approx 8-9, rarius breviter ramosis, vesiculas conidigeras acropleurogenas laxe spinulosas 20-26 \approx 10 generantibus; conidiis e sphærico ovoideis, mox secedentibus, levibus hyalinis, 20 \approx 9-10.

Hab. in caudicibus Populi sp. Paris Galliæ.

Sect. 2. Hyalodidymæ.

CEPHALOTHECIUM Corda — Syll. IV pag. 180, X pag. 549, XIV pag. 1057.

1. **Cephalothecium tetraspermum** Richon, Cat. Champ. Marne p. 428, 8153 fig. ad p. 505 (1889). — Cæspitulis maculiformibus, albis; conidiophoris erectis, indivisis 1-2-septatis, apice conidia terna-quaterna, eovoidea 1-septata, hyalina gerentibus.

Hab. in acervis putridis Hordei, St. Lumier-en-Champagne Galliæ.

2. **Cephalothecium microsporum** Eichelb., Verh. Naturw. Ver. Hamburg, 3, Folge XIV (1906) p. 39. — Hyphis sterilibus dilute viridulis, parce septatis, 3,5-4 μ . cr., substrato adpressis et penetrantibus; conidiophoris erectis, 64-270 μ . alt., basi 8-9 μ ., sursum 4,3 μ . cr., septatis, articulis 16 μ . long. præditis, coacer-

vatis nigricantibus, discretis viridulis, apice inflatis et minute verruculosis; conidiis albidis, hyalinis, capitulum laxum formantibus, oblongis, 8 × 4, medio 1-septatis.

Hab. in corticibus putridis ad pedem M. Bomole, Amani, Africæ orientalis. — Inter Mucedineas et Dematies ambigua species ex ipso auctore.

TRICHOTHECIUM Link — Syll. IV p. 178, X p. 549, XIV p. 551, XVIII p. 539.

1. **Trichothecium javanicum** Koord. Untersuch. Java (1906) p. 226, 8155 f. 36. — Hyphis sterilibus repentibus effusis, hyalinis; hyphis fertilibus simplicibus, fasciculatis, erectis, 270-360 × 4-5, hyalinis; conidiis apicalibus, solitariis, hyalinis, medio uniseptatis, ovoideis, utrinque rotundatis, 14-20 × 9-20, plerumque 18-20 × 9-10, ad septum haud constrictis.

Hab. in foliis emortuis *Ficus Vogelii* cultæ prope Loano in prov. Kedu ins. Java (KOORDERS).

LINDAUOPSIS A. Zahlbruckn. in Berichte Deutsch. Bot. Gesell. (1906) p. 141, t. X (Etym. a cl. botanico G. LINDAU, berolinensi) — Fungus in hymenio lichenum innatus et parasitans. Hyphæ dichotome divisæ, flaccidæ, inæquales (non cylindricæ) decolores, lateraliter gemmiferæ, apice furcatæ. Conidia bina terminalia, hyalina, irregulariter ovoidea v. piriformia, 1-septata, membrana tenui, levi. — A *Didymaria* et *Didymopsi* videtur (ex iconæ) maxime recedere ob hyphas et conidia omnino immersa in hymenio Lichenis.

1. **Lindauopsis Caloplacæ** A. Zahlbruckn. l. c. t. X. — Hyphis crebre dichotome ramosis, fere totum hymenium occupantibus, tenuibus, 1,8-3,5 μ. cr., septatis, in articulos 8-30 μ. longos partitis, gemmis globosis v. subglobosis, solitariis v. aggregatis obsitis; conidiis obovato-piriformibus v. soleiformibus, ad septum plerumque constrictis, 14-23 × 9-11.

Hab. in hymenio Caloplacæ Calopismatis parasitans et apothecia deformans, in insula Creta (STURANY).

DIDYMARIA Corda — Syll. IV p. 184, X p. 550, XI p. 601, XIV p. 1058, XVI p. 1039, XVIII p. 541.

1. **Didymaria perforans** (Ell. et Ev.) Dandeno, Michigan Acad. of Sc. VIII (1906) p. 45. — *Marsonia perforans* E. et Ev. apud

Selby in Ohio Agric. Exp. Stat. Bull. n. 73 (1896) p. 224 et Bull. n. 111 (1899) fig. 12. — Maculis minutis, versiformibus, 1-2 mm. diam., pallidis, mox circumscisso-deciduis; cæspitulis 100-120 μ . diam. v. confluendo amplioribus; conidiis copiosis, clavatis v. cuneatis, medio v. infra medium tenuiter 1-septatis, non constrictis, 11-15 \times 2.5-3, rarius usque ad 20 μ . longis.

Hab. in foliis *Lactucæ sativæ* cultæ in tepidario, Troy Ohio Amer. bor. (A. D. SELBY).

2. **Didymaria Epilobii** Hollós, Ann. Mus. Nat. Hungar. VII (1909) 8158 p. 57. — Maculis amphigenis, suborbicularibus, ochraceis, 2-3 mm. diam., demum confluentibus, sæpe totum folium occupantibus; cæspitulis hypophyllis, cinereis; hyphis erectis, subfasciculatis, simplicibus, continuis, rectis v. curvulis, flavidulis, 20-26 \times 3.5-4; conidiis solitariis, acrogenis, piriformibus, inæqualibus, 1-septatis, valde constrictis, nubilosso-farctis, dilute cinereo-griseis, 30-36 \times 10-16.

Hab. in foliis vivis v. languidis *Epilobii hirsuti* prope Nagy-Körös Hungariæ.

3. **Didymaria graminella** v. Höhn. Ann. Mycol. III (1905) p. 408 c. ic. 8159 — Maculis brunneis, lineatis, 1-15 mm. long.; cæspitulis amphigenis albis, dein sordidis, densis, depresso-depressis; hyphis conidiophoris erumpentibus, confertis, hyalinis, tenuibus, apice monosporis, plerumque conoideis, subinde quoque paullo elongatis, 30-75 \times 4-6, basi cellula brevi suffultis, ceterum continuis, longioribus vero 2-3-cellularibus; conidiis obclavatis hyalinis, tenuiter tunicatis, bi-cellularibus, cellula inferiori crassiore obtusa, super. angustiore acutata, 16-20 \times 4-6, raro 23-28 \times 5-7.

Hab. in foliis *Brachypodii silvatici* pr. Altenmarkt in Præalpibus Austriæ.

4. **Didymaria lutetiana** Sacc. Ann. Mycol. VII (1909) pag. 435. — 8160 Effusa, griseola; maculis amphigenis, elongatis, arescendo albican-tibus; conidiophoris obclavato-ampulliformibus, apice acutatis, 14-15 μ . altis, deorsum 5 μ . cr.; conidiis fusoideo-clavatis, deorsum acutatis, medio 1-septatis, non constrictis, hyalinis, 15 \times 4.

Hab. in foliis nondum emortuis *Brachypodii pinnati* circa Parisios, Sept. 1908 (P. HARIOT). — Probabiliter varietas præcedentis.

RAMULARIOPSIS Spèg., Myc. Argent. V, p. 421 in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. *Ramularia* et *opsis* facies). —

Hyphæ hyalinæ nodoso-articulatæ, dichotomice v. alterne ramosæ; articuli facile, soluti apice infero, attenuato-truncati, supero breviter capitato-bilobi, in conidia sensim transeuntes; conidia cylindracea 1-septata, non catenulata, concoloria

1. **Ramulariopsis Cnidoscoli** Speg., l. c., p. 422, cum icon. — Maculæ pallescentibus diffusis, obsoletis; acervulis hypophyllis nervi-sequiis v. circinantibus, erumpentibus, subhemisphæricis, 100-150 μ . diam., gossypinulæ, albæ, per ætatem subflavescentibus; conidiis quandoque leniter fusoideis quandoque vix subclavulatis, utrinque plus minusve acutiuscule rotundatis 20-50 \approx 5-7, primo continuis dein 1- rarius 2-septatis, ad septa non v. obsoletissime constrictis, rectis v. parum inæquilateralibus, hyalinis, levibus, in lobulis apicalibus articulorum superiorum hypharum alterne exsurgentibus.

Hab. ad folia *Cnidoscoli Cnicodendri* et *Cnidoscoli* sp. alterius, in silvis prope Oràn et Ledesma Argentina America austr.

MYCOGONE Link — Syll. IV p. 183, X p. 550, XI p. 600, XIV p. 1058, XVI p. 1040, XVIII p. 542.

1. **Mycogone Ulmariæ** Potebnia, Myc. St., Ann. Myc. v. V (1907) 8162 p. 21, tab. II, fig. 26 et Trav. Soc. Nat. Univ. Kharkov XXXXIII (1907). — Maculis brunneis; hyphis repentibus, hyalinis, 2-2,5 μ . cr.; sporulis piriformibus 31-35 \approx 22-26 in apice hypharum breviter ramulosis tenuibus insidentibus; loculo superiore conidiorum sphæroideo, 22-26 μ . cr., flavo-brunneo, episporio crebre verruculoso prædicto, inferiori hyalino conoideo, basi 10-12 μ . lato, 7-8 μ . alto.

Hab. in caulis putrescentibus Spirææ Ulmariæ prope Kursk Rossia.

2. **Mycogone flava** (Wallr.) Rivolta, Parass. veg. 2 ed. p. 481 (1884) 8163 fig. 187, *Mycobanche flava* Wallr. Fl. crypt. germ. II 273 (1833). — Hyphis ramosis, ramulos laterales conidiferos mittentibus; conidiis bicellularibus, cellula sup. globosa, spinulosa, inferiori subhemisphærica, levi, intus granulosa et crasse 1-guttata, primo virido-flava, matura saturate griseo-flava.

Hab. in fœno et spicis secalinis in Italia (RIVOLTA) in ligno Tiliæ in Thuringia (WALLROTH). — Species omnino ambigua.

3. **Mycogone Sporotrichi** (Cda.) Sacc. et Trav. — Syll. XX p. 159. 8164 — *Puccinia Sporotrichi* Corda, Icones fung. I, p. 6, tab. II, fig. 100

(1837). — Conidiis solitariis, sparsis, primum innatis, dein liberis, luteis, diaphanis, didymis, cellula supera magna, ovata, infera minore, apiculo minuto instructa.

Hab. in *Sporotrichis leucospermis* variis in Bohemia. — Stirps dubia, sed certe non *Puccinia*.

CHLAMYDOMYCES Bainier, Bull. Soc. Myc. Fr. XXIII (1907) p. 240.

(Etym. *clamys* probabiliter pro *chlamydospora* et *myces*). — Fungus saprophyticus. Hyphæ repentes, septatae, hinc inde ramos ramulosque patentæ apice conidiophoros gerentes. Conidia bicellularia, cellula superiore sphærica v. ovoidea, basi truncata, intense colorata; cellula inferiore obconica, levi, diaphana. — Peraffinis generi *Mycogone*, sed, teste auctore, distinguitur quia non parasitica et quia differt dispositione hypharum. An satis?

1. **Chlamydomyces diffusus** Bainier, l. c., p. 240, tab. XXVI, fig. 4-6. 8165
— Effusus, crassiusculus; conidiorum cellula superiore 22-42 ≈ 22-28, cinnamomea, episporio crassiusculo echinulato, cellula inferiore 14 ≈ 5-6, episporio tenui, levi.

Hab. in fimo vaccino in Gallia.

DIPLOCLADIUM Bon. — Syll. IV p. 176, XIV p. 1057, XVI p. 1038, XVIII p. 542.

1. **Diplocladium Theobromæ** (Lutz) Sacc. et Trott., *Fusarium Theobromæ* Lutz, Bull. Soc. Bot. Fr. LIII (1906) 1907, p. L, cum ic., non App. et Str. — Mycelio effuso, primo albo, dein ochraceo; hyphis ramosis laxe intricatis 2-3 μ. cr., articulis longis; fertilibus ascendentibus sursum bis verticillato-ramosis, ramulis obclavato-phialiformibus; conidiis oblongis utrinque rotundatis, rectis vel curvulis, inæqualibus, 10-15 ≈ 2-4, albis, diaphanis, continuis rarissime 1-septatis, subinde binis catenulatis.

Hab. in seminibus Theobromæ Cacao fermentescentibus, Roça de Boa-Entrada, S. Thomé. — Species non bene definita.

Sect. 3. Hyalophragmiae.

FUSOMA Corda — Syll. IV p. 220, X p. 566, XI p. 607, XIV p. 1065, XVI p. 1048, XVIII p. 543.

1. **Fusoma Cydoniæ** Schulz. v. Mügg., Verh. k. k. zool. bot. Ges. Wien (1871) p. 1234, t. 13, f. 11. — Hypostromate flavidæ minute

celluloso, pulvinulato; conidiis in eo superficialibus, confertis, cylindraceis utrinque valide curvatis et obtusulis, initio 4-guttatis dein 3-septatis, non constrictis, hyalinis, 26×3 .

Hab. in ramis Cydoniæ vulgaris, socia *Diplodia Phlæospora* Sacc. et Trav., in Hungaria.

2. **Fusoma blasticola** (Rostr.) Sacc. et Trav. — Syll. XX, p. 1241 — 8168
Fusarium blasticola Rostr. in Gartner. Tidend. (1895) pag. 122,
Fusoma parasiticum Tub., Pflanzenkr. p. 521, *Fusoma Pini* Hart.,
Lehrb. Pflanzenkr. pag. 116, cum ic. — Mycelio endogeno, dein
erumpente, pallide griseo byssino, ramoso, septato, hyalino; coni-
diophoris brevissimis lateralibus; conidiis acrogenis falcatis, utrin-
que obtuse rotundatis, continuis, dein sub-5-septatis, hyalinis.

Hab. in plantulis imprimis Coniferarum, quibus valde no-
xium, in Bavaria, Baden, Dania.

3. **Fusoma calidiorum** Sacc., Not. Myc. VII, Ann. Myc. IV (1906) 8169
p. 274. — Cæspitulis superficialibus, gregariis, minutis, irregulari-
ter hemisphæricis, 150μ . diam., dilute roseis, fragilibus, denuo
mycelium filiforme candidum radians circumcirca emittentibus; co-
nidiis cylindraceo-fusoideis, utrinque rotundatis, leviter curvis, $17-20 \times 4-4,5$, prorsus continuis, intus granulosis, v. 2-3-guttulatis, ex
hyalino dilutissime roseis; basidiis ex hypostromate minuto, cellu-
loso, ochraceo oriundis, bacillaribus, apice truncatis, $20-24 \times 2,8-3$,
medio tenuiter 1-septatis, subochraceis.

Hab. in pedunculis Anthuri Scherzeriani putrescentibus
in calidariis Horti botanici patavini. — Conidia et basidia aliquid
Glæosporii habent, sed cæspituli sunt omnino superficiales.

MILOWIA Massee — Syll. IV p. 222.

1. **Milowia amethystina** Massee, Kew Bull. (1907) p. 242, f. 3-4. — 8170
Cæspitulis (sporodochiis?) pulvinatis, laxe gregariis, sessilibus,
madore læte amethystinis, $0,5-1$ mm. diam., conidiis cylindraceo-
ellipsoideis, utrinque obtusatis, 7-septatis, hyalinis, $40-50 \times 7-8$,
conidiophoris hyalinis suffultis.

Hab. in ligno decorticato udo, in hortis Kew Angliæ (G. NICHOLSON).

MASTIGOSPORIUM Riess — Syll. IV p. 220.

1. **Mastigosporium album** Riess — Syll. IV, p. 220 — var. **muticum** 8171
Sacc., Ann. Mycol. (1911) p. 254. — Distinguitur conidiis ciliis

carentibus, paullo minoribus, nempe 30-32 \approx 11, conidiophoris crassiusculis, oblongis, 8 \approx 5.

Hab. in foliis languidis Dactyliidis glomeratae in Gallia (P. HARIOT). — Cæspituli hypophylli, in maculis lanceolatis rubiginoso-fuscis gregariis, 200 μ . diam., sed saepe confluentes, omnino superficiales. An cilia, typo adscripta, e facili germinatione potius oriuntur?

SEPTOCYLINDRIUM Bon. — Syll. IV p. 223, X p. 567, XI p. 607, XIV p. 1065, XVI p. 1048, XVIII p. 544.

1. **Septocylindrium bellocense** C. Mass. et Sacc., ap. Sacc. in Ann. Myc. 8172 VI (1908) p. 558. — Cæspitulis epiphyllis, suborbicularibus, sordide albis, macula propria carentibus, 2-3 mm. lat., laxiusculis; conidiophoris dense fasciculatis, sporomorphis, crebro septatis, flavidulis, 25-35 \approx 5-6; conidiis catenulatis, utrinque truncatis v. rotundatis, 1-pluriseptatis, longitudine variabilissima, 20-140 \approx 5-7, rectis v. flexuosis, hyalinis, intus granulosis, septis modo approximatis, modo remotis.

Hab. in foliis languidis Verbasci nigri in M. Bellocia, Verona, Ital. bor. (C. MASSALONGO). — A *Ram. variabili* et *R. cylindroide* certe distinguendum.

2. **Septocylindrium Cynaræ** Speg., Myc. Arg. V, pag. 429, in An. 8173 Mus. Nac. Buenos Aires XX (1910). — Maculis epiphyllis, sparsis v. laxe gregariis, orbicularibus, 2-6 mm. diam., determinatis subcinerescentibus, dense minuteque albido-pruinuloso-papillosis; pulvinulis erumpenti-superficialibus, penicillato-subhemisphæricis, 50 μ . diam.; hyphis continuis fasciculatis, rectis, 20-25 \approx 3-4, simplicibus, apice catenulam conidiorum gerentibus, hyalinis; conidiis cylindraceis, utrinque obtusis, 15-30 \approx 13, rectis v. vix inæquilateralibus, 1-2-locularibus, 2-5-catenulatis, hyalinis, mox dissilientibus.

Hab. ad folia languida v. emortua Cynaræ Scolymi in hortis La Plata Argentina Amer. austr. — A *Ramularia Cynaræ* Sacc. longissime recedens.

3. **Septocylindrium suspectum** Massee, Kew Bull. (1910) p. 4. — Cæspitulis amphigenis, densissime sparsis, albidis, ætate griseis, applanatis; hyphis repentibus laxe ramoso-intricatis, hinc inde ramulos simplices, erectos emitentibus; conidiis cylindraceis, 3-5-septatis, breviter catenulatis, hyalinis v. dilutissime roseo-tinctis, 35-45 \approx 5-6.

Hab. in corpore emortuo insectorum (*Trog-hoppers*) ad folia, ramos hærentium, Trinidad Amer. occid. — Fungus est forte insectorum occisor.

MONACROSPORIUM Oud. — Syll. IV p. 193, X p. 552, XVIII p. 544.

1. **Monacrosporium leporinum** Bubák, Ann. Mycol. IV (1906) p. 120. 8175

— Tenue; conidiophoris erectis 180-300 \approx 4,5, sursum sensim tenuatis, hyalinis, 4-5-septatis, septis sensim distantioribus; conidiis ellipsoideo-fusiformibus vel fusoideis, 5-cellularibus, cellula media conspicue majori, apice acute rotundatis, deorsum in pedicellum sensim angustatis, hyalinis, facile deciduis, 42-53 \approx 13-18,5.

Hab. in fimo leporino pr. Tabor Bohemiæ (BUBAK).

RAMULARIA Ung. — Syll. IV p. 196, X p. 553, XI p. 601, XIV

p. 1059, XVI p. 1041, XVIII p. 546.

1. **Ramularia Pæoniæ** Vogl., Ann. R. Acc. Agric. Torino XLVIII 8176

(1905) pag. 449; Atti R. Acc. Sc. Torino v. XLIII (1907-1908) p. 97 (251). — Maculis supra fuligineis, subtus brunneo-griseis, pruinosis, irregularibus, 4-6-8 mm. latis; conidiophoris hypophyllis, erectis, fasciculatis, subsimplicibus, continuis, hyalinis, valde denticulatis, 40 \approx 4; conidiis cylindraceis, hyalinis, continuis v. 1-septatis, plerumque basi apiculatis, catenulatis, 12-14(raro 16) \approx 3-4.

Hab. in foliis Pæoniæ peregrinæ, socio *Cronartio flaccido* in hortis Pedemontii Italiae bor.

2. **Ramularia serbica** Ranojevic, Ann. Mycol. VIII (1910) p. 395. — 8177

Maculis arescentibus, irregularibus, nervis brunnescentibus limitatis; cæspitulis hypophyllis, ex albo rubidis; conidiis elongatis, cylindraceis, 1-2-locularibus, rectis, 13-34 \approx 5,5-7,5, hyalinis; conidiophoris cæspitosis, ex stomatibus exeuntibus, rectis, simplicibus, continuis, apice obtusis, non denticulatis, 32-51 \approx 5-7, hyalinis.

Hab. in foliis vivis Ranunculi montani, prope Mt. Midzur, Serbia. — A *Ram. acri* basidiis constanter non denticulatis distincta.

3. **Ramularia æquivoca** (Ces.) Sacc. — Syll. IV, p. 201 — var. **bulbosa** Maubl., Bull. Soc. Myc. de Fr. XXII (1906) pag. 70. — 8178

A typo differt conidiis longioribus, 25-30 \approx 3-4; conidiophoris brevibus, simplicibus, apice dentatis.

Hab. in foliis Ranunculi repentis, Pornic Galliæ.

4. **Ramularia Pulsatillæ** Hollós, Botanikai Közlemények (1910) n. 2, 8179

p. 112. — Maculis ochraceis, indefinitis, plerumque apicem folio-

rum occupantibus; cæspitulis amphigenis, minutis, albidis; conidiophoris fasciculatis, continuis, sursum denticulatis, hyalinis, 24-30 \times 4-6; conidiis cylindraceis, utrinque attenuatis et rotundatis, rectis, v. curvulis, medio uniseptatis, non constrictis, hyalinis, 20-34 \times 3,5-4.

Hab. in foliis subvivis *Pulsatillæ nigricantis* prope Kecskemét Hungariæ.

5. **Ramularia Fumariæ** Speg., Myc. Argent. V, p. 420, in Anal. Mus. 8180 Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus, 2-5 mm. diam., centro subalbicantibus ambitu cinerescentibus, areola angusta violascente sæpius cinctis; acervulis hypophyllis v. amphigenis, densiusculis, ex hyphis tenuibus erectis v. repentibus, 30-50 \times 2, furcatis, polyblastis eformatis; conidiis cylindraceis, superne obtusiusculis inferne subattenuatis, gracilibus, 15-30 \times 3, 3-4-blastis hyalinis.

Hab. ad folia languida *Fumariæ capreolatae vulgatae* in herbosis Ensenada prope La Plata Argentina Amer. austr.

6. **Ramularia Heimeriana** P. Magn., Ber. deutsch. bot. Ges. XXVII 8181 (1909) p. 214, fig. 1-5. — Maculis nullis determinatis; cæspitulis hypophyllis, gregariis, totam folii paginam occupantibus, ex stomatibus tantum exslientibus, albis; conidiophoris fasciculatis ex nodulo stromatico oriundis, continuis, rectis curvulis; conidiis elongato-bacillaribus, diu continuis, dein 1-septatis, 22-32 \times 2,7-5, hyalinis.

Hab. in foliis *Polygalæ vulgaris* prope Vahrn Tirolia cisalp. (A. HEIMERL). — Conidia in articulos binos demum secedere videntur.

7. **Ramularia Bifloræ** P. Magn., Pilzfl. Tirol, p. 545 (1905) [nomen] 8182 Lindau Deutsch. Krypt. Fl. Pilze VIII, p. 470. — Maculis suborbicularibus 1-3 mm. diam., raro amplioribus, sæpe valde numerosis, primo viridulo-brunneis, dein albis, modo anguste atro-brunneo-marginatis, modo irregulariter brunneolo-zonatis; cæspitulis minutissimis, sparsis, albis, hypophyllis; conidiophoris e stomatibus fasciculatim erumpentibus, simplicibus, continuis, rectis vel sæpe divaricatis, apice rotundatis v. sub apice obsolete denticulatis, hyalinis, 20-25- raro 40 \times 4; conidiis tereti-fusoideis utrinque acutatis v. obtusulis, continuis v. bicellularibus, 23-30 \times 3,5-4.

Hab. in foliis adhuc vivis *Violæ bifloræ* in Tirolia (MAGNUS, BORNMÜLLER) et pr. Gastein Salzburg (MAGNUS).

8. **Ramularia Viscariæ** Kab. et Bub. Hedw. L (1909) p. 46. — Ma- 8183
Syll. Fung. XXII (VII-1913)

culis amphigenis, variis, subrotundatis, dilute dein atro-ochraceis, interdum concentrice zonatis, plus minus brunneolo-limbatis, subinde confluentibus et folium varie torquentibus et dein necantibus; cæspitulis plerumque hypophyllis per stomata crebro erumpentibus, niveis, demum sordide flavidis; conidiophoris fasciculatis, flexis, raro rectis, cylindricis, sursum tenuatis, continuis v. 1-3-septatis, 150 \approx 4-6; conidiis cylindraceis utrinque rotundatis 20-35, saepius 55 \approx 5-8, rectis curvulisve, initio continuis, mox 1-3-septatis, non constrictis, hyalinis.

Hab. in foliis vivis v. morientibus *Viscariæ vulgaris* pr. Gross-Skal Bohemiæ.

9. **Ramularia Dianthi** Lindau, in Rabenh. Kryptog.-Fl. Ed. II Hyphom. p. 447 (1906). — Maculis demum totum folium occupantibus, amphigenis, brunneis margine lato nigricante, subirregulariter cinctis; cæspitulis amphigenis, albis, punctiformibus; conidiophoris ex stomatibus fasciculatim erumpentibus, hyalinis, usque ad 58 \approx 3; conidiis cylindraceis utrinque acutatis, rectis, 1-2-cellularibus, hyalinis, 20-30 \approx 3,5.

Hab. in foliis *Dianthi carthusianorum* pr. Lenzen, Brandenburg (JAAP).

10. **Ramularia Daniloi** Bubák, Bull. Herb. Boiss. 2 sér., VI (1906) p. 486. — Maculis amphigenis, angulosis, internerviis, 2-4 mm. diam., alutaceis, arescendo albidis, sparsis; cæspitulis hypophyllis, confertis, albis, senio rubescentibus; conidiophoris confertim fasciculatis e stomatibus erumpentibus, rectis, sursum tantum curvulis, denticulisque 2-4 approximatis praeditis, hyalinis, 40-50 \approx 4-5; conidiis primo ellipsoideis, catenulatis, continuis, dein oblongo-cylindraceis, apice plerumque obtuse acutatis, bicellularibus, hyalinis, 14-35 \approx 4,5-5,5.

Hab. ad folia viva *Lavateræ thuringiacæ*, Montenegro (ROHLENA).

11. **Ramularia necator** Massee, Kew Bull. (1907) pp. 243 et 298 et 8186 in Bancrof Handb. Diseas. West. Ind. Plants (1910) p. 54, t. 5, f. 7. — Cæspitulis superficialibus, late effusis, filamentosis, albis; hyphis sterilibus dense intertextis, repentibus, septatis, hyalinis, 7-10 μ . cr., hinc inde inflatis; conidiophoris erectis sparse ramulosis, apicibus tenuatis; conidiis ellipsoideo-oblongis, utrinque rotundatis, 3-septatis, ad septa leniter constrictis, 25-28 \approx 7-9.

Hab. in cotyledonibus plantularum *Theobromæ Cacao* ex

- ins. Dominica et Jamaica provenientibus, in hortis Kewensibus Britanniæ. — Plantulis mortifera.
12. **Ramularia Lupini** Davis, Trans. Wisc. Ac. Arts. a. Sc. XV (1907) 8187 p. 777. — Maculis pallidis, subrotundis, brunneo-marginatis, 4-7 mm. diam.; conidiophoris amphigenis, cæspitulos, rectis v. leviter flexuosis, hyalinis, 20-40 \approx 3,5-5; conidiis hyalinis, cylindraceis, obtusis, demum 1-3-septatis, 25-55 \times 4-6.
Hab. in foliis Lupini sp. Pacific Northwest Amer. bor. (DAVIS).
13. **Ramularia (Cylindrospora) Phaseoli** Klotzsch, Herb. viv. mycol. 8188 II (1832) n. 327 (nomen nudum).
Hab. in foliis Phaseoli sp. in Germania.
14. **Ramularia Lathyri** Hollós, Botanikai Közlemények (1910) n. 2, 8189 p. 112. — Maculis oblongis, alutaceis, ochraceo-marginatis; cæspitulus amphigenis, albidis; conidiophoris fasciculatis, continuis, sursum 3 - denticulatis, hyalinis, 40-50 \approx 3; conidiis cylindraceis, utrinque obtusulis, rectis, continuis aut 1-septatis, hyalinis, 16-20 \times 4-5, catenulatis.
Hab. in foliis vivis Lathyri hirsuti prope Kecskemét Hungariæ.
15. **Ramularia Galegæ** Sacc. — Syll. IV p. 202. — Fm. **Lathyri** 8190 Ferr., Malpighia XX (1906) p. 153. — Maculis immarginatis; conidiis continuis v. septatis, 16-26 \approx 3-3,5.
Hab. in foliis Lathyri hirsuti pr. Alba, Piemonte (FERRARIS).
16. **Ramularia loticola** Massalongo, Nuove reclute fl. mic. veronese 8191 p. 11, in Malpighia v. XX (1906). — Cæspitulus haud maculigenis, punctiformibus, farinaceis, vulgo in tota pagina inf. foliolorum regulariter disseminatis; conidiophoris dense fasciculatis ex stomatum ostiolo egredientibus, interdum ramosis, sursum attenuatis, apice vix denticuligeris, 35-45 \approx 3-3,5; conidiis subcatenulatis, minoribus, ovoideis, majoribus cylindraceis, demum uniseptatis, utrinque subrotundatis, 3-5,5 μ . crassis et usque ad 20-25 μ . longis.
Hab. ad folia Loti corniculati prope Tregnago ex loco «Calavena», Verona, Ital. bor. — Ob cæspitulos in maculis decoratis haud insidentes, atque fere totam paginam inf. foliolorum occupantes, imprimis tamen ob conidia utrinque subrotunda ab affini *Ram. Schulzeri* Baüml. differre videretur.
17. **Ramularia Trifolii** Jaap, Fungi sel. exsicc. n. 374, ex p.; Abh. 8192

Bot. Ver. Prov. Brandb. LII (1910), Extr. p. 9. — Maculis brunneolis, oblongis, internerviis; cæspitulis albis amphigenis; conidiophoris dense fasciculatis e pallido atro-olivaceis sursum hyalinis, e recto leviter flexuosis, septatis, usque ad 100 \times 3; conidiis versiformibus, ovoideis, ellipsoideis, cylindraceis v. subclavatis, 1-2-cellularibus, usque ad 18 \times 3,5.

Hab. in foliis vivis Trifolii medii in provincia Rhenana Germaniae. — Socia *Sphærella carinthiaca* cuius est status conidicus.

18. **Ramularia Craccæ** Lindau, in Rabenh. Kryptog. Fl. Ed. II 8193

Hyphom. (1906) p. 510. — Ita vocanda est *Ramularia montana* Voss (1892) — Syll. XI p. 603 — extante anteriore homonyma *R. montana* Speg. — Nascitur quoque in eadem matrice in Brandenburg (JAAP).

19. **Ramularia australis** Sacc. in Campbell, Un nuovo fungo parasita dal Carrubo, Sora (1911) p. 2. — 8194

Maculis amphigenis fusco-nigricantibus, oblongis, plerumque secus nervos secundarios dispositis, 5-15 mm. longis, 2-3 mm. latis, saepe confluentibus, margine abrupto concolori; cæspitulis hypophyllis, rarissime et epiphyllis, candidis, gregariis, 100 μ . diam. dein confluentibus, flocculosis; conidiophoris, e basi sporigena pulvinulata fulvescente nascentibus, dense fasciculatis, bacillaribus, subrectis, continuis, non denticulatis, hyalinis, 15-20 μ . longis, 2,5-2,7 μ . crassis, apice angustato truncatis; conidiis acrogenis, catenulatis, hyalinis, anguste fusoideis, subrectis, continuis 10-11 μ . longis, 2,5 μ . crassis, junioribus 5-7 μ . tantum longis, utrinque tenuatis et obtusulis.

Hab. in foliis vivis, quæ cito exsiccantur Ceratoniae Silique in agro Formiano Ital. merid. Aprili 1911. Morbum gravem affert. Cfr. Campbell l. c.

20. **Ramularia scabiosa** Mac Alp. et Tryon in Mac Alpine Fung. 8195

Dis. Citrus (1899) p. 88, tab. 19, fig. 56. — Cæspitulis definitis, late brunneolis, circularibus, ambitu sinuosis, circ. 2 mm. diam., margine leviter elevatis, demum senio nigricantibus, area centrali depressæ et pallidiore; hyphis fertilibus cæspitulosis, erectis, simplicibus, subseptatis, hinc inde saepius subconstrictis, hyalinis v. pallidis, intus granulosis, conidio longioribus; conidiis concoloribus, terminalibus, singulis, interdum binis superimpositis, cylindraceis, utrinque obtusis, 8-9 \times 2, bilocularibus, utraque cellule guttulata et granulosa.

Hab. in utraque pagina et petiolis foliorum vivorum Citri Aurantii et C. Limonis, Toowoomba et Queensland Austra-

lie. — Ob cæspitulos demum nigricantes a typo generis sat recedit.

21. **Ramularia Tulasnei** Sacc. — Syll. IV p. 203. — Var. **Fragariæ-vescæ** C. Mass., Osserv. fitol. in Madonna Verona v. II (1908) Extr p. 9. — Maculis minutis (0,5-1 mm.) expallentibus et zona rubella limitatis; cæspitulis cito evanidis, epiphyllis; hyphis fertilibus fasciculatis e stomatum ostiolo egredientibus, sæpe continuis, apicem versus attenuatis, pro more alterne denticuligeris, 25-40 \times 3-3,5; conidiis catenulatis cylindraceis, dein 1-2-septatis 20-36 \times 4.

Hab. in foliis *Fragariæ vescæ*, Tregnago Verona Italia boreali.

22. **Ramularia Trotteriana** Sacc. — Syll. fung. XVIII p. 548. — 8197 Var. **Gei-urbani** Mass. in Sacc., Not. Myc. VII, Ann. Myc. IV (1906) p. 274. — A typo differt maculis non atro-purpureo-mARGINATIS sed linea angusta fusco-rufescente cinctis; hyphis conidiisque paullo crassioribus, nempe usque 4 μ . cr.

Hab. ad folia languida Gei urbani in silva Mantica prope Veronam. Ital. bor. (C. MASSALONGO). — *Ram. Vaccarii* T. Ferraris in *Geo montano* videtur forma luxurians *R. Trotterianæ* in eadem Gei specie lectæ.

23. **Ramularia Epilobii-rosei** Lindau, in Rabenh. Kryptog. Fl. Ed. II 8198 Hyphom. p. 474 (1906). — Maculis subrotundatis v. oblongis, majusculis, sæpe internerviis, griseo-virentibus v. pallide brunneis, immarginatis, arescentibus; cæspitulis amphigenis brunneolo-griseis, flocculosis; conidiophoris ex stomatibus erumpentibus, hypostromate brunneolo suffultis, indivisis, raro septatis, rectis, apice noduloso-denticulatis v. sæpius tantum 1-apiculatis, hyalinis, usque ad 20 \times 4; conidiis cylindraceo-fusoideis utrinque acutulis v. obtusulis, rectis, plerumque bacillaribus, rarius continuis v. 3-cellularibus, hyalinis, subinde binis superimpositis, 20-42- (sæpius 30-38) \times 5.

Hab. in foliis *Epilobii rosei* pr. Triglitz Brandenburg (JAAP) et Viborg Jutlandiæ (LIND).

24. **Ramularia Saniculæ** Linh. in Fung. Hung. n. 194 (1883) c. ic., 8199 Lindau Deutsch. Krypt. Fl. Pilze VIII p. 480. — Maculis inferne tantum manifestis, orbicularibus, rubello-brunneis, medio flavidobrancis; cæspitulis hypophyllis, griseo-albis; conidiophoris fasciculatis ex stomatibus exeuntibus, continuis, hinc inde flexis, ad genicula denticulatis, 29-54 \times 3-5; conidiis oblongo-cylindraceis, utrin-

que rotundatis, rectis curvulisve, continuis v. 1-3-septatis, hyalinis, 2042 \approx 4-5-5,5.

Hab. in foliis Saniculæ europææ, Trentschiner Kom. Hungariæ (LINHART).

25. **Ramularia Pimpinellæ** Jaap, Ann. Myc. VI (1908) p. 215. — Maculæ 8200 amphigenis, polygonis, brunneis vel subflavidis; cæspitulis plerumque hypophyllis, parvis, fere inconspicuis, albidis; conidiophoris simplicibus, hyalinis, 15-30 μ . long., apice cicatricibus conidiorum signatis; conidiis cylindraceis, apice rotundatis vel etiam attenuatis 2-4-cellularibus, raro unicellularibus, non constrictis, hyalinis, 18-38 \approx 3,5-3,5.

Hab. in foliis vivis Pimpinellæ magnæ prope Oberseeland in Karawanken Carnioliae.

26. **Ramularia Libanotidis** Bubák, Beitr. Pilzfl. Hung. in Növénytani Közlemények (1907) Heft 4, Extr. p. 41. — Maculis internerviis, irregularibus, alutaceis, saepe apicalibus; cæspitulis e stomatibus erumpentibus, pseudostromate subepidermico suffultis, hyalinis deorsum continuis, rectis, 1-septatis, sursum curvulis, 1-5-denticulatis, 10-30 μ ., raro usque ad 50 μ . longis, rarius superne dichotomis; conidiis fusoideis v. cylindraceis, 1-3-cellularibus, utrinque tenuatis, hyalinis, 12-32 \approx 2-2,5.

Hab. in foliis vivis Libanotidis montanæ pr. Herkulesfürdö Hungariæ (BUBAK).

27. **Ramularia Peucedani** Hollós, Ann. Mus. Nat. Hungar. VII 8202 (1909) p. 58. — Maculis rufo-brunneis, indefinitis, plerumque apicem foliorum occupantibus; cæspitulis amphigenis, minutis, albidis; conidiophoris fasciculatis, continuis, sursum denticulatis, hyalinis, 10-14 \approx 2; conidiis cylindraceis, utrinque obtusulis, rectis v. curvulis, continuis v. plerumque bicellularibus, raro 2-septatis, hyalinis, 18-22 \approx 2-3,5, catenulatis.

Hab. in foliis vivis Peucedani arenarii prope Kecskemét Hungariæ.

28. **Ramularia saprophytica** Bubák, Ann. Mycol. IV (1906) p. 121. 8203 — Conidiophoris ex hypostromate minuto nigro 40-60 μ . diam. ex stomatibus erumpente oriundis, 30-60 \approx 3, curvulis, hyalinis, sursum denticulos 3-7 remotiusculos gerentibus; conidiis breviter catenulatis, primo fusoideis, continuis, demum cylindraceis bicellaribus, utrinque acutatis, hyalinis, 10-22 \approx 2-3.

Hab. in caulinis emortuis siccisque Heraclei Sphondylii pr. Tabor Bohemiæ (BUBAK).

29. **Ramularia Imperatoriæ** Lindau, in Jaap Beitr. Pilzf. d. Schw., 8204

Ann. Myc. v. V (1907) p. 269. — Maculis subrotundis, oblongis v. irregulariter angulosis, interdum confluentibus, sæpius sparsis, usque ad 1 cm. lat., brunneis v. griseo-brunneis margine, angusto atro acute cinctis, superne vero zona latiore atra, concentrice signata cinctis; cæspitulis amphigenis, pruinam albam plus minus densam fingentibus; conidiophoris ex v. prope stromata fasciculatim erumpentibus, indivisis, parce septatis v. continuis, non denticulatis, apice rotundatis, hyalinis, 20-30 \approx 3; conidiis cylindraceis utrinque tenuato-rotundatis, continuis v. bicellularibus, subinde binis superimpositis, hyalinis, 20-34 \approx 3-3,5.

Hab. in foliis vivis Imperatoriæ Ostruthii, Simpeln Helvetica et in Tiroli australi (JAAP), Keilberg in Erzgebirge (KRIEGER).

30. **Ramularia Gardeniæ** C. Mass., Madonna Verona III (1909) p. 21. 8205

— Vix maculigena, pro more hypophylla; hyphis conidiophoris dense cæspitosis, subramosis, vulgo continuis, extremitatem versus alterne minute denticuligeris, 15-40 \approx 2-2,5; conidiis catenulatis ex ovoido fusoideis, longitudine varia 4-12 \approx 2-2,5, fere semper continuis, majoribus 1-septatis.

Hab. in foliis languidis Gardeniæ grandifloræ, in Horto Menegazzoli Veronæ Ital. bor. — Ad *Ovulariam* vergit.

31. **Ramularia Loniceræ** Vogl., Ann. Acc. Agr. Torino (1904) p. 72 8206

cum iconæ et ap. Sacc. in Ann. Myc. III (1905) p. 169. — Maculis castaneis, rotundis v. irregularibus, 2-3-6 mm. et ultra latis; cæspitulis gregariis, hypophyllis, candidis; conidiophoris fasciculatis, simplicibus, continuis, hyalinis, ad apicem parce denticulatis, 50-90 \approx 3-3,5; conidiis cylindraceis, hyalinis, basi apiculatis, ad apicem rotundatis, continuis, raro 1-septatis, breviter catenulatis, 24-28 \approx 4.

Hab. in foliis Loniceræ ad muros, in Pedemontio Italiæ bor.

32. **Ramularia Asteris-Tripolii** Jaap, Bot. Ver. Prov. Brandb., I 8207

(1908) p. 48. — Maculis subrotundis, v. oblongis, sæpe indistinctis et immarginatis, subinde, in toto folio extensis, flavidis, dein griseis v. brunneolis; cæspitulis confertis, flocculosis albis, amphigenis; conidiophoris fasciculatis, erectis, hinc inde curvatis, simplicibus, in medietate superiore denticulatis, hyalinis, 45-85 \approx 4-7, ætate septulatis; conidiis cylindraceis, supra rotundatis, deorsum leviter tenuatis et apiculatis, rectis v. leviter curvis, 1-4-cellularibus, hyalinis, 25-48-(sæpius 34) \approx 4-4,5, rarius tantum 18 \approx 3,5, intus granulosis, subinde guttulatis.

Hab. in foliis *Asteris Tripolii*, Schleswig-Holstein (SONDER) Wiborg (LIND). — Observante Lindau verisimiliter hæc species collidit cum *Ram. Asteris* (Phill. et Plowr.) Bub. — Syll. IV p. 29 (*Fusidium*).

33. **Ramularia Taraxaci** Karst. — Syll. IV p. 207. — Var. **epiphylla** 8208 Briosi e Cavara, Fungi parass. etc. (1904) n. 362. — Maculis amphigenis versiformibus, flavo-brunneis; cæspitulis fere semper epiphyllis; cetera typi.

Hab. in foliis *Taraxaci vulgaris*, Meaux Galliæ (P. DUMÉE).

34. **Ramularia Asteris** (Plowr. et Phill.) Bubák, Ann. Myc. VI 8209 (1908) p. 27. — Ita vocandum *Fusidium Asteris* Plowr. et Phill. — Syll. IV p. 29.

35. **Ramularia Cirsii** Allesch. — Sacc. Syll. XI p. 605. — Var. **Cirsii arvensis** C. Mass., Osserv. fitol., in Madonna Verona v. II (1908) Extr. p. 8. — Maculis subrotundis, foliicolis, subferrugineis, centro expallentibus; cæspitulis epiphyllis evanescentibus; hyphis fertilibus densissime fasciculatis ex ostiolo stomatum egredientibus continuis, 20-40 \approx 3,5-4, apice vix alterne denticuligeris; conidiis ex ovoideo elongato-cylindraceis, 27 \approx 2,5-3, vulgo continuis.

Hab. in foliis *Cirsii arvensis*, Tregnago Verona in Italia boreali.

36. **Ramularia Ptarmicæ** Lindau, in Rabenh. Krypt. Fl. Pilze IX 8211 p. 777 (1910). — Maculis minutis, subrotundis, atro-brunneis denique totum folium brunneo tingentibus; cæspitulis hypophyllis, sub vitro areolas albidas subpulvereas formantibus; conidiophoris fasciculatim e stomatibus exeuntibus, brevissimis, hyalinis, 5-6 p. cr.; conidiis cylindraceis, rectis, utrinque rotundatis, 4-(raro 2-) cellularibus, hyalinis, oleoso-farctis, 40-58 \approx 5,5-6,5, subinde tereti-clavatis, 6-cellularibus, usque ad 97 \approx 7,5.

Hab. in foliis *Achilleæ Ptarmicæ* pr. Triglitz et Hamburg Germaniæ (JAAP). — Ob conidia interdum elongata ad *Cercosporellam* nutat.

37. **Ramularia Centaureæ-atro-purpureæ** Bubák, Beitr. Pilzfl. Hung., 8212 in Növénytani Közlemények (1907) Heft 4 Extr. p. 39. — Maculis amphigenis, subrotundis, usque ad 5 mm. lat., sordide brunneis, centro alutaceis, acute et elevato-marginatis, leviter concentrica sulcatis, sparsis, interdum subconfluentibus; conidiophoris amphigenis e stomatibus erumpentibus in cæspitulos densos regulariter distributos collectis, hyalinis, sursum noduloso-curvis et paucis (2-4) denticulis praeditis, 15-35 \approx 3-4; conidiis ellipsoideis,

fusoideis v. subcylindraceis, utrinque rotundato-acutatis, hyalinis, breviter catenulatis, 1-2-cellularibus, 11-22 \approx 3-4,5.

Hab. in foliis vivis *Centaureæ* atro-purpureæ pr. Herkulesfürdö Hungariæ (BUBAK).

38. **Ramularia variegata** Ell. et Holw. — Syll. X p. 557. — Var. 8213

Petasitis-officinalis Allescher, Hedw. XXXIV (1895) p. 285. — Maculis amphigenis, irregularibus, superne brunneo-variegatis, inferne minus distinctis; cæspitulis hypophyllis; conidiophoris simplicibus, apice denticulatis, hyalinis; conidiis oblongo-cylindraceis, utrinque obtusis, primo continuis v. bicellularibus, denuque 3-6-cellularibus, ad septa vix constrictis, hyalinis, 20-40 \approx 3-4,5.

Hab. in foliis vivis *Petasitis officinalis*, Graswangtal Bavariæ sup (ALLESCHER).

39. **Ramularia cervina** Speg. — Syll. IV p. 208. — Var. **Petasitis** 8214

Bäuml. in Verhandl. zool. bot. Gesell. Wien L, p. 715 (1888). — Conidiophoris ramosis, continuis, non denticulatis, 30-60 \approx 2-3; conidiis hyalinis 18-24 \approx 2-3,5.

Hab. in foliis vivis *Petasitis albi* pr. Prencow Hungariæ (KMET).

40. **Ramularia Jurineæ** Hollós, Ann. Mus. Nat. Hung. V (1907) 8215

p. 467. — Maculis oblongis, brunneolis, fusco-marginatis; cæspitulis epiphyllis, albidis; conidiophoris, fasciculatis, continuis aut raro uniseptatis, nonnunquam sursum 1-3-denticulatis, hyalinis, 32-52 \approx 4-5; conidiis cylindraceo-clavatis, apice rotundatis, basi obtusatis, 1-septatis, hyalinis, 22-32 \approx 6-8.

Hab. in foliis vivis *Jurineæ mollis* prope Kecskemét Hungariæ.

41. **Ramularia balcanica** Bubák et Ranojević, Ann. Mycol. VIII 8216

(1910) p. 396. — Maculis amphigenis, rotundatis, brunneolis, usque ad 10 mm. lat., æque distributis, confluentibus; cæspitulis amphigenis, punctiformibus, crebris, albis; conidiophoris cæspitosis ex stomaticibus orientibus, sœpe edentatis, septatis, quandoque ramosis, 19-98 \approx 2-3, hyalinis; conidiis catenulatis, primum ex elongato ellipsoideis, globosis, fusoideis, dein elongatis, utrinque repente acutatis, raro rotundatis, demum bilocularibus, 7,5-28 \approx 2-4, hyalinis.

Hab. in foliis vivis *Cirsii candelabri*, in Serbia. — A *R. Onopordi* differt conidiophoris longioribus quandoque ramosis, sœpius non denticulatis.

42. **Ramularia Senecionis** (Berk. et Br.) Sacc. — Var. **carniolica** 8217

Jaap, Ann. Myc. VI (1908) p. 216. — Conidiophoris usque ad 70 μ .

long., conidiis 25-40 \approx 4-7, 1-2-raro 3-locularibus.

Hab. in foliis vivis *Senecionis carniolici* in Passo del Sella Tiroliæ cisalp.

43. **Ramularia Anthemidis** Hollós, Ann. Mus. Nat. Hung. V (1907) 8218 p. 467. — Maculis indeterminatis; cæspitulis hypophyllis, albidis; conidiophoris fasciculatis, continuis aut raro uniseptatis, apice subramosis, hyalinis, 54-72 \approx 4-5; conidiis cylindraceis, utrinque rotundatis v. obtusulis, continuis v. 1-septatis, hyalinis, 18-24 \approx 4-6.

Hab. in foliis languidis *Anthemidis ruthenicæ* prope Kecskemét et Nagy-Körös Hungariæ.

44. **Ramularia Tanaceti** J. Lind Ann. Mycol. III (1905) p. 431. — Maculis magnam folii partem occupantibus, sæpe ab apice usque ad marginem attingentibus, brunneis v. atro brunneis, nunc immarginatis, nunc obsolete flavo-marginatis; cæspitulis hypophyllis, sparsis, punctiformibus, albis; conidiophoris e stomatibus fasciculatim erumpentibus, confertis, brevibus, plerumque continuis, apice rotundatis v. acutis, v. denticulo auctis, hyalinis, 38 \approx 4-4,5; conidiis cylindraceo-fusoideis, utrinque acutis, rarius binis superpositis, bicellularibus, hyalinis, 30-38 \approx 4.

Hab. in foliis *Tanaceti vulgaris* pr. Viborg. in Jutlandia (LIND).

45. **Ramularia Doronici** Vogl. in Annal. R. Accad. Agricolt. Torino LIII 1910 (1911) p. 581. — Maculis subrotundis v. oblongis, 4-12 mm. et sæpe ad marginem confluentibus, flavidis dein arecentibus, inferne velutinis, fuligineis, ex hyphis conidiophoris creberrimis cylindraceis, subarcuatis, subfuligineis, 34-38 \approx 7-9 conflatis; conidiis solitarie acrogenis, cylindraceis, obtusis, hyalinis v. dilute luteolis, 2-septatis, 52-64 \approx 10-12.

Hab. in foliis vivis v. languidis *Doronici scorpioidis* et *D. Clusii* in Hortulo alpino «*Chanousia*», Piccolo S. Bernardo Ital. bor. — Mycelium intra folium penetrans, varie ramoso-intricatum, septatum, modo 4-6, modo 8-10 μ . cr.

46. **Ramularia montenegrina** Bubák Bull. Herb. Boiss. 2 sér. VI (1906) p. 486. — Maculis amphigenis, subrotundatis v. irregulares, 2-4 mm. latis, brunneis non distincte marginatis; cæspitulis amphigenis, albis; conidiophoris e stomatibus fasciculatim erumpentibus, parcis, primo rectis, apicem versus tenuatis, denticulo unico apicali præditis, demum leniter curvis et pluridenticulatis, hyalinis, 22-40 \approx 3,5-4,5; conidiis cylindraceis, utrinque obtusule tenuatis, 1-3-cellularibus, hyalinis, 13-35 \approx 2,5-4.

Hab. in foliis vivis *Hedypnoidis* scabræ et *H. creticæ* var. *monspeliensis*, Montenegro (BUBAK).

47. **Ramularia helvetica** Jaap et Lindau, in Jaap Beitr. Pilzfl. d. 8222 Schw., Ann. Myc. v. V (1907) p. 269. — Maculis sparsis, viridulo-griseis v. viridulo-brunneis, irregulariter marginatis, demum intus albis, acuteque limitatis, siccis zona inæquali flavidula cinctis 4-5 mm. lat.; cæspitulis amphigenis, maculas strato pruinoso albo obtegentibus; conidiophoris ex stomatibus fasciculatim erumpentibus, simplicibus, parce septatis, edentatis, apice rotundatis, hyalinis 30-38 \approx 3,5; conidiis cylindraceis utrinque rotundatis, saepius bicellularibus, raro 1-3-cellularibus, hyalinis, 27-40 \approx 3,5-4.

Hab. in foliis vivis *Hieracii albidii* ad Furkastrasse Helvetiæ, 2150 m. alt. — A *Ram. conspicua* rite distincta.

48. **Ramularia Scorzoneræ** Jaap, Ann. Myc. VI (1908) p. 216. — Ma- 8223 culis foliicolis rotundatis v. elongatis, atro-brunneis, medio denique pallidioribus, parcis; cæspitulis albidis, inconspicuis; conidiophoris brevibus 10-20 \approx 2,5-3, simplicibus; conidiis cylindraceis, 1-2-cellularibus, 14-22 \approx 2-3.

Hab. in foliis vivis *Scorzoneræ aristatae*, Seiser Alpe Tirolia cisalp.

49. **Ramularia hamburgensis** Lindau, in Rabenh. Kryptog. Fl. Ed. 8224 II Hyphom. (1906) p 528. — Maculis indistinctis viridulo-gri- seis v. brunneolis, immarginatis, subrotundis v. oblongis, interdum bullosis, subinde majorem folii partem occupantibus et tunc ochraceis, irregularibus; cæspitulis amphigenis, albo-punctiformibus; conidiophoris ex stomatibus dense fasciculatim erumpentibus, simplicibus, vix noduloso-curvulis, sursum levibus et apice subrotundatis, hyalinis, 30-45 \approx 4; conidiis cylindraceis utrinque obtusis, v. acutulis, rectis, continuis v. saepius bicellularibus, rarissime quoque 4-cellularibus, hyalinis, 20-30 \approx 3,5-4,5.

Hab. in foliis vivis *Hieracii vulgati* pr. Ahrensburg et pr. Langenhorn in vicinia Hamburgi (JAAP) et in Hungaria (BUBAK).

50. **Ramularia Prenanthis** Jaap, Allg. Bot. Zeitschr. XII (1906) pag. 8225 125. — Maculis subrotundis, saepius vero angulosis, internerviis, 1,5-3 mm. diam., interdum confluentibus et tunc magnam folii partem occupantibus, ochraceis v. brunneis, demum centro expallentibus v. flaventibus et purpureo-brunneo marginatis; cæspitulis hypophyllis, albis; conidiophoris ex stomatibus flasciculatim erumpentibus, indivisis, curvulis, saepè edentatis, hyalinis, 18-25 \approx 3,5;

conidiis primo ovoideis, ellipsoideis, v. oblongis, dein cylindraceis, subinde clavulatis v. fusoideis, continuis v. bicellularibus, sæpe minute guttulatis, hyalinis, 17-22 \times 3,5-5.

Hab. in foliis vivis *Prenanthis purpureæ* pr. Triberg in Schwarzwald m. 720 alt. (JAAP).

51. **Ramularia silvestris** Sacc. (1880) — Syll. IV p. 207. — Hujus 8226 synonymon est *Ramularia Dipsaci* Allesch. Verz. Südbayern Pilze p. 181, tab. I, fig. 8, (1887) lecta quoque in plurimis locis Germaniæ, Bohemiæ, Bosniæ, Belgii etc., in *Dipsaco silvestri* et *Dips. fullonum*.

52. **Ramularia Campanulæ-rotundifoliæ** Lindr. Mykol. Mitteil. 11-15 8227 in Acta Soc. pro Fauna et Fl. Fenn. XXVI (1904) pag. 16. — Maculis 1-3 mm. lat., griseis v. rubellis, sæpe zona angusta luteola v. pallida cinctis; cæspitulis plerumque hypophyllis, albis; conidiophoris numerosis ex stomatibus fasciculatim erumpentibus, subrectis, obtusis, continuis, apicem versus confertim 3-4-denticulatis, hyalinis, 40-55 \times 4-6; conidiis bacillaribus, plerumque rectis, utrinque rotundatis, continuis, raro 2-3-cellularibus, ad septa non v. vix constrictis, hyalinis, 20-40 \times 4-6.

Hab. in foliis vivis v. languidis Campanulæ rotundifoliæ in Fennia (LINDROTH).

53. **Ramularia Campanulæ-barbatæ** Jaap et Lindau, in Jaap Beitr. 8228 Pilzfl. d. Schw., Ann. Myc. v. V (1907) p. 269. — Maculis subrotundis 3-4 mm. diam., extus obscure marginatis, subinde marginalibus arescendo læte brunneis; cæspitulis amphigenis, minutissimis, albis; conidiophoris ex stomatibus dense fasciculatim erumpentibus, rectis, indivisis, continuis, hyalinis, ad 20 \times 2,5-3; conidiis longe cylindraceis, utrinque rotundatis, rectis, rarius curvulis, sæpius bicellularibus, raro 1-3-cellularibus, hyalinis, 27-39 (sæpius 35) \times 2,5-3.

Hab. in foliis Campanulæ barbatæ ad Hospitium M. Semione, 2020 m. (JAAP).

54. **Ramularia Scopoliæ** Voss in Oesterr. Bot. Zeitschr. XXXIII 8229 p. 174 (1883) et Verhandl. zool. bot. Ges. Wien (1884) p. 21 t. I, f. 4. — Maculis epiphyllis, irregularibus, brunneis; cæspitulis hypophyllis effusis, griseis; conidiophoris brevibus parce denticulatis; conidiis cylindraceis, continuis v. bicellularibus, hyalinis, 16-18 \times 5-55.

Hab. in foliis languidis Scopoliæ atropoidis pr. Idria Carnioliae (Voss).

55. **Ramularia ligustrina** Maubl., Bull. Soc. Mycol. de Fr. XXII 8230

(1906) p. 70. — Maculis amphigenis, rotundatis v. ovatis, $\frac{1}{3}$ -1 cm. latis, ochraceis, margine atro-brunneo cinctis; cæspitulis albidis, minutissimis, oculo nudo non v. vix conspicuis, simplicibus, hypophyllis, ex hyphis hyalinis, usque ad 20 μ . long. compositis; conidiis acrogenis, catenulatis, oblongis, continuis v. demum uniseptatis, 5-10 \approx 2,5. Pycnidia e gen. *Septoria* (S. Ligustri [Desm.] Kickx) minuta, formâ conidicâ sâpe coronata; sporulis filiformibus, hyalinis, curvulis, 14-19 \approx 1-1,5.

Hab. in foliis vivis Ligustri sp. sativi (?) prope Alençon Galliæ (LEMÈE).

56. **Ramularia Vincæ** Sacc. — Syll. IV p. 215. — Var. **Vincæ-mediæ** 8231

R. Maire, Bull. Soc. Myc. de France t. XXI (1905) fasc. 4, pag. 214. — Maculis latis, flavidis, indeterminatis, tarde brunnescensibus, subtus pulverulentis; conidiophoris ex stomatibus fasciculatim erumpentibus 90-100 \approx 2,5-3; conidiis cylindraceis, hyalinis, 20-40 \approx 3, pro more 2-3-septatis, utrinque obtusulis.

Hab. parasitice in foliis Vincæ mediæ, Valldemosa in ins. Balearibus — Homonyma var. ell. Traverso et Spessa ex Lusitania in eadem matrice, in Bol. Soc. Brot. XXV (1910) p. 186, differret conidiophoris multo brevioribus, nempe 28-40 \approx 3-4,5; an mera forma?

57. **Ramularia Lycopi** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 467. 8232

— Maculis brunneis, nervis limitatis; cæspitulis hypophyllis, albidis; conidiophoris fasciculatis, continuis, sursum denticulatis, hyalinis, 25-35 \approx 3-4; conidiis cylindraceis, utrinque obtusulis, rectis v. curvulis, continuis aut raro 1-septatis, hyalinis, 16-28 \approx 3-4 catenulatis.

Hab. in foliis vivis Lycopi europæi prope Kecskemét Hungariæ.

58. **Ramularia Sideritidis** Hollós, Ann. Mus. Nat. Hung. V (1907) 8233

p. 467. — Maculis brunneolis, nervis limitatis; cæspitulis hypophyllis, albidis; conidiophoris fasciculatis, continuis, sursum 2-denticulatis, hyalinis, 28-44 \approx 3-4; conidiis cylindraceis, utrinque obtusulis, rectis v. curvulis, continuis v. bilocularibus, hyalinis, 28-36 \approx 3-4.

Hab. in foliis languidis Sideritidis montanæ prope Kecskemét Hungariæ.

59. **Ramularia Ajugæ** (Niessl) Sacc., — Syll. IV p. 212. — Var. **Aju-gæ pyramidalis** Sacc., *Ramularia Tozziae* Lindau, in Jaap Beitr.

Pilzfl. d. Schw., Ann. Myc. v. V (1907) p. 269. — Maculis subrotundis, acute limitatis, immarginatis, brunneis, mox confluentibus et majorem folii partem occupantibus; cæspitulis amphigenis, demum farinoso-pulvereis; conidiophoris ex stomatibus dense fasciculatim erumpentibus, plerumque rectis, subinde hinc inde curvulis sursum pluridenticulatis v. levibus, septatis v. non hyalinis, 25-40 \approx 3; conidiis cylindraceis, rectis, utrinque rotundatis v. rarius acutulis, raro bicellularibus, interdum binis superimpositis, hyalinis, 11-27 \approx 3,5-4.

Hab. in foliis viventibus *Ajugæ pyramidalis* (non Tozziae) in Helvetia (JAAP).

60. **Ramularia Lysimachiæ** Thüm. — Syll. IV p. 213. — Huc ducen- 8235 da est *Ramularia paulula* Davis, Trans. Wisconsin Ac. of Sc. XVII, Pt. II (1909) p. 762, in foliis Lysimachiæ (Racine Amer. bor.) non *Hyperici* — Plenior diagnosis ex Davis l. c.: — Maculis definitis, suborbicularibus, brunneis, margine obscuriore, 1-4 mm. diam., sæpe in areolis decoloratis insidentibus; hyphis amphigenis, sparsis, hyalinis, subrectis, quandoque conidiis lateralibus, præditis, 20-40 \approx 3-5; conidiis hyalinis, catenulatis, cylindraceis rectis, nucleolatis, raro uniseptatis, 20-30 \approx 4-5.

61. **Ramularia Menyanthis** P. Magn. in sched. (1906); cfr. Pilzfl. Tir. 8236 p. 546, Lindau Deut. Krypt. Fl. Pilze VIII p. 532. — Maculis subrotundis v. oblongis, primo 1-2 mm. diam., dein multo amplioribus, brunneis, zona decolorata indistincta marginatis, parum elevatis, denique albis et elabentibus; conidiophoris et conidiis maturis adhuc ignotis.

Hab. in foliis et petiolis *Menyanthis trifoliata* pr. In-nichen Tiroliæ (STOLZ, P. MAGNUS).

62. **Ramularia tirolensis** Maire, Oesterr. Bot. Ztschr. LVII (1907) 8237 p. 322. — Maculis brunneis, irregulariter rotundatis, 1-6 mm. diam., subinde confluentibus; cæspitulis amphigenis, albis, e stomatibus erumpentibus; conidiophoris simplicibus, rectis, continuis v. septatis, apice 1-3-dentatis, 15-39 \approx 3; conidiis hyalinis le vibus, longe cylindraceis, 1-8-septatis, apice rotundatis, basi acutiusculis, 30-75 \approx 2-5.

Hab. in foliis languidis *Primulæ imbricatae*, Montagna d'Andraz, Tirolia. — A *R. Primulæ* conidiis multiseptatis longioribus differt.

63. **Ramularia Cærinthes** Hollós, Ann. Mus. Nat. Hungar. VII (1909) 8238 p. 57. — Maculis rotundatis, atris, ochraceo-marginatis; cæspitu-

lis epiphyllis, albidis; conidiophoris fasciculatis, continuis, sursum denticulatis, hyalinis, 20-40 \approx 3-4; conidiis cylindraceis, utrinque rotundatis v. obtusulis, continuis, dein 1-septatis, hyalinis, intus granulosis, 18-24 \approx 3-5.

Hab. in foliis vivis *Cerinthes minoris* prope Kecskemét Hungariæ.

64. **Ramularia Harai** P. Henn., Engl. Jahrb. XXXVII (1905) p. 165. 8239

— Maculis fuscidulis, effusis; cæspitulis hypophyllis, albidis, effusis; hyphis parce ramosis, hyalinis, 2-2,5 μ . cr.; conidiis cylindraceo-fusoideis, utrinque obtusis, 1-3-septatis, rectis v. curvulis, hyalinis, 10-30 \approx 3-4.

Hab. in foliis Phytolaccæ acinosæ var. esculentæ Gifu Mino Japoniæ (S. HARA).

65. **Ramularia? leptospora** Speg., Myc. Argent. V p. 420, in Anal. 8240

Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus, 2-10 mm. diam., centro pallescenti-subcinerescentibus, pellucidis, ambitu rufescens, areola angusta violascente limitatis; acervulis hypophyllis gregariis candidis, 50-60 μ . diam., ex hyphis tenuibus simplicibus gracilibus efformatis; conidiis cylindraceis subobtusiuscule rotundatis, 10-30 \approx 2, rectis v. lenissime subcurvulis, catenulatis, acrogenis, primo continuis dein 1-septatis, postremo 3-septatis, hyalinis, levibus.

Hab. ad folia languida Rumicis pulchri in herbosis La Plata Argentina Amer. austr.

66. **Ramularia Piperis** P. Henn., in Fl. du Bas- et Moy. Congo, 8241

An. Mus. du Congo, v. II, fasc. II (1907) p. 103. — Maculis amphigenis angulato-rotundatis subbulbosis, brunneo-fuscis v. atris; cæspitulis hypophyllis, albidis; hyphis fasciculatis vix ramosis, hyalinis, 3-4 μ . cr.; conidiis oblonge fusoideis utrinque acutis 1-3-septatis, hyalinis, 12-24 \approx 3,5-4.

Hab. in foliis Piperis sp. Kisantu Congo, Africa (VANDERYST).

67. **Ramularia Parietariæ** Pass. — Syll. IV pag. 216. — Var. *minor* Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) p. 486. — Conidiis saepius continuis, oblongis v. cylindraceis, 10-24 \approx 3-4,5.

Hab. in foliis vivis Parietariæ officinalis, Montenegro (ROHLENA). — Forte tantum status junior speciei.

68. **Ramularia Butomi** J. Lind, Ann. Mycol. III (1905) p. 431. — Ma- 8242

culis sparsis, minutis, oblongis, angulosis, nigris; cæspitulis albis maculas pruinoso-tegentibus; conidiophoris 3-5-fasciculatis, noduloso-flexuosis, plerumque 3-denticulatis, septatis, hyalinis, 15-24

μ. longis; conidiis oblongo-ovoideis, catenulatis, hyalinis, modo continuis $7 \approx 2,5$, modo bicellularibus et tunc 15-18 ≈ 3 .

Hab. in tribus foliorum paginis Butomium umbellati, Stockholm Sueciæ.

69. **Ramularia Smilacinæ** Davis, Trans. Wisc. Acad. Arts. a. Sc. XV 8243 (1907) p. 777. — Maculis pallide flavis v. albidis, margine angusto rubro-brunneo cinctis, rotundis v. oblongis, saepius 5-10 mm. diam.; cæspitulis albis hypophyllis; conidiophoris 10-16 ≈ 3 ; conidiis cylindraceis, continuis, catenulatis, hyalinis, 18-30 ≈ 3

Hab. in foliis Smilacinae racemosæ, Pacific Northwest Amer. bor. (DAVIS).

70. **Ramularia Wagneræ** Barthol. Fungi Columb. n. 2787 (1909). Diagnos 8244 gnosis desideratur.

Hab. in foliis Wagneræ amplexicaulis, Colorado Amer. bor.

71. **Ramularia Narcissi** Chittenden, Garden. Chron. 3 ser. XXXIX 8245 (1906) p. 277.

Hab. in foliis Narcissi specierum cultarum, quas valde vexat. — Verisimiliter non differt a *Ramularia Vallisumbrosæ* Cav. (1899). — Syll. XVI p. 1046 — cuius forma evolutior videtur *Cercosporaella Narcissi* Boud. (1901). — Syll. XVIII pag. 563 — pariter perniciosa.

ERIOMYCOPSIS Speg., Myc. Argent. V p. 429, in Anal. Mus. Nac. Buenos Aires XX (1910). (Etym. *erion* lana et *myces*) — Hypomycetea mucedinea, macronemea, subcapituligera monachospora, conidiis fusoideis pluriseptatis majusculis hyalinis prædita.

1. **Eriomycopsis Bomplandi** Speg. l. c. p. 429. — Candida velutina, 8246 in Meliolarum mycelio parasitans; hyphis fertilibus erectis pluriseptatis (5-6) 180-200 $\approx 7-8$, articulo supremo colliculosopapillato conidifero, 40-50 $\approx 9-10$; conidiis ex denticulis articuli supremi oriundi patentiusculis, 50-70 $\approx 10-11$, saepius 3-septatis, utrinque acutis, leniter arcuatis, ad septa non v. lenissime constrictis.

Hab. ad folia viva Bignoniaceæ scandentis cujusdam in silvis prope Bompland Misiones, Argentina America austr. (P. JÖRGENSEN).

DACTYLUM Nees — Syll. IV p. 188, X p. 551.

1. **Dactylum licheniforme** P. Henn., in Fl. du Bas- et Moy. Congo, 8247

Ann. Mus. du Congo, v. II, fasc. II (1907) p. 103. — Cæspitulis effusis, niveis; hyphis fertilibus erectis rigidis, usque ad 400 μ . longis, basi 10-12 μ . cr., repetito-verticillato-ramosis, hyalinis, ramulis 4-5 μ . cr.; conidiis acrogenis, clavatis, obtusis, 1-3-septatis, hyalinis, 18-24 \times 5-6.

Hab. inter mycelium *Microcycli Derridis* P. Henn. ad folia *Derridis* sp., Dembo Congo (VANDERYST). — *Dactylium tenuissimum* Berk., Journ. Hort. Soc. I (1845) p. 34, t. IV f. 20-21, observante cl. Cooke Handb. p. 608 est forma *Fusarii Solani-tuberosi* Desm.

VARICOSPORIUM W. Kegel, Ber. Deutsche Bot. Ges. XXIV (1906) p. 213 (Etym. *varicus* et *spora*). — Mycelium saprophyticum, septatum, ramosum, hyalinum, in culturis viridulum, senio rhabdos rhizomorphoideos formans. Conidia ex articulis extimis ramulorum formata, rectangulariter patentia, hyalina, cylindrica, 5-8-septata, successive conidia secundaria similia pleurogene generentia et tunc colonias arbusculiformes gignentia.

1. **Varicosporium Elodeæ** W. Kegel l. c. cum icon. — Cæspitulis 8248 viridulis; conidiis longitudine ludibundis, 4-8-cellularibus, cylindricis, rectiusculis, utrinque rotundatis, ad septa vix constrictis, facile secedentibus, hyalinis, intus nubilosus, levibus, 4-5 μ . cr., arbusculas 75-100 μ ., sub aëre usque ad 170 μ . longas formantibus.

Hab. in ramulis foliisque emortuis v. morientibus Elodeæ canadensis, in quibus saprophytice vivit. In gelatina et agar optime colitur.

GUEGUENIA Bainier, Bull. Soc. Mycol. Fr. XXIII (1907) pag. 106 (Etym. a cl. doct. F. GUÉGUEN, professore parisiensi). — Hyphæ steriles repentes; fertiles erectæ, septatæ, apice inæqualiter ramosæ, ramusculis ultimis digitatis et corymbose fasciculatis. Conidia læte colorata, solitaria, biseptata, articulo medio ovoideo, superiore hemisphærico. — Ab *Amblyosporio* dignoscitur ramis non verticillatis et conidiis solitariis, septatis.

1. **Gueguenia cæspitosa** Bainier, Bull. Soc. Myc. Fr. l. c. pag. 106, 8249 t. XIII. — Cæspitulis pannosis, effusis; conidiophoris erectis, filiformibus, 400 \times 22, septatis, sursum patenti-ramosis, ramulis pariter breviter et patenti-ramulosus, ultimis fasciculato-verticillatis, obclavatis, apice conidigeris; conidiis oblongo-ellipsoideis utrinque obtusatis, 2-septatis, articulo medio maximo, totis 16,8 \times 8,4, sub-

castaneis, articulo summo subcupuliformi v. hemisphærico hyalino.

Hab. in fungis subputrescentibus in Gallia. — Color cæspitulorum non indicatus.

Sect. 4. Hyalodictyæ.

CONIODICTYUM Har. et Pat., Bull. Soc. Myc. de Fr. XXV (1909) p. 13 (Etym. *conio* pro *Coniosporium* et *dictyum* pro *Dictyosporium*). — Mycelium parcissimum, ramosum, hyalinum. Conidia hyalina, stipitata, clathrato-pluriseptata.

1. **Coniodictyum Chevalieri** Har. et Pat., l. c. pag. 14, cum icon. — 8250
Mycelio 2-3 μ . circ. crasso, inter cellulas matricis percurrenti; conidiis levibus irregulariter globulosis, supra planiusculo-truncatis, inferne rotundatis, ambitu bullato, bullis sulcis profunde disjunctis, intus muraliter pluriseptatis, 18-30 μ . diam., stipite hyalino deorsum attenuato, simplici, eseptato, apice 5 μ . cr., 20-30 μ . alto suffultis; stipitibus parcis cæspitose approximatis.

Hab. in fructibus Zizyphi Barlei qui valde deformantur et pulvere albo-luteolo, farinaceo crasse obteguntur, Bousso inter et Fort Archambault nec non prope Mamoun in Chariensi ditione Africæ (A. CHEVALIER).

HYALODEMA P. Magn., Ber. deutsch. bot. Ges. XXVIII (1910) p. 379 (Etym. *hyalos* albus et *dema* sarcina). — Biophilum, mycelio hyalino intercellulari haustoria emitte præditum. Conidiophora superficialia erecta fasciculata simplicia et continua. Conidia solitaria acrogena globoso-ovoidea, pluriseptato-clathrata, hyalina; paraphyses tereti-clavulatæ, continuæ, hyalinæ intermixtæ. — Teste v. Höhn. Ann. Mycol. (1910) p. 590 hoc genus a *Coniodictyo* H. et P. non differt, sed confutat prof. Magnus.

1. **Hyalodema Evansii** P. Magn., l. c. p. 380, tab. XI. — Characte- 8251
res generis, cecidogenum; conidiis irregulariter globulosis, sæpe leniter angulosis, levibus, episporio tenui præditis, 31 \times 20; conidiophoris longitudine varia, sæpe conidium subæquantibus.

Hab. in ramis petiolisque Zizyphi sp. ubi cecidia subglobulo-depressa, rugulosa, 3-10 mm. crassa efformat, Zoutpansberg Transvaal Africæ (G. B. POLE EVANS).

Sect. 5. Scolecosporæ.

CERCOSPORELLA Sacc. — Syll. IV p. 218, X p. 564, XI p. 606, XIV p. 1065, XVI p. 1046, XVIII p. 561.

1. **Cercospora** *Rapistri* Hollós, Ann. Mus. Nat. Hung. VI (1908) 8252 p. 536. — Maculis sparsis, oblongis, alutaceis, indeterminatis, 5-8 mm. diam.; conidiophoris epiphyllis, cæspitulosis, niveis, leniter curvis, edentatis, 25-30 \times 3-4; conidiis fusoideis, rectis vel curvulis, 1-3-septatis, hyalinis, 60-90 \times 3-4.

Hab. in foliis vivis *Rapistri* perennis prope Kecskemét Hungariæ.

2. **Cercospora** *Sidæ* P. Henn., in Fl. du Bas- et Moy.-Congo, in Ann. Mus. du Congo, v. II, fasc. III (1908) p. 230. — Cæspitulosis epiphyllis late effusis, pallidis; hyphis filiformibus septatis, apice ramulosis, hyalinis v. flavidulis, 4-6 μ . cr.; conidiis fusoideis vel subclavatis, sæpe curvatis, acutis, pluriguttulatis, dein 3-7-septatis, 25-45 \times 4-6, hyalinis.

Hab. in foliis *Sidæ* cordifoliæ, Sonzo Congo, Africa trop. (VANDERYST).

3. **Cercospora** *elata* Sacc., in Ann. Mycol. VIII (1910) p. 339. — 8254 Cæspitulosis late, densiuscule gregariis, hypophyllis, subsuperficialibus, punctiformibus, gossypinis, candidis, 0,5 mm. diam.; hyphis fasciculatis pro genere elatis, filiformibus, 150-180 \times 5-5,5 totis hyalinis, 4-5-septatis, a medio sursum tortuoso-fractiflexis, ad angulos cicatriculas majusculas conidiorum præbentibus; conidiis elongato-fusoideis, sæpe obclavatis, 3-4-septatis, non constrictis, 45-68 \times 5,5-6, totis hyalinis, sursum magis attenuatis.

Hab. in foliis vivis vix maculosis Chasmantheræ dependentis, Ghinda-Baresa, alt. 830 m. (Hamasen) Africæ (Prof. HADR. FIORI). — Pulcra et distincta species.

4. **Cercospora** *Chærophylli* Aderh., Jahrsb. Schles. Ges. vat. Kult. 80°, II Abt. (1903) p. 17, Lindau Krypt. Fl. Hyph. VIII, p. 424. — Maculis foliorum plerumque marginalibus, irregularibus, e bruno griseis; conidiis cylindraceis, 40-65 \times 4-6.

Hab. in foliis *Chærophylli* temuli pr. Proskau Germaniæ.

5. **Cercospora** ? *tuberculoides* Speg., Myc. Arg. V, p. 422, in Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis epiphyllis pallescentibus indeterminatis obsoletis; cæspitulosis hypophyllis hinc inde pauci-gregariis erumpentibus, subhemisphæricis, 80-100 μ . d.,

ex hyphis basi coalescentibus cæterum liberis sed constipatis sæpius continuis, 30-40 \approx 3-4, bacillaribus, simplicibus; conidiis lenissime falcatis, non v. vix subclavulatis, 60-100 \approx 5-6, 3-7-septatis, ad septa non constrictis, hyalinis, levibus.

Hab. ad folia viva Verbesinæ in uliginosis circa La Plata Argentina Amer. austr.

6. **Cercosporaella Achilleæ** Jaap, Beitr. Pilzfl. d. Schw., Ann. Myc. 8257 V (1907) p. 270. — Maculis majusculis, subrotundis v. oblongis, brunneis dein expallentibus, atro-brunneo-marginatis; cæspitulis epiphyllis, albis; conidiophoris bicellularibus, hyalinis, 20 \approx 5; oonidiis filiformibus, hyalinis, 5-8-cellularibus usque ad 100 \approx 2,5, apicem versus sæpe tenuatis et 1,5 μ . cr.

Hab. in foliis vivis Achilleæ microphyllæ in Montauvert pr. Chamonix, 1910 m. alt. Sabaudiæ (JAAP).

7. **Cercosporaella Podospermi** Hollós, Ann. Mus. Nat. Hungar. VIII 8258 (1910) pag. 9. — Maculis totum folium occupantibus, ochraceis; conidiophoris epiphyllis, cæspitulosis, niveis, edentatis, 20-25 \approx 3-4; conidiis cylindraceo-clavatis, infra incrassatis et obtusatis, sursum leniter attenuatis, rectis v. curvulis, 2-septatis, hyalinis, 70-100 \approx 4-5.

Hab. in foliis languidis Podospermi Jaquiniani prope Kecskemét Hungariæ.

8. **Cercosporaella Scorzonerae** v. Höhn. Ann. Myc. III (1905) p. 338. — 8259 Maculis singulis v. paucis in quoque folio, oblongis, 5-10 mm. long., centro expallentibus, late purpureo-marginatis; cæspitulis tenuissimis, amphigenis, 15-30 μ . diam., e cuticula erumpentibus, subrotundis v. oblongis; conidiophoris modo paucis modo copiosis, dense fasciculatis, hyalinis, cylindraceis, bicellularibus, sursum 1-denticulatis, 30 \approx 3-4; conidiis rectis utrinque obtusulis, sursum sensim tenuatis, hyalinis, 3-septatis, 50-70 \approx 2-3.

Hab. in foliis Scorzonerae humilis, Wienerwald Austriae (v. HÖHNEL).

9. **Cercosporaella Hieracii** Jaap, Beitr. Pilzfl. d. Schw., Ann. Myc. 8260 V (1907) p. 270. — Maculis latiusculis, brunneis, nunc angulosis internerviis, nunc subrotundis v. oblongis, flavo-marginatis, ob conidia albo-pruinosis; cæspitulis epiphyllis, confertis, albis; conidiophoris paucis laxe fasciculatis, hyalinis, ad apicem denticulatis, 40 \approx 2; conidiis filiformibus, sursum tenuatis, curvulis, hyalinis, guttulatis, indistincte septulatis, 90 \approx 2-2,5.

Hab. in foliis vivis Hieracii prenanthoidis pr. Platten super Zermatt, 1700 m. alt. in Helvetia (JAAP).

10. **Cercosporaella Unguis-cati** Speg., Myc. Argent. V, p. 422, in An. 8261
 Mus. Nac. Buenos Aires XX (1910). — Maculis solitariis amphigenis suborbicularibus, 3-7 mm. d., indeterminatis, ad epiphyllum atro-purpureis, ad hypophyllum purpureo-tabacinis; cæspitulis hypophyllis gregariis, erumpentibus, subhemisphæricis, 50-100 μ . d.; hyphis continuis v. apice 2-3-denticulatis, 5,5 \approx 3,5, quandoque 1-3-septatis, hyalinis; conidiis vermicularibus gracilibus valde elongatis inferne subincrassatulis rotundatisque, continuis v. 1-3-septatis, non v minute guttulatis, hyalinis, 50-120 \approx 3-7.

Hab. ad folia viva *Bignoniæ unguis-cati* in hortis Santa Catalina et La Plata Argentina Amer. austr.

11. **Cercosporaella mogiphanes** Speg., Myc. Argent. V, pag. 423, in 8262
 Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus, 3-7 mm. diam., indeterminatis, pallescentibus, plus minusve bullosis; cæspitulis amphigenis erumpentibus penicilliformibus dense gregariis, chlorinis, ex hyphis cæspitosis, simplicibus, 100-200 \approx 5-6, septulatis, denticulatis, hyalinis efformatis; conidiis subcylindraceis, utrinque obtusiusculis, 20-100 \approx 5-7, primo continuis dein 3-septatis, ad septa sæpe constrictulis, rectis v. vix arcuatus, hyalinis.

Hab. ad folia viva *Mogiphanes* cujusdam in aridis prope Metán Salta Argentina Amer. austr. — A *Cercospora gomphrenicola* notis plurimis distincta.

Sect. 6. *Helicosporæ.*

HELICOON Morg. — Syll. XI p. 609.

1. **Helicoon politulum** (Schulzer) Lindau, Deutsch. Krypt. Fl. Pilze 8263
 IX (1908) p. 277, *Helicosporium politulum* Schulzer, Fl. LX (1877)
 p. 271. — Cæspitulis griseo-atris, inconspicuis, plura mm. latis;
 mycelio repente, septato, ramoso, subimpellucido; conidiophoris gregariis, simplicibus, rectis v. curvis, remote septatis, ad septa subconstrictis, æquicrassis, atro-brunneis, pellucidis; conidiis acrogenis in capitulum coadunatis, aquæ ope solutis, sinistrorum spiraliter convolutis, crebro septatis, saturate griseis, diaphanis.

Hab. ad asseres salicinos putrescentes udos prope Vinkovce Slavoniae.

2. **Helicoon Fairmani** Sacc., Not. Myc. VII, Ann. Myc. IV (1906) 8264
 p. 277. — Mycelio parcissimo; conidiis gregariis, solitariis v. sub-

solitariis, punctula pallida et sordide rosea (sub vitro) fingentibus, ambitu ellipsoideis, 45 \times 28, conidiophoro brevissimo cylindraceo (sæpe non manifesto) suffultis, ex spiris 6-8 arcte convolutis, 5 μ . cr. parce tenuiterque septatis formatis, intus cavis, dilutissime roseis.

Hab. ad ligna putrescentia dejecta, socio *Bactridio minuto*, in silvis pr. Lyndonville New York, Amer. bor. (CH. FAIRMAN). — A ceteris generis speciebus omnino distinctum.

HELICOMYCES Link — Syll. IV p. 233, X p. 568, XI p. 608.

1. **Helicomyces tenuis** Speg., Myc. Arg. V, pag. 423, in Anal. Mus. 8265 Nac. Buenos Aires XX (1910). — Plagulis tenuibus arachnoideis suborbicularibus 5-15 mm. diam., albis; hyphis dense intricatis ramulosis, 4-5 μ . diam., septulatis, laxe minuteque papillatis, hyalinis; conidiis filiformibus circinatis, 80-120 \times 1,5-2, apice supero acuto infero subincrassatulo obtuso, dense minuteque guttulatis, hyalinis.

Hab. ad culmos putrescentes Arundinis Donacis, Lezama prope Buenos Aires Argentina Amer. austr. — Ab *H. roseo* conidiis triplo gracilioribus distinctus.

Appendix ad Mucedinaceas.

Complures species a clinicis describuntur veluti causæ morborum; sed formæ plerumque tam proteæ et abnormes videntur ut non nisi culturis et notis bio-chemicis possint dignosci. Syllogue, more suo, similes has notas bio-chemicas referre non potest, utile tamen videtur ab egregia Synopsi cl. F. Guéguen (*Les Champignons parasites de l'homme et des animaux*, Paris 1904) enumerationem sequentem excerpere:

TRICHOPHYTON Malmst. — Guég. l. c. p. 137.

Sect. 1. *Endothrix* Sabouraud.

1. **Trichophyton tonsurans** Malmst., *Trichomyces tonsurans* Malmst. 8266 Guég., l. c. p. 138, f. 3, *Achorion Leberti* Ch. Rob., *Oidium tonsurans* W. Zopf, *Trichophyton megalosporum endothrix* Sabouraud.

Hab. in infantibus in quibus causat tineam tonsurantem; generat quoque trichophytiasim barbae hominum.

2. **Trichophyton Sabouraudi** R. Blanchard, Guég. l. c. p. 139. 8267
Hab. in infantibus et adolescentibus in quibus tineam tonsurantem *peladoide* dictam causat.
3. **Trichophyton caninum** Matruchot et Dassonville, Guég. l. c. p. 139, 8268
fig. 4.
Hab. in canibus, quibus affert folliculitem depilantem.

Sect. 2. *Ectothrix* Sabouraud.

4. **Trichophyton felinum** R. Blanchard, Guég. l. c. p. 139, f. 5. 8269
Hab. in canibus, equis, bovibus etc., quibus affert tineam fugacem et in hominibus in quibus dermatites alias generat. — Varietas *Sporotrichi vellerei* Sacc. et Spieg. — Syll. IV, p. 101.

Sect. 3. *Endo-ectothrix* Sabouraud.

5. **Trichophyton equinum** Gedölst, Guég. l. c. p. 140. 8270
Hab. in equis, quibus herpetem inducit.
6. **Trichophyton mentagrophytes** (Robin) Sab., *Sporotrichum mentagrophytes* (Rob.) Sacc. — Syll. IV, p. 100. 8271
7. **Trichophyton Megnini** R. Blanchard, Guég. l. c. p. 140. 8272
Hab. in Gallinaceis quibus affert gravem trichophytiasim et hominibus in quibus eruptionem quamdam cutis causat.
8. **Trichophyton depilans** Mégnin, Guég. l. c. p. 140. 8273
Hab. in vitulis quibus affert trichophytiasim peculiarem nec non in equis in quibus causat tineam depilantem et hominibus ad quos adducit epidermatitem quandam.

Sect. 4. *Faviformia*.

9. **Trichophyton faviforme** Bodin, Guég. l. c. p. 141, f. 6. 8274
Hab. in Equo Asino cui inducit tineam tonsurantem typi *Ectothrix*. — Adsunt formæ speciales in vitulis et in *Fringilla canaria*.

MICROSPORON Gruby em. Bodin, Guég. l. c. p. 143.

1. **Microsporon Audouini** Gruby, Guég. l. c. p. 143, fig. 7, *Sporotrichum Audouini* (Gruby) Sacc. — Syll. IV, p. 101, *Trichophyton decalvans* Malm., *Trichophyton microsporum* Sab., *Martensella microspora* Vuill.

1336	Deuteromycetæ, Mucedinaceæ, Trichosporum.	
2.	Microsporon canis Bodin, Guég. l. c. p. 144, f. 8. a. <i>Hab.</i> in cane, cui tineam quamdam inducit.	8276
3.	Microsporon equinum Bodin, Guég. l. c. p. 144, f. 8 b, c, d, <i>Trichophyton minimum</i> Le Calve et Malherbe. <i>Hab.</i> in equis junioribus, mulis, canibus, quibus herpetem contagiosum affert.	8277
4.	Microsporon Muris Gluge et d' Udekem, Guég. l. c. p. 145. <i>Hab.</i> in Muris sp. cui pilos et oculum destruxit.	8278
5.	Microsporon anomœon Vidal, Guég. l. c. p. 145. <i>Microsporon dispar</i> Vidal. <i>Hab.</i> in homine, cui, ut videtur, affert pityriasim circinatam et marginatam.	8279

EPIDERMOPHYTON Megnin, Guég. l. c. p. 145.

1.	Epidermophyton gallinæ Megnin, Guég. l. c. pag. 145, fig. 9, <i>Loophophyton gallinæ</i> Matruchot et Dassonville. <i>Hab.</i> in gallina, cui favum cristæ inducit.	8280
----	--	------

ACHORION Lebert, Guég. l. c. p. 145.

1.	Achorion Schœnleinii Remak, Guég. l. c. p. 145, f. 10, <i>Oidium Schœnleinii</i> Lebert, <i>Oidium porriginis</i> Mont., <i>Oospora porriginis</i> (Mont.) Sacc. — Syll. IV, p. 15.	8281
2.	Achorion Quinckeanum W. Zopf, Guég. l. c. p. 147. <i>Hab.</i> in infantibus quibus favum affert.	8282
3.	Achorion Arloingi Busquet, Guég. l. c. p. 147. <i>Hab.</i> in homine in quo generat eruptionem marginatam trichophytiformem.	8283
4.	Achorion ? repens (Eklund) Guég. l. c. p. 147, <i>Lepocolla repens</i> Eklund, <i>Epidermophyton</i> Lang, nec Mégnin. <i>Hab.</i> in homine in quo, ut videtur, psoriasim generat.	8284

TRICHOSPORUM Behrend, Guég. l. c. p. 241.

1.	Trichosporum giganteum Behrend, Guég. l. c. p. 241. <i>Hab.</i> in homine, in cuius capillitio generat sic dictam Piedra Columbiæ.	8285
2.	Trichosporum ovoides Behrend, Guég. l. c. p. 241. <i>Hab.</i> in homine in cuius barba infectionem inducit.	8286
3.	Trichosporum ovale Unna, Guég. l. c. p. 242. <i>Hab.</i> in barba hominis.	8287

4. **Trichosporon Beigelii** (Rabenh.) Vuill., Guég. l. c. p. 242, fig. 2, 8288
Pleurococcus Beigelii Rabenh., *Sclerotium Beigelianum* Hallier,
Chlamydatus Beigelii (Rabenh.) Trev. — Syll. VII, p. 1042.

Fam. 2. Dematiaceæ Fr.

Sect. 1. Amerosporæ.

Subsect. 1. Homochromæ.

CONIOSPORIUM Link — Syll. IV p. 238, X p. 569, XI p. 610, XIV
 p. 1068, XVI p. 1050, XVIII p. 563.

1. **Coniosporium argentinense** Speg., Myc. Argent. V p. 430, in Anal. 8289
 Mus. Nac. Buenos Aires XX (1910). — Pulvinulis repando-suborbicularibus, 2-7 mm. diam., compactiusculis, e nigro obsoletissime cærulescentibus; conidiis conglobatis sæpius subglobosis, 6-8 μ . diam., levibus non v. grosse 1-guttulatis, atro-fuligineis.

Hab. ad ramos dejectos putrescentes Anonæ Chérimoliæ in hortis Tucuman Argentina Amer. austr.

2. **Coniosporium Albizziæ** P. Henn., in Fl. du Bas- et Moy.-Congo, 8290
 Ann. Mus. du Congo, II, fasc. II (1907) p. 103. — Maculis flavidis v. brunneolis rotundatis; acervulis hypophyllis pulvinatis, sæpe rugosis, atris c. 1-2 mm. diam., sæpe confluentibus; conidiis subglobosis, guttulatis, atris, 5-6,5 μ . diam,

Hab. in foliis Albizziæ (A. fastigiata proxima), Gongolo Congo (VANDERYST).

3. **Coniosporium limoniforme** Syd., Ann. Mycol. VI (1908) p. 484. — 8291
 Acervulis amphigenis, minutissimis, subinde aggregatis et confluentibus, superficialibus, atris; conidiis limoniformibus, continuis, levibus, atro-brunneis, 28-38 \approx 18-24.

Hab. in foliis vivis Rosæ spec. cultæ, Salt Lake City, Utah Amer. bor. (A. O. GARRETT). — Affine videtur *Coniosporio nitido* Karst.

4. **Coniosporium Zahnii** P. Magn., Abh. Naturh. Ges. Nürnb. XVI 8292 (1906) p. 79, tab. 27. — Cæspitulis punctiformibus, sparsis, hypophyllis, nigris; conidiis ex hyphis (conidiophoris) brevissimis pleurogene orientibus, depresso-latiore varie convexis et ovoideis, utrinque leviter acutatis, levibus, basi apiculatis, brunneis, 16,6 \approx 10-7.

Hab. in pag. inf. foliorum viventium *Comari palustris* pr. Nürnberg Germaniæ (ZAHN).

5. **Coniosporium toruloides** Sacc., in Ann. Mycol. X (1912) p. 315. 8293
— Effusum, maculiforme, nigrum, tenuiter pulveraceum; conidiis globosis, exiguis, raro vix angulosis, atro-fuligineis, 5 μ . diam., e latere leviter compressis, 3,5-4 μ . cr.; conidiophoris brevissimis papilliformibus, hyalinis.

Hab. in caulis dejectis putrescentibus *Sedi* sp., Blue Mountain Lake, Amer. bor. (Doct. et Domina FAIRMAN). — *Habitus Torulæ herbarum.*

6. **Coniosporium lavallense** Sacc., in Ann. Mycol. X (1912) p. 314. 8294
— Late effusum, tenuiter pulveraceum, fuligineo-nigricans; conidiis globosis 8-8,5 μ . diam., levibus, rarius subangulosis v. breve obovatis, 11 \approx 8, olivaceo-fuligineis v. viridulo-atris, guttulis 1-2 sæpe angulosis fœtis; conidiophoris brevissimis, cylindraceis, 2-2,5 \approx 1,5, subhyalinis.

Hab. ad cortices levigatos truncorum *Coniferarum* in fodina anthracitica Genest pr. Laval Galliæ (P. CORFEC). — Rarisime conidia bina superimposita observavi.

7. **Coniosporium musicola** Speg., Myc. Arg. V, p. 430, in An. Mus. Nac. Buenos Aires XX (1910). — Pulvinulis superficialibus 1-1,5 mm. diam. plus minusve dense gregariis sæpe seriatim confluentibus, ambitu pulverulento-evanidis; conidiis parvis ellipsoideis utrinque obtusis 5-6 \approx 3, fusco-fuligineis, subopacis levibus.

Hab. ad folia et rhachides putrescentes *Musæ sapientum* in hortis Oran Argentina Amer. austr.

8. **Coniosporium Chusqueæ** Speg., Fungi Chilenses (1910) pag. 182, 8296
? *Con. inquinans* Dur. et Montgn. — Acervulis linearibus erumpentibus pulverulentis nigerrimis; conidiis subglobosis 18-20 μ . diam., levibus subopacis fuligineis.

Hab. in culmis emortuis *Chusqueæ Quilæ*, Parque Cousiño de Lota Chile Amer. austr.

9. **Coniosporium Bizzozerianum** L. Gaja, Fl. micol. prov. Padova, p. 26 8297 (1912) (sunto litogr.). — Acervulis gregariis laxe per epidermidem effusis et ad rimas petioli copiosioribus, atris, tenellis, 200-250 μ . diam.; conidiis subellipsoideis, ad marginem dense nigricantibus, intus fulvo-atris et granulosis, et ad centrum areola circulari atra præeditis, 5-5 $\frac{1}{2}$ \approx 4-5; conidiophoris subhyalinis vix conspicuis.

Hab. in petiolis *Chamæropis humilis*, in Viridario Convictus Universitatorum, Patavii, Ital. bor.

- 10. *Coniosporium Hariotianum*** Sacc., in Ann. Mycol. IX (1911) p. 255. 8298
 — Cæspitulis punctiformibus, superficialibus, subsparsis, nigris, 150-200 μ . diam.; conidiis luce directa nitidis, e sphærico obtuse angulosis, atro-fuligineis, 10-11 μ . diam., levibus, basi initio minutissime apiculatis, sessilibus.

Hab. in foliis emortuis *Caricis glaucae* circa Parisios Galliæ (P. HARIOT). — Affine *Coniosp. Arundinis* sed cæspituli minuti, vix inquinantes, conidia distinctius angulosa, e latere vix depressa.

- 11. *Coniosporium Caricis-montanæ*** Lindau, Rabenh. Krypt.-Fl. ed. II 8299 VIII (1906) Hyphom. p. 555. — Cæspitulis subsparsis, minutissimis, usque ad $\frac{1}{3}$ mm. diam., subrotundis v. oblongis, primo firmulis, dein subpulveraceis, nigris, omnino superficialibus; hyphis mycelii non visis; conidiis dense confertis, ellipsoideis, utrinque rotundatis, diaphane brunneis, plerumque grosse 1-guttatis, 9,5-11,5 \times 4-4,5.

Hab. in foliis emortuis *Caricis montanae* pr. Viborg Jutlandiæ (LIND). — Præcipue conidiis ellipsoideis ab affinibus dignoscenda species.

- 12. *Coniosporium triticinum*** L. Gaja, Flora micol. prov. Padova, p. 26 8300 (1912) (sunto litogr.). — Acervulis dense gregariis, irregularibus, atris, ad superficiem culmorum et vaginarum sparsis, 250-300 μ . diam. circiter; conidiis inæquilateralibus fere semilunaribus, nigerimis, ad marginem intensius coloratis, 16-20 \times 7 $\frac{1}{2}$ -9; conidiophoris brevibus, pallidis.

Hab. in culmis emortuis *Triticum vulgaris*, in viridario Convictus Universitariorum, Patavii, Ital. bor.

- 13. *Coniosporium Arundinis*** Corda — Syll. IV, p. 243 — var. **Ampelodesmi** R. Maire, Bull. Soc. Myc. de Fr. t. XXI (1905) fasc. 4, pag. 214. — A typo distinguitur conidiis exquisite lenticularibus, ambitu marginulatis, minoribus, nempe 6-8 \times 5-6, e latere 4,5-5 μ ., rarissime irregularibus et usque ad 10-11 μ . longis.

Hab. in culmis *Ampelodesmi tenacis*, Miramar in insulis Balearibus.

- 14. *Coniosporium Ammophilæ*** Jaap, Weit. Beit. Pilzfl. nordfries. Ins. 8302 Schrif. Naturw. Ver. Schlesw.-Holst., Bd. XIV, Heft I, p. 32 (1907). — Cæspitulis striæformibus, nervis culmi paralellis, nigris; conidiophoris oblongo-cylindraceis, curvulis, dilute olivaceis, septatis, usque ad 14 \times 3,5; conidiis ambitu subrotundis v. leviter angulosis,

lenticulari-depressis, viridulo-brunneis, sœpe grosse centrali-1-guttatis, 5-7 μ . diam.

Hab. in culmis vetustis Ammophilæ balticæ pr. Wittdün supra Amrum in ins. Frisiæ.

15. **Coniosporium punctiforme** Sacc., in Ann. Myc. X, p. 314 (1912). — 8303

Late et dense gregarium, nigrum, tenuiter pulveraceum; cæspitulæ perexiguis, 100-120 μ . diam., punctiformibus, discretis, rarius confluentibus, in areis arescentibus brunneolis foliorum plerumque hypophyllis; conidiis globosis, levibus, fuligineis, 8-9 μ . diam., rarius 9 \approx 8, e latere subcompressis, siccis valde compressis; conidiophoris brevissimis v. obsoletis.

Hab. in foliis languidis Phyllostachydis puberulæ, Prov. Izu Japoniæ (J. MIYAKE, communic. K. HARA). — Affine *Coniosp. Bambusæ*, sed habitu punctiformi imprimis diversum.

16. **Coniosporium bambusicola** P. Henn., Engl. Jahrb. XXXVIII 8304 (1905) p. 118. — Acervulis amphigenis, rotundato- v. oblongo-pulvinatis, atris, c. 300-500 μ . diam.; hyphis brevibus, fuscidulis; conidiis globosis v. late ellipsoideis, atris, levibus, 10-20 μ . diam.

Hab. in foliis Bambusæ, Sigital Ost Usambara Africæ (ZIMMERMANN).

17. **Coniosporium micans** L. Gaja, Flora micol. prov. Padova, p. 27 8305 (1912) (sunto lit.). — Acervulis dense gregariis, fuligineis, per vaginas culmorum granulatim effusis et ad nodos copiosioribus; conidiis perfecte sphæricis, 18-20 μ . diam., levibus, nigerrimis, luce directa micantibus, luce reflexa homogeneæ atris; conidiophoris cylindraceis, minutissimis, subfuscis.

Hab. ad culmos Gynerii argentei in viridario Convictus Universitariorum Patavii, Ital. bor.

18. **Coniosporium filicinum** Rostr., in Gartn.-Tid. pag. 231 (1898), 8306 Plantepathol. pag. 605, Lindau Deutsch. Krypt. Fl. Pilze VIII, pag. 553. — Maculis minutis, brunneis, transversis, nervisequiiis; conidiis effusis, copiosis, unicellularibus, ellipsoideis v. globosis, 8-10 \approx 5-6 vel 6-8 μ . diam., brunneis.

Hab. in frondibus Pteridis creticæ, quam lædit, in calidariis Daniæ.

19. **Coniosporium papyricola** Lindau, Rabenh. Krypt.-Fl. ed. II v. VIII 8307 (1906) Hyphomyc. p. 564. — Mycelio ex hyphis sparsis, septatis, repentibus, fumoso-brunneis, diaphanis, 4 μ . cr. formato; conidiophoris e mycelio oriundis, brevibus, 2,5 μ . cr., hyalinis, apice monosporis; conidiis copiosis, stratum pulveraceum, effusum piceo-

nigrum formantibus, ellipsoideis v. ovoideis, nigricantibus, impellucidis, superficie granulosis, 10-11,5 \approx 6-7,5.

Hab. in charta putrescente, Sachsenwald pr. Hamburg Germaniæ (JAAP).

FUSELLA Sacc. — Syll. IV p. 246.

1. **Fusella Typhæ** Lindau, in Rabenh. Krypt. Fl. Ed. II, Hyphom. 8308 (1906) VIII, p. 566, c. ic. — Cæspitulis sparsis, elongatis, foliorum nervis parallelis, 0,5-1 mm. long., firmis, nigris, primo epidermide velatis dein erumpenti-liberis, hypostromate viridi-brunneo suffultis; conidiis fusoideis, olivaceis, 9-15,5, plerumque 14-15 \approx 3,5-4, saepe guttulatis, semipellucidis.

Hab. in foliis emortuis *Typhæ latifoliæ*, Eschenburg pr. Hamburg (JAAP).

THIELAVIOPSIS Went. — Syll. XI, p. 612, XVIII p. 567.

1. **Thielaviopsis paradoxa** (de Seyn.) v. Höhn. Fragm. z. Myk. VI, 8309 p. 169 (1909). — Verisimilime ejus synonyma sunt: *Endoconidium fragrans* Delacr. et *Catenularia echinata* Wakker, observante von Höhn. l. c.

TORULA Pers. — Syll. IV p. 247, X p. 572, XI p. 610, XIV p. 1069, XVI p. 1051, XVIII p. 565.

1. **Torula monilioides** Corda — Syll. IV, pag. 254 — var. **globosa** 8310 Ferraris Malpighia XVI (1902) p. 40. — Cæspitulis irregularibus, nigricantibus, pulveraceis; hyphis brevibus; conidiis globosis, 4-6 μ . diam., intense brunneis, moniliformiter dispositis, in catenulas breves secedentibus.

Hab. in ligno putri pr. Crescentino Pedemontii.

2. **Torula conglutinata** Corda — Syll. IV, p. 262 — var. **citrinola** 8311 Saccardo, Not. Myc. IX, Ann. Myc. V (1907) p. 179. — Cæspitulis hypophyllis, minutis, brunneolis; hyphis conidiophoris simplicibus, 40 \approx 4, assurgentibus, subhyalinis; conidiis globulosis, catenulatis, 8 \approx 7, distincte verruculosis, fusco-vinosis.

Hab. in foliis dejectis Citri Limonum ex agro Tarvisino a cl. prof. BENZI missis et diu loco udo servatis Patavii, Ital. bor. — Species est ex subgen. *Trachytora*.

3. **Torula Elasticæ** (Koord.) Sacc. et Trott., *Catenularia Elasticæ* 8312 Koord., Botan. Unters. Java (1907) p. 230, f. 41. — Hyphis erectis, fuscis, effusis, apice conidia concatenata gerentibus; conidiis

ovoideo-oblongis v. oblongis, fumigatis, continuis, utrinque rotundatis, levibus, 5-5,5 \approx 3,5-4.

Hab. in foliis putrescentibus Fici elasticæ, in Horto Botanico Dahlem-Berlin ex planta javanica, martio 1907 (KOORDERS).

— An status conidicus *Chætomii Kunzeani* Zopf? — Videtur potius *Torulæ* sp. quam *Catenularia*.

4. **Torula Alni** Lindau, in Rabenh. Krypt. Fl. Ed. II Hyphom. VIII 8313 (1906) p. 585. — Cæspitulis minutis, firmulis, brunneo-atris, discretis rarius confluentibus, usque ad 1 mm. diam., pulvinatis; mycelio hyalino v. brunneolo, sparso, septato, apicibus in catenulas brunneas irregulariter abeunte; conidiis primo in catenulas junctis dein singulatim v. per parvas series secedentibus, brunneis, forma valde ludibundis, globosis, doliiformibus, oblongis, ovoideis, subinde quoque angulosis, 4-8 μ . altis, 5-9 μ . latis.

Hab. in ramulis siccis Alni glutinosæ ad Grunewaldsee pr. Berlin (LINDAU). — Conidia interdum lateraliter germinant.

5. **Torula grumulosa** Lindau, in Rabenh. Krypt. Fl. Ed. II, Hyphomyc. VIII (1906) p. 579. — Effusa, nigrovirens, granuloso-pulverulenta, partim crassiuscule stratosa; mycelio viridi-brunneolo, septato, ramoso, 4 μ . cr., hinc inde pleurogene conidia immediate proferente; conidiis 2,3,4 v. raro pluribus in colonias connexis, viridulo-brunneis, diaphanis, grosse 1-guttatis, rarius minute pluriguttulatis, globosis, 4 μ . diam., v. oblongis, 5,5 μ . longis, saepe 1-septatis.

Hab. in resina Abietis excelsæ pr. Putlitz, Brandenburg (JAAP). — Vegetatio potius Saccharomycetum, hinc species incertæ sedis.

6. **Torula Jaapii** Lindau, in Rabenh. Kryptog. Fl. Ed. II Hyphomyc. (1906) p. 577. — Late effusa, indeterminata, velutina, nigra, viridulo-tincta; hyphis mycelii simpliciter ramosis, repentibus et ascendentibus, apice catenulas gerentibus; conidiis breviter seriatis, singulatim rarius binatim v. ternatim secedentibus, levibus, nigris, impellucidis, globosis 7,5-8,5 μ . diam., vel ovoideis et tunc binatis, utrinque imprimis basi, truncatis ibique stipitiformi-augustatis, 15-19 \approx 7,5-8.

Hab. ad caudices putres Pin i silvestris pr. Triglitz, Brandenburg (JAAP).

7. **Torula resinæ** Lindau, in Rabenh. Kryptog. Fl. Ed. II, Hyphomyc. VIII (1906) p. 578 et in Jaap. Beitr. Pilzfl. d. Schw., Ann. Myc. v. V (1907) p. 270. — Cæspitulis crassiusculis, irregularibus, late

effusis, e lanoso pulverulentis, atro-viridi-brunneis subinde nigricantibus, hyphis sterilibus levibus subsimplicibus parce sinuosis, septatis, viridi-brunneis, diaphanis, 3,5-4,5 μ . cr., membrana dupli crassiuscula; hyphis sursum cuboideo-articulatis, apicem versus sphæroideo-articulatis et in catenulas breves abeuntibus; conidiis maturis globosis, levibus, saturate viridulo-brunneis, 4 μ . diam., saepius guttulatis.

Hab. in resina Pinorum pr. Chamounix (JAAP) et pr. Valpel-line Ital. bor. (TRAVERSO).

8. **Torula proximella** Sacc. in Malbr. et Letendr. Champ. Norm. IV 8317 p. 67, t. I f. 7 (in Bull. Soc. Amis Sc. Nat. Rouen 1887). — Maculis effusis, nigro-olivaceis; conidiis 6-7 \approx 2, oblongo-ellipsoideis, medio non constrictis, levibus, non guttulatis, breviter catenulatis.

Hab. ad ligna et trunco putrescentes, Normandie Galliae. — Ab affinis *Tor. antennata* imprimis conidiis minoribus, medio non constrictis etc. dignoscitur.

9. **Torula palmigena** Bubák, Növényt. Közlemen. VI, Hefl 4, (1907) 8318 Extr. p. 41. — Maculis valde elongatis, angustis, alutaceis, utrinque conspicuis; mycelio superficiali; cæspitulis valde approximatis, longe seriatis, theobromino-brunneis, amphigenis; conidiphoris conidium subæquantibus, brunneis, saepè curvulis 4 μ . cr.; conidiis catenulatis, ellipsoideis v. ovoideis, v. oblongis, grosse guttatis, 9-12 \approx 4,5-6,5.

Hab. in foliis vivis Phœnicis dactyliferæ, socia Graphiola, in horto botanico Budapest.

10. **Torula fumaginea** Speg., Myc. Argent. V, p. 431, in Anal. Mus. 8319 Nac. Buenos Aires XX (1910) — Biophila plerumque epiphylla, minute cæspitulosa, atra, laxissime gregaria; catenulis ex articulis 5-6, infimo maximo (15-20 μ . diam.) supremo minimo (5-6 μ . diam.) globosis, minute papillulatis vix pellucidis efformatis.

Hab. ad folia viva Zuccagniæ punctatæ in aridis Cacheuta prope Mendoza Argentina Amer. austr. — Species potius ad *Fumaginem* quam ad *Torulam* pertinens.

11. **Torula pulviniformis** H. et P. Syd., Ann. Mycol. IV (1906) 8320 p. 345. — Cæspitulis sparsis, saepius solitariis, hemisphærico-pulviniformibus, 1-2 mm. diam., pulverulentis, atris; hyphis filiformibus, circ. 200 μ . longis. 4 μ . crassis, obscure septatis, demum distincte septatis, crassioribus et in conidia se mutantibus, moniliformibus; conidiis (articulis) continuis v. binis diutius cohærenti-

bus, globosis v. subglobosis, fusco-brunneis, distincte verrucosis, 7-10 μ . diam.

Hab. in foliis putridis Bromeliaceæ cujusdam, Sao Leopoldo, Rio Grande do Sul Brasiliæ (J. RICK). — Ad subgen. *Trachytorula* Sacc. pertinet.

12. **Torula culmicola** Corda, in Sturm. Deutschl. Fl. III fasc. 8, p. 93, 8321 t. 43. (1829) — Effusa, atra, 5-10 mm. lata; hyphis sterilibus repentibus, fertilibus mox in catenulas breves conidiorum subrectas abenutibus; conidiis in quaque catenula 4-8 facile secedentibus, globosis, brunneis, subdiaphanis.

Hab. in calamis putrescentibus Typhæ latifoliæ pr. Okoriz Bohemiæ.

13. **Torula verrucosa** Vouaux in Bouly de Lesd., Bull. Soc. Bot. France 1907 (1908) LIV, p. 697. — Cæspitulis mycelii basi immersis supra emergentibus subsphæroideis, nigris, 70-150 μ . diam.; conidiis subellipsoideis, apice rotundatis v. subtruncatulis, simplicibus, raro bilocularibus, basilaribus, 4-6 \approx 2,5-3, apicalibus 8-9 \approx 4-5, obscure brunneis, verrucosis, 4-12 catenulatis, catenulis inter se confertis, stratum continuum seu parietem simulantibus.

Hab. in apotheciis Lecanoræ subfuscæ pr. Versailles Galliæ. — An *Speiræ* affinis?

14. **Torula Lichenopsis** v. Höhnel, Ergebn. Bot. Exp. Siidbras. 8323 1901 Denk. K. Ak. d. Wiss. Wien, Bd. LXXXIII, (1907) Extr. p. 36. — Lichenicola; cæspitulis atro-brunneis, applanatis, irregulariter rotundatis, $\frac{1}{3}$ mm. lat., paucis v. plurimis linea nigra tortuosa acute limitatis; hyphis brevibus, brunneis, irregulariter ramosis, 2-3 μ . cr.; conidiis breviter catenulatis, brunneis, versiformibus, subrotundis v. ovoideis v. piriformibus oblongisve 9 \approx 3-6, episporio minute obtuseque verruculoso v. levi.

Hab. in thallo lichenis crustacei cujusdam, Sao Paulo Brasil.

15. **Torula fusca** (Bon.) Sacc. — Syll. IV p. 260. — *Oospora fusca* (Bon.) Grove, Journ. of Bot. XXXIII (1885) p. 163, t. 257, f. 1. Effusa, pulverulenta, dilute brunnea; catenulis initio erectis, mox divaricatis et intricatis; conidiis in quaque catena numerosis, pallide ochraceis, 6-8 \approx 3,5-4, subinde 10 \approx 5.

Hab. in Bulgaria inquinante deliquescente in Germania et Anglia.

16. **Torula Bantiana** Sacc. in Ann. Mycol. X (1912) p. 320. — Dense 8325 cæspitosa, nigra, subvelutina; conidiophoris ex mycelio hypostro-

matico, brevi, celluloso ascendentibus, fasciculatis, cylindraceis, simplicibus, subrectis, variæ longitudinis, plerumque 15-30 μ . long., raro usque ad 60 μ . (ex cultura), 5-5,5 μ . cr., deorsum sensim leviter crassioribus, continuis, v. (longioribus) parce septatis, apice truncatis sporigeris, sub vitro atro-olivaceis; conidiis longe et sat persistenter catenulatis (in quaque catenula 5-10), concoloribus, oblongo-ellipsoideis, 8-11 \times 5, levibus, intus granulosis, summis junioribus et pallidioribus.

Hab. in tumore (granulomate) cerebralí, habitu melanotico, feminæ, causa ejusdem tumoris emortuæ, Florentiæ, hieme 1912. — Invenit, culturæ subjicit et clinice scrutatus est ill. doct. G. BANTI, professor florentinus. — Fungillus bene sed lente evolvitur temperie a 20 C ad 37 C; libentius mediis acidis, glycosio præsente v. absente. — Valde affinis caseicolæ *Torulæ nigrae* (Burri et Staub) Sacc. et Trav. Syll. fung. XX, p. 964 seu *Monilia nigra* Burri et Staub¹⁾, quæ vero colore nigro et conidiophoris simplicibus non Moniliæ species esse potest. Cum gen. *Catenularia* sensu Doct. K Saito²⁾ satis convenit, sed homonymon Grove³⁾ certe diversum. Pro tempore aptius ut *Torulæ* species sumenda.

17. **Torula simplex** (Lindn.) Sacc. — Ita potius vocandum est *Penicillium simplex* Lindner — Syll. XVIII p. 518 — seu *Catenularia fuliginea* Saito; cfr. Lindau Krypt. Fl., Pilze IX p. 787. — Ob colorem fuligineum non *Oospore* adscribenda species, ut l. c. dubitanter proposueram. — In caseo in Germania et Japonia.

18. **Torula nigra** (Burri et Staub) Sacc. et Trav. — Syll. fung. 8327 XX p. 964, *Monilia nigra* Burri et Staub in Landw. Jahrb. der Schweiz (1909) p. 487, t. I-II (absque diagnosi). — Effusa, maculiformis, nigra; hyphis vase et parce ramosis, filiformibus, inæqualibus, subcontinuis, fuligineis, hinc inde conidiophoris; conidiis in catenulas breves dispositis et facile dilabentibus, late ellipsoideis, utrinque rotundatis, atro-fuligineis, levibus, plerumque 1-guttulatis, 12-13 \times 6-8.

Hab. in cortice casei Emmentaler dicti, Bern Helvetiæ.

¹⁾ In Landwirtschaftl. Jahrb. der Schweiz, 1909, p. 487 t. I-II.

²⁾ In Journ. Coll. Science Univers. Tokyo XVIII (1904) p. 51, t. II, f. 4.

³⁾ In Syll. fungorum IV (1886) p. 303.

Maculæ usque ad 2 cm. latæ. Species caseum corrumpit. Cfr. fusiorem expositionem cl. Burri et Staub l. c.

19. **Torula Sacchari** Corda Icon. fung. IV, p. 23, t. VI, f. 7 (1840). — 8328

Mycelio floccoso, repente, bombycino v. tenuissimo, albo v. flavomaculato; hyphis ramosis, repentibus, continuis; conidiophoris cylindraceis brevibus, albis, continuis, simplicibus, conidiis globosis brunneis (ochraceo-fuscis), subæqualibus, 2,7–2,9 μ . diam.

Hab. in formis (*panibus*) saccharinis in officinis h. e. saccharificiis in Bohemia. — Saccharum maxime vexat et corrumpit.

20. **Torula brevis** (Bon.) Sacc. et Trav. Syll. XX p. 962, *Xenodochus brevis* Bonord. Handb. Myk. t. 8, p. 174 (1851). In textu deest nomen, sed cum auctor, p. 49, ad gen. *Xenodochum* referat *Torulam abbreviatam* Corda — Syll. IV p. 256 — verisimiliter ex errore in tab. scripsit *brevis* pro *abbreviatus*. Icones Cord. et Bon. conveniunt, postremus vero figurat quoque hyphas steriles repentes ramulosas hyalinæ et conidiophora brevissima, conida globosa binatum usque ad quinatum catenulata.

21. **Torula fenestralis** (Link) Schwabe, Linnæa XV (1841) p. 279, 8330

t. I, f. A. ? *Byssocladium fenestrale* (Link) Ditm. — Hyphis repentibus sterilibus vitro adnatis hyalinis, septatis, parce ramosis; conidiis in catenulas longiusculas dispositis, globosis v. subglobosis, intus granulosis, fuligineis, 12-13 μ . diam. (ex icona).

Hab. in vitris cubiculorum in Germania. — Hyphomyces radiosus, quem ipse observavi in vitris fenestrarum erat forma abnormis *Aspergilli grisei*. Cfr. Syll. IV p. 65. Verisimiliter in vitris udis plures occurrunt fungillorum species habitu simili.

22. **Torula saccharina** Heald et Pool, 21 Ann. Rep. Nebraska Agric. 8331

Exp. Stat. (1908) p. 54, c. 7 icon.

Hab. in syrupo *Aceris saccharini*, Nebraska Amer. bor. — An *Oospora*? — Diagnosim non vidi.

HEMISPORA Vuill. Bull. Sacc. Mycol. de Fr. XXII (1906) p. 128

(Etym. *hemi* dimidium et *spora*). — Mycelium copiosum, tenue, septatum, ramosum, hyalinum; hyphæ fertiles prope basim ramosæ; ramuli conidiophori vesiculæ anulo brunneo rigidulo basi cinctâ ibique constrictâ terminati; vesicula in seriem segmentorum sporiformium sensim mutata, interdum ramulum alterum conidiophorum prolificans.

1. **Hemispora stellata** Vuill. l. c. p. 129, tab. VII. — Subiculis mycelii disciformibus, albis, 0,5-2,5 mm. diam., sessilibus; conidio-

8332

phoris supra discum in lineolas radiatas v. stellatas brunneas dispositis; conidiis 4-8 superpositis, subsphaerico-cuboideis, 2,6-3,5 μ . diam., membrana externa verruculosa, fuliginea, parietibus contiguis levibus.

Hab. sub crusta mycelica *Aspergilli* repentis culti in Gallia.

GLIOMASTIX Guéguen, Bull. Soc. Mycol. Fr. XXI (1905) pag. 240, t. XIV et XV, *Torula* Auct. ex parte (Etym. *gloios* viscosus et *mastix* scutica). — Hyphæ steriles, decumbentes; fertiles breves simplices vel subsimplices. Conidia mucilaginea, catenata, mox terminaliter conglobata, initio tubulo brunneo e membrana conidiophori formato innata, mox ex anulari segmentatione tubulo denudata, inde ob disjunctores toriformes inter conida interjectos secedentia.

1. **Gliomastix chartarum** (Corda) Guég. l. c. p. 240, t. XIV et XV, *Torula* 8333 *chartarum* Corda — Syll. IV p. 261. — Mycelio repente umbriño, 3-3,5 μ . diam., parce septato, ramoso, simplici v. in fasciculos coalescente; conidiophoris erectis simplicibus v. parce æquilater ramosis, 20-30 \approx 3-4, basim versus septatis, apice tenuatis saepe verruculosis; conidiis numerosis in catenam longam flexuosa terminaliter conglobatam seriatis, ovoideis, 2,4-3,6 \approx 2,3-2,5 hyalinis, levibus, ocellatis, mucilagineis, endogenis, mox ex segmentatione anulari tubuli liberatis, brunneis.

Hab. in charta uda v. putrescente in Bohemia, Germania, Gallia, Italia.

GYROCERAS Corda. — Syll. IV p. 266.

1. **Gyroceras saxonicum** Lindau, Rabenh. Kryptog. Fl. Ed. II Hyphom. VIII (1906) p. 606. — Cæspitulis punctiformibus, discretis, e punto communi radiantibus, sub vitro velutinis, griseo-brunneis, $\frac{1}{10}$ - $\frac{1}{3}$ mm. diam., ex conidiophoris tantum formatis; conidiophoris in centro cæspituli parce ramosis v. simplicibus, raro et remote septatis, hyalinis, 3,5-4 μ . cr., superficialiter vero catenulas conidiorum 200-300 μ . longas, rectas v. curvulas, simplices v. ramosas gerentibus; conidiis flavo-brunneis sub vitro fere hyalinis, subovoideis, 7,5 μ . latis, subinde paullo latioribus quam altis, diu connexis, rarius secedentibus rotundioribus, primitus ex cellulis mycelialibus mutatis orientibus.

Hab. in caulibus *Lythri* *Salicariæ* pr. Naundorf Saxonie (SCHADE). — Ex ipso auctore species in genere dubia.

2. **Gyroceras divergens** Peck, Bull. Torr. Bot. Cl. XXXVI (1909) 8335

p. 155. -- Maculis in foliorum facie superiore griseis, facie inferiore purpureo-brunneis, saepe confluentibus; hyphis hypophyllis, sterilibus repentibus, ramosis, vulgo brevibus, hyalinis v. pallidis, fertilibus suberectis, multiseptatis, 20-80 \approx 6-10, areas tomentosas brunneas formantibus, loculis 4-8 μ . longis 6-10 μ . latis, paucis septo longitudinali aliquando divisis.

Hab. in foliis vivis *Celtidis occidentalis*, Batesville Arkansas Amer. bor. (E. BARTHOLOMEW). — A *Gyr. Celtidis* (Biv.) M. et C. omnino diversa species.

HORMISCIMUM Kunze — Syll. IV p. 263, X p. 575, XIV p. 1070, XVIII p. 567.

1. **Hormiscium Leonardianum** L. Gaja, Flora Mycol. prov. Padova, 8336 p. 27 (sunto litog.). (1912) — Cæspitulis nigerrimis, pulverulentis, tenuerrimis, per ramulos et caules late diffusis; hyphis cylindraceis, 2 μ . latis, sinuosis, reptantibus; conidiophoris subhyalinis, brevissimis, 2-3 μ . longis, subcylindraceis, ad apicem incrassatis et obscurioribus; conidiis catenulatis fere perfecte globosis, fuscis, dense hispidulis, vix secedentibus, 5-6 μ .; catenulis rarius ramosis, longitudine variis.

Hab. in ramulis *Celosia cristatae* in viridario Convictus Universitariorum, Patavii Ital. bor. — Affine est *Hormiscio stilbosporo*, a quo præcipue differt forma et ornamento conidiorum.

2. **Hormiscium Tiliae** Karst., Acta Soc. pro Faun. et Fl. fenn. XXVII, 8337 4 (1905) p. 11. — Cæspitulis erumpentibus superficialibus, pulvinatis, atris v. fusco-atris, exiguis; catenulis erectis, simplicibus, fasciculatis, rigidis, semipellucidis (sub lente), usque ad 100 μ . long., articulis plerumque 3-4, non secedentibus, 8-25 \approx 8.

Hab. in ramulis siccis *Tiliae cordatae* in regione Aboensi, Ransala, Fennia.

3. **Hormiscium gelatinosum** Hedgcock, 17th Ann. Rep. Miss. bot. Gard. St. Louis (1906) p. 101, tab. 11, fig. 4-8. — Mycelio incarnato dein brunneo effuso; hyphis catenulatis, toruloideis, forma vere ludibunda, nunc cylindraceis, subhyalinis, 2-8 μ . diam. modo ovato-subrotundis, atro-olivaceis, 5-10 μ . diam.; conidiis typicis, vix secedentibus, modo globoso-oblongis v. cuboideo-oblongis, 10-14 \approx 5-6, modo subglobosis, 7-12 μ . diam.

Hab. in lignis denigratis Coniferarum, *Ulmi* etc. in Amer. borealis.

4. **Hormiscium Handelii** Bubák in Handel-Mazzetti, Bot. Reise Pont. 8339

Randgeb. in Ann. Naturhist. Hofmus. Wien XXIII (1909) p. 106, t. V, f. 4, a-d. — Cæspitulis atris, opacis, crassis, late effusis, superficie inæquali, pulveraceis; catenis e cortice erumpentibus, repentibus v. ascendentibus, sæpius ramosis; conidiis globosis, utrinque parum applanatis, magnitudine varia, usque ad 40 μ . diam., tunica crassa, obscure castaneo-brunnea, reticulato-verrucosa.

Hab. ad corticem Pini Pityusæ, Prinkipo prope Constantinopolim.

5. **Hormiscium Vulpinæ** Lindau, Rabenh. Krypt. Fl. Ed. II Hyphomyc. VIII (1906) p. 597. — Cæspitulis amphigenis sed sæpius epiphyllis, subrotundis v. oblongis, convexulis, ex mycelio in folio repente erumpentibus, usque ad $1/2$ mm. long., non confluentibus, atro-brunneis, e catenulis conidiorum tantum formatis, firmulis dein pulverulentis; catenulis brevibus, initio ex filamentorum longiorum divisione ortis; conidiis depresso-globosis, eguttulatis, brunneis, circ. 3,5-4 \approx 4.

Hab. in foliis putrescentibus Caricis vulpinæ pr. Triglitz Germaniæ (JAAF).

ACROTHECA Fuck. — Syll. IV p. 276, X p. 579.

1. **Acrotheca Dearnessiana** Sacc. in Ann. Mycol. X (1912) p. 314. 8341
— Maculis brunneis hypophyllis; hyphis conidiophoris imprimis nervisequiis, sparsis, cylindraceis, subrectis, brunneolis, 45-48 \approx 4-5-septatis; conidiis in apice conidiophori 3-5-capitatis, oblongo-fusoideis, apice obtusioribus, subinde leviter inæquilateris, 12-15 \approx 4-5, hyalinis, 1-2-guttulatis.

Hab. in foliis languidis Piri melanocarpæ, London Ontario Amer. bor. (J. DEARNESS). Teste collectore species suis locis communis et diu vigens.

2. **Acrotheca virens** (Tul.) Cost., Muced. simpl. p. 93, fig. 58. — 8342
Dematium virens Tul. Sel. Carp. II, p. 253, t. XXXIII (1863). — Hyphis conidiophoris gregariis, erectis, rectis, filiformibus, septatis, fuligineis, 500 \approx 4-7, apice inflatulis et denticulatis pallidioribus; conidiis cylindrico-allantoideis, hyalinis, capitulatis, circ. 15-16 \approx 2, curvulis, continuis.

Hab. in ligno quercino prope Lutetias Galliæ, socia *Chætosphaeria innumera*, cuius, teste Talasne, esset st. conidiophorus. — Primitus, teste eodem auctore, conidia formantur item capitulata, periconioidea, ovoidea, pallide fusca, 6,5 \approx 3 et etiam helmintho-

sporioidea 6-8-septata, 25-30 \times 3. — An vere ex eodem mycelio?

3. **Acrotheca Zignoëllæ** v. Höhn. Sitzb. d. k. Ak. Wissensch. Wien 8343 CXVIII, Abt. I (1909) p. 332. — Hyphis sparsis v. pauci-aggregatis, plerumque simplicibus, erectis, firmulis, tenui-septatis, dia-phane brunneis, usque ad 320 \times 5-6, superne tantum 3 μ cr. ibique rarius 1-3-incurvo-ramulosis; conidiis cylindraceis, continuis hyalinis, rectis, apice rotundatis, basi cuneatis, 10-13 \times 2-3, capitatis et subconglutinatis.

Hab. in cortice levigato emortuo *Abietis*, Wienerwald Austriæ, non raro socia *Zignoella Abietis*, cuius verisimiliter est status conidiophorus.

HAPLOBASIDIUM Eriks. — Syll. X p. 578.

1. **Haplobasidium pavoninum** v. Höhn. Ann. Mycol. III (1905) p. 407 8344 c. ic. — Parasiticum; maculis saepius solitariis v. binis, saepius marginalibus, elongatis, circ. 2 cm. long., 1 cm. lat., purpureo-brunneo-marginatis, centro flavidis v. ochraceo-flavis, hyphis intramatricalibus hyalinis, septatis, e cellulis latitudine sua 2-3-plo longioribus, tenuibus formatis, irregulariter ramosis, fibulis et haustoriis destitutis, 3-6 μ . cr., intercellularibus; hyphis fertilibus e cuticula erumpentibus, brevibus, 8 μ . cr., saepius simplicibus 1-cellularibus, griseo-brunneis, demum cæspitulos farinaceo-velutinos formantibus, 25-48 \times 6-8, superne inflatis et 12-16 μ . cr., ibique catenulas 3-5 breves subverticillatas gerentibus; conidiis inferioribus oblongo-clavatis 10 \times 5-6, superioribus subglobosis minoribus, fumoso-griseis, 6-9 \times 6-7, in quaque catenula 3-5.

Hab. in foliis vivis *Aquilegiæ vulgaris* pr. Altenmarkt et Krems Austriæ (v. HÖHNEL). — Maculæ illas pennæ pavoninæ in memoriam revocant.

PERICONIA (Tode) Bon. — Syll. IV p. 270, X p. 578, XI p. 612, XIV p. 1071, XVI p. 1157, XVIII p. 568.

1. **Periconia Spiegazzinii** Sacc. — *Periconia levipora* Spieg. Myc. 8345 Argent. V p. 431, in Anal. Mus. Nac. Buenos Aires XX (1910) non Lindau. — Tenuissima atro-olivacea, hyphis sterilibus nullis, hyphis fertilibus laxis erectis tenuibus, 8-10 \times 0,5-2, laxe septulatis, subopace fuligineis, capitulo globoso, 50-90 μ diam. conidiorum terminatis, sub apice ramululis alternis adpressis, 15-30 \times 5-6, brevissime bilobis concoloribus ornatis; conidiis globosis 4-6 μ diam.,

plus minusve intense olivaceis, dichotomice botryoso-catenulatis, eguttulatis, levibus.

Hab. ad petiolos dejectos putrescentes *Zizyphi vulgaris* in horto San Miguel prope Buenos Aires Argentina Amer. austr.

— Species notis plurimis ad *Haplographium* vergens.

2. **Periconia javanica** Koord., Bot. Untersuch. Java (1907) p. 228, fig. 8346
 — Hyphis sterilibus repentibus, pro parte endophyllis; hyphis fertilibus simplicibus, fuscis, fasciculatis, rectis v. curvulis v. flexuosis, apice hyalinis et vix v. haud inflatis, 100-110 v. 8-10, parce septatis, apice conidigeris; conidiis fuscis, continuis, globosis, 8-9 μ . diam., extus minutissime punctulatis v. levibus.

Hab. saprophytica v. parasitans in vulneribus foliorum *Fici elasticæ* prope Loano prov. Kedu Java (KOORDERS).

3. **Periconia Elasticæ** Koord., Bot. Untersuch. Java (1907) p. 229, f. 39. 8347
 — Hyphis sterilibus repentibus, pro parte endophyllis; hyphis fertilibus simplicibus, fuscis, fasciculatis, 350-550 μ . longis, basi 9-12,5 μ . cr. cr. rectis v. curvulis, apice conidigeris; conidiis fuscis, continuis, globosis, capitato-congregatis, 10,5-14 μ . diam., exosporio minute echinulato.

Hab. saprophytica v. parasitans in vulneribus corticolis *Fici elasticæ* prope Kaliwiro et Penunggalan prov. Kedu Java, octob. 1905 (KOORDERS).

4. **Periconia levispora** Lindau, in Rabenh. Krypt. Fl. Ed. II Hypomyc. VIII (1906) p. 616. — Cæspitulis, in maculis elongatis sitis, inæqualiter confertis, brunneo-viridulis, flocculosis, ex conidiophoris tantum constantibus; conidiophoris erectis, senio dilabentibus, remote septatis, usque ad 1000 v. 11-24, plerumque indivisis, dorsum incrassatis, viridulo-brunneis, diaphanis, sursum subhyalinis et processibus brevibus obtusis latiusculis ornatis; conidiis in processibus solitarie acrogenis, 13-16 v. 8-12, globoso-ovoideis, capitula subrotunda oligospora formantibus, basi subinde apiculatis, viridulis, intus granulosis.

Hab. in foliis *Acori Calami* pr. Hamburg. Germ. (JAAP). —

Peric. pycnosporæ affinis sed conida majora, levia etc.

5. **Periconia ramosa** Spring. in Bull. Acad. Belg. 19 (1852) p. 557- 8349
 58, cum icone — Species omnino anceps, potius *Mucor*!

Hab. in substantiis putrescentibus in Belgio.

6. **Periconia lichenoides** Tode, Fungi Mecklenb. II, tab. 8, fig. 61 8350 (1791).

Hab. ad caules putres in Germania. — Stirps omnino dubia.

STACHYBOTRYS Corda — Syll. IV p. 269, X p. 577, XI p. 612, XIV p. 1071.

1. **Stachybotrys Elasticæ** Koord., Botan. Untersuch., Java (1907) 8351 p. 227, f. 37. — Hyphis sterilibus repentibus, fumigatis, septatis; fertilibus erectis, fumosis 50-200 \approx 4, dichotome ramosis sparse septatis; conidiophoris capitatis, clavato-oblongis, rectis v. curvulis, subhyalinis; ovoideis v. globulosis, interdum curvulis, continuis, atris, levibus, 7-12 \approx 6-8.

Hab. in foliis emortuis v. languentibus *Fici elasticæ* prope Purworedjo prov. Kedu Java (KOORDERS).

2. **Stachybotrys socia** (Sacc.) Sacc in litt. ad T. Ferraris, Ann. Mycol. VII (1909) p. 283. — Ita vocanda *Fuckelia socia* Sacc. — Syll. IV p. 331 — nam conidia denique fusca evadunt.

PERICONIELLA Sacc. — Syll. IV p. 275.

1. **Periconiella Missionum** Speg., Myc. Arg. V, p. 431, in An. Mus. 8353 Nac. Buenos Aires XX (1910). — Maculis amphigenis sæpius orbicularibus, 5-7 mm diam., determinatis, arescentibus, fragilibus, cinereis, obsolete areolatis; hyphis fertilibus sparsis sæpius epiphyllis erectis simplicibus 300-400 \approx 15-20, sæpius 3-4-septatis subopacis levibus apice subgloboso-capitatis, 35-50 μ . diam., levibus, fuligineis; conidiis globosis, 15-18 μ . diam., e papillis minutissimis el laxis capitulorum ortis, non catenulatis, fuligineis, minute denseque papillulosis.

Hab. ad folia viva v. languida *Bauhiniae forficatae* in silvis Puerto León Misiones Argentina, Amer. austr.

MICROTYPHA Speg. Myc. Arg. V. p. 432, in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. *micros* parvus et *Typha* ob conidia, *Typhæ* ad instar, cylindraceo-conferta) — Hyphomycetea dematiæ, macronemea; hyphæ fertiles erectæ articulatæ simplices graciles prope basim nudæ cæterum dense minuteque papillato-asperæ; conidia unicellularia in papillis solitarie acrogena, dense constipata fuliginea, massam cylindraceam constituentia. — Videtur *Doratomyces phæosporus*.

1. **Microtypha saccharicola** Speg. l. c. p. 432 cum icon. — Hyphis 8354 sterilibus nullis, fertilibus dense gregariis, rectis v. subcircinatis fumosis, subtorulis, parte nuda brevi, 15-20 \approx 4-5, capitulo cylindrico obtusiusculo 100-250 \approx 16-20 aterrimo; conidiis ellipsoideis, utrinque rotundatis, 5-6 \approx 3-4 subopacis, eguttulatis, levibus.

Hab. ad culmos dejectos putrescentes *Sacchari officinarum* prope Ledesma Yujuy Argent. Amer. austr.

HORMODENDRUM Bon. — Syll. IV p. 310, X p. 591, XIV p. 1076, XVIII p. 581.

1. **Hormodendrum Citri** Briosi et Farn. Atti Istit. Bot. Pavia (Extr. 8355 1906) p. 21, tab. I-XI pr. p. — Hyphis teretiusculo-fusoideis, simplicibus, septatis, brunneis, e mycelio repente ortis, saepe 80-110 \approx 4,5-5; conidiis corymbose catenulatis, ellipsoideis v. oblongis, continuis, brunneis, 6-8 \approx 4,5.

Hab. in fructibus Citri Limonis morbo s. d. *ruggine bianca* deturpatis, in Sicilia.

2. **Hormodendrum griseum** Hedgcock, 17th Ann. Rep. Miss. bot. 8356 Gard. St. Louis (1906) p. 100 tab. 10, fig. 2. — Mycelio albido granuloso, vetusto crasse tunicato, 3-10 μ . cr.; conidiophoris erectis, septatis, sursum penicillato-ramosis, 200-800 \approx 3-4, ramulis brevibus 1-2-septatis, oblongis, mox in catenulas longas, ramosas conidiorum abeuntibus; conidiis ellipsoideis, fuligineis, 3-6 \approx 2-4, levibus.

Hab. in lignis uidis Liquidambaris styracifluæ, Piniechinatæ, Fraxini americanæ, in Amer. bor.

ASPERGILLOPSIS Speg., Myc. Arg. V, p. 434, in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. *Aspergillus* et *opsis* facies). — Est *Sterigmatocystis* dematiae, hyphis conidiisque olivaceis v. nigris.

1. **Aspergillopsis intermedia** Speg., l. c. p. 435. — Cæspitulis sparsis, laxis; hyphis fertilibus parce cæspitosis, continuis, 1-3 mm. long. 10-12 μ . cr., hyalinis, capitulo subcompactiusculo nigro coronatis; vesicula hyalina minute papillata 40 μ . diam.; pseudo-basidiis primariis eximie clavato-subcapitatis, hyalinis 40-50 \approx 10-12, secundariis ovato-elongatis 7 \approx 3-4, hyalinis, apice acutis atque nigrescentibus; conidiis globosis, 4-4,5 μ . diam., catenulatis, sublevibus, fuligineis, eguttulatis.

Hab. ad folia dejecta putrescentia Coffea arabicae loco uido diu servata, La Plata Argent. Amer. austr.

2. **Aspergillopsis pulchella** Speg., Myc. Arg. V p. 436, cum icon., 8358 in An. Mus. Nac. Buenos Aires XX (1910). — Cæspitulis nigerimis dense gregariis saepe confluentibus ac totum substratum obtectibus; hyphis fertilibus dense cæspitosis, septulatis, erectis, 1-2 mm. long. 18-20 μ . cr., fumosis, capitulo globoso 50-60 μ .

diam. nigro coronatis; pseudobasidiis primariis obconicis, 30 ~ 10, chlorinis, secundariis subpyriformibus 10 ~ 10; conidiis globosis 8-10 μ . diam., dense minuteque asperulis, fuligineis, eguttulatis.

Hab. abunde ad fructus putrescentes Citri Aurantii in arvis prope Tucumán Argent. Amer. Austr.

3. **Aspergillopsis nigra** (Van Tiegh.) Speg. l. c. p. 435. — Ita vocandum est *Aspergillus (Sterigmatocystis) niger* Van Tiegh. Syll. IV p. 75.

HAPLOGRAPHIUM B. et Br. — Syll. IV p. 304, X p. 588, XIV p. 1076.

1. **Haplographium Yerbæ** Speg., Anal. Mus Nac. Buenos Aires t. XVII (1908) p. 139. — Plagulis saepius centrum sectionum occupantibus vage nubilosis, ægre perspicuis, olivascentibus; conidiophoris cylindraceis inter se remotiusculis, basi non bulbosis, sursum attenuatis, 100-500 ~ 8-12, apice obsolete denticulatis, capitulum globosum 30-50 μ . diam. fulcentibus, nigris; conidiis e denticulis apicalibus stipitum catenulatim exsurgentibus, catenulis saepes ubdichotomis, globosis, 6-7 μ . diam., levibus, saepius grosse 1-guttulatis, olivaceis.

Hab. in schidiis aridis subputrescentibus Ilicis paraguariensis circa San Pedro Misiones Rep. Argentina.

2. **Haplographium chlorocephalum** (Fres.) Grove — Syll. IV, p. 306 — * **H densum** Sacc. in Ann. Mycol. IX (1911) p. 256. — A typo differt cæspitulis densioribus, sordide olivaceis; hyphis conidiophoris æqualibus, septatis, 400-500 ~ 7-8, apice indivisis, obtusis, vix denticulatis; capitulis globosis, 50-60 μ . diam.; conidiis catenulatis, sphæricis, 1-guttatis, levibus, 4 μ . diam., ochraceo-olivaceis.

Hab. in culmis putrescentibus Sacchari officinarum in insula Madera, 1910 (Communic. prof. TORREND). Densitate, colore, conidiophoris omnino indivisis forte specifice distingui mereatur. Cum *H. Sacchari* nil commune habet.

CœDEMİUM Link — Syll. IV p. 297.

1. **Cœdemium Thalictri** Jaap, Ann. Mycol. III (1905) p. 401. — Malculis majusculis foliola integra subinde occupantibus, griseis, bruno-neo-marginatis; cæspitulis nigricantibus, hypophyllis; conidiophoris rigidulis, erectis, indivisis, raro ramosis, basim versus latioribus, flavidis, 25-32 ~ 6, apice v. latere cellulis conidiophoris atris, 11 μ . diam., globosis præditis; conidiis sphæricis, 5-9,5 μ . diam., flavidis, tunica obscuriore, verruculosa.

Hab. in foliis vivis *Thalictri minoris* pr. Warnemünde, Mecklenburg (JAAAP).

HADROTRICHUM Fuck. — Syll. IV p. 301, X p. 588, XI p. 613, XVI p. 1053, XVIII p. 571.

1. **Hadrotrichum dryophilum** Saccardo, Not. Myc. VI, Ann. Myc. III 8363 (1905) pag. 515. — Cæspitulis plerumque hypophyllis, in maculis arescendo fuscis, indefinitis, sparsis, perexiguis, punctiformibus, 50–60 μ . diam., superficialibus, nigricantibus; conidiophoris radiatim dense fasciculatis, cylindraceo-oblongis, 20–25 \times 3–3,2, continuis, olivaceis, apice rotundatis v. acutulis, monosporis; conidiis ellipsoideis v. obovoideis, rectis, continuis, dilute olivaceis, 9–10 \times 6–6,5.

Hab. in pag. inf. foliorum languidorum *Quercus pedunculatae*, Montello, Treviso, Ital. bor. — A speciebus congeneribus omnino diversa.

2. **Hadrotrichum anceps** Sacc., Ann. Mycol. IX (1911) p. 255. — Cæspitulis saepius hypophyllis, seriatim gregariis v. subsparsis, breviter linearibus, minutis, 0,5 mm. long., castaneo-nigris, prominulis, compactis; conidiophoris dense parallele stipatis, cylindricis, rectis, rarius sursum crassioribus, 35–40 \times 5,5–6, fuligineis, septo unico prope basim praeditis, apice minutissime (ex insertione conidiorum) asperulis; conidiis globosis, rarius ellipsoideo-globosis, 8–9 μ . diam., fuligineis, episporio tenui, non omnino levigato.

Hab. in foliis languidis *Brachypodii* sp. in Gallia (P. HARIOT). — Inter *Hadr. virescens* et *Hadr. microsporum* fere medium sed satis distinctum.

3. **Hadrotrichum microsporum** Sacc. et Malbr. — Syll. IV, p. 301 — 8365 var. **macrosporum** Karst., Acta Soc. pro Fauna et Fl. fenn. XXVII 4 (1905) p. 11. — Conidiis sphæroideis, subhyalinis (sub micr.), 8–13 μ . diam.; conidiophoris 30–40 \times 8.

Hab. in foliis *Agrostidis albæ* languescentibus in regione Kuopioensi Fenniae (O. LÖNNBOHM).

RHINOCLADIUM Sacc. et March. — Syll. IV p. 295, X p. 585, XIV p. 1073, XVI p. 1053, XVIII p. 572.

1. **Rhinocladium Lesnei** Vuill., in Bull. Soc. Sc. Nancy (1910) p. 10 8366 et p. 13, f. 1–12. — Hyphis ramosis, septatis, circ. 1–3 μ . lat., mox fuligineis, discretis aut fasciculatis et tunc ascendentibus, synnematis ad instar; conidiis oblongis v. ovoideis, breviter pedicu-

latis, fuligineis, 4-7 \vee 3-3,5, solitariis, insidentibus in hyphis passim v. præcipue ad apicem denticulatis, cylindricis, aut passim inflatis, aut rarius nodosis.

Hab. e tumore pedis hominis extractum in insula Madagascar. Colitur in calidariis Paris, Nancy, temp. 25-35°C. — Quoad ejus variationes cfr. Vuill, l. c.

TRICHOSPORIUM Fr. — Syll. IV p. 288, X p. 583, XI p. 613, XIV p. 1073, XVI p. 1052, XVIII p. 573.

1. **Trichosporium vesiculosum** Butler, Some Indian forest Fungi p. 9, 8367 cum ic. p. 5, in Indian Forester (1905). — Hyphis brunneis vel subhyalinis matricem penetrantibus et sub cortice in cæspitulos contextis; fertilibus filiformibus, 1,5-2 μ . cr., hyalinis, bis vel ter ramosis, apicibus incrassatis; conidiis ad hos apices glomeratis, numerosis, sessilibus, ovoideis, brunneis, coacervatis nigricantibus, 5-8 \vee 4,5-6 (conidiis interne formatis 6 \vee 4,5).

Hab. parasitice sub cortice Casuarinæ equisetifoliæ, Chatrapur, Ganjam, India. — *Trichospor. aterrimo* Massee (Syll. XVI, p. 1052) non Corda (Syll. IV, p. 289) forte peraffine. Species illa, causa homonymiæ, *Trich. Masseei* Sacc. nunc dicenda.

2. **Trichosporium Staritzii** Bres., Fungi gall., App., Ann. Myc. VI 8368 (1908) p. 47. — Cæspitulosum, nigricans; cæspitulis laxis ex hyphis simplicibus vel ramosis, septatis, sub microscopio olivaceis, apice albidis, longissimis, usque ad 3 mm. longis 12-18 μ . crassis; conidiis prope apicem ramorum insertis, dilute olivaceis, ellipticis, 10-13 \vee 8-9.

Hab. in spinis capsulæ Castaneæ vescæ Dessau Germaniæ (STARITZ). — *Trichosporio nigricanti* Sacc. proximum.

3. **Trichosporium variabile** Peck, New York St. Mus. Bull. 139 8369 (1909) p. 31. — Late effusum, stratum tenue indeterminatum nigrescens formans; hyphis repentibus v. suberectis, simplicibus v. ramosis, continuis v. leviter septatis, 4-5 μ . cr., fuscis seu partim hyalinis; hyalinis fuscis, globosis, 6-10 μ . lat. vel oblongis, 8-12 \vee 6-8.

Hab. in charta murali, Lyndonville Amer. bor. (C. E. FAIRMAN). — A *Tr. chartaceo* conidiis latioribus diversum. — An forma *Stachybotryos alternantis*?

4. **Trichosporium Saccardoi** Lindau, Krypt. Fl. Pilze VIII, p. 652. 8370 — Ita vocetur *Botrytis velutina* Wallr. — Syll. IV, p. 128 — quæ reapse vera *Trichosporii* species est, uti ipse l. c. suspicatus

sum et quæ diversa a *Trichosp. velutino* Sacc. -- Mutatio nominis *Trichosporii polyspori* (Corda) Sacc. in *Tr. fertile* Lindau ab hoc auctore proposita, superflua est, nam habemus *Sporotrichum polysporum* Link, quod *Trichosporium* non est.

CAMPSOTRICHUM Ehrenb. — Syll. IV p. 295, X p. 586, XI p. 613, XIV p. 1074, XVIII p. 574.

1. **Campsotrichum cladosporioides** Sacc., in Ann. Mycol. VIII (1910) 8371 p. 340. — Hypophyllum, maculas subcirculares, depresso-8-10 mm. diam., olivaceo-atras marginem versus dilutiores, velutino-pulvereas formans; hyphis sterilibus prælongis, intertextis, filiformibus, æqualibus, repentibus 3-4 μ . cr., parce septatis, hinc inde asperulis; conidiophoris ex hyphis sterilibus egredientibus ascendentibus tortuoso-nodulosis, crebrius septatis, 28-38 \times 4, plerumque indivisis; conidiis variis (ut in *Cladosporio*) ex ovato cylindraceis, continuis v. 1-2-septatis, varie guttatis, non constrictis, levibus, 11-15 \times 2,6-3, olivaceis.

Hab. in foliis vivis Trichiliæ emeticæ, Ghinda in Val Cecca alt. 800 m. (Hamasen) Africæ (HADR. FIORI). — Maculæ quasi *Meliolæ* v. *Asterinæ*. Videtur omnino ad gen. *Campsotrichum* ducenda species, tamen emendato charactere conidiorum, quæ (ut in *Cladosporio*) continua v. etiam 1-3-septata sunt; nisi velimus nov. gen. condere.

GLENOSPORA B. et C. — Syll. IV p. 298, X p. 586, XIV p. 1074.

1. **Glenospora Elasticæ** Koord., Bot. Untersuch. Java (1907) p. 229, 8372 fig. 40. — Hyphis laxis fuligineis, septatis, ramosis, epiphyllis; conidiis atris v. obscure fuligineis, continuis, acrogenis, levibus, depresso-globosis, ramulis diu hærentibus, 14-16 \times 12-12,5.

Hab. in foliis putrescentibus Fici elasticæ prope Purwo-redjo prov. Kedu Java (KOORDERS).

DEMATIUM Pers. — Syll. IV p. 308, X p. 589, XI p. 614, XVI p. 1053.

1. **Dematium levisporum** Speg., Myc. Arg. V, p. 433, in An. Mus. Nac. 8373 B. A. XX (1910). — Cæspitulis superficialibus sæpe subseriatilaxe gregariis, penicilliformibus, 1-2 mm. alt. 0,5-0,7 mm. diam., ex hyphis basi subfasciculatis sursum relaxatis granuloso-sporiferis erectis, 1000-1500 \times 6-9, septulatis, subopace fuligineis, simplicibus v. parum infra apicem breviusculæ patentem alternis 1-3-

ramulosis constitutis; catenulis simplicibus v. ramoso-dichotomis, ramis subbotryosis, 2-10-articulatis; conidiis globosis, 5-7 μ . diam., levissimis, eguttulatis, opace fuligineis.

Hab. ad culmos dejectos putrescentes *Sacchari officinarum* in arvis prope Tucumán Argentina Amer. austr.

CATENULARIA Grove — Syll. IV p. 303, XIV p. 1076, XVI p. 1053.

1. **Catenularia antarctica** P. Henn., Deutsche Südpolar-Exped. Bd. 8374 VIII (1906) Extr. p. 15, t. II, f. 24. — Cæspitulis sparsis, pulvinatis, amphigenis, atris; hyphis erectis, fuscis, septatis, 300-500 \approx 5-7, simplicibus, flexuosis; conidiis acrogenis concatenatis, subglobosis, sæpe angulatis, atro-castaneis, granulosis, 10-16 μ . diam., dein liberis.

Hab. in foliis siccis Poæ Cookii in insulis Possessionis ad polum australem.

ZYGODESMUS Corda — Syll. IV p. 283, X p. 581, XI p. 612, XIV p. 1072, XVI p. 1051, XVIII p. 574.

1. **Zygodesmus isabellinus** Karst., Acta Soc. pro Fauna et Fl. Fenn. 8375 XXVII, 4 (1905) p. 11. — Hyphis repentibus, intricatis, ramosis, levibus, stratum effusum isabellinum pulverulentum eformantibus, mollibus, 3-5 μ . cr.; conidiis sphæroideis, muricatis, dilutissime flavescentibus (sub lente), 8-10 μ . diam.

Hab. supra corticem vetustum *Pini silvestris* prope Mustiala Fenniæ.

2. **Zygodesmus avellaneus** Saccardo, New Fungi New York, Journ. of Myc. v. XIII (1907) p. 48, cum icon. — Effusus, velutinus, avellaneo-olivaceus; hyphis varie intricatis, ramosis, crassiusculis, dilute flavidis, septatis, 9-11 μ . diam., articulis interdum gibbis v. inflatulis rarius apice subrotundatis; conidiis acro-pleurogenis, globosis, minute asperulis, dilute melleis, 9,5-10 μ . diam.

Hab. in cortice emortuo *Pruni serotinæ*, Lyndonville, N. Y., Amer. bor. (Dr. C. E. FAIRMAN). — Affinis *Z. fulvo* var. *olivascenti* Sacc., differt præcipue hyphis etiam fertilibus multo crassioribus, nempe 9-11 μ . nec 5-7 μ . et colore. — Affinior forte *Zyg. pallido-fulvo* Peck.

3. **Zygodesmus pallido-fulvus** Peck, New York State Mus. Bull. n. 8377 105 (1906), p. 30. — Tenuiter effusus, pallide fulvescens; hyphis irregulariter ramosis, ramulis sæpius brevibus; conidiis globosis, echinulatis, 10-12 μ . diam.

Hab. in lignis dejectis, Lyndonville New York Amer. bor.
(FAIRMAN).

4. **Zygodesmus sericus** Ranojevic, Ann. Mycol. VIII (1910) p. 397, 8378
fig. 35. — Plagulis effusis, pannosis, primum flavis, dein rubro-
brunneis; hyphis ramosis, septatis, hinc inde anastomosantibus,
flavidis, dein flavo-brunneis, tunica incrassata præditis, apice pal-
lidioribus, 6-11,5 μ . cr., lateraliter v. ad apicem globoso- v. piri-
formi- v. conoideo-incrassato-clavatis, ibique septo limitatis 13-
23 \approx 9,5-15, et sterigmatibus pallidioribus 2-6,5 \approx 2-3 præditis;
conidiis (sporis?) globosis, ellipsoideis, ovoideis, basi umbilicatis,
levibus, flavo-brunneis, contentu granuloso, 13-21 \approx 7,5-17.

Hab. in ligno putri Tiliæ argenteæ, Koschutnjak Serbia.

5. **Zygodesmus membranaceus** Ell. et Ev. — Syll. Fung. X, pag. 8379
581 et in Ann. Mycol. X (1912) p. 321.

Hab. in frustulis, foliis, Muscis emortuis, strobilis dejectis in
Horto bot. Patavino et in Amer. bor. — Perfecte congruit cum
specie Ellisiana. Membranulas subroseo-isabellinas vix velutinas
format; hyphis filiformibus 4 μ . cr., interdum horizontaliter ana-
stomosantibus, ex hyalino isabellinis, hinc inde prominenter nodo-
so-fibulatis, apicibus sensim leniter clavulatis ibique 5 μ . cr., mu-
riculato-conidiophoris; conidiis globosis v. subglobosis, 2,5 μ . diam.
rarius 3 \approx 2,5, levibus, subhyalinis. — Probabiliter *Hypochnus*
sulphurinus (Karst.) Sacc. — Syll. IX p. 243 — est hujus spe-
ciei varietas, basidiis quoque deficientibus. E contrario *Hypochnus*
diffusus Sacc. — Syll. IV p. 287 (sub *Zygodesmo*) — basidiis in-
structus, videretur status perfectus *Zygodesmi membranacei*.

ACTINOCHÆTE Ferro, N. Giorn. bot. ital, XIV (1907) p. 232 (Etym.
actin radius et *chæte* seta). — Hyphæ repentes, radiantes, ramo-
sæque, nondum nodosæ, parce septatæ, subochraceæ. Conidia sub-
globosa, hyalina, muricata, ex hypharum denticulis apicalibus
oriunda.

1. **Actinochæte arachnoidea** Ferro, Nuovo Giorn. bot. it. N. S. v. 8380
XIV (1907), p. 232, tab. III, fig. 8. — Effusa, sordide ochracea;
cæspitulis depressis, stratum arachnoideo-membranaceum forman-
tibus; hyphis radiantibus ad basim luteo-fuscis, apice hyalinis,
valde ramosis; ramulis secundariis 3-5 μ . cr., in ramulis prima-
riis 5 μ . crassis recte insertis varieque intricatis, apice furcatis
et irregulariter lobulatis; conidiis hyalinis, subglobosis, eximie
aculeatis, 3,5-5 μ . diam.

Hab. in foliis coriaceis plantæ arboreæ, Tham-moi, Tonkin (BALANSA; in herb. SACC.).

Subsect. 2. Dichromæ SACC.

CIRCINOTRICHUM Nees — Syll. IV p. 314, XVI p. 1055.

1. **Circinotrichum microspermum** v. Höhn., Stzb. k. Ak. d. Wiss. 8381

Wien CXVIII, Abt. I (1909) p. 411. — Cæspitulis 0,5-0,6 mm. diam., subrotundis v. oblongis, griseo-brunneolis, confertis, distinctis; hyphis sterilibus erectis 160 μ . altis, brunneo-violaceis, tenui-tunicatis, levibus, septatis, basi discoideo-dilatatis, 3-3,5 μ . lat., sursum tenuioribus, 2-4-divaricato-ramosis, extremitate subhyalina et bis terve spirali-convoluta; conidiophoris hyalinis, continuis, subconicis, ad basim hypharum sitis; conidiis solitarie acrogenis, cylindraceis, apicibus acutis v. obtusulis, hyalinis, 6-8 \times 1,5.

Hab. in foliis emortuis, Buitenzorg Javæ.

ELLISIELLA Sacc. — Syll. IV p. 315, X p. 592.

1. **Ellisiella chilensis** Spieg., Fung. Chilenses (1910) p. 184, cum 8382

icon. — Maculis stromaticis epidermide innatis orbicularibus, 0,5-2 mm. diam., atris, setulis laxis, rigidis, acutis, rectis, opacis armatis; conidiis fusoideis non v. leniter arcuatis, plerumque utrinque acutatis, 20-25 \times 1,5-2, hyalinis, sparsis.

Hab. copiose in foliis dejectis subputrescentibus Perseæ lingue prope Ciudad de Valdivia Chile Amer. austr.

2. **Ellisiella? Boldoæ** Spieg., Fungi Chilenses (1910) p. 183, cum icon. 8383

— Cæspitulis epiphyllis erumpentibus pusillis, atris, laxe gregariis; hyphis, 3-20 erectis rigidulis, 100-250 \times 4-5, fuligineis, enodulo stromatico communi, 60-100 μ . diam. oriundis; conidiis fusoideis, arcuatis, utrinque acutis, 18-20 \times 1,5-1,75, unilocularibus, hyalinis.

Hab. in foliis dejectis subputrescentibus Boldoæ fragrantis prope Talcahuano Chile Amer. austr.

SARCOPODIUM Ehrenb. — Syll. IV p. 312, X p. 591.

1. **Sarcopodium Saccardianum** L. Gaja, Flora Micol. prov. Padova, 8384

p. 28 (sunto litogr.) — Cæspitulis confluentibus irregulariter suborbicularibus, fuscidulis, tomentosis; hyphis sterilibus e contextu filiformi laxe pseudostromatico fulvo emergentibus, parce septa-

tis, setiformibus, rigidis, basi expansis, subatris, 480-550 μ . longis; sporophoris subcylindraceis, vix septatis, basi flavo-subatris, apicem versus hyalinis, denticulatis et subrotundatis, 6-7 μ . latis; conidiis hyalinis, in apiculis ad partem superiorem sporophorum dispositis, bacillaribus, guttulatis, 16-17 \approx 3-3 $\frac{1}{2}$.

Hab. in trunco emortuo, Arquà in Euganeis, pr. Pataviis, It. bor., ad ripam lacus. — Cum haec species a typo generico differat setis rectis, nunquam tortuosis, et conidiophoris polysporis, subgenus novum constituit, quod *Orthochætium* vocandum proposuit cl. Gaja.

CHLORIDIUM Link — Syll. IV p. 320, X p. 593, XVIII p. 626.

1. **Chloridium minutisporum** Lindau, in Rabenh. Krypt. Fl. Ed. II, 8385 Hyphomyc. VIII (1906) p. 724. — Cæspitulis indeterminatis, tenuibus, flocculosis, fumosis; conidiophoris erectis, confertis, serius relaxato-intricatis, indivisis, remote septatis, basi paullo crassioribus 3,5-4,5 μ . cr., sursum sensim tenuatis, 3-3,5 μ . cr., deorsum nigricantibus, sursum pallidioribus, apice brunneis, vertice summo acuto v. obtusulo, hyalinis, 100-300 μ . altis (sæpius 200); conidiis oblongis, utrinque rotundatis, 2,5-3 \approx 0,8-1, hyalinis, pro more capitulatim conglutinatis.

Hab. in ramis dacorticatis putridis *Fagi silvaticæ*, Sachsenwald pr. Hamburg Germ. (JAAP).

MENISPORA Pers. — Syll. IV p. 325, XI p. 615, XIV p. 1077.

1. **Menispora Fairmanæ** Sacc., in Ann. Mycol X (1912) p. 314. — 8386 Effusa, tenuissima, cæsio-albida, dein fuscescens; conidiophoris dense gregariis, filiformibus, rigidulis, simplicibus, rectis, fuligineis, septatis, 140-170 \approx 4-4,5, basi subinde bulbillosis, apice pallidioribus et obtusulis; conidiis fusoideo-falcatis, hyalinis, 14 \approx 2, plasmate bipartito fœtis, utrinque brevissime et obsolete ciliatis, sed valde acutis.

Hab. ad ligna dejecta, Blue Mountain Lake N. Y. Amer. bor. Aug. 1911 (Doct. et Domina FAIRMAN). — Species dignoscitur conidiis parvulis, utrinque acutissimis sed vix ciliatis, conidiophoris simplicibus etc.

VERTICICLADIUM Preuss — Syll. IV p. 327, X p. 594, XVIII p. 627.

1. **Verticicladium Cheesmani** Crossl. ap. Cheesman in The Naturalist, 8387 Syll. fung. XXII (VII-1913)

London, (1907) March, p. 1, tab. IX (extr.). — Effusum, stratis pallide spadiceis; hyphis sterilibus repentibus, septatis, plasmate granuloso, rufo-spadiceis, 4-5 μ . cr.; hyphis fertilibus seu conidiophoris erectis, bis v. ter ramosis, 4 μ . cr., ad basim ramulorum vix crassioribus, pallide spadiceis; ramis divergentibus, ramulis ultimis plerumque binis et oppositis, subinde solitariis, obclavato-subulatis, erectis, 13-15 \times 3,5; conidiis late ellipsoideis, utrinque rotundatis, pallide spadiceis, levibus, 6-8 \times 3,5-5, facile sedentibus, intus granulosis.

Hab. in ligno decorticato, Stainor Wood prope Selby Britanniae. — An ob colorem pallidum, potius *Verticillii* specieis?

ZYGOSPORIUM Mont. — Syll. IV p. 328.

1. **Zygosporium oscheoides** Mont. — Syll. IV p. 329 — f. **Evonymi** 8388
 Bianchi, Micol. prov. Mantova, Atti R. Ist. bot. Pavia ser II, v. IX. (extr.) p. 317. — A typo differt hyphis fertilibus brevioribus, nempe 45-50 \times 4 et pariter breviore conidiophoro 14 \times 6, conidiis vero paullo majoribus, nempe 8 \times 6,

Hab. in foliis emortuis *Evonymi japonici* pr. Mantova Ital. bor. (C. BIANCHI). — Formam similem in foliis emortuis *Saxifragæ* in horto bot. Pavia legit Dr. Eva MAMELI.

2. **Zygosporium mycophilum** (Vuill.) Sacc. Ann. Mycol. IX (1911) p. 256. 8389
 — *Urophiala mycophila* Vuill. Bull. Soc. des Scienc. de Nancy, Juin 1910, p. 30, t. IV et V. — Ab affini *Zyg. oscheoide* Mont. imprimis differt conidiophoro æque clavato-semilunari et brunneo non vero laterali sed acrogeno et saltem initio apice appendiculatereti, obtusa, labili, subhyalina aucto, 9-11 \times 7; conidiis ex apice simplici v. bifido oriundis, globoso-ellipsoideis, 5-7 \times 4-5, hyalinis.

Hab. inter Mucedines in subere, Nancy et in Bretagne Galliæ (VUILLEMIN) et in hyphis sterilibus et fertilibus *Botrytis vulgaris*, *Cladosporii* herbarum et *Capnodii* sp. ad folia *Oleæ capensis*, *Nerii*, *Rhynchospori jasminoidis*, *Ilicis Aquifolii*, *Oreodaphnes foetentis*, *Holmskioldiæ sanguineæ* in frigidariis Horti bot. patavini (B PEYRONEL). — Genus *Urophiala* Vuill. etsi situ conidiophori a gen. *Zygosporio* non nihil differat, tamen habitus est tam similis ut sola comparatio *Zygosporii* typici viventis (quod tantum vetustum visum) quæstionem solvere poterit.

STACHYLDIUM Link — Syll. VI p. 331, V pag. 594, XI pag. 615, XVI pag. 1055, XVIII pag. 628.

1. **Stachyldium extorre** Sacc. — Syll. IV p. 331. — Var. **majus** 8390 Berlese, Fungi moricolæ, fasc. V, n. 19 (1888) tab. LX, fig. 1-5. — Cæspitulis griseis, velutinis; conidiophoris cylindraceis, erectis, basi bulbillosis, 300-400 \approx 4-5, sursum ramosis; ramis oppositis, sursum ramulos 4-5 verticillatos, apice 2-3 furcatos gerentibus; conidiis in capitula acrogena 8-17 μ . diam. mucoso-congregatis, ovoideis, hyalinis, 4-5 \approx 2, madore solutis.

Hab. in ligno putri decorticato Mori albæ in Horto bot. patavino, Ital. bor. — *Stachyldium Hageni* Hallier, Rivolta Parass. veg. p. 491, t. 7, f. 210 est verisimilime *Penicillii* sp. abnormiter evoluta.

CHALARA Corda — Syll. IV p. 333, X p. 595, XI p. 616, XVI p. 1024, XVIII p. 629.

1. **Chalara ampullula** Sacc. — Syll. IV p. 334. — Var. **minor** Sacc., 8391 in Ann. Mycol. XI (1911) p. 255. — A typo differt basi phialiformi minore, nempe 10-12 \approx 4-4,5 non 15 \approx 7; conidiis cylindricis utrinque truncatis, 6-8 \approx 2.

Hab. in ligno carioso, ubi maculas velutinas cinereas efficit, Lyndonville N. Y. Amer. bor. (C. E. FAIRMAN).

2. **Chalara Brefeldii** Lindau, in Rabenh. Krypt. Fl. Ed. II, Hyphomyc. VIII (1906) p. 750. — *Polyscytalum fungorum* Sacc. — Syll. IV p. 336 (1886) vix *Chalara fungorum* Sacc. — Conidiophoris fasciculatis, brunneolis, sursum pallidioribus; conidiis in catenas longas sæpe ramosas dispositis, ex interiore hypharum exsiliensibus, cylindricis, utrinque obtusis, 10-15 \approx 3-3,5.

Hab. in Nyctalide parasitica una cum *Hypomycete astero-phoro* qui ut status ascophorus est habendus. — Cfr. Phillips in Grevillea XI p. 6, t. 147, f. c-d. et Brefeld Untersuch. X p. 188, t. X f. 51, 52.

3. **Chalara Ginkgonis** Ferdinand. et Winge, Bot. Tidsskr. XXVIII (1907) p. 256, fig. 7. — Hyphis sterilibus repentibus v. nullis, fertilibus stricte erectis, unicellularibus, v. cellula basali minima e basi ampullacea leniter attenuatis, cylindricis, 50-62 \approx 9, apice tantum 2-3,5 μ . cr.; conidiis intra tubulo formatis, ex apice deinceps exsibientibus, cylindricis; utrinque truncatis, hyalinis, 5-7,5 \approx 2-2,5.

Hab. ad folia Ginkgo bilobæ in horto bot. Hafniæ, Dania.

Sect. 2. Phæodidymæ *)

BISPORA Corda — Syll. IV p. 342, X p. 596, XI p. 616.

1. **Bispora media** Sacc. Ann. Mycol. VI (1908) p. 567. — Effusa v. 8394
sparsa, maculis nigricantibus insidens, atra; hyphis fertilibus e my-
celio obsoleto ascendentibus, brevibus, cylindraceis, 18-20 \approx 4-4,5,
dilute fuligineis apice, catenulas conidiorum ferentibus; conidiis
ellipsoideis v. suboblongis, crasse 1-septatis, non constrictis, 11-
14 \approx 4, rarissime 2-septatis et 16-17 \approx 4,2, fuligineis.

Hab. in corticibus dejectis arborum, Lyndonville N. Y. Amer.
bor. (FAIRMAN). — Inter. *Bisp. monilioidem* et *Bisp. pusillam*
media.

MUCHMORIA Sacc, Not. Myc. VII, Ann. Myc. IV (1906) pag. 277.

(Etym. a rev. L. J. MUCHMORE, generi inventore). — Hyphæ sep-
tatæ, cæspitosæ; steriles ramosæ decumbentes, fertiles assurgentæ,
apice in vesiculam globulosam inflatæ; vesicula ubique muricu-
lato-conidiophora. Conidia ovato-ellipsoidea v. oblonga, 1-septata,
non catenulata, fuliginea. — A genere *Cordana* conspicue differt
hyphis densiuscule cæspitosis, fertilibus apice inflatis et muricato-
conidiophoris.

1. **Muchmoria portoricensis** Sacc. l. c. p. 277. — Cæspitulis conve- 8395
xo-pulvinatis, superficialibus, hemisphæricis v. oblongis, 1,5-2,5
mm. lat., v. confluentibus, atro-fuligineis, velutinis, interdum
griseo-pruinulosis; hyphis sterilibus repentibus, ramosis, interte-
xtis, septatis, fuligineo-olivaceis; fertilibus assurgentibus, 180-
200 \approx 8-9, concoloribus, 3-6-septatis, apice in vesiculam globoso-
ellipsoideam, 40-42 \approx 26-30, ubique muriculatam desinentibus, mu-
riculis conicis, pallidioribus, 3-4 μ . altis; conidiis ovato-ellipsoideis,
utrinque rotundatis, 1-septatis, non v. vix constrictis, 22 \approx 11,
olivaceo-fuligineis.

Hab. in rimis corticis arboris emortuæ indet. pr. Signal Towes
Hill, Ponce, Porto Rico (rev. L. J. MUCHMORE). — Ob cæspitu-
los compactiusculos ad Tuberculariaceas dematiaeas nutat.

*) Conidia hyalina in *Didymariopsis* Speg.

CEPHALOMYCES Bainier, Bull. Soc. Myc. Fr. XXIII (1907) p. 109

(Etym. *cephalos* caput, et *myces*) — Mycelium repens, album, septatum, hinc inde conidiophora erectiuscula, brevissime clavata, 1-2-septata sursum inflatula et punctato-sporigera generans. Conidia obovata, typice uniseptata, capitata, nigricantia, levia.

1. **Cephalomyces nigricans** Bainier l. c. p. 109, t. XIV. — Effusus, 8396 albus, ob conidia nigro-punctatus; conidiophoris 112-140 μ . altis, basi 6-11 μ . cr., vesicula 28-42 μ . diam., dilute fuliginea; conidiis obovatis apice rotundatis, basi conspicue acutatis, 19-25 μ . latis, 1-septatis, vix constrictis, rarius 2-3-septatis, loculo superiore multo majore, nigricantibus.

Hab. in excrementis ovinis udis in Gallia.

HADRONEMA Syd., Ann. Mycol. VII (1909) p. 172. (Etym. *hadros* validus et *nema* filum). — Hyphæ basi fasciculatæ, dense stipatæ, simplices v. parce ramosæ, crassiusculæ, obscure coloratæ, septatæ; conidia ovato-oblonga, 1-septata, fusca, plerumque solitarie acrogena, verrucosa. — Gen. *Hadroticho* affine sed differt conidiis bicellularibus verrucosis.

1. **Hadronema orbiculare** Sydow l. c. — Hypophyllum, velutinum, 8397 orbiculare, mox minutum et 1-2 mm. tantum latum, mox majus et 10 mm. circiter latum, atrum; hyphis basi fasciculatis, dense stipatis, plerumque simplicibus, raro ramis 1-2 brevibus præditis, 40-60 \approx 9-12, atro-olivaceis, parce septatis; conidiis ovato-oblongis, utrinque rotundatis, medio 1-septatis, non constrictis, fuscis, dense verruculosis 20-28 \approx 11-15.

Hab. in foliis vivis *Quercus glaucæ*, Mount Takao Musashi Japonia.

CLADOTRICHUM Corda — Syll. IV p. 370, XIV p. 1082, XVI p. 1059, XVIII p. 575.

1. **Cladotrichum foliicola** (Niessl) Ferro in N. Giorn. Bot. it. n. s. XIV 8398 (1907) p. 10, t. III, f. 6 — *Myxotrichum foliicolum* Niessl — Syll. IV p. 319. — Diagnosis emendata: Effusum; hyphis intricatis, repentibus, subramosis, septatis, hinc inde incrassatis, luteobrunneis, 3-4 μ . diam., conidiis fuscis, sæpe apiculatis, heterogeneis, nunc continuis, ovoideis, 6-7 \approx 4-5 v. globulosis 6 μ . diam., nunc 1-septatis, loculis æqualibus vel inæqualibus præditis, 10-17 \approx 4-5; nunc tandem breviter catenulatis.

Hab. in foliis *Bombacis malabarici*, Calcutta Indiæ or. (KURZ).

2. **Cladotrichum simplex** Sacc. Not. Myc. VII, Ann. Myc. IV (1906) 8399 p. 277. — Effusum, velutinum, aterrimum; mycelio repente parco; hyphis conidiophoris assurgentibus indivisis, rectis v. leviter flexuosis, 140-160 \approx 2,8-4, septatis, fuligineis, sursum paullo dilutioribus; conidiis oblongis, utrinque acutiusculis, initio continuis, 1-guttatis, dein constricto-1-septatis, 2-guttulatis, fuligineis, 8-9 \approx 3-4.

Hab. ad ligna putrescentia in silvis pr. Lyndonville N. Y., Amer. bor. (C. E. FAIRMAN).

CLADOSPORIUM Link — Syll. IV p. 350, X p. 601, XI p. 619, XIV p. 575.

1. **Cladosporium herbarum** (Link) Sacc. — Syll., IV, p. 350. — f. **carpophilum** Boccarini, Funghi Eritr., Ann. Bot. v. IV (1906) p. 277. — Hyphis sterilibus superficialibus, nascentibus e stromate filamentoso ac lacunoso flores pervadente, flexuosis, repentibus et cespitosos sporogenos dense gregarios, ac in crustam atram confluentes gignentibus; hyphis fertilibus erecto-patentibus 270 \approx 3-7, articulatis, parce ramosis, brunneis; conidiis nunc unicellularibus 9-10 μ . nunc bicellularibus 20 \approx 7-9.

Hab. in spicis Panici maximi, Cothait, Mesagus (PAPPI). Monte Agarò 1800-2400 m. Erythrææ (TERRACCIANO et PAPPI). — Var. **cerealeum** Sacc. in Ferraris, Ann. Mycol, VII (1909) p. 285. — Stromatibus cellulosis, atro-brunneis; conidiophoris minutis, cæspituloso-fasciculatis, brunneis, septatis, plerumque simplicibus; conidiis catenulatis, primum continuis deinde 1-raro 2-septatis, olivaceis. — In foliis, culmis, spicis, caryopsidibus Cerealium *Triticum*, *Hordeum*, *Secale* etc. in Europa. — Var. **vitricola** Sacc. in Ferraris l. c. p. 286. — *Byssocladium fenestrale* Auct. p. p. non Mart. nec Link — A typo differt cæspitulis dendritico-radiantibus, sorididis. — In vitris sordescensibus udis prope Avellino Italiae austr. (TROTTER).

2. **Cladosporium Farnetianum** Sacc., *Cladosporium Citri* Briosi et Farneti, Atti Ist. bot. Pavia X (1907) p. 19, t. 1-11 p. p. an Massee (1899). — Hyphis erectis v. adscendentibus, rectis v. flexuosis, simplicibus, septatis, apice plerumque oblique obtusatis, brunneis v. pallide fuscis, solitariis v. 2-4 cæspitosis, 50-70 \approx 3-4,5, rarius 110 \approx 5, e pseudostromate immerso orientibus; conidiis ellipsoideis

XVI, 1057

v. oblongis, simplicibus v. didymis, pallide fuscis, minutis, 5-11 \approx 4.

Hab. in fructibus Citri Limonis morbo s. d. *ruggine bianca* deturpatis, Sicilia.

3. **Cladosporium corrugatum** Mac Alp., Fung. Diseas. Citrus p. 88, 8402 tab. 19, fig. 57 (1899). — Cæspitulis dense confertis confluentibusque, nigro-olivaceis, amphigenis, in maculis ovalibus v. irregularibus atro-griseis brunneo-marginatis in epiphylo et flavidobrunneis in hypophyllo insertis; hyphis septatis, parce ramosis, sæpe curvatis, radiantibus, 5,5 μ . cr.; conidiis acro-pleurogenis, solitariis v. binatis, ovoideo-ellipsoideis, pallide viridulis, intus minute granulosis, demum olivaceis, levibus, elliptico-oblongis, 1-3-septatis, non constrictis, 9-15 \approx 4,5-5,5.

Hab. in utraque pagina foliorum Citri Aurantii pr. Melbourne Australiæ. — A *Cladosp. compacto* sat distinctum.

4. **Cladosporium Citri** Massee Text. book of Plant Diseas. (1899) 8403 p. 310. — Conidiophoris cæspitulosis, erectis, ramosis, septatis, brunneis, 30-75 \approx 2-4; conidiis fusoideis, obscuris, pro more continuis, interdum 1-3-septatis, 8-9 \approx 2,5-4.

Hab. in foliis et fructibus Citri Limonis, verruculas 6-7 mm. d. generans, in Florida et Louisiana. Species vere pathogena.

5. **Cladosporium nervale** Ell. et Dearn. Fungi Columb. (1905) n. 2010. 8404 — Cæspitulis effusis, hypophyllis, olivaceis, in areis foliorum dealbatis sitis; hyphis fertilibus fasciculatis, septatis, parce ramosis, deorsum olivaceo-fuligineis, sursum pallidioribus, 150 \approx 6; conidiis quam hyphis pallidioribus, acro-pleurogenis, solitariis v. catenulatis, 1-septatis, ellipsoideo-acuminatis, 10-18 \approx 5-8.

Hab. in foliis vivis Rhois typhinæ, London, Canada Amer. bor. (J. DEARNESS).

6. **Cladosporium compactum** B. et C. — Syll. IV p. 364. — Var. 8405 *Bosciæ* Sacc., Ann. Mycol. VIII (1910) p. 340. — Cæspitulis effuso-confluentibus, brunneo-fuligineis; hyphis ascendentibus, fasciculatis, subsimplicibus, septatis, apice rotundatis, 50-80 \approx 5; conidiis versiformibus, nunc (typicis) ovoideo-oblongis, 1-septatis, 8-11 \approx 4-5, nunc (multo rarioribus) fusoideo-subcylindraceis, 14-16 \approx 4-5, bi-triseptatis, olivaceo-fuscis.

Hab. in areolis internerviis plerumque hypophyllis, ab insectis excavatis, quas omnino occupat, in foliis *Bosciæ senegalensis* Agordat, Barca, colonia Erythræa, alt. 640 m. — Interdum hyphæ in articulos cylindricos 4-septatos sporomorphos dilabuntur.

7. **Cladosporium cornigerum** Bubák in Handel Mazzetti Bot. Reise 8406

Pont. Randgebirg. in Ann. Naturhist. Hofmus. Wien XXIII (1909) p. 106. — Cæspitulis parvis, hypophyllis, dispersis v. gregariis, maculis griseo-nigris insidentibus, e tuberculis parvulis, atris, sclerotiformibus v. gregariis, maculis griseo-nigris insidentibus orientibus; hyphis 50-70 \approx 4, 3-septatis, parum flexuosis, olivaceo-brunneis; conidiis forma et magnitudine variabilibus, 4-16 \approx 3-6,5 ovoideis, ellipsoideis fusoideis, usque 1-2-cellularibus, apice attenuatis, basi rotundatis v. truncatis, olivaceo-brunneis.

Hab. in pagina inferiore foliorum vivorum *Corni australis* in montibus ponticis Anatoliæ.

8. **Cladosporium Grewiæ** Bacc., Funghi Eritr., Ann. Bot. v. IV, 8407 (1906) p. 277. — Cæspitulis epi-hypophyllis maculis aridis late effusis, insidentibus; hyphis erectis, simplicibus, gregariis vel fasciculatis, septatis 70-200 μ . longis, conidiis apici et lateri hypharum insidentibus, continuis, uniseptatis vel rarius biseptatis, rotundis vel ovatis 6-7 μ . long.

Hab. in foliis emortuis, exsiccatis *Grewiæ*, Mai Hiryi Erythrææ (PAPPI).

9. **Cladosporium Soldanellæ** Jaap, Beitr. Pilzfl. d. Schw., Ann. Myc. v. V (1907) p. 270; Ann. Mycol VI (1908) p. 217. — Cæspitulis nigricantibus, punctiformibus, primo in maculis subrotundis pallidis concentrica dispositis, dein expansis et folium necantibus, amphigenis, imprimis epiphyllis; conidiophoris in fasciculos densos, erectos, subtortuosos, atro-olivaceos confertis, septatis, ramosis 100-175 \approx 4-5; conidiis ovoideis, v. oblongis, v. cylindraceis, utrinque rotundatis v. uno polo acutatis, distinete apiculatis, minute spinulosis, dilute olivaceis v. subhyalinis, 1-2-raro pluricellularibus, 8-17 \approx 4-5.

Hab. in foliis emortuis *Soldanellæ alpinæ* prope Hospitium M. Sempione, c. 2010 m. alt. et in M. Penegal, Trentino (JAAP).

10. **Cladosporium Oxycocci** Shear, Bull. Torr. Bot. Cl. XXXIV (1907) 8409 p. 306. — Conidiophoris hypophyllis, simplicibus, septatis, flexuosis, flavidobrunneis, erectis v. diffusis, in cæspitulos minutos confertis; cæspitulis hypostromate sclerotioideo compacto, minuto suffultis, in maculis rufo-brunneis insertis, 50-100 μ . diam.; conidiis acrogenis flavidobrunneis, 1-3 in quoque conidiophoro, subcylindraceis v. subclavatis, continuis v. 1-septatis, 15-24 \approx 3-4.

Hab. in foliis vivis *Vaccinii macrocarpi*, Nova Scotia, N. Yersey, Massachusetts Amer. bor.

11. **Cladosporium foveolicola** Speg., Myc. Arg. V, p. 437, in An. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis v. obsoletissimis; cæspitulis e foveolis hypophyllis exsurgentibus, plagulas velutinas atro-olivaceas subindeterminatas efficientibus, ex hyphis paucis (sæpius 3-7) erectiusculis v. vix flexuosulis 80-110 \approx 4-5, 2-4-septatis, olivaceis, monospermis efformatis; conidiis subcylindraceis acrogenis, solitariis, mox deciduis, rectis v. vix curvulis 20-25 \approx 4, utrinque rotundatis, continuis v. paucilocularibus (1-2 septulatis) fumosis v. chlorinis.

Hab. ad folia viva Eupatorii bupleurifoliī in pratis prope San Javier Misiones Argent. Amer. austr. — An rectius *Cercosporæ* specie?

12. **Cladosporium Rivinæ** Speg., Myc. Arg. V, p. 437, in An. Mus. Nac. Buenos Aires XX (1910). — Maculis orbicularibus, 4-6 mm. diam., determinatis, amphigenis albicantibus exareolatis; cæspitulis sæpius epiphyllis, dense gregariis, olivaceis, minutis; hyphis simplicibus rectis v. vix flexuosis, 50-150 \approx 5-6, septulatis olivaceis apice non v. vix denticulatis, laxe parceque cæspitosis; conidiis subellipsoideis, 0-3-septatis, 5-15 \approx 5, ad septa non constrictis, concoloribus.

Hab. ad folia viva Rivinæ levis in dumetis prope Metán Salta Argent. Amer. austr.

13. **Cladosporium clavatum** Schwabe, Flora anhalt. 2, p. 349, tab. 6, fig. 13 (1839). — Cæspitulis minutis gregariis, subinde subconfluentibus; hyphis atro-virentibus, pellucidis, inæqualibus, hinc inde flexis et inflatulis, parce ramosis; conidiis minutis, oblongo-clavatis, concoloribus, 1-3-septatis.

Hab. in lignis emortuis, adhuc firmis, imprimis quercinis in Germania

14. **Cladosporium Laricis** Saccardo, Not. Myc. VI, Ann. Myc. v. III (1905) p. 515. — Cæspitulis punctiformibus, nigricantibus, erumpentibus, 80-150 μ . diam., hypostromate minute celluloso pulvinato, crassiusculo, olivaceo-fusco suffultis; conidiophoris ex hypostromate ascendentibus, simplicibus, rarissime sursum furcatis, filiformibus, septatis, 30-60 \approx 4-5, olivaceis, apice pallidioribus; conidiis acrogenis, initio hyalinis minutis, 6 \approx 2,5, dein paullo majoribus æque hyalinis et continuis, 11-12 \approx 4-5, denique tereti-oblongis 1-4-septatis, non v. vix constrictis, 13-19 \approx 5-6, olivaceis.

Hab. in foliis adhuc vivis Laricis europææ quæ inde flavescent, arescent et dilabuntur, Giogo di Scarparia (Mugello) in

Appennino etrusco (Prof. V. PERONA, commun. prof. H. FIORI). Species laricetis valde noxia. — An sit status magis evolutus v. metageneticus *Hartigiellæ Laricis* (Hart.) Syd. (*Meria Laricis* Vuill.) inquirendum est

15. *Cladosporium Miyakei* Sacc. et Trott., *Cladosporium Oryzæ* I. 8414

Miyake, Pilze Reispfl. Japan, Journ. College Agricult. Tokyo, II (1910) p. 262, t. XIV, f. 68-70 — non Sacc. et Syd. — Mycelio superficiali, repente, maculas nigras efficiente; conidiophoris prominentibus obscuris, varie longis, plerumque 45-70 \times 4-5, septatis, apice alterne denticulatis; conidiis brunneis, 1-4-sed plerumque 2-locularibus, magnitudine variabilibus, 7-20 \times 4-6, septis constrictulis.

Hab. in foliis Oryzæ sativæ in Japonia. — A *Cl. maculanti* mycelio superficiali distinctum.

16. *Cladosporium Exoasci* Lindau, Krypt. Fl. Deutsch. etc. Hypho- 8415

myc. Bd. VIII (1907) p. 808. — Cæspitulis *Exoasci* bullas æqualiter obtegentibus, velutinis, brunneo-viridibus, fere nitidis, conidiophoris dense stipatis, erectis, vix flexuosis, indivisis, sursum parce nodosis, basi atro-virentibus, diaphanis, apicibus pallidioribus, septatis, grosse guttulatis, 60-120, raro 150 \times 4-6; conidiis late ovoideis, utrinque obtusule acutatis, bicellularibus vel ex oblongo subcylindraceis 6-cellularibus, e griseo viridulis, non constrictis, guttulatis, 7,5-16 \times 4-8, subcylindraceis vero 15-30 \times 7,5-8,5.

Hab. in gallis *Exoasci Pruni* ad *Prunum domesticum* Brandenburg (JAAP), *Pruni Padi* in Helvetia (JAAP) nec non in gallis *Exoasci Rostrupiani* ad *Prunum spinosum* pr. Gersfeld Germaniae (JAAP. — Forte idem ac *Clad. Exoasci* Ellis in Fung. Columb. n. 1493 (sine diagnosi).

17. *Cladosporium parasiticum* Sorok. Mykologisch. Ocherk. (1891) 8416
p. 30, Guéguen Champ. paras. p. 256. — Mycelio septato undulato; conidiophoris cylindraceis; conidiis solitariis v. 2-5 in catenulas digestis, continuis v. septatis, 15 \times 10.

Hab. in abdomen Melolonthæ fullonis quam vexat v. necat, Saratow Rossiae.

18. *Cladosporium ramulosum* Reissek, Sitzb. k. Ak. d. Wiss. Wien 8417
Math. Nat. Kl. VII (1851) p. 336, — Lindau Kryptfl. Pilze,
pag. 833.

Hab. in polline Pin i silvestris in Austria. — Species omnino dubia, cfr. Lindau l. c.

19. **Cladosporium arundinicola** Berl. Riv. Patol. veget. IV (1895) 8418
 p. 19, tab. 3, fig. 17. — Cæspitulis superficialibus compactiusculis, fulvo-olivaceis, demum subcrustaceis; hyphis fasciculatis, ramulosis plus v. minus nodulosis; conidiis in ramulis lateralibus acrogenis, cylindraceo-fusoideis, muriculatis, 1-3, raro 5-septatis, 20-26 \approx 6-8, apicalibus brevioribus, subcontinuis, 6-8 \approx 4.
Hab. in culmis putrescentibus Arundins Donacis, Avellino Ital. merid. — Quoad hujus speciei aliarumque affinum biologiam cfr. Berlese l. c.
20. **Cladosporium æcidiicola** Thüm. — Syll. IV p. 368 — Diagnosis 8419 sequenti modo emendanda. Cfr. Sacc. in Ann. Mycol. VIII (1910) p. 346. — Cæspitibus effusis, atro-olivaceis, folia late occupantibus, amphigenis; conidiophoris ex hypostromate late effuso nigricante assurgentibus, subfasciculatis, filiformibus, leviter tortuosis, simplicibus, 2-3-septatis, olivaceis, sursum leviter tenuatis et pallidioribus, 50-65 \approx 4; conidiis oblongo-fusoideis, typice 1-septatis seu diblastis, 14-16 \approx 5,5-6, dilute olivaceis, levibus, rarius 2-3-septatis v. continuis.
Hab. in pag. inf. foliorum Euphorbiæ Cypearissiæ ab Aecidio Euphorbiæ deformatorum in Bavaria et Italia boreali (THUM. SPEG. MASSAL.). — Diagnosis Thümeniana l. c. cum exemplaribus ipsius auctoris, nec non Spegazzinii et Massalongo minime conveniunt.
21. **Cladosporium casei** (Johan-Olsen) Sacc. et Trav. — Syll. XIX 8420 p. 296. — *Dematium casei* Johan. Ols., Centralbl. Bakter III (1897) p. 280, t. 4-5, f. 7-13. — Polymorphum; primo saccharomycetoidem amycelicum, cellulis 6-8 \approx 2,5 gemmantibus, hyalinis, demum myceliophorum: hyphis longis, filiformibus, septatis, sæpe in fasciculos connexis, v. radiantibus, parce ramosis (coloratis?) nunc conidia obovata v. ellipsoidea 5-6 \approx 2, subspicata generantibus, nunc in catenulas conidiorum subcylindraceorum 10 \approx 2 abeuntibus.
Hab. in caseis in Norvegia.
22. **Cladosporium fuligineum** Bon. — Syll. IV p. 368. — Huc 8421 spectat *Cladosporium Exobasidii* Jaap., Verh. Bot. Ver. Prov. Brandenb II (1907) p. 29, teste Lindau Deutsch. Krypt. Fl. Pilze VIII p. 808, qui plurima loca et matrices indicat.
23. **Cladosporium syphiliticum** Hallier, Flora (1868) pag. 291-301, 8422 t. 3, f. 13 est species omnino obscura et vix *Cladosporium*.
24. **Cladosporium zeylanicum** Sacc. et Trott. — Ita vocetur *Cl. sub-* 8423

compactum Roum. et Karst. (1890). — Syll. X p. 603 — non *Cl. subcompactum* Sacc. — Syll. IV p. 361 (1886).

PENOMYCES Giard, Sur les Cladosporiees entomophytes etc. in C. R. Acad. Sc. 21 Juin 1891 (Etym. *penos* tela et *myces*). — Mycelium septatum, ramosum, brunneolum, corpus animalis indumento araneoso v. pannoso obducens. Conidiophora brevia, simplicia, conidio terminali continuo v. uniseptato prædita. — Affine *Polyrrhizio* Giard quod quoque genus ad Dematies prope *Cladosporium* locandum est.

1. **Penomyces telarius** Giard, l. c., Guéguen Champ. paras. p. 257. 8424
— Corpore insecti indumento dense pannoso undique obducto; conidiis pro more continuis, oblongis, 14 \approx 7.

Hab. in corpore *Ragonychæ melanuræ* (Coleopt.) et *Phygadii Urticæ?* (Hemipt.) in Gallia. — Animalcula vegetabilibus arcte adhærent et moriuntur. Habitus cladosporiaceus.

2. **Penomyces Cantharidum** Giard, l. c., Guéguen Champ. paras. 8425 p. 257. — Corpore insecti mycelio pluricellulari, ramoso, rufescenti tecto; conidiis continuis v. 1-septatis, magnitudine variis, 4-16 μ . longis.

Hab. in corpore *Telephori lividi* (Coleopt.,) Beaune (Côte d'Or) Galliæ. — Animalcula foliorum *Coryli* pag. inferiori mycelio adhærentia, corpore secus costam adpresso, prius forte Entomophthorâ quadam occisa.

MYCELODERMA Ducomet, Recherch. sur le développement de quelques champignons parasites à thalle subcuticulaire, Thèse Fac. Sc. Paris (1907) p. 119, fig. 1 et 2, et t. XI-XII (Etym. *mycelium* et *derma*, h. e. *mycelium pachydermaticum*). — Thallus endophyticus et ectophyticus; mycelium superficiale reticulatum; hyphis brunneis, crassis, paucis, tunica crassa præditis; mycelium profundum inter cuticulam et epidermidem nidulans; conidia brunnea, ovoidea simplicia v. elongato-septata, in basidiis ampulliformibus lateraliter inserta; pycnidia (?) v. spermogonia, scutellata, ostiolata. — Genus vere ambiguum.

1. **Myceloderma cuticulare** Ducomet, l. c. p. 120. — Mycelio superficiali 6 μ . c. cr., ampullis conidigenis 6-8 μ . long., basi contractis, c. 5 μ .; conidiis simplicibus, 8-10 \approx 6-7, saepè uni- v. biseptatis et tunc 13 μ . long. ad septa non constrictis; cystibus ca-

tenulatis 2-6-articulatis, articulis sphæroideis 6-9 μ . diam.; pycnidiiis (?) scutellatis 40 μ . cr., 25 μ . alt.

Hab. in ramulis foliorum *Quercus Suberis* f. occidentalis in nemoribus Lot-et-Garonne Galliæ.

PASSALORA Fries et Mont. — Syll. IV p. 344, X p. 597, XI p. 617, XVIII p. 578.

1. **Passalora bacilligera** (Mont.) Fr. — Syll. IV, p. 345 — fm. Alnobetulæ Jaap, Fungi sel. exs. n. 149 (1906); Verh. Bot. Ver. Prov. Brandenb. IL (1907) p. 28. — Maculis subrotundis, non acute limitatis, superne flavo-brunneolis, inferne griseo-viridulis; cæspitulis hypophyllis, vix conspicuis; conidiophoris fasciculatis, continuis, non divisitis, curvulis nodulosisque, 38-60 \times 4,5-5; conidiis clavatis, medio septatis et constrictis, hyalinis, articulis subfusoideis acutiusculis, 42-50 \times 5, articulo infero 3 μ . crasso.

Hab. in foliis Alni Alnobetulæ (= A. viridis) pr. Triberg in Silva nigra et M. Sempione (JAAP) et prope Lackenhof Austriæ (v. HÖHNEL).

DIDYMARIOPSIS Speg. Myc. Argent. V, p. 424, in Anal. Mus. Nac. Buenos Aires XX (1910) (Etym. *Didymaria* et *opsis* facies). — Est *Didymaria* hyphis olivaceis conidiisque hyalinis donata.

1. **Didymariopsis cuphæicola** Speg., l. c. p. 424, cum icon. — Maculis amphigenis primo orbicularibus dein repandis, 2-5 mm. diam., fuscous, subdeterminatis; cæspitulis amphigenis erumpentibus olivaceis, ex hyphis tenuibus 100-250 \times 6, fuligineis, simplicibus, septulatis; conidiis saepius subcylindraceis rarius subclavulatis utrinque rotundatis 14-20 \times 5-6, primo continuis dein medio 1-septatis, non constrictis, hyalinis, eguttulatis, acrogenis, solitariis.

Hab. ad folia viva Cuphææ mesostemonis in dumetis pr. Metan Salta Argentina Amer. austr.

SCOLOCOTRICHUM K. et S. — Syll. IV p. 347, X p. 599, XI p. 618, XIV p. 1078, XVI p. 1057, XVIII p. 581.

1. **Scolecotrichum cladosporioideum** R. Maire, Not. myc., Ann. Myc. IV (1906) p. 329. — Cæspitulis compactis, punctiformibus, atro-brunneis, erumpenti-superficialibus, in macula arida flavo-marginata saepè circinatis, circ. 0,1-0,3 mm. diam., hyphis conidiophoris erectis, dense fasciculatis, brunneis, parce septatis, 100-150 \times 8-10, levibus, apice conidiferis pallidioribusque; conidiis saepius acroge-

nis, flavo-brunneis, verrucosis, oblongis vel cylindraceis, 23-42 \times 12-16, utrinque rotundatis, 1-2-septatis, ad septa haud vel paululum constrictis.

Hab. in foliis Iridis fœtidissimæ, Tleïncen, les Cascades, Oran Algeriæ. — Conidiis verrucosis a *Scol. graminis* dignoscitur; multis notis cum gen. *Cladosporio* collidit.

2. **Scolecotrichum graminis** Fuck. — Syll. IV, p. 348 — var. **nanum** 8430 Saccardo, Not. Myc. VI, Ann. Myc. III (1905) p. 515. — A typo differt hyphis multo brevioribus, 30-50 \times 4-5, conidiisque paullo minoribus, 30-32 \times 6-6,5, utrisque olivaceo-fuligineis.

Hab. in foliis Dactylidis glomeratæ, Agordo, Belluno Ital bor. (D. SACCARDO). — Var. **brachypodium** Speg., Myc. Arg. V, pag. 436, in An. Mus. Nac. Buenos Aires XX (1910). — A typo leniter recedens hyphis conidiferis conspicue brevioribus, 30-70 \times 5-8, continuis, olivaceis; conidiis acrogenis, solitariis, e cylindraceo-lanceolatis, 30-40 \times 8-12, primo continuis dein medio 1-septatis, non constrictis, pallide rufescensibus. — Vulgata ad folia languida Graminum Hordei jubati, Bromi unioloidis etc. in tota Argentina Amer. austr.

FUSICLADIUM Bon. — Syll. IV p. 345, X p. 597, XI p. 617, XIV p. 1077, XVI p. 1056, XVIII p. 579.

1. **Fusicladium Pruni** Ducomet, Rech. sur le développ. de quelques 8431 champign. parasites à thalle subcuticulaire, Thèse Fac. Sc. Paris (1907) pag. 137, tab. XIII-XIV. — Cæspitulis griseis v. brunneis, velutinis, in maculis vigentibus; mycelio subcuticulari, initio incolore, hyalino, dein brunneo; conidiophoris brunneis, simplicibus, erectis, solitariis, cylindraceis, basi contractis, apice laxe et irregulariter verrucosis, 1-2-septatis, 25-42 \times 3,5-4,5; conidiis simplicibus, raro 1-septatis, fusoideo-oblongis, medio sœpe constrictis, brunneo-viridescentibus, 14-18 \times 3,5-5.

Hab. in fructibus Pruni domesticæ var. « Ente », Villeneuve sur Lot Galliæ. — *Fusicladio Cerasi* (Rabh.) Sacc. affine.

2. **Fusicladium heterosporum** v. Höhn. Ann. Myc. III (1905) p. 337. — 8432 Maculis brunneis usque ad 3 cm. long., elongatis, minoribus inter nerviis, majoribus non acute marginatis et halone flavidò cinctis sœpe confluentibus; cæspitulis hypophyllis, confertis, ex stomatibus erumpentibus, non confluentibus, griseo-brunneis, 20-40 μ . latis; conidiophoris sœpius brevibus, cylindraceis, continuis, 28 \times 5, subinde 60 \times 5-6, 1-3-cellularibus, ramulis uno alterove

auctis; conidiis acrogenis typice 2-cellularibus, rarius 3-4-cellularibus, pallide brunneolis, bicellularibus utrinque rotundatis, medio valde constrictis, 22-32 \times 9-14, tri-quadrangularibus cylindraceo-clavatis, leviter constrictis, 36-40 \times 8-12.

Hab. in foliis vivis *Epilobii parviflori*, Wiener Wald Austriae (v. HÖHNEL). — Species inter *Fusicladium*, *Scolecotrichum* et *Cercosporam* ambigua.

3. **Fusicladium Peucedani** Syd. Ann. Myc. V (1907) p. 340. — Ma- 8433 culis epiphyllis, brunneolis, orbicularibus vel irregularibus, 3-5 mm. diam.; cæspitulis hypophyllis, punctiformibus, nigricantibus, 75-150 μ . diam., in maculis plus vel minus dense dispositis; conidiophoris dense stipatis, paliformibus, e basi stromatica atro-fuliginea bene evoluta orientibus, continuis, olivaceo-brunneis, 10-15 μ . longis; conidiis variæ magnitudinis, oblongis subinde anguste clavatis, circa medium 1-septatis et sæpe constrictis, 15-55 \times 5-10, dilute olivaceis.

Hab. in foliis *Peucedani decursivi*, Tokyo Japoniæ (N. NAMBU).

4. **Fusicladium consors** Sacc., Notæ myc. VIII, Ann. Myc. IV (1906) 8434 pag. 491, tab. X, fig. 3. — Effusum, imperspicuum, brunneum; hyphis fertilibus hinc inde fasciculatis, indivisis, cylindraceis, basi nonnumquam bulbillosis, 25-30 \times 4-5, fuligineis, sursum dilutioribus, obsolete 1-septatis, apice obtusulis et parce denticulatis; conidiis obclavato-fusoideis, rarius fusoideis, apice acutioribus, 1-septatis, non constrictis, 15-17 \times 4, dilutissime fuligineis.

Hab. in caulinis emortuis *Scabiosæ Succisæ*, socia *Didymosphaeria pere exigua*, cuius est verisimiliter status conidiophorus, Meudon, Galliæ (LUDWIG, comm. P. HARIOT).

5. **Fusicladium Fici** Bacc., Funghi Eritr., Ann. Bot. v. IV (1906) 8435 p. 277. — Maculis orbicularibus amphigenis, supra pallidis et rubro-cinctis, subtus rufo-ferrugineis; cæspitulis amphigenis punctiformibus; hyphis fertilibus simplicibus, continuis, brevibus, fuscidulis, ad apicem pallidioribus; conidiis piriformibus, fuscidulis, septatis, 20 \times 10.

Hab. in foliis *Ficus* sp., Valle Catalaben, Mensa 1900 m. alt. in Erythræa (PAPPI).

6. **Fusicladium Elasticæ** Koord., Botan. Untersuch. Java (1907) p. 231, 8436 fig. 42. — Hyphis olivaceis, endophyllis, septatis; fertilibus sparsis, solitariis, erectis, pluriseptatis, olivaceis, apice subhyalinis et dichotome ramosis, c. 230 \times 3 filiformibus; conidiis hyalinis, fusoi-

deo-oblongis v. subclavato-oblongis, utrinque rotundatis vel basi subacutis et apice rotundatis, medio uniseptatis, acrogenis, solitariis, 10-15 v. 2,5-3.

Hab. in foliis languidis vel in partibus foliorum emortuis *Ficaria elasticæ*, Penunggalan prov. Kedu Java (KOORDERS).

7. **Fusicladium Hariotianum** Sacc., in Ann. Mycol. VI (1908) p. 560. 8437

— Cæspitulis punctiformibus, nigricantibus, dense seriatis, epiphyllis, superficialibus, 125-130 μ . diam.; hyphis fertilibus dense fasciculatis, paliformibus, simplicibus, continuis, atro-olivaceis, 70 v. 5,5-6, apice obtusulis; conidiis tereti-oblongis, basi truncatis, apice rotundatis, 1-septatis, non constrictis, 30 v. 8, olivaceis.

Hab. in foliis languidis *Glycériæ Borreri* prope Parisios (P. HARIOT).

8. **Fusicladium radiosum** (Lib.) J. Lind, Ann. Mycol. III (1905) p. 429. 8438

Oidium radiosum Lib. Crypt. Ard. n. 285 (1834), *Cladosporium Asteroma* Fuck. — Syll. IV, p. 357. — Cfr. etiam Sacc. Funghi Ardenn. Libert. p. 24 (Malpighia 1888). — Status ascophorus: *Venturia Tremulæ* Aderh.

9. **Fusicladium saliciperda** (All. et Tub.) J. Lind, Ann. Mycol. III, 8439

(1905) p. 430, *Septoglæum saliciperdum* All. et Tub. in Allesch. F. imp. VII, p. 617 — Sacc. Syll. XIV, p. 1031. — Status ascophorus: *Venturia chlorospora* (Ces.) Karst.

10. **Fusicladium Eriobotryæ** (Cav.), Sacc. *Basiascum Eriobotryæ* Cav. 8440

— Syll. X, p. 471. — Hujus nomen novum *Fusicladium melanconoides* Ferraris, Ann. Mycol. VII (1909) p. 284, est supervacaneum nam nomen Cavaræ 1888 antecedit nomina *F. pirinum* var. *Eriobotryæ* Pegl. 1894 et *F. dendriticum* var. *Eriobotryæ* Scalia 1901.

11. **Fusicladium Kaki** Hori et Yoshino, Bot. Mag. Tokyo XIX (1905) 8441

p. (220) (japonice).

Hab. in foliis *Diospyri Kaki* in Japonia.

POLYTHRINCUM Kunze — Syll. IV p. 350.

1. **Polythrincium Trifolii** Kunze — Syll. IV p. 350 — var. *platense* 8442

Speg., Myc. Argent. V, p. 437, in An. Mus. Mac. Buenos Aires XX (1910). — Cæspitulis hypophyllis, minutis, gregariis subconfluentibusque, olivaceis; hyphis constipatis erectis subspiraliter tortis 50-70 v. 6-7 fumoso-olivaceis, ad septa constrictis atque nigroannulatis, simplicibus; conidiis fumosis, obovatis v. biconicis, 16-18 v. 12-14, 1-septatis non constrictis.

Hab. ad folia viva *Trifolii platensis* prope Lezama prov.
Buenos Aires, Argentina Amer. austr.

2. **Polythrincium Shiraianum** P. Henn., Engl. Jahrb. XXXVII (1905) 8443
p. 165. — Maculis fuscis, rotundato-angulatis; cæspitulis epiphyllis minutis dense gregariis, atris; hyphis fasciculatis, ramosis, erectis, flexuosis, subtoruloso-septatis, 4-5 μ . cr., olivaceo-fuscis; conidiis acrogenis, ovoideis, granulatis, primo continuis, dein medio septatis, constrictiusculis, atro-olivaceis, 15-30 \times 7-8.

Hab. in foliis *Cercidophylli japonici*, Nikko Japoniæ (SHIRAI). — A *P. Trifolii* maculis, hyphis conidiisque distinctum.

HORMODENDRUM Bon. — Syll. IV p. 310, X p. 591, XIV p. 1076, XVIII p. 581.

1. **Hormodendrum obesum** (v. Höhn.) Lindau Deut. Krypt. Fl. Pilze 8444 I (1906) p. 702, *Hormiactella obesa* v. Höhn., Ann. Myc. III (1905) p. 556, cum ic. — Cæspitulis effusis, tenuibus, brunneo-nigricantibus, e conidiis albo-conspersis; hyphis rigidulis, crassiuscule tunicatis, diaphane atro-brunneis, irregulariter ramosis, intricatis, sursum pallidioribus, breve articulatis, 400-500 μ . alt., 14-16 μ . cr. (sterilibus 6-8 μ . tantum), sursum plus minus dichotomice ramosis, catenuligeris; conidiis inæqualiter globosis, doliformibus v. cylindraceis, 20 \times 14-20, breviter catenulatis, continuis, tenui-tunicatis, hyalinis.

Hab. in ramis putridis dejectis Fagi silvaticæ pr. Pressbaum Austriæ (v. HÖHNEL).

2. **Hormodendrum Citri** Briosi et Farn., Atti Ist. Bot. Pavia 9 (Extr. 1906) pag. 30, tab. 1-11, pr. p. — Hyphis teretiusculo-fusoideis, simplicibus, septatis, brunneis, e mycelio repente ortis, sæpe 80-110 \times 4.5-5; conidiis corymboso-catenulatis, ellipsoideis v. oblongis, brunneis, 6-8 \times 4.5.

Hab. in fructibus Citri Limonis morbo s. d. *ruggine bianca* deturpatis, in Sicilia.

3. **Hormodendrum griseum** Hedge. Missouri Bot. Gard. (1906) p. 100, 8446 tab. 10, fig. 2. — Cæspitulis tomentosis, initio griseis, demum atris; hyphis sterilibus repentibus, crebre septatis, 3-10 μ . cr., subhyalinis; conidiophoris ascendentibus 200-800 \times 3-4, sursum bis subverticillato-ramosis, ramulis (ramo-conidiis) ovato-oblongis, 1-3-septatis, 6-14 \times 3-4; conidiis longe ramoso-catenulatis, in quoque catenula 8-10, ellipsoideis, fumoso-griseis, 3-6 \times 2-4.

Hab. in ligno *Liquidambar styracifluæ*, *Pini echinatae*.
Syll. fung. XXII (VII-1913)

natæ, Fraxini americanæ, Missouri Amer. bor. — Lignum infectum colore atro-griseo tingitur.

4. **Hormodendrum resinæ** Lindau, Rabenh. Krypt.-Fl. ed. II, Hyphomyc. I (1906) p. 699. — Cæspitulis late effusis, indeterminatis, velutinis, brunneo-viridulis, sat laxis; hyphis sterilibus repentibus v. leviter ascendentibus, 4-4,5 μ . diam., parce ramosis, remote septatis, viridulo-brunneis, diaphanis; conidiophoris ex apice hypharum oriundis, rarius pleurogene, ascendentibus; crebriuscule septatis, sursum pallidioribus, 3,5-4 μ . diam.; ramis paucis alternis v. pluribus capitulatim confertis, brevissimis, apice catenuligeris; conidiis elliptico-fusoideis, utrinque obtuse tenuatis, viridi-brunneis. diaphanis, 5,5-7 \approx 3,5-4,5.

Hab. in resina Abietis excelsæ, Sachsenwald pr. Hamburg (JAAP).

5. **Hormodendrum Hordei** Bruhne — Syll. XIV, p. 1076 — var. **parvisporum** A. L. Smith, Trans. of Brit. Mycol. Soc. 1907, v. III (1908) p. 35, tab. I, fig. 2. — Hyphis sterilibus brunneis, repentibus; fertilibus erectis, septatis, simplicibus, circ. 200 μ . altis, verruculosis, apicibus capitula conidiorum ferentibus; conidiis primariis oblongis, brevibus, catenulatis, 6-10 \approx 3-4, in catenulas conidiorum minorum brunneorum globoso-cuboideorum, verruculosorum abeuntibus.

Hab. in charta uda, Southampton Angliæ (J. F. RAYER).

DIPLOCOCCIUM Grove — Syll. IV p. 374, X p. 606.

1. **Diplococcium cylindricum** Jaap, in Lindau Kryptog. Fl. Deutschl. Hyphomycetes VIII (1907) pag. 841. — Cæspitulis diffusis, tenuibus, discretis, fumosis, pulveraceis, centro vero compactioribus, non acute limitatis, parum emergentibus et tunc vix conspicuis; mycelii hyphis rectiusculis, remote septatis, parce ramosis, atro-brunneis, fere impellucidis, apice subhyalinis et in catenulas ramosas conidiorum abeuntibus; conidiis cylindraceis, rectis, utrinque rotundatis, e viridulo subhyalinis, primo 1-cellularibus, dein 2-cellularibus grosseque biguttatis, 12-15 \approx 3.

Hab. in cortice ramorum putrescentium Pini silvestris pr. Triglitz, Brandenburg (JAAP).

FUMAGO Pers. — Syll. IV p. 547, XI p. 638, XIV p. 1099.

1. **Fumago oosperma** Speg., Fungi Paul., Rev. Mus. La Plata t. XV, p. 43 (1908). — Latissime diffusa laxèque matrice adnata, sæpius

epiphylla, glabra, articulis hypharum quandoque subparenchymatice connexis angulato-subglobosis, grosse 1-2-guttulatis, quandoque subliberis, catenulatis, ellipsoideis 5-20 \approx 5-10, grosse 1-2-guttulatis medio plus minusve coarctatis, fuligineis, levibus; conidiis hinc inde glomerulatis, pycnidia rudimentalia simulantibus, utrinque obtusiusculis 12-16 \approx 6-8 subopace fuligineis.

Hab. ad folia coriacea cujusdam in hortis Sao Paulo Brasilia (USTERI). — In eodem mycelio adsunt sœpe conidia altera sparsa bacillari-fusoidea utrinque attenuato-acutata, 20-30 \approx 5, 3-septata, ad septum medium leniter constricta, hyalina.

PSEUDOFUMAGO Br. et Farn., in Atti Ist. bot. Pavia X (extr. 1906) p. 31 (Etym. *pseudes* falsus et *Fumago*). — Catenulæ v. ganglia cellulosa polymorpha, simplicia v. ramosa, raro fasciculata, sœpe primum hyalina v. pallide fusca, dein brunnea v. fuliginea. Cellulæ globosæ v. ellipsoideæ, leves v. asperulæ, continuæ, raro 1-2-septatæ. — Genus omnino obscurum.

1. **Pseudofumago Citri** Br. et Farn., l. c., tab. 1-11, p. p. — Chara. 8451 cteres generis.

Hab. in fructibus Citri Limonis morbo s. d. *ruggine bianca* deturpatis, in Sicilia. — Cellulæ 4-17 \approx 3-13. — An mera forma *Fumaginis*?

Sect. 3. Phæophragmiæ.

STIGMINA Sacc. IV p. 394, XI p. 622, XIV p. 1083, XVI p. 1061, XVIII p. 581.

1. **Stigmina xanthoxylcola** Speg., Myc. Argent. V, p. 443, in Anal. 8452 Mus. Nac. Buenos Aires XX (1910). — Maculis majusculis determinatis repandulis, sœpius totum apicem foliorum occupantibus, amphigenis, sordide cinerescentibus; cæspitulis hypophyllis confertis superficialibus, subhemisphæricis 90-110 μ . diam., olivaceis; conidiis ellipsoideis v. obovatis, 20-28 \approx 12-18, sœpius transverse triseptatis, loculis 1 v. 2 septo altero longitudinali divisis, olivaceis, pedicello brevissimo, 10 \approx 4, mox deciduo hyalino fultis.

Hab. ad folia languida Fagaræ (*Xanthoxylum*) sp. cujusdam in silvis Puerto León Misiones Argentina Amer. austr.

2. **Stigmina valdiviensis** Speg., Fungi Chilenses (1910), p. 186, cum 8453 icon. — Acervulis pusillis, 50-100 μ . diam., erumpenti-superficia-

ibus, olivaceis, subiculo repente subgelatinoso efformatis; conidiis confertis erectis, cylindraceo-subfusoideis saepius 7-septato-constrictulis, loculis olivaceis, extimis exceptis, hyalinis.

Hab. in foliis emortuis *Libertiae ixoidis* in pratibus Ciudad de Valdivia Chile Amer. austr.

CLASTEROSPORIUM Schw. — Syll. IV p. 382, X p. 606, XI p. 621.

XIV p. 1082, XVI p. 1060, XVIII p. 582.

1. **Clasterosporium Citri** Mac Alpine, Fung. Diseas. Citrus, pag. 89, 8454 t. 25, f. 123-124 (1899). — Hyphis sterilibus repentibus, septatis, parce ramosis, pallide brunneis, circ. 3,5-4 μ . cr.; conidiis fusoides, vermiculatis, flavidо-brunneis, 8-septatis, 45 \times 8, non v. vix constrictis.

Hab. in foliis languidis *Citri Limonis*, pr. Melbourne Australiae.

2. **Clasterosporium caulincola** (Corda) Sacc. — Syll. IV, p. 393, X, 8455 p. 606 — var. **pellucidum** Grove, in Journ. of Bot. (1886) p. 12, tab. 267, fig. 1 (extr.) (*Bactrodesmium*). — Effusum, atrum; conidiis sessilibus, dense compactis, cylindricis, utrinque vix attenuatis v. etiam obtusis, 6-12-septatis, dilute olivaceis, pellucidis, 60-100 \times 8-10.

Hab. in caule subherbaceo plantæ ignotæ, Sutton Coldfield Britanniæ.

3. **Clasterosporium Bonordenii** Sacc. — Syll. IV, pag. 385 — var. 8456 **atrum** (Schulz.) Sacc. — Syll. XIX, p. 304 — *Macrosporium clavatum* var. *atrum* Schulz. in Verh. zool.-bot. Ges. Wien (1870) p. 636, t. XIV, f. 2. — Gregarium, atrum; conidiophoris erectis, basi subinflatis, cylindraceis, fuligineis, conidia longitudine subæquantibus; conidiis fusoides rectis v. leviter inæquilateris, apice obtuse attenuatis v. rotundatis, 8-10-septatis, non constrictis, fuligineis, articulo summo hyalino, 45-90 \times 12-16.

Hab. in fragmentis ligneis *Carpini Betuli* in Hungaria.

4. **Clasterosporium Elasticæ** Koord., Botan. Untersuch. Java (1907) 8457 p. 232, fig. 43. — Hyphis repentibus saprogenis, flavo-brunneis, hinc inde conidia conoideo-attenuata, fusca, apice pallidiora 4-5-ptata 40-45 \times 6-9 gerentibus.

Hab. in cortice *Fici elasticæ* prope Purworrdjo prov. Kedu ins. Java (KOORDERS).

5. **Clasterosporium javanicum** Koord., Bot. Untersuch. Java (1907) 8458 p. 232, fig. 44. — Mycelio effuso, fuligineo, parasitico; in maculis

irregularibus brunneis insidente; conidiis oblongis, fuscis, 2-3-septatis, utrinque obtusis, ad septa constrictis, 25-35 × 8-10.

Hab. in foliis vivis Fici elasticæ cultæ prope Pennunggalan prov. Kedu Java (KOORDERS).

6. **Clasterosporium glanduliforme** v. Höhnel, Fragm. z. Mykol., Sitzb. 8459 k. Ak. d. Wiss. Wien Bd. CXVI, Abt. I (1907) p. 152. — Hyphis sterilibus nullis; conidiophoris indivisis, rectis curvulisve, continuis v. spurie 1-2-septatis, deorsum brunneolis, 3-4 µ. cr., sursum sensim pallidioribus et usque ad 6-7 µ. cr., tenui-tunicatis, 30 µ. long., apice monosporis et, conidio decedente, denuo sporigeris, basi in discum crenulatum subcircularem productis; conidiis subglobosis 4-cellularibus, basi truncatis, vertice rotundatis, 12 × 10, cellula sup. nigricante, subhemisphærica, secunda subdisciformi brunnea, binis inferioribus fere hyalinis.

Hab. parasitice in hyphis Corticis coronati, Wienerwald Austriae (v. HÖHTEL).

PSEUDOCERCOSPORA Speg., Myc. Arg. V, p. 437, in An. Mus. Nac. Buenos Aires XX (1910) (Etym. *pseudes* falsus et *Cercospora*). — Genus Hyphomycetum dematium macronemeum phragmosporum, conidiis, pluriseptatis, catenulatis, a *Septonemate* vita biophila et conidiophoris longioribus distinctum.

1. **Pseudocercospora Vitis** (Lév.) Speg., l. c. p. 438. — Huc ducendum est *Septonema Vitis* Lév. — Syll. IV, p. 398.

Hab. adde in hortis Tucuman Argentina.

SEPTONEMA Corda — Syll. IV p. 307, X p. 609, XI p. 622, XIV p. 1084, XVI p. 1062, XVIII p. 583.

1. **Septonema orchidophilum** Speg., Myc. Arg. V, pag. 438, in An. 8461 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; acervulis minutis, punctiformibus, 80-120 µ. diam., compactiusculis, primo epidermide tectis dein nudis; conidiis ellipsoideis utrinque rotundatis, 10-15 × 5, ad septa leniter constrictis, 10-15 × 5, rectis v. vix inæquilateralibus, fuligineis.

Hab. ad scapos florales aridos Oncidi i cujusdam, San Lorenzo prope Orán Jujuy Argentina Amer. austr.

2. **Septonema smilacinum** Speg., Myc. Arg. V, p. 439, in An. Mus. 8462 Nac. Buenos Aires XX (1910). — Cæspitulis minutis, olivaceis, erumpentibus, dense gregariis, hemisphæricis, 100-150 µ. diam.;

conidiis e cylindraceo subfusoideis, utrinque truncatis, 15-35 \approx 7-9, 1-4-septatis, ad septa non constrictis, fuligineis, eguttulatis.

Hab. vulgatum ad sarmenta arida subputrescentia *Smilacis campestris* in Parque Roca Tucumán Argent. Amer. austr.

CRYPTOCORYNEUM Fuck. — Syll. IV p. 395, X p. 608, XI p. 622, XVI p. 1062, XVIII p. 583.

1. **Cryptocoryneum erumpens** Saccardo, Not. Myc. VI, Ann. Myc. III 8463 (1905) p. 515. — Acervulis gregariis plerumque epiphyllis, diu epidermide tumidula nitida tectis, dein erumpentibus, pulvinatis, 200-300 μ . diam., basi hypostromate concavo excipulum dimidiatum fere formante, minute celluloso, fusco suffultis; conidiis paliformibus e pseudostromate oriundis, dense fasciculatis, sessilibus, apice rotundatis, plerumque 3-septatis, non constrictis, 30-32 \approx 4-5, dilute ochraceis.

Hab. in acubus *Taxi baccatæ*, Weimar Germaniæ (H. DIEDICKE). — Stirps ambigua ad Melanconiaceas vergens et ulterius inquirenda.

SPOROSCHISMA B. et Br. — Syll. IV p. 486, XVIII p. 582.

1. **Sporoschisma juvenile** Boud., Ic. Mycol. III, t. 589 (ser. I, p. 12) 8464 (1910). — Maculis velutinis longe lateque expansis ex hyphis sterilibus et conidiophoris formatis; hyphis fertilibus atro-fuligineis, 40-80 μ . longis, ad basim septatis, loculo supero inferne inflato et hic 20-25 μ . cr., cavis et conidiis hyalinis concatenatis et exslientibus repletis; hyphis sterilibus dimidio brevioribus et gracilioribus, septatis, ad apicem pallidioribus; conidiis longe concatenatis; cylindricis, junioribus hyalinis, intus granulosis et continuis, maturis pallide fuligineis, triseptatis, apicibus rotundatis, 30-45 \approx 10-12.

Hab. ad basim caulum *Angelicæ silvestris*, Montmorency Galliæ.

2. **Sporoschisma mirabile** Berk. et Br. — Syll. IV, p. 486 — var. 8465 **attenuatum** Cavara, in Rev. Mycol. XI (1889) pag. 185, t. 88bis, f. 6. — Effusum, nigrum, setulosum; hyphis sterilibus ascendentibus, cylindraceis, septatis, apice clavulatis, olivaceo-virentibus; conidiophoris continuis deorsum longe tenuatis, quasi stipitatis, sursum cylindraceis v. leviter inflatis, 250-300 \approx 13-14; conidiis endogene catenulatim generatis, cylindraceis, utrinque truncatis, 3-septatis, brunneo-viriduiis, intus granulosis vel grosse guttulatis, 30-35 μ . longis.

Hab. in ligno putri in cellis Horti botanici, Pavia, Ital. bor.

3. **Sporoschisma Juniperi** Lind et Vleugel, Svensk Botan. Tidskr. 8466

Bd. II (1908) p. 388, fig 5, *a, b.* — Cæspitibus effusis, non limitatis, atris, nitidis, crustaceis; hyphis conidiophoris sæpius fasciculos irregulares coremiiformes formantibus, cylindraceis, membrana tenui præditis, sub microscopio flavo-viridibus (ut citrus immaturus), basi 15 μ . ceterum 9 μ . cr., simplicibus, in parte inferiore protoplasmate granulo repletis; conidiis in interiore partis superioris hypharum catenulatim formatis et dein exsilientibus, dilute flavo-viridibus vel subhyalinis, quoad longitudinem valde variabilibus, 16-45 μ ., typice 40 μ . long., constanter 8 μ . latis, septis 3-12, typice 9-10 præditis, ad septa constrictis.

Hab. ad corticem Juniperi communis vetustæ, Umea Sueciæ (J. VLEUGEL).

ACROTHECIUM Preuss — Syll. IV p. 483, X p. 662, XIV p. 1089, XVIII p. 584.

1. **Acrothecium Tulasnei** Sacc., *Pyrenophoræ relicinæ* st. conid. Tul. 8467

Scl. Carp. III, p. 259, t. XXIX, f. 1 et 2 (1865). — Cæspitulosum v. subsparsum, atrum; hyphis conidiferis, erectis, filiformibus, septatis, fuligineis, basi paullo incrassatis apice obtuse denticulatis v. brevissime ramulosis; conidiis capitulatis acrogenis, oblongo-ellipsoideis, utrinque rotundatis, 3- raro 4-septatis, non constrictis, atro-olivaceis, 30 \times 13.

Hab. in culmo Avenæ socio st. ascoph. *Pyrenopeziza relicina*, in Gallia (TULASNE et DELACROIX). — Subinde hyphæ conidiophoræ ex ipsis peritheciis oriuntur.

2. **Acrothecium Bambusæ** v. Höhn., Stzb. k. Ak. d. Wissenschaft. Wien 8468

CXVIII, Abt. I (1909) p. 335. — Hyphis conidiophoris simplificibus erectis, atro-brunneis, opacis, sursum pallidioribus, 200 \times 6-7; conidiis acrogenis, capitatis, elliptico-ovoideis, 4-cellularibus, cellulis tribus inferioribus brunneolis, summa subhyalina, ima cellula ceteris duplo longiore et basi apiculata.

Hab. in vaginis emortuis Bambusæ spec. Buitenzorg Javæ, socio *Acanthostigmate Bambusæ* cuius videtur st. conidiophorus.

3. **Acrothecium Krombholzii** Sacc. et Traverso — Syll. XIX, p. 14 — 8469

Dactylium atrum Krombh. Abb. u. Beschr. t. VI, f. 29 (1831), non *Acroth. atrum* (Preuss) Sacc. — Hyphis filiformibus sursum tenuato-cuspidatis, continuis, atris, apice conidia 3-5 capitata, dis-

creta, oblongo-clavata, apice rotundata, sub-4-septata, non constricta, atra gerentibus.

Hab. ad ligna putrida in Germania, — Krombholz l. c. p. 84, n. 29 pro hac species citat Link, sed hic auctor habet tantum *Triposporium nigrum* Link.

4. **Acrothecium bicolor** (Cost.) Sacc., *Pleurophragmium bicolor* Cost., 8470 Muced. simpl. f. 70 (1888). — Hyphis conidiophoris erectis, filiformibus, septatis, brunneis, apice et sub apice denticulato-sporigeris, pallidioribus, 4 μ . cr.; conidiis in denticulis insertis, oblongis, basi acutiusculis, apice rotundatis, 16 \times 4, plerumque 3-septatis, subhyalinis, coacervatis dilute coloratis, non v. vix constrictis, capitulum oblongum pallidum formantibus.

Hab. ad truncos? in Gallia. — Conidia acropleurogena etiam in aliis generis speciebus occurunt, hinc novum genus Costantinii non satis validum videtur.

SPONDYLOCLADIUM Martius — Syll. IV p. 482, X p. 661, XVIII p. 583.

1. **Spondylocladium xylogenum** A. L. Smith, Trans. Brit. Mycol. Soc. 8471 1907, v. III (1908) p. 37, tab. I, fig. 5. — Hyphis sterilibus repentibus, fere hyalinis; fertilibus erectis, plerumque simplicibus v. raro ad basim furcatis, septatis, olivaceo-brunneis, apice subhyalinis, 150 μ . long.; conidiis ex hyphis verticillatim ortis, sessilibus, brunneis, opacis, subclavato-oblongis, 3-septatis, 15-25 \times 8-11.

Hab. in lignis vetustis, Shropshire Britanniae (W. B. ALLEN).

2. **Spondylocladium atro-virens** Harz — Syll. IV, p. 483 — Appel 8472 et Laubert in Arb. K. Biol. Anst. Land - Forstwirts., V (1907) p. 439. — Huc spectant *Phellomyces sclerotiphorus* Frank et *Spondylocladium abietinum* (Zukal) Sacc. — Syll. X, p. 662.

HETEROSPORIUM Kl. — Syll. IV p. 480, X p. 657, XI p. 630, XIV p. 1088, XVI p. 1064, XVIII p. 585.

1. **Heterosporium Auriculæ** Cooke, Fung. Pests p. 57, tab. 4, f. 71 8473 (1906), Massee, Dis. of cult. Plants p. 498 (1910). — Cæspitulis 3-4 in quoque folio, viridi-olivaceis, extensis; conidiophoris prælongis, tenuibus, sæpe ramosis, 4-5 μ . cr.; conidiis elongatis, varie longitudinis, 14-20 \times 5-6, sæpius 1-septatis, griseo-olivaceis.

Hab. in Primulæ Auriculæ cultæ foliis quæ denique vittiantur et perforantur in Britannia.

2. **Heterosporium ferox** Bubák, Fungi imperf. exsicc. (1907) n. 444, 8474

Hedwigia XLVII (1908) p. 363; Lindau, in Rabenh. Kryptogamenfl. IX Abt. p. 83 et p. 798. — Mycelio endophyllo; cæspitulis amphigenis, effusis, velutinis, olivaceis; conidiophoris erumpentibus, initio fasciculatis, erectis, demum divaricatis, simplicibus, raro ramulo laterali auctis, laxe septatis, fumoso-griseis, geniculatoflexis, 200-250 \approx 6-8; conidiis oblongis vel oblongo-cylindraceis, utrinque rotundatis, rectis, raro curvulis, læte griseo-flavidis, 2-3-raro 1-5-septatis, extus spinuloso-granulosis, 23-78 \approx 7,5-8, promore 38-58 μ . longis.

Hab. in foliis Ranunculi arvensis quem vexat, deformat et occidit, in Horto botanico Tabor Bohemiae.

3. **Heterosporium Berberidis** Ranojevic, Ann. Mycol. VIII (1910) 8475

p. 399. — Plagulis in substrato griseo decolorato crebre distributis, brunneo-nigris; conidiophoris ex hyphis noduloso-intricatis subepidermicis orientibus, numerosis, divergentibus, rectis v. curvis, simplicibus, raro leniter ramosis, nodosis, brunneo-fuligineis, dein brunneis et præcipue apicem versus septis pluribus transversis, crassis præditis, apice attenuatis, pallidioribus, usque ad 210 μ . long., 5,5-9,5 μ . cr.; conidiis primum ellipsoideis, unicellularibus, dein elongatis, utrinque rotundatis v. leniter attenuatis, conidiophoris concoloribus, 1-3 raro 4 septis transv. præditis, ibique non v. leniter constrictis, 9,5-22 \approx 4,5-9,5, crebre verrucosis.

Hab. in ramis vivis Berberidis vulgaris prope Belgrad Serbia.

4. **Heterosporium Cytisi** Ranojevic, Ann. Mycol. VIII (1910) p. 398. 8476

— Plagulis ramicolis effusis confertisque in furcis ramorum insidentibus, brunneis; conidiophoris ex stomatibus exeuntibus, cæspitosis, simplicibus, septatis, nodulosis, flavo-brunneis, apice pallidioribus, 76-200 \approx 5,5-7,5; conidiis ellipsoideis, ovoideis, elongatis, continuis v. 1-3-septatis, flavo-brunneis, verruculosis. 9-27 \approx 4,5-9,5.

Hab. in ramis siccis Cytisi elongati, Avala Serbia.

5. **Heterosporium ? Vellosoanum** Speg., Myc. Arg. V, p. 442, in An. 8477

Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis sparsis et suborbicularibus, 1-3 mm. diam., indeterminatis, fuscescentibus; cæspitulis saepe epiphyllis, plus minusve confertis, e globoso depressis, 75-80 \approx 50, ex hyphis subtoruloso-tortuosis 30-50 \approx 6-7 fusco-fumosis efformatis; conidiis clavulatis, saepe triseptatis, 50-60 \approx 12, rufescentibus, obsolete asperulis.

Hab. vulgata ad folia viva Mimosæ Velloianæ in sepi-
bus Orán Jujuy Argentina Amer. austr.

6. **Heterosporium Opuntiae** Lindau, Krypt. Fl. Deutschl. etc. Hypho- 8478
myc. IX (1907) pag. 84. — Cæspitulis effusis, breviter velutinis,
brunneo-nigricantibus; conidiophoris confertis, subflaccidis et for-
titer hinc inde curvatis, inæqualiter septatis, atro-brunneis, 200-
500 \approx 5,5-8, intermixtis hyphis usque ad 20 μ . cr., sursum palli-
dioribus, tenuatis; conidiis terminalibus, oblongis, utrinque rotun-
datis, rectis, brunneis, diaphanis, 2-3-septatis, raro 1- v. 4-septa-
tis, minute spinulosis, 23-35 \approx 11-16.

Hab. in fructibus Opuntiae sp. in Horto botanico Berolinensi
Germaniæ (HENNINGS).

7. **Heterosporium Amsoniae** Kab. et Bub., Hedwigia XLVII (1908) 8479
p. 362. — Maculis epiphyllis sparsis, parvis, rotundatis, rubidis,
sæpe indistinctis, immarginatis quandoque confluentibus; acervulis
hypophyllis, parvis, crebris, nigris, sæpe confluentibus; conidio-
phoris arcte fasciculatis, ascendentibus, rectis v. curvulis, cylin-
draceis, apice angustioribus, apicem versus hinc inde valde infla-
tis, non denticulatis, 500 \approx 4-6, parce septatis, æqualiter brunneo-
olivaceis, raro apice pallidioribus; conidiis ellipsoideis, breviter cy-
lindraceis v. ellipsoideo-fusoideis, 25-40 \approx 10-15, primum unilocu-
laribus parvis, maturis 1-3-transverse septatis, flavo-olivaceis v.
olivaceo-viridibus, crebre verruculosis.

Hab. in foliis dejectis Amsoniae angustifoliae pr. Turnau
Bohemia (KABAT)

8. **Heterosporium Symphoricarpi** Ranojevic, Ann. Mycol. VIII (1910) 8480
p. 398. — Plagulis in greges elongatos crebre distributis, brun-
neis; conidiophoris cæspitosis, cylindraceis, simplicibus, septatis, no-
dulosis, pallide flavo-brunneis, apice subangustatis et pallidioribus,
rectis curvulisve, 34-120 \approx 6-10; conidiis elongato-ellipsoideis, utrin-
que rotundatis v. subangustatis, 1-3-septatis, raro ad septa sub-
constrictis; conidiophoris concoloribus, verruculosis, 11,5-25 \approx 6,5-9,5.

Hab. in ramis vivis Symphoricarpi racemosi, Belgrad
Serbia.

9. **Heterosporium Syringæ** Klebahn, Krankh. des Flieders, pag. 11, 8481
fig. 5, p. 12-16, f. 6-16, p. 36, f. 29 (1909). — Maculis irregu-
laribus, latiusculis, postremo griseo-brunneis; conidiophoris ex my-
celio profunde immerso, vase ramoso ascendentibus erumpenti-
busque, cylindraceis, irregulariter tortuosis v. subrectis, septatis,
brunneis, 70-130 \approx 5-6, simplicibus, apice acutatis v. obtusis an-

gulosisque; conidiis versiformibus ex ellipsoideo tereti-oblongis, initio continuis v. 1-septatis, maturis 3-septatis, minute verruculosis, plerumque 20 \approx 7, rarius 9 \approx 4,5 v. 32 \approx 13, olivaceo-brunneis.

Hab. in foliis *Syringæ vulgaris* cui valde damnosum, Hamburg Germaniæ.

10. **Heterosporium Paulsenii** Rostr., Bot. Tidsskr. XXVIII (1907) 8482 p. 218. — Cæspitulis gregariis, velutinis, aterrimis, caulicolis; hyphis fuscis, septatis, levibus; conidiis obscure fuligineis, 1-5-septatis v. continuis, grosse verruculosis, 20-45 \approx 10-13.

Hab. in caulis *Macrotomiæ euchromæ*, ex *Borraginaceis*, Pamir, Asia.

11. **Heterosporium Fraxini** Ferdinands. et Winge, Bot. Tidsskr. XXVIII (1907) pag. 256, f. 8. — Cæspitulis nigris, congregatis; hyphis incremento sympodiali flexuosis, sparsis, ramosis, septatis, brunneolis, basi stromatica; conidiis acrogenis (et pleurogenis, ex icono?) breviter cylindraceis, utrinque rotundatis, primo continuis, dein 1-3-septatis, griseolis, plerumque 17 \approx 5-6, maximis circ. 25 \approx 7-10, muriculatis.

Hab. ad fructus (samaras) nondum dejectos *Fraxini excelsioris* pr. Værloese Selandiæ.

12. **Heterosporium Tupæ** Speg., Fungi Chilenses (1910) p. 188, cum 8484 icon. — Maculis non v. vix manifestis sed eximie bullosis, 5-15 mm. diam.; cæspitulis hypophyllis confertis olivaceis pusillis 50-70 μ . diam., ex hyphis cylindraceis bicellularibus levibus 20-25 \approx 7-8 efformatis; conidiis ellipsoideis v. obovatis didymis 1-3-septatis, ad septum medium valde constrictis, fulvellis, dense minuteque papilloso-asperulis, 20-40 \approx 10-14.

Hab. in foliis vivis *Lobeliæ Bridgesi* prope Ciudad de Valdivia Chile Amer. austr. — Secundum Cl. Auct. forsan forma *Cercosporæ ? Tupæ* Speg.

13. **Heterosporium Lobeliæ** Speg., Fungi Chilenses (1910) p. 188, cum 8485 icon. — Maculis indeterminatis amphigenis pallescentibus planiusculis, 2-10 mm. diam.; cæspitulis hypophyllis confertis minutis ex 3-4 hyphis cylindraceis tortuosulis 2-4-septatis olivaceis 50 \approx 4-5 efformatis; conidiis cylindraceis 1-4-cellularibus, ad septa non constrictis, fuligineis, dense minuteque ruguloso-asperulis, 15-30 \approx 8.

Hab. frequens in foliis vivis *Lobeliæ salicifoliæ*, Cerro Alegre de Valparaiso Chile Amer. austr.

14. **Heterosporium Centaureæ** Ranojevic, Ann. Mycol. VIII (1910) 8486 p. 398. — Plagulis crebris, validis, brunneo-fuligineis; conidiophoris

e basi pseudostromatico cæspitose productis, numerosis, simplicibus, septatis, nodulosis, flavo-brunneis, apice angustatis et pallidioribus v. etiam hyalinis, usque ad 248 μ . long. 5,5-8,5 μ . cr.; conidiis pallide flavis, primum ellipsoideis v. ovoideis, unicellularibus, dein elongatis, conoideis, utrinque rotundatis, 2-4-locularibus, 9,5-23 \approx 5,5-9,5, minute verrucosis.

Hab. in ramis emortuis siccis *Centaureæ spinulosæ* pr. Belgrad Serbia.

15. **Heterosporium Ephedræ** Potebnia, Myc. St., Ann. Myc. v. V (1907) 8487 pag. 21 et Trav. Soc. Nat. Univ. Kharkov XXXXIII (1907). — Conidiophoris nodulosis 80-120 \approx 4-5, pallide brunneis, in cæspitulis divergentibus congregatis; conidiis concoloribus, episporio verruculoso præditis, 12-16 \approx 5-7, unilocularibus vel inconspicue 1-3-septatis.

Hab. in ramis *Ephedræ vulgaris*, Kharkov, Rossia.

16. **Heterosporium repandum** Ferd. et Winge, Botanisk Tidsskr. 8488 XXIX (1908) p. 23, tab. II, fig. 13. — Cæspitulis singulis dense gregatis, intricato-confluentibus, indeque faciem mycelii ramulos late obtegentis præbentibus, atris; conidiophoris simplicibus vel parce ramosis, septatis, incremento sympodiali flexuosis, usque ad 250 \approx 5-6, fuligineo-fuscis; conidiis cylindraceis, utrinque rotundatis, constanter 3-septatis, ad septa non constrictis, 21-28 \approx 5,5-7, paucissimis paululo majoribus v. minoribus, nonnumquam guttulatis, fuligineis, distincte verrucosis.

Hab ad ramulos sicos indet. in insula St. Thomas Indiæ occ. (RAUNKIAER).

17. **Heterosporium asperatum** Massee, Amer. Monthl. Microsc. Journ. 8489 XIV (1893) p. 33, t. I. — Maculis pallidis; cæspitulis maculiformibus atris; conidiophoris e mycelio innato erumpentibus, fasciculatis, bacillaribus, basi inflatis, septato-nodulosis, brunneis, sursum pallidioribus, intus guttulatis, levibus, 120-150 \approx 8-10; conidiis plerumque binis acrogenis, oblongis, maturis 3-septato-constrictis, distincte asperulis, 17-19 \approx 8 (ex iconæ), subinde apice conidiolo auctis.

Hab. in foliis Convallariæ, Smilacinae, Smilacis, Polygonati et Majanthemi, quibus valde noxium in Amer. bor. — Quoad formas metageneticas speciei cfr. Massee l. c.

18. **Heterosporium Allii-Cepæ** Ranojevic, Ann. Mycol. VIII (1910) 8490 p. 399. — Maculis secus fibras totam superficiem scaporum occupantibus, elongatis, 2,5 \approx 1 cm., griseis, cyanescenti-marginatis,

confluentibus; conidiophoris cæspitosis ex stomatibus exeuntibus, simplicibus, dein septatis, irregularibus, nodosis, flavo-brunneis, usque ad 198 μ . long., 7,5-20 μ . cr.; conidiis flavo-brunneis, verruculis crebre tectis, unicellularibus, dein piriformibus, conoideis v. elongato-ellipsoideis, 32-48 \times 9,5-19 v. elongatis, 1-2 raro 3 septis transversis præditis, rectis quandoque medio angustatis biscoctiformibus, ad septum non vel leniter constrictis, 44-76 \times 9,5-20 (raro usque ad 101 \times 25).

Hab. in scapis languidis Allii Cepæ, Veliko Oraschje Serbia.

19. **Heterosporium graminum** Rostr., Plantenpatologi p. 607 (1902), 8491
Lindau. Deutsch. Krypt. Fl. Pilze IX, p. 77. — Conidiophoris brunneis, nodulosis; conidiis oblongis, brunneis, spinulosis, 3-4-septatis.

Hab. in Dactylide glomerata et Tritico vulgari in Dania. — Diagnosis omnino imperfecta. Observante cl. I. Lind, an idem ac *Cladosporium graminum* Corda?

HELMINTHOSPORIUM Link — Syll. IV p. 402, X p. 610, XI 623, XIV p. 1084, XVI p. 1062, XVIII p. 587.

1. **Helminthosporium valdivianum** Speg., Fungi Chilenses (1910) p. 192, 8492
cum icon. — Erumpens clathrato-effusum velutinum nigrum; hyphis sterilibus erectis simplicibus 10-15-septatis, 300-500 \times 10, olivaceis; conidiis clavulatis saepe 7-septato-constrictulis, 45-50 \times 10-12, olivaceis, loculis extimis hyalinis.

Hab. in ramis emortuis subputrescentibus Sophoræ microphyllæ prope Ciudad de Valdivia Chile Amer. austr. — *Helm. folliculato* affinis species.

2. **Helminthosporium Albizziæ** Petch, Ann. R. Bot. Gard. Peradeniya 8493
IV, Pt. V (1909) p. 306. — Maculis minutis nigris 0,5 mm. diam., ex cæspitulis plurimis areolam albida centrale cingentibus formatis, hypophyllis; conidiophoris basi coalescentibus, 70 \times 7 plerumque prope basim uniseptatis, nodulosis, fuligineis; conidiis acrogenis, clavatis, utrinque rotundatis, 42-56 \times 12, ima basi 4 μ . cr., minute verrucosis, fuligineis, cellula terminali pallidiore, rectis v. curvatis, 3-4-septatis. septis 3-4 μ . cr., tunica 2-3 μ . cr., ad septa non constrictis.

Hab. in foliis Albizziæ Lebbok, Peradeniya Ceylon.

3. **Helminthosporium Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires 8494
t. XVII (1908) p. 140. — Plagulis difformibus effusis 1-25 mm. diam., saepe confluentibus, nigris; hyphis fuligineis erectis pelluci-

dis apice acutiusculis basi non v. vix subbulbosulis, 150-400 \approx 8-10, 3-7-septatis; conidiis acrogenis quandoque cylindraceo-ellipsoideis utrinque obtusiusculis, 40-60 \approx 12-14, quandoque elongatis, subhirsutiniformibus, 180-200 \approx 14-15, pellucidis, semper fuligineis, ad septa non constrictis.

Hab. ad ramos dejectos putrescentes *Ilicis paraguariensis* in silvis circa San Pedro Misiones Reip. Argentinæ.

4. **Helminthosporium Theæ** Bernard, Bull. Dep. Agric. Néerland. XI 8495 (1907) p. 30, f. 50-51. — Effusum, velutinum, nigricans; conidio-phoris erectis saturate brunneis, septatis, 300-350 \approx 10-12; conidiis obclavato-piriformibus, 4-5-locularibus, pro more 4-locularibus basi apiculo (hyphæ apice?) auctis, sursum conspicue tenuatis acutisque, loculis binis inferioribus, brunneis superioribus multo angustioribus, subhyalinis, totis 20-22 \approx 7-8 (basi).

Hab. in ramulis, *Stilbi Thæe* ope jam necatis, *Theæ assamicæ*, Java. — Dimensiones ex iconibus petitæ.

5. **Helminthosporium ubangiense** P. Henn., Mission Em. Laurent 8496 fasc. III (1906) p. 318 — Cæspitulis orbicularibns v. effusis amphigenis, atro-crustaceis, hyphis fasciculatis erectis, rigidis, subsimplicibus, atro-castaneis, septatis, 3-6 μ . cr. v. repentibus, ramosis, 2-3 μ . cr.; conidiis fusoidois, atro-fuscis, apice acutiusculis, 3-4-septatis, 30-60 \approx 5-8.

Hab. in foliis Coffeæ, Ubangi Africæ trop.

6. **Helminthosporium coarctatum** Riess, in Eisenach, Uebersicht der bisher in d. Umg. v. Cassel berb. Pilze (1878) pag. 17 (nomen nudum).

Hab. in caulibus Pisi sativi pr. Cassel Germaniæ.

7. **Helminthosporium densum** Riess l. c. (nomen nudum). 8498

Hab. in caulibus emortuis Conii maculati pr. Cassel Germaniæ.

8. **Helminthosporium Grewiæ** P. Henn., in Fl. du Bas- et Moy. Congo, Ann. Mus. du Congo v. II, fasc. II (1907) pag. 105. — Maculis explanatis subpallidis v. obsoletis; cæspitulis hypophyllis effusis, atro-fuscis; hyphis fusciculatis, septatis, fuscis, 90-120 \approx 5-8; conidiis fusoidois, 2-4 septatis, 35-45 \approx 8-10, fuscidulis.

Hab. in foliis Grewiæ sp., Kisantu Congo Africæ (VANDERYST).

9. **Helminthosporium Viticis** Syd., Hedwigia XLIX, (1909) p. 83. — 8500 Maculis præcipue epiphyllis, orbicularibus, $\frac{1}{3}$ - $\frac{2}{3}$ cm. latis, griseo-brunneis; cæspitulis hypophyllis, minutissimis, in tomento folii

nidulantibus, olivaceo-fuligineis; hyphis tenuibus, septatis, usque ad 80 μ . long. 2-3 μ . latis, ramosis, fuscis; conidiis cylindraceis utrinque leniter attenuatis, rectis v. lenissime curvulis, 1-3-septatis, non constrictis, fuligineis, 12-20 \approx 2,5-3,5.

Hab. in foliis Viticis flaventis, Para Americæ austr. (C. F. BAKER).

10. **Helminthosporium Chrysobalani** P. Henn., in Fl. du Bas- et Moy. Congo, v. II, fasc. II (1907) p. 105. — Maculis late effusis; cæspitulis amphigenis plerumque hypophyllis, gregarie effusis, atris; hyphis fasciculatis, rigidis, sæpe flexuosis, erectis, guttulatis, v. septatis, fuscis, 3-3,5 μ . cr.; conidiis fusoideis utrinque acutiusculis, 2-4-septatis, guttulatis, fusco-atris, 25-50 \approx 3-4.

Hab. in foliis Chrysobalani, Congolo Congo Africa (VANDERYST).

11. **Helminthosporium Heveæ** Petch, Ann. Roy. Bot. Gard. Peradeniya Pt. I (1906) p. 8. — Epiphyllum, sistens maculas primum minutas purpureas deinde albidas, semi-translucidas, orbiculares, 1-5 mm. diam. brunneo-marginatas; hyphis sparsis, olivaceis, simplicibus, 80-100 μ . longis; conidiis cymbiformibus, 8-11-septatis, brunneis, 100-120 \approx 15-18.

Hab. in foliis et plantulis Heveæ brasiliensis, quas valde vexat et foliis orbat, Ceylon Indiæ.

12. **Helminthosporium inæquale** Shear, Bull. Torr. Bot. Club XXXIV (1907) p. 307; Cranberry Diseas. tab. 5, fig. 4-9. — Hyphis sterilibus effusis decumbentibus, ramosissimis, atro-brunneis, interdum 3-12, in fasciculos cohærentibus; conidiophoris ascendentibus v. suberectis, septatis, longitudine ludibundis, 6-8 μ . cr.; conidiis acro-pleurogenis, inæquilateris, v. curvis, 3-5-cellularibus, crasse tunicatis, brunneis, 22-32 \approx 11-14, cellula centrali ceteris ampliore et tumidula.

Hab. tantum ex cultura in pulpa baccarum Vaccinii vitiati, New Jersey Amer. bor. — Ex cultura evolvuntur formæ sclerotioideæ erectæ, firmæ, interdum ramosæ, demum quoque conidia proferentes.

13. **Helminthosporium orthospermum** Sacc. et Fairm., Saccardo, Microm. Amer. novi, Journ. of Myc. v. XII (1906) p. 50. — Late effusum, tenuiter velutinum, opace nigrum; hyphis sterilibus repentibus parcis; fertilibus seu conidiophoris erectis, simplicibus, interdum fasciculatis, rectis, 3-4-septatis, non constrictis, 50-60 \approx 5 fuligineis; conidiis cylindraceis, apice rotundatis, basi ima co-

nico-truncatis, rectis, 60-80 \approx 10-12, rarius usque ad 110 μ . long., 12-14-septatis, non constrictis, septis binis summis approximatis, fuligineis.

Hab. in ligno putrescente (quercino ?), Lyndonville, N. Y., Amer. bor. (FAIRMAN). — Subaffine *Helm. folliculato* sed distinctissimum conidiophoris multo brevioribus et conidiis multo longioribus.

14. **Helminthosporium Elasticæ** Koord., Bot. Unter. Java (1907) p. 233, 8505

fig. 45. — Hyphis gregariis, strictis, solitariis v. rarissime binis, fuligineis, remote septatis, articulatis, rectis v. curvulis, simplicibus rarissime ramosis, plerumque 200-250 \approx 8-10 rarius usque ad 500-600 \approx 10; conidiis oblongo-fusoideis v. cylindraceis, 70-80 \approx 16-18, sursum attenuatis, basi rotundatis, crasse (4 μ .) tunicatis, plerumque 6-9-septatis, pallide olivaceis, rectis v. curvulis.

Hab. in foliis emortuis Fici elasticæ prope Purworedjo prov. Kedu Java, sept. 1905 (KOORDERS).

15. **Helminthosporium kwangense** P, Henn., in Fl. du Bas- et Moy. 8506

Congo in Ann. Mus. du Congo, v. II, fasc. III (1908) pag. 231.

— Cæspitulis hypophyllis, late effusis, ochraceo-fuscidulis, crustaceo-velutinis; hyphis repentibus ramosis, septatis, aureo-brunneis fuscescentibus, 4-8 μ . crassis; conidiis clavatis, vertice obtuso-rotundatis, 2-5-septatis, haud constrictis, 30-65 \approx 15-20.

Hab. in foliis arboris cuiusdam, Kisantu, Congo Africæ (VANDERYST). — Socia adest *Parodiella kwangensis* P. Henn.

16. **Helminthosporium incurvatum** Ch. Bernard, Bull. Dept. Agric. 8507

Indes Néerland. II (1906) p. 31, t. I partim et t. II, f. 1-6. — Effusum tomentosum, saprogenum; hyphis erectis, laxis, rigidulis, ad basim subbulbosis, simplicibus, 6-11-septatis, 250-320 \approx 6-8; conidiis maximis terminalibus, fusiformibus, incurvatis, apice obtusiusculis, ad septa non v. vix constrictis, levibus, pallide fuligineis, 7-12-septatis, non constrictis, 110-150 \approx 19-20, episporio crasso.

Hab. in foliis Cocoës nuciferæ a *Pestalozzia Palmarum* necatis, in ins. Java orient. — Affine, ut videtur, *Helm. gigasporo*. De hac Pestalozzia cfr. dissertationem et icones cl. Bernard l. c.

17. **Helminthosporium Cyperi** Bacc., Funghi Eritr., Ann. Bot. v. IV 8508

(1906) p. 277. — Hyphis fertilibus gregariis, amphigenis, laxis, plus minus orbiculatim dispositis in macula pallida, rectis vel

subflexuosis, fuscidulis, apice pallidiore ac attenuato; conidiis fusoides, fuscidulis, 5-8-septatis, 78 ~ 9.

Hab. in Cypero dichostachyde, Mai-Flungi Amasen Erythrææ (PAPPI).

18. **Helminthosporium bdellomorphum** Speg. Fungi Chilenses (1910) 8509 p. 191, cum icon. — Late effusum, velutinum, atrum; hyphis sterilibus erectis simplicibus 5-10-septatis, 50-150 ~ 6-8, fuligineis; conidiis hirudiniformibus, 10-25-septatis, ad septa non v. leviter constrictis, 60-150 ~ 10-14, subopacis fuligineis levibus.

Hab. frequens in culmis emortuis subputrescentibus Chusqueæ valdiviensis, Bahia de Corral Cerro Caracol de Concepcion Chile Amer. austr.

19. **Helminthosporium ustilaginoideum** P. Henn., in Fl. du Bas- et Moy. Congo, Ann. Mus. du Congo, v. II, fasc. II (1907) p. 104. — Cæspitulis in ovariis, ea destruentibus deformantibusque, subglobosis, compactis, atris; hyphis subramosis fuscidulis, 3-3,5 µ. cr.; conidiis cylindraceis v. subfusoideis, obtusis, 1-5-septatis, fuscis, 10-50 ~ 3,5-4,5,

Hab. in floribus Panici (? spicati), Sanso et Kisantu, Congo, maj., jun. 1906 (VANDERYST).

20. **Helminthosporium Tritici-repentis** Diedicke Aufzähle. Erfurts Micromyc. (1910) p. 101, Centralbl. Bakt. II, Abl. XI, p. 56. — Ab *Helm. gramineo* notis biologicis, ut videtur, tantum distinguitur.

Hab. in foliis Tritici repentis pr. Erfurt Germaniæ. — Cfr. Lindau Deutsch. Krypt. Fl. Pilze IX p. 36.

21. **Helminthosporium Avenæ-pratensis** Diedicke l. c. p. 101. — Mycelio 8512 subepidermico, matricem nigricante; conidiophoris solitariis v. fasciculatim approximatis, septatis, atro-castaneis, rectis, prope apicem inæqualiter geniculatis et hinc inde flexis ibique papillas sporigeras gerentibus, 300 ~ 8-11; conidiis cylindraceis v. obclavatis primo læte dein saturate brunneis, utrinque pallidioribus 5-11-septatis, 70-107 ~ 16-21, membrana sat tenui demum vero crassissima et impellucida.

Hab. in vaginis inferioribus arescentibus Avenæ pratensis, interdum socia *Tetraploa aristata* pr. Erfurt Germaniæ.

22. **Helminthosporium Avenæ-sativæ** (Briosi et Cav.) Lindau Deutsch. 8513 Krypt. Fl. Pilze IX, p. 35 *Helm. teres* var. *Avenæ sativæ* Br. et Cav. Funghi parass. ess. N. 80 c. ic. (1889), *Helm. Avenæ* Eidam in Der Landw. XXVII p. 509 (1891). — Maculis subro-

tundis, non striiformibus, ceteris notis *Helm. teretis*, conidiis raro paullo crassioribus.

Hab. in foliis *Avenæ sativæ*, in Italia, Germania, Dania.

23. **Helminthosporium Bromi** Diedicke, Centralbl. f. Bakter. Parasit. tenk. etc. 2 Abt. XI (1903) p. 56; Krieger, Fungi sax. n. 1941; Sydow, Myc. germ. n. 445. — Parasiticum; maculis subrotundis v. oblongis, non striiformibus; conidiophoris et conidiis ut in *Helm. terete*.

Hab. in foliis *Bromi inermis*, Königstein Saxoniæ (KRIEGER), *Bromi asperi* pr. Erfurt (DIEDICKE). — Cf. Lindau, Deut. Krypt Fl. Pilze IX p. 36.

24. **Helminthosporium Eragrostidis** P. Henn., in Fl. du Bas- et Moy. Congo, in Ann. Mus. du Congo, v. II, fasc. III (1908) p. 231. — Cæspitulis in spicis effusis, atris, subvelutinis; hyphis fasciculatis septatis, inflatis, flavidо-fuscidulis, 4-7 μ . cr.; conidiis clavatis v. fusoideis, obtusiusculis, 2-4-septatis, flavidо-fuscidulis, 30-70 \approx 10-15.

Hab. in glumis *Eragrostidis* sp. Dembo Congo, jun. 1906 (VANDERYST).

25. **Helminthosporium Oryzæ** Miyabe et Hori, Bot. Mag. Tokyo, XIX (1905) p. 220 (japonice).

Hab. in foliis *Oryzæ sativæ* in Japonia.

26. **Helminthosporium Cynodontis** Marignoni, Micromiceti di Schio, Schio (1909) p. 27, cum icon. — Effusum, atro-olivaceum v. fuligineum; conidiophoris aggregatis, laxis, simplicibus, parce septatis, tortuosis, 80-150 \approx 6-7; conidiis elongatis, utrinque rotundatis plerumque octo-septatis, fuligineis, 60-75 \approx 12-14.

Hab. in foliis siccis *Cynodontis Dactyli*, prope Schio Italiæ bor.

STEMPHYLIOMMA Sacc. et Trav. — Syll. XX p. 886 (1911) (Etym. *Stemphylium* et *omma* aspectus) — *Stemphyliopsis* Speg., Fungi Chilenses (1910) p. 193, non A. L. Smith — Hyphæ repentes dense lanoso-intertextæ, ramosæ, olivaceæ; conidia acrogena transverse pluri-septata. — Est *Helminthosporium* hyphis repentibus ramosisque donatum, v. *Stemphylium* phæophragmum.

1. **Stemphyliomma valparadisiacum** Speg. — Sacc. et Trav. l. c. *Stemphyliopsis valparadisiaca* Speg. Fungi Chilenses (1910) p. 193 cum icon. — Superficiale late effusum, gossypinulum, olivaceum; hyphis gracilibus, 2-3 μ . cr., multisep-tatis, sterilibus repentibus flexuosis,

fertilibus erectiusculis plus minusve circinatis; conidiis acrogenis solitariis ellipsoideis v. clavulatis, 3-septatis, ad septa constrictis, 20-22 \approx 9-10, opace nigris, loculo supremo excepto hyalino.

Hab. frequens in foliis emortuis subputrescentibus Puyæ chilensis, Cerro Alegre de Valparaiso et Puyæ cæruleæ Cerro San Cristobal de Santiago Chile Amer. austr.

BRACHYSPORIUM Sacc. — Syll, IV p. 423, X p. 617, XI p. 624, XIV p. 1087, XVIII p. 592.

1. **Brachysporium kerguelense** P. Henn., Deutsche Südpolar. Exped. 8519 Bd. VIII (1906) Extr. p. 16. — Cæspitulis effusis, atris; hyphis fasciculatis, rigidis, atro-rufis, rectis vel flexuosis, 3-4 μ . cr., simplicibus v. subramosis; conidiis acrogenis, clavatis, atris, primo 1- dein 4-septatis, apice obtusis, 10-18 \approx 5-7.

Hab. in caulis emortuis decorticatis Acænæ ascendentes in insul. Kerguelen (WERTH).

2. **Brachysporium Warneckeanum** P. Henn., Engl. Jahrb. XXXVIII 8520 (1905) p. 118. — Maculis fuscidulis v. obsoletis; acervulis rotundatis v. confluenti-effusis, ochraceo-ferrugineis, compactiusculis, velutinis; hyphis septatis, saepe confluentibus, 5-8 μ . cr., ochraceis, granulatis; conidiis cylindraceis v. clavatis, apice obtuse rotundatis, primo continuis, dein 1-3-septatis, paulo constrictis, flavo-ochraceo-brunneis, saepe granulatis, 50-65 \approx 15-20.

Hab. in foliis Euphorbiaceæ cujusdam, Amani, Usambara orient. Africæ (WARNECKE).

3. **Brachysporium Pini-insularis** P. Henn., Hedwigia XLVII (1908) 8521 p. 264. — Cæspitulis gregarie sparsis minutis, atris v. effusis; hyphis fasciculatis, septatis, fuscis, 2-3 μ . latis; conidiis ellipsoideis, 2-septatis, atro-fuscis, 10-12 \approx 6-7,

Hab. in foliis Pin i insularis, Luzon, Benguet, Baguio Ins. Philippin. (MERRILL).

4. **Brachysporium torulosum** Syd., Hedwigia XLIX (1909) pag. 83. 8522 — Cæspitulis hypophyllis, effusis, irregularibus, olivaceo-brunneis; hyphis fasciculatis, simplicibus, rectis, erectis, multiseptatis, eximie torulosis, fusco-brunneis, usque ad 175 μ . longis, 6-8 μ . cr., ad nodos usque ad 14 μ . crassis; conidiis late clavatis, apice rotundatis, basi attenuatis, 3-5-septatis, non constrictis, levibus, fusco-olivaceis, 35-60 \approx 13-20 μ .

Hab. in foliis emortuis Musæ sapientum, Para, America austr. (C. F. BAEKER).

5. **Brachysporium Eragrostidis** P. Henn., in Fl. du Bas- et Moy. 8523 Congo, in Ann. Mus. du Congo, v. II, fasc. III (1908) p. 230. — Cæspitulis in spicis sparsis, atris, floccosis; hyphis fasciculatis simplicibus, brunneis, 40-60 \approx 3-5; conidiis ovoideis v. late fusoides, obtusiusculis, 3-septatis, cellulis mediis olivaceo-fuscis, cellulis extimis pallidioribus, 15-23 \approx 10-15.

Hab. in glumis *Eragrostidis Chapellieri* Nees, Dembo Congo Africæ (VANDERYST).

NAPICLADIUM Thüm. — Syll. IV p. 481, X p. 660, XI p. 631, XVI p. 1065, XVIII p. 594.

1. **Napicladium Ononidis** (Auersw.) Sacc., Notæ Myc. VIII, Ann. 8524 Myc. v. IV (1906) p. 494, tab. X, fig. 16. — *Exosporium Ononidis* Auersw. — Syll. IV p. 757 (nomen) — *Cercospora Ononidis* v. Höhn. Ann. Mycol. III (1905) p. 339.

Hab. in foliis vivis *Ononidis repentis*, quæ ob pycnidia subjecta creberrima tunc inde nigrescunt, Meudon Galliæ (LUDWG). Ob conidia crassa et proportione brevia, nempe 25 \approx 7, rarius 28 \approx 7-8, species ad gen. *Napicladium* aptius ducenda videtur quam ad *Cercosporam*. Perithecia adhuc immatura occurunt; probabiliter ad *Stigmatoæ* species pertinentia.

2. **Napicladium Fumago** Speg., Fungi Chilenses (1910) p. 190, cum 8525 icon. — ? Syn. *Cladosporium Fumago* Mont. in Gay, Fl. chil. VIII, p. 32, non Lk. — Tenuissime effusum, matrici arctiuscule adnatum, fuligineum; hyphis parce ramulosis, torulosis, articulis 15-20 \approx 14; conidiis fusoideis 100-120 \approx 17-18, olivaceis, 9-11-septato-constrictis.

Hab. in foliis vivis *Eugeniae* v. *Myrti*, in silvaticis Bahia de Corral, Chile Amer. austr.

3. **Napicladium rufescens** Spegazz., Fungi Paulist., Rev. Mus. La 8526 Plata t. XV, p. 44. (1908) — Plagulis arcte matrici adnatis, 1-5 mm. diam., maculis nullis, ambitu fimbriatulo-evanescentibus; hyphis rectis v. angulato-geniculatis, 50-100 \approx 6, 1-5-septatis, ferrugineis; conidiis acro-pleurogenis rectis v. flexuosulis 30-150 \approx 5, primo multiguttulatis dein pluriseptatis, apice altero leniter incrassatis, obtusis, altero attenuatis acutiusculis levibus.

Hab. ad folia viva *Eugeniae* cujusdam in hortis Spiranga Brasilia (USTERI). — Species *Napicladio Myrtacearum* Speg. sat affinis sed bene distincta, ad *Cercosporam* non nihil vergens.

4. **Napicladium cucurbiticola** Speg., Myc. Argent. V p. 443, in An. 8527

Mus. Nac. Buenos Aires XX (1910). — Maculis nullis v. obsoletissimis; hyphis repentibus ramulosis, 5 μ . cr., parce septulatis plagulas hypophyllas olivaceas subfumagineas efficientibus; conidiis cylindraceis rectis v. leniter curvulis utrinque subrotundatis 20-100 \approx 6, saepius pluri-septatis ad septa non v. lenissime constrictulis (an catenulatis?) chlorinulis.

Hab. ad folia viva *Cayaponiæ citrullifoliæ* in sepibus prope Tucumán Argentina Amer. austr.

5. **Napicladium asclepiadinum** Speg. Myc Argent. V p. 442, in An. 8528

Mus. Nac. Buenos Aires XX (1910). — Maculis nullis v. pallenscentibus indeterminatis, 5-10 mm. diam., saepius bullosis; hyphis repentibus, 5 μ . cr., olivaceis, plagulas hypophyllas olivaceas subcladosporiaceas efficientibus, dense patuleque ramulosis; conidiis subclavulato-elongatis, rectis v. leniter curvulis, 20-60 \approx 5, saepius pluriseptatis, ad septa non v. lenissime constrictulis, chlorinulis.

Hab. ad folia viva *Philibertiæ rotatæ* in dumetis Tucumán Argentina Amer. austr.

6. **Napicladium Celtidis** Cavara, in Briosi e Cav. Funghi parass. n. 420 8529

(1908). — Hypophyllum, maculas olivaceas, velutinas, suborbiculares v. angulosas efficiens; cæspitulis subepidermicis, erumpentibus, compactis; conidiophoris brevibus, validis, superne obtusis, fasciculatis, conidium subæquantibus; conidiis valde heteromorphis, globulosis, ovalibus, clavulatis, simplicibus v. cylindraceis, rectis curvulisve, 1-3-septatis, levibus, fusco-olivaceis, 12-19 \approx 7-9.

Hab. in foliis vivis, quæ necantur, *Celtidis latifoliæ*, in Horto botanico, Catania, Sicilia (CAVARA).

7. **Napicladium Elasticæ** Koord, Botan. Untersuch. Java (1907) p. 234, 8530

fig. 46. — Mycelio effuso; hyphis fertilibus 10-12 \approx 3, simplicibus, subolivaceis, phyllogenis; conidiis acrogenis, solitariis, oblongis, lævibus, fuligineis, biseptatis, 15-16 \approx 5-5,5, utrinque rotundatis v. truncatis.

Hab. in foliis vivis *Fici elasticæ* prope Purworedjo Loano prov. Kedu Java (KOORDERS).

8. **Napicladium testaceum** Spegazz., Fungi Paulist., Rev. Mus. La 8531

Plata t. XV p. 44 (1908). — Plagulis arctiusculæ ad hypophyllum matrici adnatis, subcrassiusculis 2-10 mm. diam., subvelutinis ambitu repandulis v. confluendo difformibus; thallo tenuissimo membranaceo submucoso obscure parenchymatico flavidulo; hyphis rectiusculis v. flexuosis ferrugineis 150-400 \approx 6-8 lævibus plurisepta-

tis; conidiis rectis, apice altero attenuatis minuteque subtruncatis 50-60 \approx 15, ad septa non constrictis.

Hab. ad folia coriacea arbusculæ cujusdam ignotæ in hortis circa Sao Paulo, Brasilia (USTERI). — Inter hyphas adsunt sæpe sclerotia (perithecia immatura?) numerosa globosa 80-150 μ . diam., ferruginea glabra, carnosο-parenchymatica.

9. **Napicladium? valdivianum** Speg., Fungi Chilenses (1910) p. 191. 8532

— Cæspitulis erumpentibus, linearibus 0,5-1,5 mm. long., 100-250 μ . lat., olivaceis; hyphis rectis constipatis, majusculis, sursum attenuatis continuis, subopacis, fuligineis, 20-80 \approx 5-10; conidiis acrogenis elongato-ellipsoideis, basi attenuato-acutatis, sæpius abruptiuscule incurvatis, 25-30 \approx 6-8, 1-2-3-septatis, non constrictis, hyalinis.

Hab. frequens in foliis vaginisque vivis Hierochloæ utriculatae prope Ciudad de Valdivia Chile Amer. austr.

DENDRYPHIUM Wallr. — Syll. IV p. 487, X p. 662, XI p. 631, XIV p. 1089, XVIII p. 593.

1. **Dendryphium Pini** v. Höhn, Fragm. z. Mykol., Sitzb. k. Ak. 8533 d. Wiss. Wien, Bd. CXVI, Abt. I (1907) p. 153. — Cæspitulis minutis, velutinis, nigricanti-griseis; hyphis sterilibus vix conspicuis; conidiophoris erectis, 200-400 \approx 4, æqualibus, diaphane griseis, violaceo-tinctis, tenui-tunicatis, septatis, levibus, ex articulis 25-35 μ . longis formatis, superne ramulis lateralibus, plerumque oppositis brevibus, apice catenuligeris; conidiis breviter catenulatis, cylindraceis utrinque, rotundatis, 2-4-septatis, ut plurimum 4-septatis, 16 \approx 5,5-6.

Hab. in cortice putrescente Pini silvestris, Steinberg, Wienerwald Austriæ (v. HÖHNEL).

BRACHYCLADIUM Corda — Syll. IV p. 489.

1. **Brachycladium ramosum** Bainier, Bull. Soc. Myc. Fr. XXIV 8534 (1908) p. 80, tab. VI, f. 1-15. — Mycelio copioso, valde ramoso, subpannoso; conidiophoris ascendentibus, confertis, filiformibus, parce septatis, variæ longitudinis, apice irregulariter ramulosolobulatis; conidiis laxe capitatis v. breviter spicatis, oblongis, irregularibus, apice obtusioribus, 25-30 \approx 11-14, brunneis, 3-4-septatis, non constrictis.

Hab. in caule emortuo Urticæ in Gallia. — Mycelium cultum edit postremo sclerotia columnaria nigra, 4-5 mm. alt., 160-210 cr., ex quibus conidiophora iterum evolvuntur.

2. **Brachycladium spiciferum** Bainier, Bull. Soc. Myc. Fr. XXIV 8535 (1908) p. 81, tab. VII, fig. 11-26. — Mycelio copioso, subpannoso, ramosissimo; conidiophoris confertis parce septatis, simplicibus v. parce ramosis, sursum longo tractu flexuosis nodulosisque; conidiis e nodulis nascentibus, longiuscule spicatis, ellipsoideis v. obovatis, utrinque rotundatis, 3-septatis, non constrictis, crasse 4-guttulatis, fuligineo-olivaceis, 30-36 \times 11-14.

Hab. in fragmentis ligneis uidis in Gallia.

3. **Brachycladium spicatum** Bainier, Bull. Soc. Myc. Fr. XXIV (1908) 8536 p. 82, tab. VII, fig. 1-10. — Ab affini *Brachycladio spicifero* distinguatur conidiis brevius spicatis et plerumque conspicue longioribus, 40-42 \times 11-14, prætereaque loco.

Hab. in fimo vaccino in Gallia.

Sect. 4. Phæodictyæ.

STIGMELLA Lév. — Syll. IV p. 507, X p. 667, XI p. 633, XIV p. 1091, XVI p. 1076. XVIII p. 612.

1. **Stigmella scitula** Syd. in Theissen, Ann. Mycol. VII (1909) p. 343. 8537 — Conidiis in pagina inferiore foliorum vivorum æqualiter laxe gregariis, solitariis, punctiformibus, nigris, ellipsoideo-piriformibus, utrinque rotundatis, 28-38 \times 25-28, triseptatis septoque unico longitudinali divisus, non v. vix constrictis, sub microscopio atro-violaceis, opacis; hyphis conidiophoris simplicibus, erectis, 1-2-septatis, hyalinis, 80-90 \times 3 $\frac{1}{2}$ -4.

Hab. in foliis vivis Bignoniaceæ sp., São Leopoldo Rio Grande do Sul, Brasilia. — *Stigm. Uleanæ* Sacc. et Syd. proxima, magnitudine vero conidiorum diversa.

CONIOTHECIUM Corda — Syll. IV p. 508, X p. 668, XI p. 633, XIV p. 1091, XVI p. 1076, XVIII p. 613.

1. **Coniothecium arachideum** Lucks, Centralbl. f. Bakter. etc. II, 8538 Abt. XXXIII (1909) p. 642, tab. I-III. — Conidiis moniliformiter dispositis, primo cylindraceis demum doliformibus, postremo incrassatis et septato-clathratis, atro-brunneis, fere moriformibus.

Hab. in leguminibus Arachidis hypogææ in Germania late diffusum. — Seminum farina vitiata fit animalibus, quæ ea cibantur, perniciosa.

2. **Coniothecium Rhois** Sacc. et Trott. n. sp. — Cæspitulis minutis- 8539

simis vix visilibus laxe gregariis inter fibrillas ligni dealbatas nidulantibus denique erumpentibus, nigris; conidiis laxiusculis, subglobosis vel subcylindraceis rectis v. curvatis, plerumque transverse 1-3-septato-constrictulis, loculis 1-2 saepè etiam longitudinaliter 1 septatis, 10-9 v. 15-18-5-10, obscure brunneis.

Hab. in ramulis emortuis sed adhuc stantibus *Rhois Oxyacanthæ*, M. Mergheb prope Homs Tripolitania Africæ bor. — *Con. appланato* Sacc. affine; distinguitur acervulis punctiformibus inter fibrillas nidulantibus vix conspicuis, socio *Hyalothyridio*.

3. **Coniothecium platense** Speg. Myc. Argent. V, p. 445, in An. 8540 Mus. Nac. Buenos Aires XX (1910). — Cæspitulis sparsis v. laxe gregariis erumpentibus superficialibus compactiusculis, subhysteroideis, 200-500 μ . diam., atro-olivaceis; conidiis constipatis subcatenulatis, subcuboideis, 2-8-cellularibus, 14-20-7-14, saepius sarciniformibus, cellulis cuboideis, 6-8 μ . diam., grosse 1-nucleatis, olivaceis.

Hab. ad palos decorticatos putrescentes *Eucalypti globuli* La Plata Argentina Amer. austr.

4. **Coniothecium Eryngii** Moesz, Gomb. Budap. I, (1909) p. 25, t. III, 8541 fig. 12 Bot. Közlem. — Cæspitulis dense gregariis, primo epidermide tectis deim erumpentibus, fuligineo-atris, c. 70 μ . diam., 33-270 μ . long.; conidiis fuscis, multiglomerulatis, subglobosis v. angulatis, crasse tunicatis, 13-14-8-10, glabris.

Hab. in caulis emortuis *Eryngii campestris* prope Budapest Hungariæ. — A *Con. Heraclei* cellulis numerosis, nec 4-12, præcipue differt.

5. **Coniothecium Rhododendri** Bubak in Handel Mazzetti Bot. Reise 8542 Pont. Randgebrig. in Ann. Naturhist Hofmus. Wien, XXIII (1909) p. 107. — Cæspitulis hypophyllis, tenuibus, atris; conidiis initio singularibus v. breviter (2-3) catenulatis, deinde irregulariter sarciniformibus; conidiis globosis v. ovoideis, 4-7 μ . diam., crasse tunicatis, glabris, obscure brunneis.

Hab. in pagina inferiore foliorum *Rhododendri caucasici*, in montibus ponticis Anatoliæ.

6. **Coniothecium radians** Sacc., Ann. Mycol. VI (1908) p. 563, — 8548 Minutum, disciforme, erumpens inter pycnidia *Phoma frigidæ* (parasitice?) oriens, nigrum; hyphis e centro radiantibus cylindraceis, varie septatis, nucleatisque, ad septa quædam constrictis, in cellulas sporomorphas, modo simplices, modo biloculares, modo

3-4-loculares (*Triphragmii* ad instar) abeuntibus, fuligineis; articulis 7-15 μ . diam.

Hab. in ramis junioribus Populi Tremulæ frigore, ut videtur, necatis, socia *Phoma frigida*, Rüdnitz pr. Bernau Germaniae, Majo 1907 (H. SYDOW).

7. **Coniothecium Abietis** Lindau, in Rabenh. Krypt. Fl. Pilze IX, 8544 p. 170 (1908). — Cæspitulis punctiformibus, tenuibus, nitidulis, brunneo-nigris, subsolitariis v. paucis confluentibus; glomerulis subglobulosis, 30-45 μ . diam.; articulis ex oblongo ovoideis v. subsphæricis, 5-7 μ . diam.

Hab. in pag. inferiore Abietis albæ pr. Gersfeld in Rhöngebirge, Germania (JAAP).

8. **Coniothecium argentinense** Speg., Myc. Arg. V, p. 445, in An. 8545 Mus. Nac. Buenos Aires XX (1910). — Cæspitulis dense gregariis compactiusculis, plagulas crustiformes effusas, 5-20 mm. diam., efformantibus; hyphis repentibus gracilibus, dense tortuoso-ramulosis, 15-30 \approx 45, crebre septulatis subopacis fuligineis; conidiis e difformibus subglobosis, 15-25 μ . diam., e cellulis 3-7 radiantibus conflatis, eguttulatis, atris, subopacis, levibus.

Hab. ad truncos cariosos in silva Santa Catalina prope Buenos Aires Argentina Amer. austr.

9. **Coniothecium Anaptychiæ** Lindau Krypt. Fl. Pilze IX p. 169, 8546 (1908). — Tenue, nigrum, thalli partes vetustas æqualiter obducens; hyphis nullis visis; conidiis globoso-ovoideis v. subangulosis, atro-brunneis, fere impellucidis 5-7 μ . diam., 2, 4 v. pluribus in glomerulos connexis.

Hab. in thallo Anaptychiæ ciliaris, Triglitz, Brandenburg (JAAP). — A *Con. lichenicola* omnino distinctum.

10. **Coniothecium gonorrhœicum** Hallier, Flora (1868) p. 292, tab. III, 8547 fig. 8 et 15. — Stirps omnino dubia.
11. **Coniothecium syphiliticum** Hallier, ibid p. 294, tab. III, fig. 11 8548 et 14. — Stirps omnino dubia.
12. **Coniothecium stilesianum** Riv. Parass. veg. p. 427, t. 4 f. 101, 8549 (1873). — Stirps omnino dubia.

SPEIRA Corda — Syll. IV p. 514, X p. 671, XI p. 634.

1. **Speira chilensis** Speg., Fungi Chilenses (1910) p. 194, cum icon. 8550 — Maculis stromaticis amphigenis, epidermide parenchymateque innatis, irregulariter angulosis, 1-5 mm. diam. nigris, planis, centro setuloso-hirsutis, ambitu glabris; setulis 1-2,5 mm. long. 6-14

μ . cr., conidiis inter setulas nidulantibus obovatis, e catenulis 2-6 rectis coalescenibus olivaceis, 6-9-torulosis efformatis, 20-25 \approx 4-5, pedicello communi brevi crassiusculoque suffultis.

Hab. in foliis dejectis subputrescentibus *Ætoxici punctati* in silvaticis Cerro Caracol de Concepción Chile Amer. austr. — Ob setulas intermixtas a typo desciscit.

DICTYOSPORIUM Corda — Syll. IV p. 513, X p. 670.

1. **Dictyosporium Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires t. XVII 8551

(1909) p. 138. — Acervulis matrici sordide infuscata insidentibus, saepius laxe gregariis globoso-depressis 75-100 μ . diam., nigris; conidiis 5-10 in quoque acervulo dense constipatis, ovatis v. obovatis, utrinque obtusis 20-30 \approx 20-25, saepe medio subcoarctatulis, subopace olivaceis, 24-32-loculigeris, pedicello vix evoluto hyalino obrupte radicatis.

Hab. in schidiis ligneis subputrescentibus *Ilicis paraguariensis*, prope San Pedro Misiones in Rep. Argentina.

SPORODESMIUM Link — Syll. IV p. 497, X p. 665, XI p. 632, XIV p. 1090, XVI p. 1075, XVIII p. 615.

1. **Sporodesmium Cucumis** Niessl, in J. Paul, Verh. naturf. Ver. in Brünn XLVII, Extr. p. 27. — Effusum, nigrum; conidiis oblonge ovatis, subpiriformibus, obtusis, interdum parum curvatis, 45-60 \approx 15-18, muriformibus, seu 4-7 transverse, 1-2 longit. septatis, stipite brevi.

Hab. in *Cucurbita Pepone*, Schönberg, Moravia.

2. **Sporodesmium pluriseptatum** (K. et H.) Peck, N. Y. St. Mus. Bull. 8553 131 (1909) pag. 27. — Ita distinguatur et decatur *Sporodesm. mucosum* var. *pluriseptatum* Karst. et Har. — Syll. X p. 667.

Hab. in fructibus *Cucurbitæ* etiam in America.

3. **Sporodesmium Cinchonæ** Koord., Botan. Untersuch., (1907) p. 235, 8554 fig. 46. — Mycelio parasitico intracellulari, septato; conidiis acrogenis subsolitariis, in radicum cellulis inordinate dispositis, prima juventute hyalinis v. pallide olivaceis v. fuscis, continuis, dein aterrimis, oblongis v. irregularibus, plerumque 30-45 \approx 14-21 usque ad 50-64 \approx 15-18, multicellularibus.

Hab. in cortice radicum *Cinchonæ* sp. ab *Heterodera radicicola* plus minusve infectis, prope Anggrong-Gondok prov. Kedu, Java (KOORDERS).

4. **Sporodesmium Lycii** Niessl, var. *major* Potebnia, Myc. St. Ann. 8555

Myc. v. V (1907) pag. 22, fig. 43 et Trav. Soc. Nat. Univ. Kharkov XXXXIII (1907). — Hyphis parallelis, pseudostromatice congestis; sporulis elongatis, brunneo-fuligineis, 45-60 \approx 15-20, 4-6-septatis leviter constrictis, raro longitudinaliter 1-5-septatis.

Hab. in ramis siccis Lycii barbari, socia Didymosphaeria massarioide var. majore Kharkov, Rossia.

5. **Sporodesmium Scorzonerae** Aderh., Arb. k. Gesundh. Amt. III 8556 (1903) p. 439 cum icon. — Maculis amphigenis, subrotundis, 1-3 mm. diam., flavo-brunneis, sanguineo-marginatis, confluentibus; conidiophoris brevibus, 6-7 μ . cr. curvis; conidiis obclavatis, apice longe productis basi rotundatis, 10-12-septatis et longitrorsum 1-2-partitis, parce constrictis, flavo-melleis, subinde fumoso-brunneis, sursum pallidioribus, 50-75 \approx 13,5-16,5, cum processu apicali 2-2,5 crasso 185 μ . longis.

Hab. in foliis caulibusque Scorzonerae hispanicae, prov. Proskau et pr. Münster, Germania (ADERHOLD). — Fungillus *Scorzonerae* valde noxius.

6. **Sporodesmium carpineum** Schulz. v. Mügg. Vert. zool. bot. Ge-sellsch. Wien (1870) p. 635, tab. 14, fig. 1. — Gregarium, atrum; hyphis sterilibus, parcis, repentibus, subhyalinis, hinc inde conidiophora filiformia, tortuosa, conidia subæquantia v. breviora emit-tentibus; conidiis inter setulas crebras, filiformes, brunneas erectas apice tumidulas subhyalinas interseminatis, ellipsoideis v. oblongo-ellipsoideis, 7-9-septatis crebroque muriformibus, initio subhyalinis, dein fulvescentibus, demum atro-fuligineis, ad septa leniter constrictis, 28-56 \approx 14-24.

Hab. in fragmentis ligneis Carpinii Betuli in Hungaria. — Ob setulas copiosas inter conidia inspersas potius *Septosporii* species.

7. **Sporodesmium Vogelianum** Syd., Ann. Myc. (1910) p. 493, — Cæ- 8558 spitulis sub epidermide sitis eamque elevantibus et tandem longitudinaliter disrumpentibus, c. 0,50 mm. longis, atris, denique sub-superficialibus et confluendo majoribus; conidiis, ovato-oblongis clavulatis, 3-4-septatis usque, ad omnia septa constrictis, cellulis 2-3 septo longitudinali divisis, flavo-brunneis, 20-38 \approx 13-19, pedicello hyalino, continuo v. 1-2-septato crasso, usque ad 35 μ . longo suffultis.

Hab. in ramis emortuis junioribus et pedunculis Celtidis occidentalis, Tamsel Germaniæ (P. VOGEL).

8. **Sporodesmium cavernarum** Laubert, Arb. k. biol. Anst, f. Land. 8559

u. Forstwirtsch. V (1906) p. 209, fig. 4. — Mycelio atro, denso, inter corticem et lignum extenso; hyphis brunneis contortis, intricatis; conidiis acrogenis, singulis, subglobosis v. subovoideis, transverse et longitudinaliter septatis e nigro-brunneo nigris, 7,5-15 \approx 14-30.

Hab. in ramis Betulæ, Kreis Jerichow, prov. Sachsen Germany. — Socium adest *Fusicoccum betulinum* in morbo «Einschnürungskrankheit» dicto.

9. **Sporodesmium Sacchari** Speg. Myc. Argent. V, p. 443 cum icon. 8560 in An. Mus. Nac. Buenos Aires XX (1910). — Acervulis erumpenti-superficialibus subcrustaceis confluentibus linearibus et 3-15 mm. long., nigerrimis; hyphis nullis; conidiis ovoideis v. saepius piriformibus v. subclavatis 16-22 \approx 10-12, transverse (rarius radiatim) 1-3-septatis, ad septa non v. leniter constrictis, loculo medio saepius v. longitudinaliter 1-septato, levibus, primo fuligineis, dein nigris opacis.

Hab. ad culmos dejectos putrescentesque Sacchari officinarum in campis prope Ledesma Jujuy Argentina Amer. austr.

10. **Sporodesmium effusum** P. Henn., in Fl. du Bas. et Moy. Congo, 8561 Ann. Mus. du Congo, v. II, fasc. II, (1907), p. 105. — Crustaceo-effusum, atrum; conidiophoris articulatis; conidiis subglobosis, olivaceo-fuscis, clathrato-septatis, 10-16 μ . diam.

Hab. in floribus Trichopteris sp., Kisantu Congo, Africa (VANDERYST).

11. **Sporodesmium sclerotica** P. Henn., in Fl. du Bas. et Moy. 8562 Congo, Ann. Mus. du Congo, v. II, fasc. II (1907) p. 105. — Crustaceo-effusum, atro-violaceum, gyrosum; conidiis subglobosis, ovoideis v. ellipsoideis 1-2-septato-clathratis, basi breve stipitatis, olivaceo-fuscis, 8-20 μ . diam.

Hab. in sclerotiis in Panico et Andropogone Gayano, Kisantu, Congo, Africa (VANDERYST).

SIRODESMIUM De Not. — Syll. IV p. 516, XIV p. 2137, XVI p. 1077.

1. **Sirodesmium Rosæ** Bubák, Fünft. Beitr. Pilzfl. Tir., in Ber. natur. med. Ver. Innsbruck, XXX Jahrg. (1905-1906) p. 19. — Mycelio hyalino in pycnidiis vacuis vivente, ex ostiolo denique exeunte saturatiore, crassiore, parallele fasciculato et epidermidem perforante, septato; cæspitulis subrotundis, depresso-pulvinatis, demum liberis, nigris, pulverulentis; conidiis catenulatis, forma et posi-

tione valde ludibundis, clathrato-septatis, atro-olivaceo-brunneis, fere impellucidis, 9-35 \approx 9-17, cellulis singulis subglobosis v. mutua pressione polygonis.

Hab. in pycnidiis vetustis Phomaæ pusillæ ad ramos Rosarum cultarum, Meran agri Tridentini.

2. **Sirodesmium Catamarcae** Spieg., Myc. Argent. V, p. 445, in An. 8564 Mus. Nac. Buenos Aires XX (1910). — Pulvinulis primo hemisphæricis 200-250 μ . diam., dein confluendo difformibus latissimis, aterrimis, subpulverulentis; conidiis catenulatis e globoso ellipsoideis polymorphis, 6-20 \approx 6-18, transverse 1-4-septatis loculo uno alterove v. omnibus septo longitudinali divisis, ad septa constrictis, atro-fuligineis, levibus.

Hab. ad tigilla putrescentia in montanis Huillapima Catamarca Argentina Amer. austr.

FUSICLADIOPSIS Maire, Bull. Soc. Bot. Fr. LIII (1906) p. CLXXXVI, (Etym. *Fusicladium* et *opsis* ospectus). — Est quasi *Fusicladium* dictyosporum. — A *Macrosporio* hyphis conidiferis brevibus subfasciculatis, non septatis distinguendum.

1. **Fusicladiopsis conviva** Maire l. c. p. CLXXXVII. — Hyphis vegetativis dilutissime brunneolis, in cellulis matricis late effusis, in epidermide interdum substromaticis; hyphis conidiferis brunneis, cylindricis v. arcuatis, subfasciculatis, circ. 18-22 \approx 6-7; conidiis ovoideis v. ellipsoideis, circa 24-30 \approx 13-17, primo continuis, dein uniseptatis, tandem muralibus, brunneis, minute asperulis.

Hab. in partibus foliorum Urgineæ Scillæ a *Physodermate* *Urgineæ* enecatis, Orán Algeria.

STEMPHYLIUM Wallr. — Syll. IV p. 519, X p. 671, XI p. 634, XIV p. 1092, XVI p. 1078, XVIII p. 617.

1. **Stemphylium macrosporoideum** (Berk.) Sacc. — Syll. IV p. 519 — 8566 var. **spumarioides** Penz, Studi botan. Agrum. p. 413, t. 44, fig. 5 (1887). — Effusum, pulvinatum, extus hyphis junioribus luxuriantibus incoloribus candidum, intus aternum; hyphis intricato-ramosis, hyalinis, haud septatis, 1,5-2 μ . diam.; conidiis in ramulorum apice v. latere insertis, solitariis v. rarissime concatenatis, subgloboso-moriformibus, cruciatim v. radiatim septatis, ad septa constrictis, initio achrois, demum fuligineis, levibus, 13-20 μ . d.

Hab. in trunco vetusto Citri vulgaris, Romæ. — Ob cæ-

spitulos extus candidos, intus aterrimos, Myxomycetem quemdam imitantes, forma mox dignoscenda.

2. **Stemphylium Citri** Flora Patterson, Charles et Veihmeyer. U. S. 8567 Bureau of Plant Industr. Bull. n. 171 (1910) p. 14. — Mycelio elongato, hyalino, demum atro, 4 μ . cr., septato; conidiophoris brevibus; conidiis atro-brunneis, subglobosis v. oblongis, apiculatis, irregulariter septato-muriformibus, 20-30 \times 12-15, pro more catenulato-ternis, per istmos breves hyalinos connexis.

Hab. in Citri Limonum fructibus, quos necat, Arizona Amer. bor.

3. **Stemphylium Tritici** Flora Patterson, Bull. Torr. bot. Cl. (1910), 8568 p. 205. — Hyphis decumbentibus, irregulariter ramosis, fuligineis; ramis fertilibus erectis, crebro septatis, 4-5 μ . diam.; conidiis irregularibus, plerumque clavatis, catenulatis, muriformibus, ad septa leniter constrictis, 24-35 \times 12-15, fuligineis, verruculosis, isthmis brevibus, 3-4 μ . diam.

Hab. in foliis vivis et ovariis Tritici sativi, Texas et Oklahoma Amer. bor. — Speciei vis pathogena vere manifesta.

MACROSPORIUM Fr. — Syll. IV p. 523, X p. 672, XI p. 634, XIV p. 1093, XVI p. 1079, XVIII p. 618.

1. **Macrosporium Sydowianum** Farneti, Ann. Mycol. (1905) p. 433, 8569 cum icon. — Cæspitulis parvis brunneis in maculis fructuum are-scentibus, furfuraceis; hyphis simplicibus adscendentibus, flexuosis, nodulosis, septatis, fuligineis, 60 μ . longis, in hypostromate effuso, toruloideo, inæqualiter constipato insertis; conidiis clavatis, brevi-ter pedicellatis, multiseptatis, ad septa leniter constrictis, vertice rotundato, fuligineis, 28 \times 12.

Hab. in fructibus Piri communis in Italia bor. — Generat in superficie fructuum maculas punctiformes leves (*erpente furfu-raceo* Farneti), non profunda vulnera ut *Fusicladium*.

2. **Macrosporium Dictamni** Lindau, in Rabenh. Kryptog. Fl. Pilze 8570 IX p. 244 (1908). — Cæspitulis punctiformibus, subglobosis, remotiusculis, nigris, late effusis; conidiophoris dense fasciculatis, plerumque ex stromatibus exeuntibus, crebro septatis, irregulariter nodosis v. flexis v. æqualibus, olivaceo-brunneis, sursum pallidioribus, 40-60 \times 4-5, raro 100 \times 6,5; conidiis ovoideis v. subclavatis, subinde tenuato-substipitatis, apice rotundatis, 3-4-pluri-septatis, longitudinaliter v. oblique 1-2-septatis, olivaceo-brunneis, parte tenuata pallidiore, 23-40 \times 8-12.

Hab. in caulibus Dictamni albi pr. Leucha in Thuringia (OERTEL).

3. **Macrosporium Yerbæ** Spegazz., Anal. Mus. Nac. Buenos Aires 8571 t. XVII (1908) p. 138. — Plagulis latiusculis 10-25 mm. diam., tenuibus, ambitu sensim evanescentibus; hyphis erectiusculis, flexuosulis 3-7-septatis, apice denticulatis 40-80 \approx 5, fuligineis; conidiis ex denticulis hypharum oriundis, clavulatis, parte supera elliptica, 3-4-locularibus, loculis 1-3 mediis sæpe longitudinaliter divisis, ad septa constrictulis, loculo infimo elongato attenuatoque pedicelliformi, 40-50 \approx 8-10 long. tot., olivaceis.

Hab. ad ramos emortuos putrescentes Ilicis paraguariensis in dumetis circa San Pedro Misiones Rep. Argentina.

4. **Macrosporium verrucosum** Lutz, Bull. Soc. Bot. France LIII 8572 (1906-1907) p. XLVIII, cum icon. — Hyphis effusis, junioribus subhyalinis, parce ramosis et septatis, 5 μ . cr., quandoque conidiophoris abbreviatis, multiseptatis, nodulosis, atro-olivaceis; conidiis forma et magnitudine variis, 12-18 \approx 12, ætate proiecta ovoideis, rotundatis, ellipsoideis v. clavulatis, 2-pluri- (usque ad 10) septatis, septis obliquis transversalibus v. longitudinalibus, ad septa constrictis, atro-olivaceis, 12-36 \approx 12-18, episporio crasso conspicue remotiuscule verrucoso.

Hab. in fructibus Theobromæ Cacao ægris, Roça de Boa-Entada, San Thomé.

5. **Macrosporium commune** Rabh. — Syll. IV, p. 524 — var. **theicola** Speschn., Die Pilzparasiten d. Teestrauchen (1907) pag. 18, tab. 3, fig. 8-13, p. p. — Maculis arecentibus non acute marginatis, variis; cæspitulis irregularibus, sparsis, convexis, atro-olivaceis; hyphis subfasciculatis 50-90 \approx 3-4, divergentibus; conidiis acrogenis globoso-ovoideis v. oblongis, sæpe piriformibus, 5-7-multiseptato-muriformibus, olivaceis, pro more 24-28 \approx 10, rarius minoribus et parcus septatis.

Hab. in foliis Theæ sp. cultæ in Caucaso, socio st. ascophoro *Pleospora Theæ*. — Uterque fungillus vere noxius.

6. **Macrosporium Cirsii** Lindau, Deutsch. Krypt. Flora, Pilze IX, 8574 p. 250 (1908). — Maculis variis, acute limitatis, superne pallide viridulo-brunneis, indistincte zonatis, inferne griseis; conidiophoris hypophyllis 2-3 fasciculatim e stomatibus erumpentibus, simplicibus erectis v. inclinatis, curvis, plus minus dense septatis, cellulis apicalibus inflatis v. angulosis, brunneis, diaphanis, 55-230 \approx 6-8; conidiis acrogenis solitariis, oblongis fere biscoctiformibus,

utrinque rotundatis, brunneis, diaphanis, medio constricto-septatis, reticulato-septatis, 27-38 \approx 13-15,5.

Hab. in foliis vivis *Cirsii arvensis* pr. Wiborg in Jutlandia (LIND).

7. **Macrosporium Arnicæ** Rostr., Bot. Tidsskr. XXVI (1905) p. 315. 8575
— Maculis amphigenis subrotundis, brunneis, confertim concentrica-zonatis, acervulis punctiformibus, brunneis; conidiis septato-muriformibus, 36-40 \approx 30, brunneis.

Hab. in foliis vivis *Arnicæ montanae* pr. Nyborg supra Fühnen (ROSTRUP).

8. **Macrosporium helminthosporioides** (Corda) Sacc. et Trav. — Syll. 8576 XX, p. 8, *Azosma helminthosporioides* Corda, in Sturm Deutsch. Fl. III, fasc. 12, p. 35, t. 18. — Cæspitulis oblongis, superficiilibus, olivaceis, 2-4 mm. long.; hyphis laxe fasciculatis, ascendentibus, filiformibus; conidiis cuneiformibus v. obovatis apice rotundatis, diaphane olivaceis, 3-7-septato-muriformibus.

Hab. in foliis emortuis Coniferarum pr. Prag Bohemiæ.

9. **Macrosporium cæpicola** Speg., Myc. Arg. V, p. 445, in An. Mus. Nac. Buenos Aires XX (1910). — Maculis sparsis orbicularibus 10-15 mm. diam., determinatis arescentibus subcallosis; cæspitulis præcipue marginalibus ex stomatibus erumpentibus 35-50 μ . diam.; hyphis simplicibus v. breviter ramulosis, cylindraceis utrinque incrassatulis subtruncatis 30-40 \approx 5-6 cum articulis brevibus subglobosis, 5-6 μ . diam., alternantibus, pallide rufescensibus; conidiis acrogenis solitariis cylindraceo-ellipsoideis saepius triseptatis (radius 5-7) non v. vix ad medium lenissime constrictis, loculo uno alterove, septo longitudinali diviso, levibus, pallide fuligineis, 30-40 \approx 12-15.

Hab. ad folia Allii Cæpæ ex Peronosporâ laborantia in hortis La Plata Argentina Amer. austr. — A *M. parasitico* Thm. et *M. Porri* Ell. toto cælo recedens.

10. **Macrosporium lanceolatum** Massee, Kew. Bull. (1910) pag. 5. — 8578
Cæspitulis epiphyllis, nigro-olivaceis, dense aggregatis ac matricis superficiem totam velutino-puberulam efficientibus; hyphis cylindraceis, erectis, flexuosis, deorsum atro-olivaceis, sursum sensim dilutioribus, septatis, 80-120 \approx 7-8; conidiis lanceolatis, 5-7-septatis, loculis centralibus verticaliter 1-2-septatis, olivaceis, episporio crasso levi donatis, 60-70 \approx 14-17.

Hab. in foliis Agaves rigidæ, Mozambico, Africæ trop. (W. H. JOHNSON).

11. **Macrosporium Cheiranthi** (Lib.) Fr. — Syll. IV, p. 525 — var. 8579
Asparagi Thüm. in Boll. Soc. Adriat. Trieste III, p. 432 (1877).
— Conidiis longe stipitiformi-attenuatis, ad septa vix constrictis;
stipite 20 μ . longo.
Hab. in fructibus arescentibus **Asparagi officinalis**, Gradiška in agro Goritiensi (BOLLE).
12. **Macrosporium Sparganii** Lindau, in Rabenh. Krypt. Fl. Pilze 8580
IX, p. 230 (1908). — Cæspitulis versiformibus, effusis, velutinis,
olivaceo-brunneis; conidiophoris ex stomatibus fasciculatim erumpentibus, simplicibus erectis, rectis, rigidulis, usque ad 190 \approx 7,5-8,
diaphane brunneis, apice hyalinis, septatis, articulis nonnullis subinflatis; conidiis oblongis, utrinque rotundatis, brunneis, 2-6-pluri-septatis parceque muriformibus, deorsum tenuato-substipitatis,
ibique subhyalinis, totis 60 \approx 11-12.
Hab. in foliis emortuis **Sparganii ramosi** pr. Wyk supra
Föhr Germania (JAAP).
13. **Macrosporium heteronemum** Desm. — Syll. IV, p. 524 — Teste 8581
cl. v. Höhnel Fragm. Mykol. VI, p. 133 species hæc est mixtura
Cercosporellæ macrosporæ Bres. cum conidiis brunneis muralibus
Macrosporii cujusdam.
14. **Macrosporium caricinum** Bonord., Handb. p. 85, tab. VI, f. 135 8582
(non Fr. quod = *Clasterosporium*). — Dubia species a Bonordenio
in Umbelliferis, non in Caricibus indicata!
15. **Macrosporium torulosum** Bonord., l. c. tab. V, fig. 123 (nomen 8583
deest in textu) non Pass. — Est certe *Cladosporii* species dubia.
16. **Macrosporium graminum** Le Maout et Decaisne, Traité général 8584
Bot. (1868) p. 704, fig. (absque ulla diagnosi et loco).

SEPTOSPORIUM Corda — Syll. IV p. 543, X p. 678, XI p. 637.

1. **Septosporium velutinum** C. et Ell. — Syll. IV, p. 544 et in Ann. 8585
Mycol. X (1912) p. 315.

Hab. quoque in cortice interiore emortuo arborum, Blue Mountain
Lake N. Y. Amer. bor. (Doct. et Domina FAIRMAN). — Conidio-
phora dilute brunnea flexuosa obsolete septata, 40-45 \approx 3,5-4, in-
termixtis setis sterilibus 150 \approx 4-5, rectis, basi bulbillosis, aterrimis;
conidia oblongo-ellipsoidea æque aterrima, basi apiculata, 45-55 \approx
22-25, crebro 10-12-septato-muriformia, non constricta.

ALTERNARIA Nees — Syll. IV p. 545, X p. 679, XI p. 637, XIV p. 1098, XVI p. 1080, XVIII p. 622.

1. **Alternaria Brassicæ** (Berk.) Sacc. — Syll. IV, pag. 546 — var. 8586
Dauci (Kühn) Lindau, Deutsch. Krypt. Fl. Pilze IX, pag. 260,
Polydesmus exitiosus var. *Dauci* Kühn, Hedw. I p. 91 (1855). —
 A typo recedit conidiophoris crassioribus fere monstrose efformatis; conidiorum cauda longius producte et sæpe curvata.

Hab. in Dauco Carota in Germania (KÜHN, SYDOW) et Dania (ROSTRUP). — var. **nigrescens** Peglion in Riv. Pat. veg. I (1893) p. 296 — Syll. XIX, p. 41. — Conidiis fusoideo-clavatis, 100 \approx 14-20, demum 6-12-septato-muriformibus brunneo-fuligineis. — In Cucumere Melone, cui noxia pr. Avellino Ital. merid.

2. **Alternaria Dianthi** Stev. et Hall, in Rep. Divis. Biol. N. Carol. 8587
 Exp. Stat. (1909) p. 72-75, fig. 1-8. — Maculis determinatis, sub-circularibus, cinerescentibus; hyphis cæspitosis ex stomatibus exiliens, amphigenis, atro-brunneis, 1-4-septatis, 1-25 ex quoque stomate; conidiis catenulatis, clavatis, deorsum obtuse tenuatis, atro-brunneis transverse 5-9-septatis, longitrorsum 0-5-septatis, 26-123 \approx 10-20, ad septa constrictis.

Hab. in foliis vivis caulibusque Dianthi Caryophylli, quem valde vexat, Raleigh N. C. Amer. bor.

3. **Alternaria Ribis** Bubák et Ranojevic, Ann. Mycol. VIII (1910) 8588
 p. 400. — Maculis epiphyllis, effusis, griseis, arescentibus, brunneo-marginatis, subtus brunneis; conidiophoris cæspitosis, numerosis, divergentibus, simplicibus, septatis, nodulosis, brunneo-fuligineis, apice rotundato pallidioribus, basi tuberiformi incrassatis, 15-28 \approx 4-6; conidiis conoideis, late fusoideis, brunneo-fuligineis, 3-8 septis transv. præditis, ibique plerumque constrictis, longitudinaliter 2-3 muraliter divisis, in pedicellum attenuatis v. etiam sessilibus, 17-45 \approx 7,5-19; pedicello usque ad 38 μ . long., 3-4 μ . cr.

Hab. in foliis vivis Ribis rubri prope Schabac Serbia.

4. **Alternaria Grossulariæ** Jacz., Bull. Soc. Myc. Fr. XXII (1906) 8589
 p. 122, cum icon. — Hyphis gregariis, erectis, brunneis, septatis, simplicibus v. parce ramosis; conidiis superimpositis, lageniformibus, elongatis, cito deciduis, rostro brevi præditis, brunneo-fuligineis, transverse 5-7-septatis, ad septa constrictis, septis longitudinalibus 1-2 præditis, 42-50 \approx 8-12.

Hab. in baccis Grossulariæ, Livonia Rossiæ.

5. **Alternaria Cerasi** Potebnia, Myc. St. in Ann. Myc. V (1907) 8590
 pag. 22, fig. 41 et Trav. Soc. Nat. Univ. Kharkov, XXXXIII (1907). — Maculis velutinis; conidiophoris brevibus 35-50 μ . long., brunneis, in cæspitulos fortiter et parallele congestis; conidiis co-

noideis, apice distincte elongato-attenuatis, ibique conidia secundaria gerentibus, 50-60 \times 17-20, 4-6-transverse, 6-longitudinaliter septatis.

Hab. in margine sicco foliorum *Pruni Cerasi* in Kharkov, Rossia.

6. **Alternaria Nucis** Moesz, Gomb. Budapest I (1909) p. 25, t. II, 8591 f. 1, Bot. Közlem. — Effusa indeterminata, fumigata; hyphis flexuosis, irregulariter ramoso-intricatis, glabris v. asperulis, dilute fuscis v. dilute olivaceis griseis v. fuligineis, septatis, 2,5-5 μ . cr.; conidiis polymorphis, globosis vel oblongis, glabris vel asperulis, fuscis, olivaceis, fuligineis, catenulatis v. disjunctis, saepius terminalibus, solitariis, continuis v. transverse 1-4 et longitudinaliter 1-septatis, plerumque 20-23 \times 10-13, denique 30-43 \times 16-23.

Hab. in nuce Juglandis regiae in superficie endocarpii ossei et in facie interiore mesocarpii viridis prope Budapest Hungariæ. — Differt ab *Alt. hispida* conidiis minoribus, magis regularibus et parcior septatis. Fungus endocarpium osseum tenuius efficit.

7. **Alternaria Secalis** (Fée) Sacc. et Trav. — Syll. XX, p. 1184 — 8592 *Helminthosporium Secalis* Fée Mem. sur l'Ergot du Seigle, in Mém. Soc. du Mus. d'hist. nat. Strasb. (1843) p. 36, t. II, f. C-i. Hyphis aggregatis, crustam efformantibus, nodulosis, obscure virulentibus, simplicibus v. ramosis septatis; conidiis clavatis, saepius uno apice tenuatis, 4-5-septato-muriformibus, ad septa non v. vix constrictis.

Hab. ad ovarium, glumas, rhachidemque Secalis Cerealis in Gallia, Germania. — Forte, ex icon., var. *Alternariæ Brassicæ*.

Sect. 5. Staurosporæ.

TERATOSPERMA Syd., Ann. Mycol. VII (1909) p. 172 (Etym. *teras* monstrum v. *mirum* et *sperma* spora, pro conidium). — Mycelium repens; hyphæ fertiles erectæ, obscure coloratæ, septatæ, simplices; conidia solitarie acrogena, peculiari ancoræ ad instar forma, colorata, pluriseptata.

1. **Teratosperma singulare** Syd., l. c., cum icon. — Cæspitulis epiphyllis, sine maculis, plerumque orbicularibus, 1-3 mm. diam., atris; mycelio repente, septato, ramoso, fusco, ca. 6-8 μ . cr.; hyphis fertilibus erectis, simplicibus, 2-3-septatis, fuscis, 25-45 \times 6-8; conidiis solitarie acrogenis, peculiari ancoræ ad instar forma, in ma-

turitate e partibus tribus (rarius quattuor) compositis; parte media elongato-obclavata, erecta, recta 3-7-septata, obscure olivaceo-brunnea, cellula apicali in rostrum dilutius coloratum v. subhyalinum longum producta, tota hac parte media (cum rostro) 70-110 μ . longa, inferne 17-22 μ . cr.; partibus duabus (raro tribus) alteris e cellula partis mediæ basali lateraliter oriundis, primitus continuis, tandem 1-2-septatis, dilutioribus v. subhyalinis, usque ad 35 μ . long., 5-8 μ . cr.

Hab. in foliis vivis *Ulm*i parvifoliæ, Nikko, Japonia (MIRYAKE).

TRIPOSPORIUM Cesati — Syll. IV p. 554, XIV p. 1107, XVI p. 1081, XVIII p. 626.

1. **Triposporium pannosum** (Berk.?) Speg., Fungi Chilenses (1910) 8594 p. 195, cum icon. — Ita vocanda est *Fumago pannosa* Berk., Montagne in Gay Fl. Chil. VII, p. 495. De hac sp. Cl. Auctor exhibit hanc novam diagnosim: Late effusum pelliculosum v. pannosum atrum ex hyphis crassiusculis (6-7 μ . cr.) dense ramosis intertextis apice toruloso-proligeris (8-20 \approx 6-7) efformatum; conidiis stellatim 3-ramosis, ramis breviusculis 2-3-septatis, conoideis 20-40 \approx 10, olivaceis.

Hab. copiose in ramis foliisque vivis Boldoæ fragrantis, prope Talcahuano Chile Amer. austr.

2. **Triposporium stelligerum** Speg., Fungi Chilenses (1910), p. 196, 8595 cum icon. — Superficiale, pelliculosum, orbiculare, atrum; hyphis dimorphis: alteris crassis (10 μ .) rectis, paucis, parce ramosis obscure olivaceis sterilibus, alteris tenuibus (4-5 μ .) dense ramosis, fumosis, fertilibus; conidiis 3-4-radiatis, ramis 4-5-septato-constrictulis, apice hyalinis 50-60 \approx 12-14.

Hab. in foliis vivis Ætoxici punctati in silvaticis Cerro Caracol de Concepcion, Chile Amer. austr.

3. **Triposporium patavinum** L. Gaja, Flora micol. provinc. Padova, 8596 p. 25 (sunto litogr.). — Mycelio atro membranaceo acervulatim sub secedente epidermide ramorum effuso; conidiophoris pallescens-tibus, simplicibus, septatis, subcylindraceis, ac prope septa sæpe tortuosis et crassioribus, 25-40 \approx 2,5-3 circiter; conidiis acrogenis, 3-radiatis conice desinentibus, fulvo-fuscis, 44-48 μ . diam.; radiis 2-septatis, inæqualibus, ad septa constrictis ibique obscurioribus et ad apicem pallidioribus, 16-20 \approx 9-10.

Hab. in ramis emortuis sub epidermide secedente *Taxi* bac-

catæ, in Viridario Convictus Universitariorum, Patavii, Ital. bor. — Est affine *Triposporio eleganti*, a quo differt conspicue longitudine et numero septorum radiorum.

4. ***Triposporium fructigenum*** Rabh. (ubi?), Cooke, Black Moulds t. 24, 8597 f. 6 (absque diagnosi). — Conidiophoris ascendentibus crebro septatis, subtorulosis, brunneis, 150-160 \times 10-11, simplicibus; conidiis stellato-triradiatis, radiis cylindraceis sursum tenuatis, 4-5-septatis, 4-guttulatis, brunneis, 50-60 \times 10, articulo extime pallidiore.

Hab. in fructibus in Germania. — Diagnosis ex icone.

CERATOSPORIUM Schw. — Syll. IV p. 552.

1. ***Ceratosporium productum*** Petch, Ann. Roy. Bot. Gard. Peradeniya III (1906) Pt. I, p. 9. — Hyphis repentibus olivaceis, nitentibus, 4 μ . diam.; conidiis 2-4 fasciculatis, 9-13-septatis, non constrictis, olivaceis, ad apicem pallidioribus, 130-200 \times 10-12 (basi), apice 5 μ . cr., loculis basi quadratis, sursum attenuatis.

Hab. in ramis emortuis Heveæ brasiliensis, Ceylon Indiæ.

Sect. 6. Scolecosporæ.

CERCOSPORA Fres. — Syll. IV p. 431, X p. 618, XI p. 625, XIV 1099, XVI p. 1066, XVIII p. 595.

1. ***Cercospora Nigellæ*** Hollós, Ann. Mus. Nat. Hungar. VIII (1910) 8599 p. 8. — Cæspitulis amphigenis, punctiformibus, nigris; hyphis fasciculatis, simplicibus, dilute brunneis, sursum pallidioribus, leviter nodulosis, 24-40 \times 4; conidiis cylindraceo-clavatis, infra incrassatis e obtusatis, sursum leniter attenuatis, rectis v. curvulis 1-3-septatis, intus granulosis, hyalinis, 28-60 \times 4-5.

Hab. in foliis languidis Nigellæ arvensis prope Kecskemét Hungariæ.

2. ***Cercospora Berteroæ*** Hollós, Ann. Mus. Nat. Hung. V (1907) 8600 p. 468. — Maculis rotundatis, expallentibus, griseo-cinctis; cæspitulis amphigenis, aggregatis, brunneis; hyphis fasciculatis, simplicibus, sursum leviter nodulosis, dilute brunneis, 45-55 \times 4; conidiis cylindraceo-clavatis, infra incrassatis, sursum leniter attenuatis, rectis v. curvulis, 5-septatis, hyalinis, 60-70 \times 5-6.

Hab. in foliis languidis Berteroæ incanæ prope Kecskemét Hungariæ.

3. ***Cercospora brassicicola*** P. Henn. Engl. Jahrb. XXXVII (1905) 8601 p. 166. — Maculis rotundatis, gregariis, pallidis, exaridis, zona

fusca circumdatis; cæspitulis hypophyllis; hyphis fasciculatis, fuscis, simplicibus, 20-35 \approx 3; conidiis longe clavatis, obtusis, 5-9-septatis, hyalinis, 40-80 \approx 2,5-3.

Hab. in foliis Brassicæ sinensis, Komaba, Tokyo Japaniæ (MIYAKE). — A *C. Bloxami* conidiis plerumque clavatis, obtusis diversa sed *C. Armoraciæ* Sacc. proxima.

4. **Cercospora biformis** Petch, Bull. Torr. Bot. Cl. XXXVI (1909) 8602 p. 156. — Maculis brunneis, angularibus, folii venulis limitatis, aliquando confluentibus; hyphis hypophyllis, flexuosis, septatis, 30-150 \approx 4-6, brunneis; conidiis biformibus, aliis subcylindraceis hyalinis utrinque obtusis, vulgo 3-4-septatis, 40-100 \approx 4-6, aliis in partem gracilem longam sursum extenuatis, 6-12-septatis, hyalinis, 5-6 μ . ad partem latiorem, 3-4 μ . ad partem angustiorem crassis.

Hab. in foliis vivis v. languidis Passifloræ incarnatæ, Batesville Arkansas, Amer. bor. (E. BARTHOLOMEW). — *Cerc. fusco-virenti* Sacc. et *C. truncatellæ* Atk. affinis sed satis distincta.

5. **Cercospora? phæochlora** Speg., Myc. Arg. V, p. 441. in An. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; cæspitulis hypophyllis densissime congestis, subhemisphæricis; ac plagulas dense velutinas olivaceas obliquas efficientibus; hyphis simplicibus, tortuosulis, 30-50 \approx 5-6, continuis v. 1-3-septatis, non denticulatis, olivaceis; conidiis subcylindraceis leniter fusoideis v. obsoletissime clavulatis, rectis v. curvulis, 15-75 \approx 4,5-5, 1-5-septatis, ad septa non constrictis.

Hab. ad folia languida Lithreæ brasiliensis in horto bot. Municipali Buenos Aires Argentina Amer. austr.

6. **Cercospora Mangiferæ** Koord., Botan. Untersuch. Java (1907) p. 236, 8604 fig. 47. — Maculis angulatis, brunneis, 1-2 mm. diam., numerosissimis, paginam inferiorem foliorum occupantibus, supra pallide brunneis; hyphis fuligineis cylindraceis 1-2-septatis, 20-24 \approx 3-4; conidiis vermicularibus olivaceis, 36-47 \approx 5-5,5, plerumque 46 \approx 5.

Hab. in foliis vivis Mangiferæ indicæ, Purworedjo prov. Kedu, Java (KOORDERS).

7. **Cercospora Helianthemi** Cavara in Briosi e Cav., Funghi parass. n. 334 (1904). — Maculis epiphyllis, minutis, 2-2,5 mm. lat., orbicularibus, griseo-brunneis, non marginatis; conidiophoris fasciculatis, e nodulo mycelico subepidermico ortis, erectis, cylindraceis, 2-3-septatis, olivaceo-fuscis, typice monosporis, non denticulatis conidio paullo longioribus; conidiis cylindraceis v. obclava-

tis, obtusiusculis, 1-3-septatis, non constrictis, pallidioribus, 25-50 \approx 3-4.

Hab. in foliis *Helianthemi polifolii* var. *rosei* in Horto botanico, Pavia, Italia bor. (G. B. TRAVERSO et M. TURCONI).

8. **Cercospora exitiosa** Syd. Mycoh. germ. n. 545, Ann. Myc. IV 8606 (1906) p. 485. — Cæspitulis in ramis vivis vel subvivis evolutis, maculas orbiculares valde conspicuas $1/2$ - $1\frac{1}{2}$ cm. diam. atro-brunneas linea elevata bene limitatas efficientibus, in medio maculae dense aggregatis, minutis, griseo-olivaceis; hypostromate pro ratione valde evoluto, celluloso, atro vel atro-olivaceo; hyphis minutis, olivaceis, ca. 20-40 μ . longis, 3 μ . crassis, dense stipatis; conidiis fusoideis vel oblongo-clavatis, indistincte 1-3-septatis, rectis vel leniter curvulis, hyalino-olivaceis, 22-50 \approx 4-6.

Hab. in ramis vivis v. subvivis *Tiliæ platyphyllæ*, Tam-sel Marchiæ (P. VOGEL).

9. **Cercospora Pareiræ** Speg., Myc. Arg. V, p. 440, in An. Mus. 8607 Nac. Buenos Aires XX (1910). — Maculis amphigenis saepius bullosis, repando-orbicularibus, 2-5 mm. diam., fuscescentibus determinatis; cæspitulis saepius hypophyllis laxè gregariis, olivaceis; hyphis confertiusculis 40-75 \approx 5-6, saepius 2-3-septatis rarius continuis, vix denticulatis efformatis; conidiis cylindraceis v. clavulatis, 1-3-septatis, rectis v. curvulis, 15-40 \approx 6-7, chlorinis.

Hab. ad folia viva *Cissampeli Pareiræ* in sepibus prope Tucuman Argentina Amer. austr. — Species notis nonnullis ad *Cladosporium vergens*.

10. **Cercospora meliicola** Speg., Myc. Arg. V p. 440, in An. Mus. 8608 Nac. Buenos Aires XX (1910). — Maculis suborbicularibus, 1-5 mm. diam., repandis, amphigenis (determinatis) candidis; cæspitulis saepius epiphyllis laxè gregariis minutis olivaceis; hyphis erectis tortuosulis 100-200 \approx 6-10, simplicibus, asperulis, olivaceis; conidiis linearibus lenissime subclavulatis, 80 \approx 4, leniter curvulis, saepius 3-septatis, chlorinis.

Hab. ad folia *Meliæ Azedarach* in Orán Jujuy Argentina Amer. austr.

11. **Cercospora undulata** (Ch. Bern.) Sacc. — *Ramularia undulata* 8609 Bernard, Bull. Départem. Agric. Neérland. XI (1907) pag. 47, fig. 62-65. — Maculis epiphyllis nigricantibus, hypophyllis flavis, minoribus fertilibusque; conidiophoris subfasciculatis, filiformibus, obsolete septatis; saturate brunneis, erectis, e mycelio filamentoso, repenti, septato, ramoso oriundis, 150 \approx 4-6, sursum denticulato-

undulatis; conidiis breviter fusiformibus, 4-5-cellularibus, non constrictis, initio hyalinis, demum brunneis, 24-25 \approx 6-8.

Hab. in foliis *Ægles odoratæ* et *Citri* sp. in hortis, Buitenzorg Javæ. — Dimensiones ex iconibus petitæ.

12. **Cercospora coleroides** Saccardo Microm. Amer. novi, Journ. of Mycol. v. XII (1906) p. 52. — Maculis amphigenis, subcircularibus, 3-5 mm. diam., subgriseis linea atro-brunnea cinctis, interdum confluentibus; cæspitulis amphigenis laxe gregariis, punctiformibus, atris, 200 μ . diam., hypostromate celluloso, pulvinato, fuligineo, erumpente; conidiophoris e superficie hypostromatis orientibus dense stipatis, paliformibus, simplicibus, continuis, oliveis, 40-50 \approx 5,5-6, apice truncatulis; conidiis in apice conidiophori solitariis, bacillaribus, rectis v. curvis, basi truncatis, oliveis, brevioribus, 90-100 \approx 5-6 et 3-4-septatis, longioribus 140-150 \approx 5-6 et 10-12-septatis, non constrictis, septis superioribus minus evidentibus, articulis plerumque utrinque 1-guttulatis.

Hab. in foliis languidis Casimiroæ edulis vulgo *Zapote blanco*, Tenancingo, Mexico. (BONANSEA) — Ob cæspitulos punctiformes conidiis radiantibus conspersos *Coleroam* in mentem revocat. Ob hypostroma conspicuum hæc species et aliæ consimiles ad *Exosporium* nutant.

13. **Cercospora Bruceæ** Petch, Ann. R. Bot. Gard. Peradeniya IV 8611 Pt. V (1909) p. 306. — Plagulas nigras hypophyllas formans; hyphis fuscis, repentibus et internerviis, subpanniosis, 3-4 μ . diam.; conidiis multiseptatis, subclavatis, rectis v. curvis, 45-65 \approx 5.

Hab. in foliis Bruceæ sumatranae, Kandy Ceylon.

14. **Cercospora Violæ** Sacc. — Syll. IV p. 434. — Var. *minor* Rota- 8612 Rossi III Contr. Mic. Bergamo, Atti R. Ist. bot. Pavia, ser. II, v. XIII (1907) p. 199. — A typo differt conidiis brevioribus, nempe 50-90 \approx 4-5.

Hab. in foliis Violæ sp. Parre, Bergamo Ital. bor.

15. **Cercospora Kleinhofiaæ** v. Höhnle, Fragm. z. Mykol., Sitzb. L. 8613 Ak. d. Wiss. Wien, Bd. CXVI Abt. I (1907) p. 150. — Maculis amphigenis, copiosis, inæqualiter anguloso-circularibus, 2-10 mm. diam., saepè confluentibus, brunneis, ochraceo-marginatis; cæspitulis minutis, vix conspicuis, infra copiosis, supra parcioribus; conidiophoris brunneolis, simplicibus, continuis, parcis, 20-25 \approx 4-5, unidenticulatis; conidiis filiformi-cylindraceis, sursum leniter tenuatis, apice, obtusis, 2-5-cellularibus, 35-65 \approx 4-5.

Hab. in foliis Kleinhofiae hospitæ, Matrotua in insulis Samoa (Doct. RECHINGER).

16. **Cercospora Dilleniæ** Petch, Ann. Roy. Bot. Gard. Peradeniya 8614

III Pt. I (1906) p. 9. — Maculis fusco-brunneis, demum supra griseis, zona fusco-brunnea cinctis; conidiophoris saepius epiphyllis, in cæspites nigros, minutos congestis, brevibus, olivaceis; conidiis obclavatis, rectis v. leniter curvatis, olivaceis, 5-9-septatis, 60-90 \approx 47.

Hab. in foliis Dilleniæ retusæ, Ceylon Indiæ.

17. **Cercospora Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires t. XVII 8615

(1908) p. 140. — Maculis fuscis orbicularibus, 2-5 mm. diam., obsolete determinatis centro fuscescentibus depresso ambitu incrassato callosulis; acervulis centro macularum dense aggregatis, punctiformibus, 90-120 μ . diam., fusco-olivaceis, compactiusculis; hyphis brevibus olivaceis erectis, simplicibus 20-50 \approx 5, 1-3-septatis, apice denticulatis; conidiis rectis v. curvulis, ad septa non v. vix constrictis, clavulatis, apice obtusiusculis, deorsum attenuato-acutatis, 30-60 \approx 5, levibus, acrogenis, chlorinis.

Hab. ad folia languida Ilicis amaræ prope Villa Encarnacion Misiones Riep. Argentinæ.

18. **Cercospora Zizyphi** Petch, Ann. R. Bot. Gard. Peradeniya IV Pt. 8616

V (1909) p. 306. — Maculis primum flavis dein brunneis et flavo-marginatis, circularibus v. ovatis, usque ad 4 mm. diam.; pustulis minutis, amphigenis, 40 μ . circ. diam., nigris; conidiophoris 16-20 \approx 4, rectis; conidiis 40-75 \approx 4, minoribus æqualibus, majoribus clavatis et conoideis usque ad 2 μ . diam., plerumque nodulosis, rectis, apice obtusis, 3-8-septatis, chlorinis.

Hab. in foliis Zizyphi oenopliæ, Peradeniya Ceylon.

19. **Cercospora Vitis-heterophyllæ** P. Henn., Engl. Jahrb. XXXVII 8617

(1905) p. 166. — Cæspitulis hypophyllis, effusis, atro-fuscis, hyphis fasciculatis brunneo-fuscis, septatis, 3-4 μ . cr.; conidiis cylindraceo-clavatis v. fusoideis, 5-10-septatis, constrictulis, atro-olivaceis, 40-75 \approx 4-4.5.

Hab. in foliis Vitis heterophyllæ, Nishiarai Tokyo Japaniæ (NAMBU).

20. **Cercospora vexans** C. Mass. in Sacc., Notæ Myc. VIII, Ann. 8618

Myc. v. IV (1906) p. 494. — Cæspitulis hypophyllis, imperspicuis, laxè sparsis in maculis parvis irregulariter angulosis, subferrugineis et vulgo zona e flavo rubescenti cinctis; hyphis fertilibus fasciculatim ex ostiolis stomatum egredientibus, fuligineis,

sursum dilutioribus, apice obsolete denticuligeris, saepius septatis, raro ramulosis, 40-60 \approx 3-3,5; conidiis initio ovoideis, deinde cylindraceo-fusoideis, 15-18 \approx 2-3, continuis, interdum 1-septatis, hyalinis, catenulatis (ut videtur).

Hab. in foliis languidis *Fragariae* vescæ in cultis, Tregnago, Verona (MASSALONGO).

21. **Cercospora Crataegi** Sacc. et C. Massal. in Saccardo, Not. Myc. 8619 VI, Ann. Myc. v. III (1905) p. 515. — Maculis praesertim hypophyllis minutis $\frac{1}{2}$ -1 mm. diam. e rotundo angulosis, alutaceis, non discolori-marginatis; cæspitulis minutis, parcis; hyphis fertilibus fasciculatis, cylindraceis, subflexuosis, 1-2-septatis, sursum parce nodulosis, 30-40 \approx 3, dilute fuligineis; conidiis tereti-fusoideis v. anguste obclavatis, 3-septatis, saepius curvulis, 18-28 \approx 2,5-3, hyalinis demum dilutissime fuligineis.

Hab. in foliis adhuc vivis *Crataegi Oxyacanthæ* in silvis di Veralta supra S. Mauro di Saline, Verona, Ital. bor. (MASSALONGO). — Socia et verisimiliter matagenetica adest *Phyllosticta cratægicola*.

22. **Cercospora Punicæ** P. Henn., Engl. Jahrb. XXXVII (1905) 8620 p. 165. — Maculis rotundatis, atro-fuscidulis; cæspitulis hypophyllis, conidiophoris fasciculatis, fuscidulis, 20-40 \approx 3; conidiis cylindraceis, subfusoideis v. subclavatis, 40-50 \approx 3-3,5, hyalino-subfuscidulis, 4-septatis.

Hab. in foliis *Punicæ Granati*, Komata Tokyo Japoniæ (MIYAKE).

23. **Cercospora Usteriana** Spegazz., Fungi Paulist. Rev. Museo La Plata t. XV, p. 46 (1908). — Maculis obsolete fuscescentibus indeterminatis, amphigenis; acervulis hypophyllis, villo foliorum absconditis, penicilliformibus, ex hyphis subfasciculatis 40-80 \approx 4-5 subtulosis, 1-3-septatis efformatis, olivascentibus; conidiis curvulis v. sigmoideis 30-100 \approx 5-6, 3-5-septatis, ad septa non constrictis, lævibus, an catenulatis?, fumosis.

Hab. ad folia languida Myrtaceæ cujusdam in Horto botanico Sao Paulo, Brasilia (USTERI).

24. **Cercospora? puccinoides** Speg. Myc. Arg. V, pag. 441, in An. 8622 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; cæspitulis hypophyllis ferrugineis dense constipatis; hyphis simplicibus erectis, septulatis, levibus, 25-50 \approx 5, fumoso-olivaceis, non denticulatis; conidiis clavulatiis, solitaris, 30-60 \approx 5-8, 2-5-septatis, ad septa non constrictis, fumoso-olivaceis.

Hab. ad folia viva Collææ argentinæ in collinis prope Córdoba Argentina America austr. — Acervuli compactiusculi soros *Pucciniæ* cujusdam optime simulant.

25. **Cercospora Wildemanii** Syd., in De Wildem. Flore Bas- et Moy. 8623 Congo t. III, fasc. I (1909) Extr. p. 21. — Maculis amphigenis, orbicularibus v. suborbicularibus, 2-8 mm. latis, centro arescentibus, zona purpurea latiuscula cinctis; cæspitulis hypophyllis, minutissimis, olivaceo-griseis; hyphis fasciculatis, olivaceo-fuligineis, subcontinuis, 20-30 \approx 4-6; conidiis obclavato-cylindraceis, distincte 8-14-septatis, viridulis, rectis subinde valde curvatis, 50-100 \approx 6-8.

Hab. in foliis Dolichi sp., Kimdua Congo, Africa (VANDERYST).

26. **Cercospora Vanderysti** P. Henn., in Fl. du Bas- et Moy. Congo, 8624 Ann. Mus. du Congo, v. II, fasc. II (1907) p. 104. — Maculis fuscidulis effusis; cæspitulis hypophyllis effusis velutinis, olivaceo-cinereis; hyphis ramosis, septatis, guttulatis, fuscis, 3,5-4,5 μ . cr.; conidiis clavatis, apice obtusis, 1-5 septatis, guttulatis, fuscis, 25-40 \approx 3,5. (usque ad 70 μ . long. sec. SYDOW, 1909).

Hab. in foliis Vignæ venulosæ Bak., Kisantu Congo, Africa (VANDERYST).

27. **Cercospora Sesbaniae** P. Henn. in Fl. du Bas- et Moy. Congo, 8625 Ann. Mus. du Congo v. II, fasc. II (1907) p. 104. — Maculis effusis flavidulis; cæspitulis hypophyllis effusis, subcinereo-fuscis; hyphis fasciculatis, simplicibus, interdum 1-4-septatis, fuscis; conidiis fusoideo-clavatis, curvatis, obtusiusculis, pluriguttulatis dein 10-16 septatis, fuscidulis, 30-62 \approx 4-5.

Hab. in foliis Sesbaniae sp., Kisantu Congo, Africa (VANDERYST).

28. **Cercospora innumerabilis** (Fuckel) v. Höhn. Sitzb. K. Ak. d. 8626 Wissensch. Wien CXVI (1907) p. 622. — Ita vocandum *Psilothecium innumerabile* Fuckel — Sacc. Syll. III p. 446 (? Stagonospora) — sec. v. Höhnel l. c.

29. **Cercospora Ternateæ** Petch, Ann. R. Bot. Gard. Peradeniya IV, 8627 Pt. V (1909) p. 306. — Maculis foliicolis rotundatis, nigris, centro brunneis, dein griseis margine flavidò v. pallide viridi præditis, 3 mm. diam.; conidiophoris amphigenis; maculis in leguminibus usque ad 5 mm. diam., confluentibus, nigris brunneo-marginalis; conidiophoris olivaceis, e stromate minuto orientibus, septatis, levibus, usque ad 90 \approx 5, apice unidenticulatis et monosporis, dein usque ad 200 μ . long. et nodulosis; conidiis filiformibus 80-120 μ .

long. sursum tenuatis et ad 2-4 μ . cr., multiseptatis, curvatis, septis circiter 8 μ . distantibus.

Hab. in foliis leguminibusque *Clitoriae Ternatae*, Peradeniya Ceylon. — A *C. Clitoriae* Atk. conidiis et conidiophoris longioribus differre videtur.

30. **Cercospora Rautensis** C. Mass., Madonna Verona III (1909) 8628

p. 19. — Maculis parvis subrotundis pallide griseis, 2-3 mm. lat., zona rufa cinctis; cæspitulis epiphyllis crebre disseminatis; conidiophoris 1-2-septatis, varie nodulosis et inflexis, superne alterne denticuligeris, 60-90 \approx 3-4, subrubiginosis; conidiis obclavato-cylindraceis, sursum attenuatis, sæpe curvulis, pluriseptatis, hyalinis 60-100 \approx 4-5.

Hab. in foliis *Coronillæ variæ* in silva «delle Raute» prope Cogolo Verona (MASSALONGO).

31. **Cercospora Loti** Hollós, Ann. Mus. Nat. Hung. V (1907) p. 468. 8629

— Maculis rotundatis, rubro-brunneis; cæspitulis epiphyllis, aggregatis, olivaceis; hyphis fasciculatis, simplicibus, sursum leviter nodulosis, 1-2-septatis, pallide olivaceis, 80-100 \approx 4-5; conidiis cylindraceo-clavatis, infra incrassatis et obtusatis, sursum leniter attenuatis, rectis curvulisve, 10-11-septatis, pluriguttulatis, hyalinis, 70-90 \approx 4-5.

Hab. in foliis languidis Loti siliquosi prope Kecskemét Hungariæ.

32. **Cercospora Stolziana** Magn. in Dalla Torre et Sarnt. Fl. Tirol. 8630

III (1905) p. 558. — Maculis arescendo flavis, bullatis, circumcirca non bene definitis; conidiophoris fasciculatis, ex stomatibus utriusque paginæ erumpentibus, septatis, denticulatis, 35-40 μ . longis; conidiis fere filiformibus, 9-pluriseptatis, hyalinis, 85 μ . longis, articulis circ. 8 μ . longis.

Hab. in foliis Trifolii repentis pr. Innsbruck (STOLZ). — Præsertim ob maculas peculiares a ceteris speciebus trifoliicolis dignoscenda species.

33. **Cercospora Hippocrepidis** Jaap, Beitr. Pilzfl. d. Schw., Ann. 8631

Myc. V (1907) p. 271. — Maculis subrotundis, 2-3 mm. latis, dilute griseis v. albidis, brunneo-marginatis; cæspitulis amphigenis griseo-nigricantibus; conidiophoris fasciculatis, leviter curvis et nodulosis, denticulatis, olivaceis, septatis, 50-70 \approx 5; conidiis septatis, hyalinis, usque ad 60 \approx 3,5-4,5.

Hab. in foliis vivis Hippocrepidis comosæ pr. Meiringen Helvetiæ (JAAP).

34. **Cercospora Ceratoniæ** Pat. et Trab. — Syll. XVIII p. 601. — 8632
 Diagnosim pleniorum vide in Ann. Mycol. VII (1910) pag. 346
 (Saccardo). Species nascitur quoque in Italia meridionali.
35. **Cercospora sapiicola** Speg., Myc. Arg. V p. 442, in An. Mus. 8633
 Nac. Buenos Aires XX (1910). — Maculis amphigenis angulatis,
 2-5 mm. diam., determinatis, tabacinis, centro pallidioribus; cæ-
 spitulis hypophyllis penicilliformibus, 40-50 μ . diam., olivaceis;
 hyphis rectis v. leniter arcuatulis, non v. vix flexuosis, 35-40 \approx 5,
 obsolete (sæpius 2-3-) septulatis olivaceis; conidiis linearibus non
 v. vix clavulatis, 35-70 \approx 5-6, obsolete septulatis, chlorinis.
Hab. ad folia viva Sapii aucuparii, var. salicifoliæ in
 silvis Puerto León Misiones Argentina Amer. austr.
36. **Cercospora Jatropharum** Speg., Myc. Argent. V, p. 440, in An. 8634
 Mus. Nac. Buenos Aires XX (1910). — Maculis repando-orbicu-
 laribus, 3-5 mm. diam., amphigenis, determinatis, concentrica di-
 scoloribus; cæspitulis epiphyllis laxè insidentibus, pusillis, 75-90 μ .
 diam., olivaceis, compactiusculis; hyphis constipatis, 25-35 \approx 6,
 cylindraceis, continuis, chlorinis; conidiis vermicularibus, lenissi-
 me clavulatis, 30-80 \approx 5-8, 1-3-septatis, ad septa non constrictis,
 chlorinis.
Hab. ad folia viva Jatrophæ macrocarpæ prope Cata-
 marca Argent. Amer. austr.
37. **Cercospora Manihotis** P. Henn., in Fl. du Bas- et Moy. Congo, 8635
 Ann. Mus. du Congo v. II, fasc. II (1907) p. 104. — Maculis ro-
 tundatis v. effusis, fusco-atris; cæspitulis hypophyllis, ferrugineis;
 hyphis fuscis, septatis, 3,5-4 μ . cr.; conidiis clavatis sæpe curvu-
 lis, vertice obtusis, 1-5-septatis, subfuscidulis, 25-37 \approx 4-5.
Hab. in foliis Manihot utilissimæ, Kisantu Congo, Africæ
 (VANDERYST).
38. **Cercospora Cearæ** Petch, Ann. Roy. Bot. Gard. Peradeniya, III 8636
 Pt. I (1906) p. 8. — Maculis irregularibus rubro-brunneis, deinde
 griseis, fusco-brunneo-marginatis, demum confluentibus; conidio-
 phoris amphigenis in cæspites minutos deinde griseos congestis;
 conidiis cylindraceis, sursum leniter attenuatis, rectis, olivaceis,
 5-10-septatis, 42-78 \approx 6-7.
Hab. in foliis Manioth Glaziovii, Ceylon Indiæ.
39. **Cercospora profusa** Syd., Ann. Mycol. VII (1909) p. 175. — 8637
 Maculis nullis; cæspitulis hypophyllis, minutissimis, sed dense ag-
 gregatis et demum plerumque totam folii superficiem obtegenti-
 bus, obscure olivaceis; hyphis fasciculatis, subflexuosis, septatis,

simplicibus v. parce ramosis, dilute olivaceis, 60-110 \approx 4-6; conidiis vermicularibus, 5-7-septatis, hyalino-olivaceis, 50-90 \approx 4-6.

Hab. in foliis *Acalyphæ australis*, Hoki-ya-mine Tosa Japoniæ (YOSHINAGA). — Secundum diagnosim a *Cerc. Acalyphæ* Peck videtur diversa.

40. **Cercospora Tiglii** P. Henn.; *Hedwigia* XLVII (1908) pag. 265. 8638

— Maculis sparse gregariis, rotundatis, subbullatis, atris, hyphis fasciculatis, fuscidulis, septatis, 70 \approx 4; conidiis cylindraceo-fusoides v. clavatis, fuscidulis, 40-50 \approx 3,5, 4-5-septatis.

Hab. in foliis *Crotonis Tiglii*, in insula Balut ex Philipinensibus (MERRILL).

41. **Cercospora obtegens** Syd., *Ann. Mycol.* VII (1909) p. 171. — 8639

Maculis nullis; cæspitulis hypophyllis, plerumque per totam folii superficiem effusis, atro-olivaceis; hyphis simplicibus, olivaceo-brunneis, parce septatis, 35-70 \approx 4-6; conidiis cylindraceis, 5-12-septatis, olivaceis, rectis v. curvulis, 60-130 \approx 3,5-6.

Hab. in foliis *Hydrangeæ hortensis*, var. *Azisa*, Sugamo Tokyo Japonia. — Secundum diagnosim a *Cerc. Hydrangeæ* Ell. et Ev. diversa.

42. **Cercospora Araliæ** P. Henn. *Engl. Jahrb.* XXXVII (1905) p. 165. 8640

— Maculis effusis, fuscis; cæspitulis hypophyllis effusis; hyphis fasciculatis, septatis, ramosis, hyalino-fuscidulis, 2,5-4 μ . cr.; conidiis cylindraceo-fusoideis v. subclavatis, subacutis, fuscis, 3-6 septatis constrictiusculis, 30-60 \approx 5-6.

Hab. in foliis *Araliæ sinensis*, Kônodai, Tokyo Japoniæ (KUSANO).

43. **Cercospora hamasensis** Sacc. *Ann. Mycol.* VIII (1910) p. 340. 8641

— Maculis amphigenis luteolis subrotundis; cæspitulis punctiformibus confertissimis nigris hinc easdem maculas atra efficientibus, e tubculo atro hemisphærico (in pycnidium demum evadente) oriundis; hyphis brevibus, cylindraceis, radiantibus, continuis, dilute fuligineis; conidiis fusoideo-obclavatis, sursum attenuatis, obsolete 3-septatis, non constrictis, 55-70 \approx 5-6, dilute olivaceis.

Hab. in foliis subvivis *Peucedani fraxinifolii*, Nefasit ad Maha-bar alt. 1600 m. (Hamasen) Erythraea (HADR. FIORI). — Cfr. *Phyllosticta hamasensis*.

44. **Cercospora Handelii** Bubak in Handel-Mazzetti, *Bot. Reise Pont.* 8642

Randgebirge, in *Ann. Naturhist. Hofmus. Wien* XXIII (1909) p. 106, t. V, f. 5 a-b. — Maculis irregularibus, magnitudine variis, plerumque confluentibus magnamque folii partem occupanti-

bus, arescentibus et deinde obscure ochraceis, cæspitulis hypophyllis fere æque distributis, e tuberculis sclerotiformibus orientibus, fasciculatis griseo-viridibus; hyphis cylindricis, 20-35 \approx 2,5, dense fasciculatis, in medio uniseptatis, apice dense denticulatis, parum curvatis, olivaceo-brunneis; conidiis longis, cylindraceis, plus vel minus curvulis, usque ad 100 μ . long., 3-5 μ . latis, non-nullis septis instructis, olivaceis.

Hab. in foliis Rhododendri pontici in montibus Ponticis Anatoliæ.

45. **Cercospora Petroselini** Sacc. in Ann. Mycol. X (1912) p. 321 et 8643
Syll. Fung. IV p. 422 (ut var. *C. Apii*).

Hab. in foliis languidis Petroselini sativi, Romæ, (D. SACARDO). — Aptius ut species propria habenda; conidiophoris cæspitulosis, brunneis, amphigenis, sæpius 1-septatis, 60-70 \approx 5-6, sursum distincte denticulatis pallidioribus; conidiis tereti-fusoideis, rectis curvulisve, 1-2-septatis, 36-40 \approx 4-5, subhyalinis; maculis minutis subolivaceis, non marginatis.

46. **Cercospora Malkoffii** Bubák, Ann. Mycol. IV (1906) p. 121. — 8644
Maculis pallide brunneis, foliola tota v. apicem tantum occupantibus et necantibus; cæspitulis amphigenis, confertis, minutissimis, albis; conidiophoris confertis fasciculatim ex stomatibus erumpentibus et hypostromate suffultis, continuis, curvis, 2-3-denticulatis, dilute olivaceis, sursum tenuatis dilutioribus, 25-35 \approx 3-4,5; conidiis primo ramularioideis, rectis curvulisve, bicellularibus, demum apicem versus sensim tenuatis, curvatis, 2-4-septatis, hyalinis, grosse v. minute guttulatis, usque ad 90 \approx 3-4,5.

Hab. in foliis Pimpinellæ Anisi, Philippopol Bulgariæ (MALKOFF).

47. **Cercospora lumbricoides** Turconi et Maffei, Atti Ist. Bot. Univ. 8645
Pavia ser. II, v. XII (1910) extr. p. 330, tab. XII, fig. 1. — Maculis amphigenis, subcircularibus, raro plus minus oblongis, avellaneis in epiphylo obscurius zonatis, anguste rubro-brunneo-marginatis, in hypophyllo pallidioribus, atque marginatis; cæspitulis hypophyllis, sparsis v. subgregariis, fuscis; conidiophoris fasciculatis, erectis, quandoque superne nodulosis, septatis, fuscis, 30-60 \approx 4-6; conidiis cylindraceis v. sursum leniter attenuatis, utrinque rotundatis, pluriseptatis, non constrictis, flexuoso-recurvis, lumbriciformibus, 80-200 \approx 4-6, fuscis.

Hab. in foliis vivis Fraxini sp. Vautepec, Estado de Morelos in Mexico (A. L. HERRERA).

48. **Cercospora Kabatiana** Allescher in Vestergr. Micr. sel. n. 546 8646 (sine diagn.), Lindau Deutsch. Krypt. Fl. Pilze IX, p. 130 (1908). — Maculis irregularibus, marginalibus angulosis, centralibus subrotundis, lète ochraceo-brunneis, brunneo- v. viridulo-marginatis, demum arescentibus et subevanidis; cæspitulis amphigenis, punctiformibus, brunneo-viridulis; conidiophoris dense fasciculatis e stomatibus exeuntibus, simplicibus, non denticulatis, 23-43 \approx 4-5, e viridulo brunneo-viridulis; conidiis ensiformibus, curvulis, sursum sensim tenuatis, apice obtusulis, obsolete pluri-septatis hyalinis, 38-58 \approx 3-4.

Hab. in foliis vivis Galeobdoli lutei pr. Turnau Bohemiæ (KABAT).

49. **Cercospora Helminthostachydis** P. Henn., Hedwigia XLVII (1908) 8648 p. 265. — Maculis fuscidulis, sparsis, rotundatis; cæspitulis hypophyllis atro-fuscis, hyphis fasciculatis, fuscis, septatis, 25-50 \approx 3-4; conidiis fusoideis, fuscidulis, 3-7-septatis, 40-60 \approx 3-4.

Hab. in foliis Helminthostachydis zeylanicæ, Mindanao, Davao (Ins. Philippin.) mart. 1904 (COPELAND).

50. **Cercospora ? Tupæ** Speg., Fungi Chilenses (1910) p. 187, cum 8649 icon. — Maculis vix manifestis amphigenis pallescentibus indeterminatis, subbullosis, 5-10 mm. diam.; cæspitulis hypophyllis innato-erumpentibus confertis subparenchymaticis 50-100 μ . diam., ex hyphis olivaceis brevissimis bicellularibus efformatis, 10-12 \approx 4-5; conidiis polymorphis, obovatis cylindraceis clavulatis, saepius 2-3-cellularibus, rarius continuis v. 4-cellularibus, ad septa valide constrictis, pallide olivaceis, 30-45 \approx 8-12.

Hab. frequens in foliis vivis Lobeliæ Tupæ prope Ciudad de Valdivia Chile Amer. austr.

51. **Cercospora Volkameriæ** Spegazz., Fungi Paulist. Rev. Mus. La Plata t. XV, p. 107 (1908). — Maculis primo minutis callosulis, dein confluendo difformibus majusculis 1-20 mm. diam., determinatis sordide cinerescentibus angulosis; acervulis subhemisphæricis 80-150 μ . diam., epiphyllis sparsis v. hinc inde circinantibus; hyphis erectis non v. vix flexuosulis apice denticulatis, 50-75 \approx 6, continua v. 1-2-septatis; conidiis flexuosis deorsum incrassatulis sursum longissime attenuatis primo pluriguttulatis dein multiseptatis 70-120 \approx 5, hyalinis.

Hab. ad folia viva Volkameriæ fragrantis in Horto botanico Sao Paulo Brasilia (USTERI).

52. **Cercospora Batatæ** P. Henn., Engl. Bot. Jahrb. XXXVIII (1905) 8651

p. 118. — Maculis rotundatis atro-fuscis; acervulis hypophyllis, hyphis fasciculatis, septatis, 20-30 \approx 3, fuscidulis; conidiis fusoides v. clavatis, 40-60 \approx 3,5-4, fuscidulis, 3-5-septatis.

Hab. in foliis Batatae edulis, Amani Ost Usambara Africæ (ZIMMERMANN). — Conidiophoris et conidiis minoribus videretur diversa a *Cerc. Batatae* Zimm. (1904). — Syll. XVIII p. 605 — sed verisimiliter est tantum forma minus evoluta.

53. **Cercospora tichenensis** Cavara in Briosi e Cavr., Funghi parass. 8652
n. 336 (1900) — Maculis variis, griseo-fuscis, nervis secundariis limitatis, zonis transversis, undulatis, nigris præditis; hyphis fertilibus seu conidiophoris hypophyllis fasciculatis, continuis, dilute ochraceis, 40-45 \times 4-5; conidiis terminalibus cylindraceis v. clavatis, chlorinis, 1-4-septatis, 20-85 \approx 3-4.

Hab. in foliis languidis Sambuci nigræ in Horto bot. Pavia Italia bor. — Huc spectat *Cercospora depazeoides* nonnull. auct. et ipsius Cavara in D. Sacc. Myc. ital. n. 199, sed ab ea dignoscitur maculæ forma, conidiophoris hypophyllis, brevioribus etc.

54. **Cercospora Gay-Lussaci** Spegazz., Fungi Paulist., Rev. Mus. La 8653
Plata t. XV, p. 46 (1908). — Maculis epiphyllis laxe gregariis sub-determinatis ex orbiculari angulatis, primo minutis dein confluendo majoribus 1-5 mm. diam.; acervulis minutis laxe gregariis ex hyphis rectiusculis 1-3-septatis apice denticulatis 10-50 \approx 4-6 olivaceis e nodulo grosse parenchymatico exsurgentibus efformatis; conidiis rectis v. leniter curvulis sursum obtusiusculis deorsum acutiusculis, 20-40 \approx 4, ad septa non constrictis, hyalinis.

Hab. ad folia languida Gaylussaciæ cujusdam, Ipiranga Cambucy Brasiliæ (USTERI).

55. **Cercospora epigæina** Davis, Trans. Wisconsin Ac. of Sc. v. XVI, 8654
P. II (1909) p. 758. — (Maculis foliicolis late effusis rubro-brunneis; cæspitulis hypophyllis dense effusis; hyphis brunneo-nigris e basi tuberculiformi arcte coalitis, rectis v. curvulis, 20-30 \approx 3-4; conidiis hyalinis rectis v. curvulis, acicularibus pluriseptatis, 60-100 \approx 3.

Hab. in foliis Epigææ repentis, Adams County Amer. bor. (DAVIS).

56. **Cercospora Erythrææ** Hollós, Ann. Mus. Nat. Hung. IV (1906) 8655
p. 369. — Maculis nullis; cæspitulis caules foliaque invadentibus, aggregatis, olivaceis, 100-150 μ . diam.; hyphis simplicibus, septatis, dilute brunneis, 30-40 \approx 4-5; conidiis cylindraceo-clavatis, deorsum paullo incrassatis, sursum leniter attenuatis, utrinque ob-

tusis, rectis v. curvulis, 3-5-septatis, ad septa interdum constrictis, flavidulis, 30-70 \approx 3,5-4.

Hab. in foliis caulibusque languidis *Erythraeæ linaliae* foliæ prope Jzsák Hungariæ.

57. **Cercospora dulcamaricola** Hollós, Ann. Mus. Nat. Hung. IV 8656 (1906) p. 370. — Maculis rotundatis, brunneis, dein medio pallenscentibus, brunneo-cinctis; cæspitulis amphigenis, aggregatis, brunneis, c. 40 μ . diam.; hyphis simplicibus, 1-2-septatis, dilute brunneis, 30-40 \approx 3,5-4; conidiis cylindraceo-clavatis, deorsum incrassatis, sursum leniter attenuatis, rectis v. curvulis, 3-8-septatis, hyalinis, 70-150 \approx 3,5-5, plerumque 80 \pm 4.

Hab. in foliis languidis Solani Dulcamaræ prope Kecske-mét Hungariæ. — A *Cercospora Dulcamaræ* (Peck) Ell. differt conidiis majoribus magisque septatis.

58. **Cercospora agnostoica** Spegazz., Fungi Paulist., Rev. Mus. La Plata t. XV p. 45 (1908). — Maculis amphigenis suborbicularibus 1-10 mm. diam. pallide tabacinis, centro non v. vix cinerescentibus, obsolete determinatis, saepe totum folium occupantibus; acervulis penicilliformibus pusillis plerumque hypophyllis, hyphis rectiusculis v. subflexuosulis 40-50 \approx 5-6 continuis v. 1-2-septatis a basi liberis pallide olivascentibus efformatis; conidiis rectiusculis clavulatis 60-75 \approx 5, apice altero obtusulo altero longe attenuato acutiusculo, 3-5-septulatis hyalinis.

Hab. ad folia languida Symphyti ?asperri mi in Horto botanico Sao Paulo Brasilia (USTERI).

59. **Cercospora Bomplandiana** Speg., Myc. Argent. V, p. 439, in An. 8658 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis repandulo-orbicularibus, 3-5 mm. diam., sordide fusco-cinerescenscentibus; cæspitulis amphigenis, confertiusculis, subcircinantibus, pusillis, olivaceis; hyphis basi fasciculatis rectiusculis apice rotundatis 30-50 \approx 5-6, continuis v. 1-3-septatis efformatis, olivaceis, 30-50 \approx 5-6; conidiis subvermicularibus, 80-120 \approx 5-6, levibus, chlorinis, 5-7-septatis.

Hab. ad cladodia viva Baccharidis genistelloidis in silvis prope Bompland Misiones Argentina America austr. (P. JÖRGENSEN).

60. **Cercospora kansensis** Syd., Ann. Myc. V (1907) p. 340. — Maculis epiphyllis, vix perspicuis, indeterminatis, flavidis; cæspitulis hypophyllis, majusculis, effusis, 1-3 mm. diam., obscure olivaceis; hyphis flexuosis, decumbentibus, longissimis, c. 300-500 μ . longis,

remote septatis, non ramosis, olivaceo-fuscis, 3-5 μ . crassis; conidiis cylindraceis, rectis, utrinque obtusis, 1-3-septatis, non constrictis, primo subhyalinis, dein dilute olivaceo-brunneolis, 25-35 \approx 5-7.

Hab. in foliis *Cardui altissimi*, Lebanon, Kansas Americæ bor. (E. BARTHOLOMEW). — *Cerc. ferruginea* et *Cerc. Absinthii* habitu similis.

61. **Cercospora sublateritia** P. Henn., in Fl. du Bus- Moy. Congo, 8660 Ann. Mus. du Congo, v. II, fasc. II (1904) p. 104. — Maculis obsoletis v. subpallidis rotundatis; cæspitulis hypophyllis rotundatis vel effusis, lateritiis; hyphis usque ad 250 μ . longis, 4-7 μ . cr., ramosis, septatis, hyalino-lateritiis; conidiis clavatis vel subfusoideis, pluriguttulatis dein pluriseptatis, 40-80 \approx 3,5-4, pallide lateritiis.

Hab. in foliis *Vernoniæ* sp., Sonso Congo Africa (VANDERYST).

62. **Cercospora Rudbeckiæ** Peck, N. Y. St. Mus. Bull. 131 (1909) 8661 p. 19. — Maculis irregularibus, subconfluentibus brunneis v. viridi-brunneis; hyphis hypophyllis, cæspitosis, 75-100 \approx 5-6, flexuosis, leniter septatis; conidiis subcylindraceis v. sursum attenuatis 1-3-septatis, 20-90 \approx 5-6.

Hab. in foliis viventibus Rudbeckiæ laciniatæ, prope Painted Post, Steuben co. Amer. bor. — Cæspituli *Ramulariæ Rudbeckiæ* similes, vero hyphæ longiores, magis congestæ, coloratae.

63. **Cercospora brunnea** Peck, Bull. Torr. Bot. Cl. XXXVI (1909) 8662 p. 156. — Cæspitibus hypophyllis, minutis, dense effusis, maculas angulares, sæpe confluentes, brunnescentes, 2-5 mm. latas occupantibus; hyphis confertis, flexuosis, 1-3-septatis, brunneis, 60-100 \approx 5-6; conidiis cylindraceis v. subclavatis, sæpe curvatis, subhyalinis, 40-60 \approx 5-6.

Hab. in foliis *Prenanthis altissimæ*, Rogers Arkansas Amer. bor. (E. BARTHOLOMEW). — Differt a *C. Prenanthis* hyphis brunneis et conidiis septatis.

64. **Cercospora Rhagadioli** Bubák, Bull. Herb. Boiss. 2 ser. VI 8663 (1906) p. 487. — Maculis rotundis v. oblongis ad margines foliorum irregularibus, usque ad 8 mm. lat., brunneis, indistincte marginatis; cæspitulis minutissimis, brunneolis, hypophyllis; conidiophoris fasciculatis e stomatibus erumpentibus, undulatis superne 3-denticulatis, dilute brunneis, sursum dilutioribus, conti-

nuis, 30-45 \approx 3,5-6,5; conidiis filiformibus, rectis curvulisve apicem versus sensim tenuatis, 4-6-septatis, hyalinis, 50-90 \approx 2-3,5.

Hab. in foliis vivis *Rhagadioli stellati*, Montenegro (BUBAK).

65. **Cercospora inconspicua** Pat. et Har., Bull. Soc. Mycol. Fr. XXIV 8664 (1908) p. 16. — Maculis amphigenis, orbicularibus, sparsis 4-6 mm. diam., glaucescentibus, non marginatis, cæspitulis præcipue epiphyllis, numerosis, minutis, 40-50 μ . latis; conidiophoris paucis fasciculatis, chlorino-brunneis, cylindraceis, sursum denticulatis, 28-35 \approx 5, pro more continuis; conidiis elongato-ovatis, concoloribus, continuis, v. 1-2-septatis, 20-30 \approx 4-6.

Hab. in foliis *Calotropidis* sp. Chari, Bahr-El-Ghazad, Tchad, Manacori (A. CHEVALIER).

66. **Cercospora illinoensis** Barthol. Fungi Columb. (1908) n. 2611. 8665 — Diagnosis desideratur.

Hab. in foliis *Asclepiadis syriacæ*, Illinois Amer. bor.

67. **Cercospora peronosporoidea** Pat. et Har. Bull. Soc. Mycol. Fr. 8666 XXIV (1908) p. 16. — Maculis griseis, parum notabilibus, cæspitulis hypophyllis, olivaceis, densis velutinis; hyphis erectis 5-10-cæspitosis, brunneis, cylindraceis, prope apicem alte dentatis, 10 μ . cir. longis, 5-6 μ . cr., transverse pluriseptatis; conidiis bacillaribus, inferne regulariter attenuatis, superne obtusis, multiguttulatis, e hyalino chlorinis, 75-90 \approx 4-6.

Hab. in foliis *Asclepiadaceæ* sp., Chari infer., Fort-Lamy et Mondjafa (A. CHEVALIER).

68. **Cercospora Pircuniæ** Speg., Myc. Arg. V, p. 441, in An. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis sinuatis, 1-3 mm. diam., albicantibus determinatis; cæspitulis plerumque hypophyllis centro macularum laxe gregariis, pusillis, compactiusculis; hyphis e subclavulato cylindraceis, 40 \approx 6, non v. 1-septatis sursum pauci-denticulatis; conidiis cylindraceis continuis v. 2-3-septatis, utrinque obtusiusculis, 20-60 \approx 4-6, rectis v. leniter curvulis, fumosis.

Hab. ad folia languida Pircuniæ dioicæ, Pereira prope La Plata Argentina Amer. bor.

69. **Cercospora dubia** (Riess) Bubák, Ann. Mycol. VI (1908) p. 29, 8668 non Wint. — *Ramularia dubia* Riess — Syll. IV p. 216. — *Cercospora dubia* v. *Atriplicis* Bondarz. in Act. Horti Petrop XXVI (1906) p. 51 extr. — Conidiophora 45-62 \approx 4,5-6,5; conidia 3-septata 38-55 \approx 4,5-7, ad septa subconstricta.

Hab. in foliis *Atriplicis hastatæ*, *A. nitentis*, *A. patulae* in Germania, Bohemia, Rossia. — Ab hac differt spec. seq.

70. **Cercospora Chenopodii** Fres. Beitr. p. 92, Sacc. F. ital. fig. 680, 8669

Bubak in Ann. Mycol. IV (1908) p. 29. — *Cercospora dubia* Wint., Hedw. 1883 p. 10. — A præcedente dignoscitur conidiophoris 50-90 \approx 4,5-6,5; conidiis 4-6-septatis, 50-70 \approx 5-7, non constrictis,

Hab. in foliis vivis *Chenopodii albi* in Germania, Italia, Bohemia.

71. **Cercospora Achyranthis** Syd., Ann. Mycol. VII (1909) p. 171. 8670

— Cæspitulis in maculis fuscis v. pallidis insidentibus, in greges rotundatos v. irregulares c. 2-6 mm. diam. densissimos, brunneolos; hyphis fuscis septatis, subinde ramulosis, nodulosis, usque ad 200 μ . long., 4-6 μ . cr.; conidiis cylindraceo-filiformibus, 5-10-septatis, subhyalinis, 50-125 \approx 3-6.

Hab. in foliis *Achyranthis bidentatae* var. *japonicæ* Ome Musashi, Japonia.

72. **Cercospora smilacina** Spegazz., Fungi Paulist., Rev. Mus. La Plata t. XV, p. 46. 8671

— Maculis parvis 1-3 mm. diam. pallidis præcipue ad epiphyllum ubi sæpe albescensibus areola fusco-atra sæpius latiuscula cinctis; acervulis subdimorphis olivaceis erumpenti-superficialibus; epiphylloides paucis subcentralibus subcircinatis ex hyphis dense constipatis continuis 45-55 \approx 5-7 v. 1-3-septatis olivaceis efformatis, conidiis clavulatis 40-50 \approx 3-4, curvulis e hyalino chlorinis ornatis; acervulis hypophyllis sat numerosis totam fere maculam obtengentibus ex hyphis elongatis simplicibus ramis ramulosis rectiusculis multiseptatis 72-120 \approx 5-6, olivaceis efformatis, conidiis linearis-clavulatis, 3-5-septatis, 75-100 \approx 4, fumoso-chlorinis donatis.

Hab. ad folia viva *Smilacis* cujusdam prope Sao Paulo Brasilia (USTERI). — Species *C. nubilosæ* Ell. et Ev. affinis sed sat distincta videtur.

73. **Cercospora Miyakei** P. Henn., Engl. Jahrb. XXXVII (1905) 8672

p. 166. — Maculis flavo-brunneis, rotundato-angulatis v. confluentibus; cæspitulis hypophyllis, hyphis erectis, fasciculatis, septatis vix ramosis, denticulatis, fuscidulis, 60-200 \approx 3-4; conidiis longe cylindraceis subclavatis, 5-12 obsolete septatis, 60-120 \approx 4-4,5, brunneis.

Hab. in foliis *Smilacis* herbaceæ var. *nipponicæ*, Meguro Tokyo Japoniæ (MIYAKE).

74. **Cercospora Cordylines** P. Henn. — Syll. XVIII pag. 611. 8673

Hujus est species homonyma et posterior: *Cerc. Cordyline* Speg. Myc. Argent. V, p. 439, in An. Mus. Nac. Buenos Aires XX (1910) et Fung. Paulist. in Rev. Mus. La Plata t. XV pag. 45, reperta in eadem *Cordyline dracænoide* in hortis Santa Catalina Argentina (SPEGAZZINI) et Sao Paulo Brasilia (USTERI). Sec. diagnoses cl. Spegazzini l. c. hyphæ conidiophoræ variant 40-60 \approx 5 et conidia 15-60 \approx 5, 2-5-septata (Argentina) et conidia 20-77 \approx 5, 3-9-septata (Brasilia).

- 75. *Cercospora contraria* Syd.**, in De Wildem. Flore Bas- et Moy Congo t. III, fasc. I (1909) Extr. p. 21. — Maculis amphigenis, in epiphylo magis perspicuis et sordide griseo-brunneis, dein arecentibus, 3-10 mm. diam.; cæspitulis amphigenis, præcipue epiphyllis, sparsis v. aggregatis, minutissimis, atris; hyphis e basi stromatica 20-50 μ . cr. oriundis, dense fasciculatis, brevibus, 15-25 \approx 3-4, simplicibus, non septatis, olivaceo-brunneis; conidiis cylindraceis, 5-9-septatis, plerumque rectis, dilute olivaceis, 50-100 \approx 3-4.

Hab. in foliis *Dioscoreæ* sp., Kisantu Congo, Africa (VANDERYST).

- 76. *Cercospora Epipactidis* C. Mass. ap. Sacc. in Ann. Mycol. IX (1911) 8675 p. 256. — Maculis fusco-rubiginosis elongatis, internerviis, vulgo lateraliter confluentibus; cæspitulis hypophyllis minutissimis, punctiformibus, nigris, crebro disseminatis; conidiophoris 1-3-septatis, rubiginosis, apicem versus decoloratis, subhyalinis, simplicibus rectiusculis v. varie sinuoso-inflexis, 40-100 \approx 4-6; conidiis subacicularibus sursum attenuatis, hyalinis, septatis, usque ad 130 \approx 4.**

Hab. in foliis *Epipactidis palustris*, in sabulosis secus fl. Athesim, S. Michele prope Veronam, Italiæ borealis (C. MASSALONGO).

- 77. *Cercospora scandens* Sacc. et Wint. — Syll. IV p. 476 — var. 8676 *macrospora* C. Mass., Osserv. fitolog. in Madonna Verona v. II (1908) Extr. p. 7. — Maculis foliorum subrotundis, parvis, fuligineis, dein centro expallentibus, et zona luteola cinctis; cæspitulis epiphyllis, hyphis fuliginosis fasciculatis, continuis, rarius 1-2-septatis, simplicibus, superne alterne et inflexo-denticulatis, vulgo 40-60 \approx 4-5; conidiis elongatis, aciculari-obclavatis, hyalinis, falcatis, sursum attenuatis, 80-130 \approx 4-4,5, primo continuis, demum basi septatis.**

Hab. in foliis *Tami communis* pr. Tregnago, Verona, Ital. bor. — An species distincta?

78. **Cercospora Caladii** Cke — Syll. IV p. 478 — var. **Colocasiæ** v. 8677 Höhnel, Fragm. z. Myk., Sitzb. R. Ak. d. Wiss. Wien, Bd. CXVI, Abt. I (1907) p. 150. — Maculis amphigenis, subrotundis, brunneis, atro-marginatis, concentrice zonatis, 3-7 mm. diam. cæspitulis copiosis, punctiformibus, e stomatibus erumpentibus, atro-brunneis; conidiophoris 30-45 \approx 5 sursum 1-2-denticulatis; conidiis subhyalinis v. dilute brunneolis, 4-5-cellularibus 50-100 \approx 4, sursum sensim tenuatis.
Hab. in foliis Colocasiæ sp., Malifa in ins. Samoa (Dr. RECHINGER).
79. **Cercospora Chevalieri** Sacc. *Cercospora Amorphophalli* Pat. et 8678 Har., Bull. Soc. Mycol. Fr. XXIV (1908) p. 15 non vel vix P. Henn. — Maculis exaridis, amphigenis, sparsis v. confluentibus, angulosis v. suborbicularibus, albidis, fusco-cinctis; cæspitulis, hypophyllis numerosis, minutis, 50-80 μ . latis; hyphis fasciculatis, erectis, brunneolis apicem versus denticulatis, 80 μ . circiter longis, 6 μ . cr.; conidiis linearibus, flexuosis, utrinque obtusis, 6 (pro more) septatis, subhyalinis, 80 \approx 5.
Hab. in foliis vivis Amorphophalli sp. Oubangui, in medio Tomi Krebedje Africæ (A. CHEVALIER).
80. **Cercospora Polygonati** Rostr., Bot. Tidsskr. XXVI (1905) p. 314. 8679 — Maculis subrotundis, pallidis, atro-purpureo-marginatis; cæspitulis hypophyllis, minutissimis, copiosis, primo rubentibus, dein brunneis; conidiis, 60-70 \approx 5-6.
Hab. in foliis Polygonati multiflori in Dania (ROSTRUP).
Affinis *C. Majanthemi* sed maculæ omnino diversæ.
81. **Cercospora microstigma** Sacc. in Ann. Mycol. X (1912) p. 315. 8680 — Maculis elongatis versiformibus, ex albido et fuligineo variegatis; cæspitulis minutissimis, punctiformibus, crebre gregariis, hypophyllis, in areis albidis sitis, 30-40 μ . diam.; hyphis fasciculatis, totis brunneis, subflexuosis, sursum parce denticulatis, subcontinuis; conidiis bacillaribus, æqualibus, utrinque obtusulis, sub-5-septatis, 32-36 \approx 2,5, sæpe curvulis, subhyalinis.
Hab. in foliis languidis Caricis laxifloræ var. London Ontario Amer. bor. (J. DEARNESS). — A *Cerc. caricina* differt cæspitulis crebris, extremæ parvitatis, maculis peculiaribus, conidiis non obclavatis nec continuis etc.
82. **Cercospora Oryzæ** Miyake, Pilze Reispfl. Japan., (Journ. College 8681 Agricult. Tokyo II (1910) p. 263, t. XIV, p. 71-72. — Cæspitulis conidiferis ex stomatibus exeuntibus, solitariis v. 2-3 congreg-

gatis, obscuris, 3-pluriseptatis, 88-140 \approx 4-5, apice obscurioribus; conidiis cylindraceis v. subclavatis 3-10-septatis, 20-60 \approx 5.

Hab. in glumis brunnescensibus *Oryzæ sativæ*, Ehime Japonia.

83. **Cercospora longipes** Butl., Mem. Dep. Agric. in India, Bot., 8682 Ser. I (1906) p. 44, tab. 5-6. — Maculis elongatis, amphigenis, saepe confluentibus, primo sanguineis, arescendo stramineis, bruno-cinctis; hyphis in cæspitulos gregarios collectis, plerumque hypophyllis, flexuosis, brunneis, sursum geniculatis v. denticulatis, 100-200 \approx 4; conidiis obclavatis, sursum attenuatis, rectis v. curvulis, 4-6-septatis, 40-80 \approx 5, hyalinis.

Hab. in foliis *Sacchari officinarum*, cui nocet, in India orient.

CERCOSPORINA Speg., Myc. Arg. V, p. 424, in An. Mus. Nac. Buenos Aires XX (1910) (Etym. *Cercospora*, cui peraffine genus). — Biogena foliicola; cæspituli erumpentes ex hyphis olivaceis apice denticulatis simplicibus efformati; conidia vermicularia pluri-septata hyalina. — A *Cercosporella* hyphis olivaceis, a *Cercospora* conidiis hyalinis recedens; sed multæ aliæ *Cercosporæ* species, jam descriptæ, huc ducendæ sunt.

1. **Cercosporina asparagicola** Speg. l. c. p. 424. — Maculis solitariis 8683 v. confluentibus subellipticis 2-5 mm. diam., pallescentibus late purpureo-areolatis; hyphis confertis flexuoso-nodulosis 1-2-septatis apice acutiusculis pauci-papillosis, 40-60 \approx 5-6; conidiis deorsum leniter incrassatis 50-80 \approx 3-4, 3-5-septatis, hyalinis.

Hab. ad ramulos languidos *Asparagi officinalis* in hortis La Plata Argentina Amer. austr.

2. **Cercosporina elongata** (Peck) Speg., Myc. Argent. V, p. 425, in 8684 Ann. Mus. Nac. Buenos Aires XX (1910). — Ita vocanda *Cercospora elongata* Peck, Syll. IV 442.

Hab. quoque, in foliis *Dipsaci silvestris*, in pratis La Plata Argentina Amer. austr.

3. **Cercosporina ricinella** (Sacc. et Berl.) Speg. l. c. p. 429. — Ita 8685 vocanda est *Cercospora ricinella* Sacc. et Berl., Syll. IV p. 456.

Hab. quoque, in foliis *Ricini communis*, La Plata Argent. Amer. austr.

4. **Cercosporina Tetragoniae** Speg., Myc. Argent. V, p. 425, in An. 8686 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis suborbicularibus 5-20 mm. diam., determinatis, concentrice rugulosis,

fuscescentibus; cæspitulis epiphyllis, laxe gregariis, minutissimis, olivaceis ex hyphis 20-30 \approx 4.5, nodulosis, fumoso-olivaceis compositis; conidiis subacicularibus deorsum sensim leniterque incrassatis rectiusculis, 60-85 \approx 4.5, 3.5-septatis, hyalinis.

Hab. ad folia *Tetragoniæ* expansæ in hortis La Plata Argentina Amer. austr.

5. **Cercosporina stenolobiicola** Speg., Myc. Argent. V, p. 428, in 8687 Anal. Mus. Nac. Buenos Aires XX (1910). — Maculis solitariis v. laxe gregariis, 1-5 mm. diam., amphigenis suborbicularibus, determinatis, sordide rufescenscentibus; cæspitulis saepius amphigenis minutis olivaceis; hyphis rectiusculis, 50-75 \approx 5.6, 1.3-septatis parce denticulatis, olivaceis; conidiis vermicularibus hyalinis, 75-125 \approx 3.5, multiguttulatis obsolete septulatis, supra angustissime linearibus.

Hab. ad folia viva v. languida *Stenolobii* stantis in sepiibus prope Tucumán Argentina Amer. austr.

6. **Cercosporina sphæralceicola** Speg., Myc. Arg. V. p. 427, cum 8688 icon., in An. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis suborbicularibus, 2-5 mm. diam., vix pallescentibus indeterminatis, ægre perspicuis; cæspitulis amphigenis densiuscule gregariis erumpentibus penicilliformibus, minutis, olivaceis; hyphis olivaceis continuis v. 2-3-septatis, rectiusculis, vix denticulatis 100-150 \approx 6.7; conidiis rectis elongato-subclavulatis, 5-10-septatis, hyalinis 100-200 \approx 5.6.

Hab. ad folia languida *Sphæralceæ* patagonicæ in horto La Plata Argentina Amer. austr.

7. **Cercosporina Caracallæ** Speg., Myc. Argent. V, p. 425, in An. 8689 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis angulosis repandulis, 3-7 mm. diam., determinatis centro, sordide cinerescentibus fusco-areolatis; cæspitulis saepius hypophyllis densiuscule gregariis sordide olivaceis ex hyphis erectiusculis flexuosulis, 40-80 \approx 5.6, subcontinuis, denticulatis constitutis; conidiis acicularibus arcuatulis, deorsum non vix vel incrassatis 50-75 \approx 4, 3.5-septatis, hyalinis.

Hab. ad folia languida *Phaseoli* Caracallæ in silvis prope Tucumán, Argentina Amer. austr. — Cum *C. phaseolina* Speg. et *C. canescente* (Ell. et Mit.) non comparanda.

8. **Cercosporina sensitivæ** Speg., Myc. Argent. V, p. 427, in An. 8690 Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis difformibus rufescenscentibus determinatis, 2-5 mm. diam.; cæspitulis

hypophyllis laxe gregariis minutissimis, compactiusculis, olivaceis, 40-60 μ . diam., ex hyphis 1-septatis, clavulatis, levibus 14-18 \approx 6, efformatis; conidiis vermicularibus, curvulis v. sigmoideis, 30-75 \approx 2-2,5, multiguttulatis, hyalinis.

Hab. ad folia viva *Mimosæ sensitivæ* in pratis Orám, Argentina Amer. austr.

9. **Cercosporina physalidicola** Speg., Myc. Argent. V, p. 427, in An. 8691 Mus. Nac. Bnenos Aires XX (1910). — Maculis amphigenis sub-indeterminatis 3-7 mm. diam., leniter bullosis, pallescentibus; cæspitulis hypophyllis laxe gregariis, minutis, olivaceis; hyphis rectiusculis 50-150 \approx 5-6, olivaceis, 3-5-septatis, non denticulatis; conidiis subclavatulo-vermicularibus 3-5-septatis, hyalinis.

Hab. ad folia viva v. languida *Physalidis viscosæ*, Már-mol prope Buenos Aires Argentina Amer. austr. — A *C. Physalidis* (Ell.) magnitudine omnium partium sat differre videtur.

10. **Cercosporina Mate** Speg., Myc. Arg. V, p. 426, in An. Mus. 8692 Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus, 5-10 mm. diam., cinerescentibus determinatis, sæpe late purpureo-limitatis; cæspitulis epiphyllis erumpentibus subhemisphæricis, 50-150 μ . diam., minutis, olivaceis; hyphis brevibus chlorinis vix flexuosis parceque denticulatis continuis v. 1-3-septatis, 15-40 \approx 3-4; conidiis subvermicularibus vix curvulis 30-60 \approx 3-4, 1-3-septatis, hyalinis.

Hab. ad folia viva *Ilicis paraguariensis* prope S. Ignazio (J. TORRE) et prope Santa Ana (B. ZAMBONI), Argentina Amer. austr.

11. **Cercosporina hydrangeicola** Speg. Myc. Argent. V, p. 426, in 8693 An. Mus. Nac. Buenos Aires XX (1910). — Maculis amphigenis orbicularibus v. confluendo ellipticis, purpureo-areolatis; cæspitulis sæpius epiphyllis densiuscule gregariis minutis olivaceis, ex hyphis teretiusculis non v. vix flexuosis, 2-7-septatis, 80-100 \approx 5-6; conidiis vermicularibus rectiusculis deorsum lenissime incrassatulis, 3-5-septatis, hyalinis, 80-150 \approx 5.

Hab. ad folia languida *Hydrangeæ hortensis*, La Plata Argentina Amer. austr.

12. **Cercosporina jatrophicola** Speg., Myc. Argent. V, p. 426, in An. 8694 Mus. Nac. Bueno Aires XX (1910). — Maculis amphigenis sub-orbicularibus, 1-7 mm. diam., cinerescentibus determinatis anguste sordideque fusco-areolatis; cæspitulis epiphyllis, olivaceis minutis, hyphis rectiusculis 40-80 \approx 5-6, continuis v. 1-2-septatis vix

denticulatis, conidia vermicularia leniter curvula v. sigmoidea, 3-5-septata, hyalina, 50-80 \approx 3-4 gerentibus.

Hab. ad folia viva *Jatrophæ macrocarpæ* in dumetis prope Tucumán Argentina Amer. austr.

13. **Cercosporina daturicola** Speg., Myc. Argent. V, p. 425, in An. 8695 Mus. Nac. Buenos Aires XX (1909). — Maculis subamphigenis orbicularibus, 2-5 mm. diam., candidis, areola angusta vix fuscescente cinctis; cæspitulis penicilliformibus ex hyphis ima basi coalescentibus cæterum liberis apice vix tortuosus, denticulatisque, subcontinuis, 80-100 \approx 5-6, fusco-fuligineis; conidiis vermicularibus saepius triseptatis non v. lenissime subcurvulis, 80-100 \approx 4-5, hyalinis.

Hab. ad folia languida *Daturæ Stramonii*, La Plata, Argentina Amer. austr. — A *C. crassa* Sacc. et *C. Daturæ* Peck notis plurimis desciscens.

CORYNESPORA Güssow, in Zeitschr. f. Pflanzenkr. XVI (1906) p. 10, um iconib. (Etym. *coryne* clava et *spora*) — A gen. *Cercospora* distinguitur conidiis obclavatis et (teste Güssow) breviter catenulatis; a gen. *Polydesmo* conidiophoris longis et septatis et conidiis ad septa non constrictis. Videtur hinc genus intermedium, sed vix distinctum.

1. **Corynespora Melonis** (Cooke) Sacc. *Cercospora Melonis* Cooke — 8696 Syll. XVIII p. 598 et XIX p. 353 — *Corynespora Mazei* Güssow l. c. p. 10-13, fig. 1-5.

Hab. in foliis e fructibus immaturis *Cucumeris Melonis*, cui valde perniciosa, in Britannia et Germania.

Sect. 7. *Helicosporæ.*

HELICOSPORIUM Nees — Syll. IV p. 557, X p. 681, XI p. 638, XIV p. 1107, XVI p. 1081, XVIII p. 625.

1. **Helicosporium Tiliæ** Peck, Bull. Torr. Bot. Club. XXXIV (1907) 8697 p. 103. — Velutinum, confluendo effusum et maculas olivaceo-brunneas efformans; hyphis erectis, septatis, apice plerumque pallidioribus, 5-8 μ . cr.; conidiis in massam congestis, subhyalinis, 5-6 nucleatis, obscure septatis, 8 μ . cr.; massa conidiorum 20-22 μ . lata.

Hab. in cortice *Tiliæ americanæ* prope Emma Missouri Amer. bor. (C. H. DEMETRIO).

2. ***Helicosporium Richonis*** Boud. Ic. Mycol. III, tab. 599 (Ser. IV p. 8, 8698 n. 317) (1910). — Minutissimum, nigro-maculans, hyphis sterilibus repentibus fuligineis, fertilibus ex iis assurgentibus brevibus, concoloribus, 1-septatis, undulatis, 30-40 \approx 5-8, apice conidiophoris; conidiis ovatis ex filamento nigro-olivaceo, multiseptato intus granuloso, spiraliter 8-10-convoluto formatis, 50-80 \approx 50-60.

Hab. in ramo dejecto putri *Populi*, Saint-Amand-sur-Fion Galliae (Doct. RICHON). — Affine *Hel Mülleri* sed distinctum.

3. ***Helicosporium Ellisii*** Cooke, Black Moulds, tab. 26, f. 24 (absque dia- 8699 gnosi) (1877). — Conidiophoris erectis, strictis, obsolete septatis, non constrictis, filiformibus, 500-600 \approx 4-5, brunneis; conidiis (acrogenis?) cylindricis, spiraliter convolutis, 4-5-septatis, non constrictis hyalinis, totis (convolutis) 22 μ . latis, spiriculis binis-ternis, 4-5 μ . cr.

Hab. ad truncos (?) in America boreali. — Diagnosis ex iconе.

4. ***Helicosporium ramosum*** (Berk. et Sm.) Massee, Brit. Fungus Flora 8700 III (1893) p. 440 et p. 442, f. 29. — *Helicocoryne ramosa* Berk. et Sm. in Gard. Chron. Apr. 1882. — Cæspitulis effusis, sæpe latis, velutinis, e brunneo olivaceis; hyphis sterilibus repentibus, fertilibus ascendentibus vage ramosis, brunneis, septatis, 5-7 μ cr., lateraliter conidigeris, conidiis cylindricis denique dense spiraliter convolutis, pluriseptatis, olivaceo-brunneis, totis ellipsoideis v. obtuse fusoideis, 60-80 \approx 30-40, spiriculis 7-9, contiguis.

Hab. ad ligna uda in Britannia.

5. ***Helicosporium Phragmitis*** v. Höhn. Ann. Mycol. III (1905) p. 338. 8701 — Cæspitulis effusis, cm. aliquot extensis, brunneolo-griseis, ob conidia rubello-pulverulentis; hyphis infra ramosis, sursum simplicibus, tenui-tunicatis, griseo-brunneolis, levibus, septatis, ex cellulis 20-25 \approx 3-5 formatis, sursum tenuatis et pallidioribus; conidiis copiosis, hyalinis, coacervatis rubescentibus, in hyphæ denticulis patentibus 2-3 \approx 1,5 insertis, in spiram 15-20 μ . latam ter quater revolutis, 110 \approx 1,5-2,7, distinete crebro septatis, multiguttulatis.

Hab. in culmis putridis *Phragmitis communis* pr. Tulln Austria infer. (V. HÖHNEL).

*Fam. 3. Stilbaceæ Sacc.**Ser. 1. HYALOSTILBEÆ Sacc.**Sect. 1. Hyalosporæ*

STILBUM Tode — Syll. IV p. 564, X p. 681, XI p. 640, XVI p. 1086, XVIII p. 636.

1. **Stilbum spherocephalum** Massee, Kew Bull. (1907) p. 243, fig. 13- 8702
14. — Synnematibus capitatis; capitulis, usque ad 1 mm. diam., stramineis, glabris, demum ob conidia albido-pruinosis; stipite subtereti compresso, lœvi, in capitulum diffuso, concolore, basi incrassato, fusco, 2 mm. alt., 100 μ . cr.; conidiis ellipsoideis, hyalinis, 7 \times 3.

Hab. in vulneribus caulis viventis *Philodendri* sp. in calidariis hortorum Kew Angliae. — Affine *Stilbo connato* sed capitula straminea et conidia minora.

2. **Stilbum Kermesi** Speg. Myc. Arg. V, pag. 447, in An. Mus. Nac. 8703 Buenos Aires XX (1910). — Substrato toto sordide cinerescente; stipitibus hinc inde laxè gregariis erectis glabris teretibus 2-3,5 mm. long. 80-120 μ . diam., sordide fuscis, ex hyphis arcte coalitis tenuibus 2,5-3 μ . cr. parce septulatis flexuosis denticulatisque pallide fuligineis efformatis, apice abruptiusculæ subglobosis et saepius sublateraliter capitatis, capitulo primo albescente compactiusculo, dein subdiffluente rufescente; conidiis globosis, 6-7 μ . diam., fulvellis, catenulatis, uniguttulatis levibus.

Hab. ad truncos dejectos putrescentes in silvis prope Formosa Argentina Amer. austr. (E. KERMES). — Species habitu *S. aurantiaco-cinnabarinus* Speg. affinis sed conidiorum fabrica longe recedens.

3. **Stilbum Theæ** (Ch. Bern.) Sacc. et Trott. — *Stilbella Theæ* Ch. 8704 Bernard Bull. Depart. Agricult. Ind. Néerl. XI (1907) pag. 25, fig. 43-49. — Synnematibus dense gregariis, minutis; stipite cylindrico glabro, nitido, 300-800 μ . longo rubro-brunneo, sursum pallide roseo-aurantio; capitulo globoso roseo 150-300 μ . diam., minutissime pulverulento; conidiis perexiguis, ovoideis, 5-7 \times 2,5-4, hyalinis, coacervatis roseolis.

Hab. in ramis Theæ assamicæ, cui valde noxiū, in insula Java.

4. **Stilbum Elasticæ** (Koord.) Sacc. et Trav. — Syll. XX p. 903 -- 8705

Stilbella Elasticæ Koord., Bot. Untersuch. Java (1907) p. 238, f. 49.

— Gregarium; synnematibus cylindraceis erectis, 450-650 \approx 50-100, apice 100-200 μ . diam., levibus; capitulis globosis, obscure rubescens, 200 μ . diam.; conidiis continuis, hyalinis, utrinque obtusis, 5-7 \approx 3-4.

Hab. in cortice Fici elasticæ prope Kaliwiro prov. Kedu, Java majo 1906 (KOORDERS).

5. **Stilbum Simmonsii** Rostr., Rep. second Norweg. arctic Exp. 8706

Fram (1906) p. 10. — Sparsum, foliicola, melleum, 1 mm. altum; stipitibus fibrosis, glabris, 0.6 mm. altis, 0,3 cr., capitulis hemisphæricis; conidiis bacillaribus, 2-3 \approx 0,5.

Hab. in foliis Eriophori polystachii, E. Havne Fjord Norvegiæ.

6. **Stilbum incarnatum** Junghuhn Præmissa Fl. crypt. Javæ p. 6, 8707

fig. 4 (1838). — Capitulo globoso, sæpius basi impresso, persistente, adulto intus nigro sed strato conidiorum roseo v. carneo-roseo undique cincto; conidiis minimis globosis; stipite subæquali erecto, rigido, atro, primum capitulo concolore, demum atro.

Hab. in culmis Bambusæ arundinaceæ in insula Java.

— Fungillus 1,5-2,5 mm. altus, initio subgelatinosus *Tuberulariam* æmulatur, dein elongatur et formam *Stilbi* induit.

7. **Stilbum polyporicola** (P. Henn.) Sacc. — *Stilbella polyporicola* P. 8708

Henn., Engl. Jahrb. XXXVIII (1905) p. 118. — Synnematibus fasciculatis v. subsingularibus, erectis, pallidis, c. 1,5-2,5 mm. altis, stipite cylindraceo c. 30-50 μ . cr., flavidulo, basi fuscidulo, apice subhemisphærico-capitato; capitulis c. 120-180 μ . latis 80-100 μ . altis, hyphis hyalinis, 10-12 \approx 1; conidiis acrogenis ellipsoideis, hyalinis, 3,5-4 \approx 1,5.

Hab. in Polyporo putri, Amani Usambara or. Africæ (EICHELBAUM). — A *St. hyalino* diversum.

8. **Stilbum maximum** (Eichelb.) Sacc. — *Stilbella maxima* Eichelb., 8709

Verh. naturw. Ver. Hamburg, 3 Folge, XIV (1906) pag. 42. — Synnemate 8 mm. alt. albo, subæquali, 45 μ . cr., apice usque ad 60 μ . incrassato, sæpe ramoso-prolifero; capitulo ovoideo in stipitem decurrente, albido, dein flavidio, postremo viridulo; conidiis ex ovoideo cylindraceis 4 \approx 2, albo-diaphanis, laxe muco obductis, mox solutis.

Hab. in stromate Hypocrellæ sp. in Culcaria scan-

dente parasiticæ, Amani Africæ orient. — Forsitan *Hypocrellæ* subjectæ st. conidicus.

9. **Stilbum Torrendianum** Sacc. in Ann. Mycol IX (1911) p. 256. — 8710
 Fungicola, subsparsum, minutissimum, totum album; stipite cylindraceo basi non incrassato, 300-400 \approx 70-80, glabro, ex hyphis filiformibus dense fasciculato-compactis, inferne 2-3 μ . cr. et minutissime granulosis, superne angustioribus, 1,5 μ . cr., sublevibus, in capitulum radiantibus; capitulo globuloso, obtuso, 200 μ . diam., levi, compactiusculo; conidiis ellipsoideis, utrinque rotundatis 5,5-6 \approx 4, levibus, hyalinis, intus 1-2-guttatis v. granulosis.

Hab. in fungis putrescentibus (*Thelephoraceis?*) ad truncos in Lusitania (Prof. TORREND). — Ab affini *Stilbo fructigeno* differt stipite levi, non muriculato et loco.

10. **Stilbum flavo-viride** (Fuck.) v. Höhnel, Sitzb. k. Ak. d. Wiss. 8711
 Wien CXVII (1908) Abt. I, p. 1026. — Ita vocandum est, teste v. Höhnel, *Sphæronæma flavo-viride* Fuck. — Syll. III p. 618 (*Sphæronæmella*).

11. **Stilbum bæomycioides** (Massal.) Sacc. — Ita vocandum *Stilbum resinæ* 8712 Sacc. et Bres. — Syll. XVIII p. 634 — *Coniocybe bæomycioides* Massal. in Lotos (1856), *Dendrostilbella bæomycioides* (Mass.) Lindau Krypt. Fl. Pilze IX p. 305, *Coniocybe crocata* Körb. Parerg. p. 300.

12. **Stilbum coccophilum** Sacc. Not. Mycol. IX, in Annales Myc. v. V (1907) pag. 178. — Gregarium, parasiticum, capitato-stipitatum, totum album v. albido, 800-900 μ . altum; synnematibus ex mycelio filiformi, ramuloso, repente, 2-3 μ . cr. surgentibus, filiformibus, 40 μ . cr., glabris, ex hyphis angustissimis 4-5 μ . cr., hyalinis, dense stipatis formatis; capitulo globuloso, basi obtuso (non sensim in stipitem tenuato) 200 μ . diam., ex hyphis radiantibus formato, compactiusculo, glabro; conidiis oblongo-fusoideis, 6,5-7 \approx 2,5, utrinque acutulis, hyalinis (rarius subcatenulatis).

Hab. ad ramos Fici capensis, parasitice in scutellis Cero-plastis Rusci pervasis a Thoracantha cyanea, in horto botanico Panormitano Siciliæ (prof. JOANN. HECT. MATTEI).

TILACHLIDIUM Preuss — Syll. IV p. 576, XVIII p. 636.

1. **Tilachlidium subulatum** Annie L. Smith, Trans. Brit. Myc. Soc. 1908 8714
 v. III (1909) p. 122, tab. VI, fig. 8 a, b, c. — Synnematibus gregariis, flavidis v. griseolo-albis, erectis, 0,5-2 mm. altis, cylin-

draceis, sursum sensim tenuatis, ubique ramulos patentibus capituligeros gerentibus; ramulis (conidiophoris) 25-35 μ . long.; conidiis cylindraceo-oblongis, 5-7 \times 2, continuis, hyalinis, capitula minuta, globosa 5-6 μ . diam. formatibus.

Hab. in fragmentis vegetabilibus, Inverness-shire et Swaraton (W. L. W. EYRE). — *Tilachl. pinnato* videtur simile.

ISARIA Pers. — Syll. IV pag. 584, X p. 687, XI p. 641, XIV p. 1109, XVI p. 1084, XVIII p. 639.

1. **Isaria edessicola** Speg., Myc. Arg. V, p. 449, in An. Mus. Nac. 8715 Buenos Aires XX (1910). — Synnematibus erumpentibus confertis erectiusculis, 3-7 mm. alt., gracilibus tenuibus dense patentimque ramulosis, roseolis v. subluteolis, ramulis acutiusculis denticulatis farinosulis; conidiis ellipsoideo-cylindraceis, utrinque rotundatis, 2-3 \times 0,75-1, eguttulatis levibus hyalinis.

Hab. in corpore Edessæ (Pentatomæ) meditabundæ inter folia dejecta Parque Roca Tucuman Argentina Amer. austr.

2. **Isaria citrinula** Speg. Myc. Argent. V, p. 449, in An. Mus. Nac. 8716 Buenos Aires XX (1910). — Synnematibus brevibus densiuscule gregariis abrupte majusculeque subgloboso-capitatis, 2-3 mm. long., 1 mm. cr., ex hyphis tenuissimis subcontinuis ramulosis arcte coalescentibus efformatis; capitulis subglobosis v. obovatis pulvрulentis, primo citrinis v. sulfureis serius pallescentibus; conidiis globosis, 2-2,5 μ . diam., catenulatis, hyalinis, levibus, eguttulatis.

Hab. ad chrysalides Lepidopterorum emortuas in Parque Roca Tucumán Argentina Amer. austr.

3. **Isaria araneosa** Speg., Myc. Arg. V, p. 448, in An. Mus. Nac. 8717 Buenos Aires XX (1910). — Late effusa, candida v. roseo-subflavescens, araneoso-velutina; hyphis fertilibus v. conidiophoris confertissimis erectiusculis saepius abrupte bifidis deorsum incrassatulis sursum attenuatis acutatis, 10-15 \times 1,5-2, continuis, hyalinis; conidiis utrinque plus minusve obtusis, 3-4 \times 1,5-2, non v. leniter inaequilateralibus, levibus, hyalinis, eguttulatis.

Hab. in Lecanio cyprioidoide ad folia viva Citri deliciosæ, La Plata Argentina Amer. austr.

4. **Isaria elegantula** Syd. in Hedwigia XLIX (1909) p. 84. — Synnematibus sparsis solitariis vel pluribus basi fasciculatis, apice breviter ramosis, raro simplicibus, totis 1 $\frac{1}{2}$ -2 mm. altis; stipite tereti, flavo-brunneo, 100-150 μ . crasso, ex hyphis subhyalinis septatis 3-4 μ . crassis composito; ramis 2-6 brevissimis patentibus,

omnibus clavula albida obtusa minuta cylindracea usque ad 200 μ . crassa terminatis; hyphis clavulæ conidiophoris cylindraceis hyalinis 10-15 μ . longis, 3 μ . cr.; conidiis subbacillaribus, uno fine plerumque latioribus, altero acutis, continuis, hyalinis, 5-7 \approx 1-1 $\frac{1}{2}$.

Hab. in ramis emortuis Murrayæ exoticæ, Para, America austr. (C. F. BAKER).

5. **Isaria amorpha** v. Höhn., Stzb. k. Ak. d. Wiss. Wien CXVIII, 8719 Abt. I (1909) p. 415. — Entomogena; mycelio crasse tunicato, insecta penetrante; synnematibus copiosis, proteiformibus, 2-7 mm. alt., modo cylindraceis simplicibus apice globulosis, modo ovoideo-dilatatis, modo superne 2-3 ramulos tenues breves capituligeros emittentibus, modo depresso, irregularibus fere, thelephoroideis; capitulis albidis (?) ex hyphis ramoso-dendroideis, intricatis, elongatis formatis; conidiophoris solitariis v. subgomeratis. acro-pleurogenis, globoso-phialiformibus, 2-4 μ . lat., apice acutis et conidium singulum cylindraceum 3-4 \approx 1-1,5 gerentibus.

Hab. in corpora majusculæ Cicadæ sp. Sukabumi Javæ (Major OUWENS).

6. **Isaria lecaniicola** Jaap, Verh. Ver. Prov. Brandenb. (1908) 8720 p. 49, Ann. Myc. VI (1908) p. 218, Exsicc. n. 298. — Synnematus gregariis, cylindraceis v. clavatis, simplicibus, subinde sursum furcatis, albis, dein ochraceo-flavis v. brunneolis, 2,5-4, saepius 3 mm. altis, 0,2-0,4 mm. cr., ex hyphis hyalinis v. dilute flavis 2,5-3,5 μ . cr. indistincte septatis formatis; conidiophoris lateribus, indivisis, 1-2-cellularibus elongatis, spinuliformibus pseudosterigmate 1, rarius 2-3 praeditis; pseudosterigmatibus 8 μ . longis; conidiis ovoideis, altero fine rotundatis, hyalinis, saepè obsolete 2-guttulatis, 5-8 \approx 2-3,5.

Hab. parasitice in Lecanio Persicæ ad ramos Coryli Avellanæ pr. Eisenkappel Carinthiæ (JAAP).

7. **Isaria abietina** v. Höhn., Stzb. k. Ak. d. Wiss. Wien CXVIII, 8721 Abt. I (1909) p. 416 cum icon. — Entomogena, flavidо-grisea, insecta hinc inde investiens; synnematibus solitariis v. confertis, conico-subulatis, 3 mm. altis, basi 300 μ ., superne 55 μ . crassis, ex hyphis hyalinis, parallele fasciculatis, 2-3 μ . cr. formatis; sursum patenter divaricato-ramulosis, ramulis ad 160 \approx 55; conidiis minutissimis, subrotundis, glomerulato-acrogenis (dimensionibus non indicatis).

Hab. parasitice in corpore Cimicis spec. arboricolæ, Sukabumi Java (Major OUWENS).

8. **Isaria Guignardi** Maheu, Ann. Sc. Nat. ser. 9, III (1906) p. 113- 8722
 115, fig. 1-4. — Mycelio albo-viridescente, copioso, parce ramoso,
 septato, ex cellulis 14 \approx 5 formato; synnematibus ex cellulis sub-
 seriatis 12-16 \approx 3-4, brunneolis, dense fasciculatis compositis, fili-
 formibus concoloribus 4-5 mm. altis, basi simplicibus v. 2-4-fur-
 catis, 500 μ . cr., sursum divaricato-ramosis, spiculas formantibus,
 ramulis conidiophoris subverticillatis e basi inflatula sensim cu-
 spidatis, 55 \approx 6-8 (basi); conidiis solitarie acrogenis, oblongo-ellip-
 soideis, 7 \approx 2, hyalinis, eguttulatis, parcis (an geminis?).
Hab. in corpore *Quedii mesomelini* in cryptis Lutetiæ
 Parisiorum Gallia.
9. **Isaria Saussurei** Cooke, Veget. Waps p. 53 et p. 54 (icon) (1892) ex 8723
 Saussure, Vesp. Soc. t. II, f. 5. — Flavo-aurantia, subfasciculata,
 filiformis, apice cuspidata, glabrescens (cetera non descripta).
Hab. in thorace et abdomine *Polistes americanæ* in An-
 tillis et Cayenna. — Forte status conidius *Cordicipitis sphæcoce-
 phalæ*.
10. **Isaria elata** (Kalchbr.) Sacc. et Trav. — Syll. XIX p. 983, In- 8724
 stitale *elata* Kalchbr. Rev. Mycol. II (1880) p. 154, tab. 7, fig. 3.
 — Synnemate incompleto e fibris erectis, ramosis, esepbatis, apice
 liberis, cervinis, in massam carnosam 1,5-2 m. alt. stipato; co-
 nidiis copiosissimis, fibris intermixtis, pulverulentis, subglobosis,
 4-6 μ . diam., verruculosis, e fusco violascentibus.
Hab. ad ligna? Sikkim, Himalaya (J. REMY). Dubia stirps.

ATRACTIELLA Sacc. — Syll. IV p. 578

1. **Atractiella muscigena** (Speg.) Speg. Myc. Arg. V, pag. 447 cum 8725
 icon, in An. Mus. Nac. Buenos Aires XX (1910). — Ita vocan-
 da est *Anthina muscigena* Speg. Syll. — XIV p. 364. — Hyphæ
 steriles septulatæ sed non articulatæ, 5 μ . cr.; fertiles relaxatæ,
 subdichotomice ramulosæ, eximie articulatæ, articulis 20-30 \approx 5-8;
 conidia naviculari-fusoidea, utrinque acuta, 30 \approx 7, continua, nu-
 bilosa, hyalina.

ARTICULARIELLA v. Höhn. Fragm. z. Mykol. VI, in Stzb. k. Ak.
 d. Wiss. Wien CXVIII, Abt. I (1909) p. 410 (Etym. *Articularia*,
 cuius est analogum genus). — Conidiophora in synnema cylin-
 draceum conglutinata, filiformia, verticillatim pleurogena, breviter
 emergentia et in vesiculos minutis sporigeras abeuntia. Conidia
 quina-octona in vesicula inserta, oblonga, continua, hyalina.

1. **Articulariella aurantiaca** v. Höhn. l. c. f. 27. — *Leptophymatis* 8726
aurantiaci (Ell. et Mart.) Sacc. Syll. VIII p. 845, stat. conidioph.
 — Cæspitulis albis (non aurantiacis!) fere tubercularioideis; hyphis
 vesiculigeris 20-40 \times 2-3; conidiis tereti-oblongis, 6-9 \times 1,5-2, hya-
 linis, levibus.

Hab. in pag. inferiore foliorum *Quercus laurifoliae* in
 America bor., socio *Leptophymate*, cuius est certe stat. conidio-
 phorus.

ACTINICEPS B. et Br. — Syll. IV p. 579, XI p. 641.

1. **Actiniceps Timmii** Eichelb., Verh. naturw. Ver. Hamburg, 3 Fge., 8727
 XIV (1906) p. 43. — Synnemate longe stipitato, apice piriformi-
 capitato, flavidus; stipite nigro, obscure contexto, atro impellucido,
 3,4 mm. longo, 30 μ . cr., basi usque ad 90 μ . incrassato, erecto,
 recto, v. curvulo, sursum in c. 50 ramulos acute subulatos simpli-
 ces abeunte; ramulis 3-4-septatis, diaphanis, flavo-viridulis, 86 \times 4,
 conidigeris; conidiis minutissimis, ovoideis, 2 \times 1,5, hyalinis, muco
 obvolutis (catenulatis?).

Hab. in ligno putrescente, rarius, Amani Africæ orient. Vi-
 detur subaffine *Graphio chlorocephalo* et *Gr. stricto*.

COREMIUM Link — Syll. IV p. 581, X p. 687, XI 641, XIV p. 1108,
 XVIII p. 642.

1. **Coremium Elasticæ** Koord., Botan. Untersuch. Java (1907) p. 239, 8728
 fig. 50. — Gregarium, pusillum, vix 0,5 mm. altum; hyalinum,
 stipite filiformi, ex hyphis concretis composito, erecto, supra co-
 piōse ramoso; conidiis continuis, hyalinis, ovoideis v. ovoido-ob-
 longis, haud muco obvolutis, acrogenis, typice catenulatis.

Hab. in foliis emortuis Fici elasticæ, Purworedjo, prov.
 Kedu Java, oct. 1905 (KOORDERS)

2. **Coremium aureum** (Hedg.) Sacc. — *Graphium aureum* Hedgcock, 8729
 17th. Ann. Rep. Miss. bot. Garden St. Louis (1906) p. 94, tab. 9,
 fig. 5-7. — Mycelio albo, dein aureo, 2-3 μ . diam.; synnematibus
 capitatis, albis, dein flavis, 50-750 \times 10-90, e filamentis parallelis
 1-2 μ . diam. constantibus; conidiis primaris hyalinis, obovatis,
 4-5 \times 1-2; conidiis secundaris obovatis v. subclavatis, hyalinis,
 4-8 \times 1-2, catenulatis.

Hab. in ligno Pini Strobi brunneo-maculato in Amer. bor.
 — Ob colorem lætum et conidia catenulata ad *Coremium* potius
 referenda species videtur.

3. **Coremium arbuscula** H. Fischer, Ber. deutsch. bot. Gesellsch. Bd. 8730 XXVII (1909) p. 502 cum icon; Centralbl. f. Bakter. etc. II Abt. Bd. 26 (1910) p. 57. — Cæspitulis albis, gossypinis, dein rubentibus, 2-3 cm. lat., 1 cm. alt.; conidiophoris modo ex unica cellula brevi, apice sterigma unum v. plura gerente, modo longiore, verticillos 1-2 apice 2-12-sterigmaticos gerente formatis; sterigmatibus phialiformibus, apice acutis; conidiis breviter catenulatis, ovoideis, hyalinis, coacervatis e roseo fuscidulis, 4-6 v. 2,5-3; synnematibus simplicibus, clavatis, v. ramosis arbusculiformibus, solitariis v. aggregatis, usque ad 2 cm. alt., demum rubellis v. rubro-brunneis.

Hab. ex solo vario pr. Berolinum extracto et cum gelatina culto in laboratoriis. Facile mediis variis colitur.

4. **Coremium album** (Cost.) Sacc. et Trav., Syll. XIX p. 428, *Synpe-nicillum album* Costant. Bull. Soc. Mycol. Fr. IV (1888) p. 67, tab. 14, fig. 10-17. — Cæspitulis albis; conidiophoris primo simplicibus cylindraceis, septatis, copiose vacuolatis, sursum iterato et verticillato-ramosis, pseudosterigmatibus fusoideis; conidiis catenulatis, ellipsoideis, e 6 v. 3 usque ad 13 v. 7; conidiophoris demum plurimis parallele fasciculatis.

Hab. (cultum) in gelatina, in Gallia. — Descriptio imperfecta.

5. **Coremium cinereum** Rivolta, Parass. veget. p. 500, tab. 8, fig. 250 8732 (1873) (an *Sporocybe*).

Hab. in fœno putri v. fermentescente in Italia. — Species dubia.

6. **Coremium flavum** Rivolta l. c. p. 500, tab. 8, fig. 251 b-c. (1873). 8733

Hab. in fœno putrescente v. fermentescente in Italia. — Species dubia.

7. **Coremium fuscum** Rivolta l. c., p. 500, tab. 8, fig. 249 (1873). 8734

Hab. in fœno putri v. fermentescente. — An *Sporocybe*?

8. **Coremium? fruticulosum** Cumino, Fung. Vallis Pisii Spec., in 8735 Act. Ac. Taur. (1805) p. 260, tab. 3, fig. 3 (*Mucor*).

Hab. ad lignum putre in cellis vinariis in Pedemontio.

9. **Coremium syphiliticum** Hallierz, in Flora (1868) pag. 295, tab. 3, 8736 fig. 16.

Hab. in homine syphilitico in Germania. — Stirps omnino dubia.

10. **Coremium tubulosum** Gasparr. Relaz. malat. Vite, in Rend. 8737 Accad. Scienze (1852) p. 134, tab. 1-2 (?).

Hab. in Vite vinifera in Itat. merid. — Descriptionem

et icones l. c. reperire nequivi. An citatio ex opere quodam adhuc inedito?

ALPHITOMYCES Reissek, in Sitzungsb. K. Akad. Wiss. Wien XXI (1856) p. 326 (Etym. *alphiton* farina el *phyton* planta ob superficiem farinosam). — Synnemata fusoidea v. subclavata, compressa, pallida, ex hyphis subparallelis filiformibus contexta, carnosula, demum subcoriacea (majuscula), tota superficie conidigera. Conidia longe moniliformi-catenulata ex apice hypharum repetito furcatarum acrogena, globosa, minutissima, hyalina. — A gen. *Isaria* recedit conidiis longe concatenatis et loco; a *Coremio* synnemate tereti-fusoideo, apice acutato, ubique conidigero.

1. **Alphitomyces Schrötteri** Reissek l. c. cum tabula eximia. — Gre- 8738 garius, elatus, 2-4 cm. alt. 2-4 mm. medio crassus, subinde irregularis et fissus, albidus dein subalutaceus, tota superficie (e conidius) farinosus; hyphis longissimis, septulatis, 2,5-3 μ . cr. repetito arrecto-dichotomis; conidiis in catenas longissimas usque ad 150 μ . longas dispositis, sphæricis, 1,2-1,3 μ . diam., levibus, hyalinis.

Hab. in superficie caseinæ aqua solutæ diu quiescentis in Austria (Prof. SCHRÖTTER).

GIBELLULA Cav. — Syll. XI p. 643, XVIII p. 644.

1. **Gibellula capillaris** Morgan, Journ. of Myc. XI (1905) p. 50. — 8739 Synnematibus 5-8 mm. alt., 40-60 μ . cr., simplicibus, capillaribus, flexuosis, curvis, contortis, fulvis, summitate pallidis, basi brevi v. nulla, ubique conidiferis; hyphis longitudinaliter solide coalescentibus, tenuibus, fulvis, ramulos sporiferos brevissimos exerentibus; conidiophoris crassis, obtusis, pallucidis, apice catenulam unicum v. paucas conidorum gerentibus; conidiis in quaque catenula plurimis, clavato-oblongis, levibus, hyalinis, 6-9 \approx 1-2.

Hab. in insecto quodam minuto, emortuo, inter folia in silvis Preston Ohio Amer. bor.

2. **Gibellula eximia** v. Höhn, Ergebni. Bot. Exp. Südbras. (1901) 8740 Denk. k. Ak. d. Wiss. Wien Bd. LXXXIII (1907) Extr. p. 37. — Synnematibus, gregariis, ochraceo-flavis, simplicibus v. semel dichotomice ramosis, 3,5-4 cm. altis, 0,5-1 mm. cr., flexuosis, ex hyphis 2 μ . cr., saepe asperulis, tenuibus, parallelis formatis, sursum racemosis v. dichotomico-racemosis, ramis conidiophora copiosa brevia, simplicia patentia apice capitata gerentibus; capitu-

lis subglobosis 20-25 μ . diam., ex cellulis minutis ubique pseudo-basidiis radiatim divergentibus ovato-piriformibus 3-4 μ . longis dense obtectis; conidiis allantoideis, minutissimis, curvulis 3-3,5 \approx 1.

Hab. in chrysalide Papilionis cujusdam, dejecta, Sao Paulo Brasiliæ (V. SCHIFFNER). — Probabiliter statum conidicum *Cor-dycipitis* cujusdam refert.

Sect. 2. Didymosporæ.

DIDYMOSTILBE P. Henn. — Syll. XVIII p. 645.

1. **Didymostilbe coccinea** (Massee) Sacc. *Hartiella coccinea* Massee 8741

Kew. Gard. Bullet. (1910) p. 5. — Synnemate verticali, tereticolavato, v. rarissime ramoso, coccineo, 1 mm. alt., rigido, ex hyphis coalitis conflato; conidiis in hypharum apicibus solitariis, ellipsoideis, 1-septatis, levibus, coccineis, 7-9 \approx 4-5.

Hab. in pericarpio Theobromæ Cacao, Trinidad Indiæ occ. (J. H. HART). — Genus *Hartiella* Massee nulla nota a *Didymostilbe* differre videtur.

Ser. 2. PHÆOSTILBEÆ Sacc.

Sect. 1. Hyalosporæ.

GRAPHIUM Corda — Syll. IV p. 609, X p. 693, XI p. 644, XIV p. 1110, XVI p. 1087, XVIII p. 648.

1. **Graphium Geranii** Vogl., Ann. Ac. Agric. Torino (1904) pag. 79, 8742

cum icon., Ann. Myc. III (1905) p. 170; Atti R Acc. Sc. Torino v. XLIII (1907-1908) p. 97 (251). — Maculis fulvis, fuligineis, rotundis seu subellipticis, 1-4-5 mm. latis, etiam confluentibus; conidiophoris hypophyllis, dilute fuligineis, filiformibus, septatis, 5-6 μ . cr., in synnema primum sursum leniter attenuatum, solitarium, 250-230 μ . longum coalitis; conidiis cylindraceis v. ovoido-oblongis, hyalinis, e denticulis divergentibus oriundis, 16-24 \approx 5-7.

Hab. in foliis vivis Geranii mollis in Pedemontio Italiae bor. — *Graphio gracili* Peck proximum.

2. **Graphium rhodophæum** Sacc. et Trott. — Syll. XVI, p. 1087 — 8743

var. **elatius** Sacc. in Ann. Mycol. IX (1911) p. 256. — A typo dignoscitur stipite pariter nigro, glabro, rigidulo sed usque ad 5-6

mm. alto; capitulo 0,5 mm. diam. dilute roseo, glabro, nitidulo; conidiis typi, nempe 5,5-6 \approx 2,7-3, roseolo-hyalinis, obsolete guttulatis.

Hab. in ramulis emortuis in calidariis Horti Patavini, Ital. bor.

— Verisimiliter species exotica importata cum plantis cultis.

3. **Graphium anomalam** Massee, Kew Bull. (1908) p. 218. — Synnem- 8744
mate verticali flavidu, siccitate rigido, 1,5-2 mm. alto, e fibris
conglutinatis composito; hyphis sursum relaxatis, pallidioribus,
conidiferis; conidiis continuis, ellipsoideis, hyalinis, 5 \approx 1,5, ex co-
nidioforis lateralibus orientibus.

Hab. in caule emortuo herbaceo, Aburi, Africa occid. (JOHNSON). — Ob conidia in conidiophoris lateralibus nascentia, a typo
generis, teste auctore, deflectit.

4. **Graphium fissum** Preuss. — Syll. IV, pag. 610 — subsp. ***G. clavulatum** Sacc., in Ann. Mycol. X (1912) p. 321. — Synnematibus
dense v. laxe gregariis, tereti-clavulatis, obtusis, minutis, nigre-
scentibus, sursum pallidioribus 400 \approx 70-90; hyphis filiformibus,
septatis, brunnois, sursum pallidioribus et obtuse leviterque den-
ticulatis, parum divergentibus; conidiis fusoideis, rectis v. inaequi-
lateris, 8-9 \approx 2, hyalinis.

Hab. ad caules putres in Horto Musei agrarii, Romæ Italiæ
(D. SACCARDO). — Verisimiliter species distincta.

5. **Graphium perpusillum** Sacc., Ann. Mycol. VI (1908) p. 567 (ex 8746
err. *Gr. pusillum*, non Wallr.) tab. XXIV, fig. 13. — Sparsum,
per exiguum, fuscum, sursum (ex conidiis) candicans; synnemati-
bus breve cylindraceis, 50 \approx 14 ex hyphis fasciculatis fuligineis fili-
formibus, apice relaxatis dilutioribus et capitulum minutum for-
mantibus; conidiis oblongis utrinque præcipue basi obtusatis, 7 \approx
2,5, subhyalinis, 1-guttulatis, initio saltem breve catenulatis.

Hab. in lignis putrescentibus dejectis in silvis Ridgeways, Or-
leans County N. Y., Amer. bor. (FAIRMAN). — Minutie et notis
datis facile dignoscitur. Socium adest *Brachysporium apicale* B.
et Br.

6. **Graphium ramosum** Preuss, in Kl. Herb. viv. Mycol. n. 1263, Bot. 8747
Zeit. (1849) p. 294. — Acervulis minutissimis punctiformibus, ni-
gris epi- et entoxylinis, stipite lignum penetrante erecto apice pal-
lido albido, simplici v. saepius ramoso, ramulis aut floccosis aut
penicillatim divisum capitulum ovatum formantibus; conidiis ovo-
deis albis.

Hab. ad ligna putrescentia in agro Hoyerswerda.

7. Graphium Ailanti (Ranojœv. et Bub.) Sacc., *Dendrostilbella Ailanthei* 8748

Ranojœvic et Bubák, Ann. Mycol. VIII (1910) p. 401. — Synnematibus crebre distributis, cylindraceis, nigris, ex hyphis nigro-fuligineis, parce septatis, parallelis constitutis, 171-304 \approx 19-32; capitulis subglobosis v. reniformibus, griseo-cinereis, usque ad 218 μ . cr.; conidiis limoniformibus, ovoideis, ellipsoideis, 5.5-10 \approx 3.5-6, hyalinis.

Hab. in superficie interna corticis trunci dejecti Ailanti glandulosæ prope Belgrad Serbia. — Habitus myxomycetoideus *Dictydiae* ex. g.

8. Graphium atro-virens Hedgcock, 17th Ann. Rep. Miss. bot. Gar. 8749 den St. Louis (1906) p. 94, tab. 8, fig. 1-3. — Mycelio hyphis in fasciculos parallele cohærentibus ramosis confluentibus, hyalinis, dein olivaceis, 3-4 μ . cr.; synnemate ex atro-viridi nigricante, raro pallidiore; stipite 1,5-3 mm. alto, 8-80 μ . cr.; forma simplici: conidiis secundariis acropleurogenis, ex obovato ellipsoideis, 4-5,5 \approx 1,6-2, hyalinis, serius guttulatis; forma capituligera: capitulis muco obvolutis, ex albo griseis, 40-600 μ . diam.; conidiis primariis obovato-ellipsoideis, 3,5-4,5 \approx 1,4-2, hyalinis.

Hab. in ligno pineo atro-maculato putrescente in Amer. bor.

9. Graphium ambrosiigerum Hedgcock, 17th Ann. Rep. Miss. bot. 8750 Gard. St. Louis (1906) p. 85, tab. 8, fig. 4-7. — Mycelio albo dein brunneo-nigricante; synnematibus ex hyphis parallele fasciculatis 2 μ . cr. formatis, 500-900 μ . long.; capitulis ex albo brunneis, muco obvolutis, 200 μ . diam.; conidiis primariis ovoideis, 5 \approx 3, secundariis 3,7 \approx 1,3, non catenulatis.

Hab. in ligno pineo atro-maculato in Amer. bor.

10. Graphium Bambusæ (v. Höhn.) Sacc., *Phæoisaria Bambusæ* von 8751 Höhn. Stzsb. k. Ak. d. Wiss. Wien, CXVIII, Abt. I (1909) p. 330. — Synnematibus atris, dense gregariis, hinc inde subcæspitosis, 1-1,5 mm. altis, 40-50 μ . cr., subulatis, basi disciformi-dilatatis hyphis que violaceo-brunneis cinctis, apice acutis v. obtusis, ex hyphis numerosis, parallelis, 2-3 μ . cr. constitutis, sursum conidiophora subhyalina, 10-20 \approx 2-2,5, minute denticulata exerentibus; conidiis hyalinis ex oblongo cylindraceis, obtusulis, continuis, 6-10 \approx 1,5-2.

Hab. in caudicibus emortuis Bambusæ e subgen. Gigantochloæ in Horto botanico Buitenzorg ins. Java. — Teste v. Höhn. l. c. *Neopeckia Bambusæ* v. Höhn. est status ascophorus. Genus *Phæoisaria* v. Höhn. a *Graphio* tantum differt synnematibus sursum acutis nec clavatis.

11. **Graphium melanotes** (Syd.) Sacc., *Stilbella melanotes* Syd., Hedw. 8752
XLIX (1909) pag. 84. — Synnematibus solitariis vel paucis basi
 coalitis, ex hyphis fuscidulis ca. 2-3 μ . crassis compositis, totis
 atris; stipite cylindrico, glabro, usque ad 1 mm. longo, 200-400 μ .
 crasso; capitulo subgloboso vel irregulari, 400-700 μ . crasso; co-
 nidiis minutissimis, hyalinis, 2-2 $\frac{1}{2}$ \approx 0,8-1.
Hab. in cortice Bactridis majoris, Para, Amer. austr. (C.
 F. BAKER).
12. **Graphium hippotrichoides** (Lind.) Sacc., *Clavularia hippotrichoides* 8752*
 Lindau, in Rabenh. Krypt. Fl. Pilze IX, p. 313, cum icon. f. 3
 (1908). — Synnematibus longissimis, rhizomorphoideis, nigris, fi-
 liformibus, deorsum sæpe pluribus confluentibus, sursum supra
 altitudinem 2-3 mm. pallidioribus brunneolo-albis, ex hyphis se-
 ptatis, 3 μ . cr. cohærentibus formatis; capitulis clavulatis v. glo-
 bosis, $\frac{1}{2}$ - $\frac{3}{4}$ mm. diam., brunneo-flavidis; conidiophoris simplicibus
 continuis, acutatis, hyalinis, 19-24 \approx 3.5 dense radiatim stipatis;
 conidiis copiosissimis, oblongo-cylindraceis, utrinque rotundatis, re-
 ctis v. raro curvulis, hyalinis, 7,7-9,6 \approx 1,5-2.
Hab. ad terram, verisimiliter ad radices emortuas pr. O'desloë,
 Schleswig (JAAP). — Ob synnemata nigra hippotrichoidea potius
 ad *Graphium* quam ad *Clavulariam* spectat.
13. **Graphium cicadicola** Speg., Myc. Arg. V, p. 446, cum icon., in 8753
 An. Mus. Nac. Buenos Aires XX (1910). — Stipitibus solitariis
 v. pauci-cæspitosis, 1-2 mm. long., deorsum teretibus gracilibus
 25-40 μ . cr., obscure cinereis, sursum elliptico- vel fusoideo-capi-
 tatis, 150-300 μ . long., 50-80 μ . cr., pulverulentis, albescensibus,
 ex hyphis tenuibus 15 μ . cr. hyalinis septulatis apice subincras-
 satulis abrupteque in conidiophora, breviuscula gracillima mono-
 sperma productis conflatis; conidiis ellipsoideis utrinque rotundatis
 1,5-2 \approx 1, eguttulatis, levibus, hyalinis.
Hab. in corpore putrescente Tympanoterpis sibilantis
 humo infosso, Parque Roca Tucumán Argentina Amer. austr.
14. **Graphium albo-nigrescens** Lindau, in Rabenh. Krypt. Fl. Pilze 8754
 IX, pag. 362 (1908). — Ita vocandum *Graphium leucocephalum*
 (Berk. et Curt. 1874) Sacc., Syll. IV p. 611, nec *Gr. leucocepha-
 lum* (Wallr. 1833), Syll. IV, p. 165.

STILBOCHALARÀ Ferdinands. et Winge, Botanisk Tidsskrift XXX
 (1910) p. 220 (Etym. *Stilbum* et *Chalara* inter quæ genera medium).

— Genus phæostilbeum, conidia endogena *Chalarœ* modo generans. Est *Chalara* stilbiformis.

1. **Stilbochalara dimorpha** Ferdinands. et Winge, l. c. p. 220, fig. 7. 8755

— Synnematibus 2-2,5 mm. alt., ad basim cylindraceis, altero cum altero coalitis, nigro-fuscis, sursum liberis, penicillatis, e conidiis albo-pulverulentis; hyphis singulis pro ratione tenuissimis, flexibilis, saepius ramosis, fuscis, crebre septatis, 4-5 μ . ut plurimum crassis, superne *Chalarœ* modo apertis, tubuliformibus, paulo infra tubulum apertum crassitudinem maximam, usque ad 9 μ . attingentibus; conidiis endogenis, seriatim e tubulis protrusis, dimorphis, aliis numerosissimis hyalinis (catervatim brunneolo-tinctis), cylindricis, utrinque truncatis, membrana tenui, intus vacuolatis, 10-12 \approx 4-5, aliis paucioribus fuscis, ut plurimum ellipsoideo-cylindricis, membrana crassiore, 1-2 vacuolatis, 10-13 \approx 5,5-6,5, paucis infra ultrave; conidiis fuscis in cellulis propriis versus basim synnematis præcipue formatis, paucis autem, charactere saepe intermedio, in iisdem tubulis, in quibus conidia hyalina gignuntur, inventis, semperque, quod si evenit, infra hyalina observatis.

Hab. ad fructus semiputridos *Theobromæ Cacao*, Las Trincheras Venezuela (H. LASSEN). — Socia adest *Sterigmatocystis dipus* Ferd. et Wing.

STROMATOGRAPHIUM v. Höhnel, Ergebniß Bot. Exp. Südbras. 1901, Denk. k. Ak. d. Wiss. Wien, Bd. LXXXIII (1907) Extr. p. 37 (Etym. *stroma* et *Graphium*). — Synnemata et conidia *Graphii* sed complurima e communi stromate crasso, molli-carbonaceo nascentia.

1. **Stromatographium stromaticum** (Berk.) v. Höhnel l. c., *Stilbum* 8756 *stromaticum* Berk. Journ. of Bot. (1843) p. 642 — Syll. IV p. 575 (nomen). — Stromate sordide nigro appланato, 500-600 μ . crasso, 1-1,5 cm. lato, ambitu subrotundo v. oblongo lobato, e cellulis oblongo-polygoniis 15-25 \approx 10 hyalino-violaceis conflato; synnematis nigris, numerosis, 3-5 mm. longis, superne 140 μ , inferne 200 μ . cr., ex hyphis 2-3 μ . cr. parallelis, atro-brunneis constantibus et extus corticatis; capitulo flavido, 500 μ . diam., ex conidiophoris curvatis, ramosis, 100 \approx 1 et conidiis copiosis, oblongis, 1,5-2,5 \approx 1, mucoso-conglutinatis, hyalinis constante.

Hab. in caudicibus putridis Sao Paulo Brasiliæ, Minas Geraes, Adams-Peak Ceylon. — Prof. v. Höhnel l. c. lapsui meo tribuit

loci citationem (Syll. l. c.) ad Adam's Peak, sed revera lapsus est Höhnelio. Cfr. Berk. et Br. Fung. of Ceyl. n. 866!

HARPOGRAPHIUM Sacc. — Syll. IV p. 619, X p. 695, XVIII p. 650.

1. **Harpographium Yerbæ** Speg., Anal. Mus. Nac. Buenos A. t. XVIII 8757 (1908) p. 141. — Cæspitulis sæpius linearibus 1-5 mm. long., 1-1,5 mm. lat., primo erumpentibus dein, cortice secedente, nudis, fusco-atris; synnematibus numerosis confertis e nodulo stromatico communi assurgentibus, 250-1500 \approx 30-60, ex hyphis tenuibus 2-3,5 μ . cr., deorsum olivaceis coalescentibus sursum hyalinis relaxatis denticulatis septulatis efformatis; conidiis clavulatis 10-20 \approx 2,5, sæpius leniter curvulis, continuis, hyalinis eguttulatis.

Hab. ad ramos dejectos putrescentes Ilicis paraguariensis in silvis circa San Pedro Misiones Reip. Argentina.

2. **Harpographium fasciculatum** Sacc. — Syll. IV, p. 619 — var. **hir-sutum** Ferraris, Ann. Mycol. VII (1909) p. 281. — Synnematibus cæspitulosis, atris, rectis v. adscendentibus 3-4 mm. circ. altis, apice subclavulatis, hyphis olivaceis flexuosis, simplicibus v. ramosis, septato-nodulosis, 5 μ . cr. undique vestitis; hypharum ramulis extremis pallidioribus, subhyalinis, verruculosis, subclavulatis, apice conidigeris; conidiis hyalinis, subfusiformibus, utrinque acutis, 15 \approx 2.

Hab. in ramulis Mori albæ a Diaspide pentagona affectis pr. Serravalle d'Asti Pedemont. Italiæ collectis et in vaso vitreo diu servatis.

STYSANUS Corda — Syll. IV p. 620, X p. 696, XI p. 644, XIV p. 1112, XVI p. 1088, XVIII p. 650.

1. **Stysanus Yerbæ** Speg., Anal. Mus. Nac. Buenos Aires t. XVII 8759 (1908) p. 140. — Stipitibus laxe gregariis erectis rigidulis 500-2500 μ . alt., tenuibus, atris, e basi subbulbosula 50-60 μ . diam. sensim attenuatis, 40-25 μ . fibrosis, hyphis indistinctis, apice lanceolato-subcapitatis, pallescentibus purpurellis 40-60 μ . diam.; conidiis subcatenulatis, ellipsoideo-obovatis, 5-8 \approx 2-3, hyalinis, non v. minute 2-guttulatis.

Hab. in disco ramorum excæsorum Ilicis paraguariensis in dumetis circa Campo das Cuias Misiones Reip. Argentina.

2. **Stysanus graphioides** Schulz. v. Mügg., Verh. zool.-bot. Ges. Wien 1865 p. 795, tab. 16, fig. 3. — Ab affini *Stys. Stemonite* distinguatur statura multo minore, stipite synnematis proportione capi-

tuli breviore, conidiisque cuneato-ovatis, prope apicem crasse 1-guttatis, initio hyalinis, dein griseo-nigricantibus.

Hab. in sectione tuberum Solani tuberosi in cellis in Hungaria.

STILBOTHAMNIUM P. Henn. — Syll. XIV p. 1110, XVI p. 1086, XVIII p. 636.

1. **Stilbothamnium Penicillopsis** P. Henn. — Syll. XVI, p. 1086. — 8761

Status ascophorus: *Aspergillus Penicillopsis* (P. Henn. et Nym.) Raciborski, Bull. Ac. Sc. Cracovie (1909) p. 372. — Sclerotis diu sterilibus demum in conceptacula ascophora mutatis; conceptaculis pariete crasso griseo-cyaneo præditis, 0,6 mm. diam., intus nucleo globuloso albo, molliore fœtis; ascis in centro nuclei ex hyphis hyalinis, septatis, 2-3 µ. cr. generatis, sphæricis v. breviter ovoides, tenui-tunicatis, 21-24 µ. diam., octosporis; sporidiis e fronte orbicularibus e latere ellipticis, sulco æquatoriali præditis, tenuiter verruculosis, maturis diam. 11-13 µ. et latere 6-7,5 µ., episporio brunneo-viridulo.

Hab. in umbrosis sub arboribus, Buitenzorg, Java.

TRICHURUS Clem. et Shear — Syll. XVI p. 1089.

1. **Trichurus gorgonifer** Bainier, Bull. Soc. Myc. Fr. XXIII (1907) 8762

p. 230, tab. 25. — Ex albo cinerescens; synnematibus elongatis, cylindricis, nigricantibus, sursum ramis conidiophoris capitulum formantibus extus divaricatis præditis, ramis septatis hinc inde in ramulos verticillato-ramosos penicillioideos divisus, apiceque in hymen longam sinuosam septatam, 200 × 2,5, sterilem desinentibus et capitulum pilosum reddentibus; conidiis catenulatis, ellipsoideis, 2,8-5,6 µ. diam., saepius vero ovoides 5,8 × 2,8, coacervatis cinerescentibus v. brunneolis.

Hab. in fimo vaccino in Gallia. — Teste auctore *Trich. gorgonifer* dignoscitur pilis simplicibus undulatis, conidiis cinereis, ovoides, 5 × 2,8; *Trich. spiralis* pilis spiralibus, conidiis flavobrunneis, 5-6 × 2-3; *Trich. cylindricus* pilis simplicibus et iterato-furcatis, conidiisque oblongis 8-9 × 3, glaucis.

ANTROMYCES Fres. — Syll. IV p. 626, X p. 698.

1. **Antromyces Copridis** Fresen. — Syll. IV, p. 626 — fm. *italicus* 8763

Ferraris, Ann. Mycol. VII (1909) p. 282. — Synnematibus sparsis, rigidis, setuliformibus, lucidis, usque ad 10 mm. altis, 50-60

μ . cr.; capitulo 125-150 μ . diam., strato conidiorum 100-200 μ . cr. obtecto; conidiis catenulatis, utrinque truncatis, 7-9 \approx 2-3, continuis, hyalinis (immaturis?).

Hab. in terra humosa in castanetis, Costa prope Vittorio Treviso Ital. bor.

2. **Antromyces subtropicalis** Speg., Myc. Arg. V, p. 449, in Anal. 8764 Mus. Nac. Buenos Aires XX (1910). — Stipitibus sparsis v. laxè gregariis 5-10 mm. long., 300-350 μ . cr., erectis, insititiis, apice abruptiusculè incrassato-capitatis albescensibusque; hyphis stipitum cylindraceis olivaceis septulatis, 4 μ . cr. non articulatis arcte coalescentibus in capitulo subsolutis, ramulosis, articulatis 6-16 \approx 5-6, hyalinis, sensim in conidia transeuntibus; conidiis catenulatis subnavicularibus utrinque acutiusculis, 5-6 \approx 2,5, continuis, hyalinis, eguttulatis.

Hab. ad caules dejectos putrescentes Aristolochiæ Esperanzae in silva primæva Bobadal Jujuy Argentina Amer. austr. Antr. *Copridis* Fres., secundum specimina italica ab Auctore lecta, conidiis omnibus et semper continuis et unicellularibus (nec præcl. Boudier monente 1-septatis) præditus est

Sect. 2. Phæosporæ.

SPOROCYBE Fr. — Syll. IV p. 604, X p. 692, XI p. 643, XIV p. 1109, XVIII p. 653.

1. **Sporocybe philippinensis** P. Henn., Hedw. XLVII (1908) p. 265. 8765 — Cæspitulis dense gregariis, villosis, atro-fuscis, effusis; stipitibus erectis rigidis, atris, 200-250 μ . longis, fusco-tomentosis, apice capitellatis; capitulis subglobosis v. ovoideis, atris, 200-220 μ . d., conidiis ellipsoideis v. ovoideis, fuscis, 8-13 \approx 5-6.

Hab. ad lignum N. Samar, Cajaogan ins. Philippin. (MERRILL).

SACCARDÆA Cavara — Syll. XI p. 643.

1. **Saccardæa argentinensis** Speg., Myc. Arg. V, p. 450, cum icon., 8766 in An. Mus. Nac. Buenos Aires XX (1910). — Plagulis plus minusve late ambientibus; stipitibus nigris densiusculè gregariis, erectiusculis, 2-3 mm. long., 30-50 μ . diam., apice abrupte setulosocapitatis ibique 100-250 μ . diam., ex hyphis tenuibus 1,5-2 μ . cr. septulatis obscure fuligineis arcte coalescentibus efformatis; setulis capituli patulis, flexuosis, 200 \approx 2-4, infra septulatis; conidiophoris

ad basim septulorum enascentibus, denticulatis, 5-10 \approx 3-4; conidiis non catenulatis, ellipsoideis, utrinque rotundatis, 4-5 \approx 2-3, eguttulatis, fumosis.

Hab. ad radices putrescentes in cella humida laboratorii diu servatas Buenos Aires Argentina.

STYSANOPSIS Ferraris, Ann. Mycol. VII (1909) p. 281 (Etym. *Stysanus* et *opsis* aspectus). — A gen. *Stysano* differt conidiis fuscis, catenulatis. — Huc pertinent secundum Ferraris: *Stysanus medius* Sacc., *S. globosus* Pegl., *S. atro-nitens* Sacc.

ENDOCALYX B. et Br. — Syll. VII, p. 466 — em. Petch, Ann. of Bot. XXII (1908) pag. 399 (Etym. *endon* intus et *calyx*). — Synnemata stipitata v. sessilia, basi innata, ex hyphis parallelis verticalibus composita; hyphæ internæ supra disjunctæ, conidiferæ; hyphæ externæ in membranam fragilem, cylindricam v. infundibuliformem conglutinatæ; conidiophora simplicia, libera, densissime conferta, deorsum coalescentia; conidia pleurogena, alterna, stipitellata, continua, fusca, compressa. — Quoad synonyma cfr. Petch l. c.

1. **Endocalyx melanoxanthus** (B. et Br.) Petch, l. c., *Melanconium* 8767 *melanoxanthum* B. et Br. — Syll. III, pag. 758. — Conidia ex angulato subglobosa, primo flava, dein nigra, compressa, levia, 14-19 \approx 12-14, e latere 6-7 μ . cr. — In frondibus Cocoës et Oncospermatis, Ceylon.
2. **Endocalyx Thwaitesii** B. et Br. — Syll. VII, p. 467 — Petch, 8768 l. c. pag. 400 — Conidia ovoidea v. globosa, minime compressa, atro-fusca verruculosa v. echinulata, 17-21 \approx 16-19. — In frondibus Oncospermatis, Ceylon.
3. **Endocalyx cinctus** Petch, Ann. of Bot. XXII (1908) pag. 394 et 8769 399. — Synnematibus, 1,5 mm. alt. erectis, cylindraceis, supra infundibuliformibus, flavis, ex hyphis parallelis, 1,5-2 μ . cr. conglutinatis formati, deorsum vagina nigra cylindrica ad 0,6 mm. alta, 0,1 mm. diam. ex hyphis parallelis composita cinctis; hyphis externis supra in membranam fragilem, flavam, striatam dentibus quadratis recurvis fissam conglutinatis; hyphis internis deorsum in stipitem conglutinatis, supra liberis, confertis, conidiferis; conidiis globosis v. ovoideis, compressis, primo flavis et minute verrucosis dein nigris, 11-12 \approx 9-12.

Hab. in frondibus *Oncospermatis fasciculati* (ex Palmis) emortuis Peradeniya, Ceylon.

Sect. 3. Phragmosporæ.

ARTHROBOTRYUM Ces. — Syll. IV p. 628, XVI p. 1089, XVIII p. 655.

1. **Arthrobotryum caudatum** Syd., in De Wildem. Fl. Bas- et Moy.- 8770 Congo t. III, fasc. I (1909) Extr. p. 22. — Synnematibus epi-phyllis, in mycelio *Meliolæ* (ut videtur) parasitibus, solitariis v. pluribus basi fasciculatis, totis flavo-brunneis, 400-800 μ . long., 20-35 μ . latis, basi paulo crassioribus, teretibus, ex hyphis dilute brunneis 2-3 μ . crassis dense contextis, apice divergentibus et capitulum 70-120 μ . longum, 35-70 μ . crassum formantibus compositis; conidiis solitariis, fusoideis, 3-septatis, cellula inferiori in stipitem longum (15-20 μ) attenuata, diu hyalinis, tandem dilute olivaceo-brunneis, 25-40 (cum stipite) longis, 6-8 μ . latis.

Hab. in foliis Randiæ sp. verisimiliter parasitica in mycelio *Meliolæ* (*M. amphitrichæ*?) Kimpako et Boko Sainte-Barbe Congo Africæ (VANDERYST).

2. **Arthrobotryum Rickii** H. et P. Syd., Ann. Mycol. IV (1906) p. 345. 8771 — Synnematibus sparsis v. basi paucis fasciculatis, erectis, atris, filiformibus, rigidis, usque ad 1 mm. long., 50-70 μ . cr., basi subbulbosis, apice clavato-incrassatis, parte claviformi circ. 70-200 μ . longa, ex hyphis circ. 2-3 μ . cr. dense cohærentibus compositis; conidiis subcylindraceis, elongatis, utrinque rotundatis, 6-18-septatis, non constrictis, quaque cellula plerumque 1-guttata, fuscis, 35-80 \times 5-6.

Hab. in culmis Arundinariæ, São Leopoldo, Rio Grande do Sul Brasiliæ (J. RICK).

LINDAUOMYCES Koord., Bot. Unters. Java (1907) p. 240 (Etym. a cl. prof. G. LINDAU). — Synnemata stipitato-capitata ex hyphis compactis composita, rigida, erecta, fusca; stipitibus parenchymaticis, tenacibus, sursum in capitulum globosum conidiferum productis. Conidia in hyphis fasciculatis, subbrevis, fuligineis, filiformibus, in capitulo peripherice inserta, acrogena, solitaria (haud concatenata), oblonga v. fusoideo-oblonga, fumigata, 1-3-septata, ad septa non constricta. — Genus vix diversum ab *Arthrobotryo*.

1. **Lindauomyces javanicus** Koord., Botan. Untersuch. (1907) p. 240, 8772 fig. 51. — Stipitibus 250-275 \times 35 hypophyllis; conidiis levibus 7,5-13 \times 4, rectis v. curvulis, utrinque acutis v. obtusis, plerumque 10-13 \times 4.

Hab. in foliis emortuis Fici elasticæ cultæ pr. Pennunggalan prov. Kedu ins. Java (KOORDERS).

PODOSPORIUM Schw. — Syll. IV p. 627, X p. 699, XIV p. 1113, XVI p. 1089, XVIII p. 656.

1. **Podosporium chlorophæum** Speg., Myc. Arg. V. pag. 450, in An. 8773 Mus. Nac. Buenos Aires XX (1910). — Subiculo superficiali araneoso v. submembranaceo centro velutino v. hirsuto, 10-15 mm. diam.; stipitibus densiuscule gregariis erectis, penicillato-ramulosis, atro-fuligineis, 150-250 \times 20-30, ex hyphis simplicibus septulatis vix flexuosis, 4-5 μ . cr., olivaceis pellucidis efformatis; conidiis acrogenis clavulatis, 20-30 \times 5, quadrilocularibus, olivaceis, loculis apicalibus pallidioribus, levibus, eguttulatis.

Hab. ad folia languida Merostachydis argyronematis prope San Pedro Misiones Argentina Amer. austr.

PHÆOISARIOPSIS Ferraris, Ann. Mycol. VII (1909) p. 280 (Etym. *phajos* obscurus et *Isaria*) — Synnemata gracilia, olivacea vel brunnea ex hyphis plus minusve relaxatis efformata. Conidia in paniculam v. capitulum laxum digesta, ovoido-oblonga v. cylindracea, pluriseptata, hyalina v. subhyalina. — Huic generi secund. FERRARIS adscribendæ sunt: *Isariopsis griseola* Sacc., *I. Grayana* Ell., *I. mexicana* Ell. et Ev., *I. pilosa* Earle; sed verisimillime a gen. *Lindauomyces* Koord. non differt.

1. **Phæoisariopsis Tweediana** (Speg.) Sacc. et Trott., *Isariopsis Tweediana* Speg., Myc. Arg. V, p. 451, in An. Mus. Nac. Buenos Aires XX (1910). — Maculis obsoletis amphigenis angulosis olivascentibus; stipitibus hypophyllis erectis teretibus, 150-300 \times 20-40, laxiscule gregariis cylindraceis vix apice fimbriatis, olivaceis, ex hyphis simplicibus septulatis apice non v. vix denticulatis, 4-6 μ . cr., subolivaceis efformatis; conidiis vermicularibus, 50-80 \times 4-5, 3-5-septatis, ad septa non constrictis, levibus, hyalinis.

Hab. ad folia viva Cissi Tweedianæ in dumetis prepe Tucumán Argentina Amer. austr. — Species notis nonnullis ad *Cercosporinam* vergens, cum *Cercospora Riacheuli* Speg. non comparanda.

Sect. 4. Dictyosporæ.

HERMATOMYCES Speg., Myc. Arg. V, pag. 445, in An. Mus. Nac. Buenos Aires XX (1910) (Etym. *Hermes* (pileo bialato) et *myces*). — Hyphæ steriles repentes ramulosæ olivaceæ septulatæ; hyphæ fertiles erectæ clathrato-muriformes subhyalinæ, apice bicornutæ, cornubus retroflexis arcteque adpressis nigris monospermis; conidia globosa clathrato-muriformia subopace fuliginea.

1. **Hermatomyces tucumanensis** Speg., l. c. p. 446, cum icon. — Hyphæ sterilibus 3-4 μ . cr. dense intertextis, subiculum tenuissimum ægre perspicuum arcte matrici adnatum vix fuscescens efformantibus; conidiophoris e latere compressis clavatis v. subclavatis, 20-40 \times 25, e latere 10-15 μ . cr., e cellulis superpositæ biseriatæ efformatis; conidiis e latere compressis sublenticularibus 35-40 \times 30, e latere 15-20 μ . cr., concentrice parenchymaticis, subopace olivaceis.

Hab. ad ramulos dejectos putrescentes Smilacis campestris et Celtidis cujusdam in Parque Roca Tucumán Argentina Amer. austr.

Dubiæ sedis.

PSEUDOGASTER v. Höhnel, Ergebniß Bot. Exp. Südbras. 1901 Denk. k. Ak. d. Wiss. Wien Bd. LXXXIII (1907) Extr. p. 38 (Etym. *pseudes* falsus et *gaster* pro gasteromycete). — Synnemata clavata ex hyphis laxè cohærentibus, deorsum parallela, sursum irregulatiter reticulatim ramoso-connexis formata. Conidia subglobosa, continua, in hypharum ramulis pleurogena et tegumento peculiariter obducta, tegumento verruculoso pallide brunneo ex hyphis intertextis conflato. — Genus quoad sedem ambiguum, Gasteromyctem minutum æmulans.

1. **Pseudogaster singularis** v. Höhnel l. c., Char. generis. — Lichenicola; synnematibus 0,5-1 mm. altis, stipite 200-300 μ . cr., albo præditis, sursum clavatis, griseis; hyphis indistincte septatis. 1,5-1,8 μ . cr.; conidiis subglobosis, 8-12 μ . diam. griseo-brunneis obtegumentum firmulum, intertextum inæqualiter verrucoso - angulosus.

Hab. in thallo tenui albido Lichenis cujusdam ad cortices São Paulo Brasiliæ (SCHIFFNER).

*Fam. 4. Tuberculariaceæ EHRENB. em. SACC.**Ser. 3. TUBERCULARIEÆ MUCEDINEÆ SACC.**Sect. 1. Hyalosporæ.*

TUBERCULARIA Tode — Syll. IV p. 638, X p. 700, XI p. 645, XIV p. 1115. XVI p. 1090, XVIII p. 658.

1. **Tubercularia longipes** Peyl, Lotos VII (1857) p. 66, tab. II, fig. 8. 8777
— Sporodochiis erumpentibus, longiuscule stipitatis, hemisphæri-co-capitatis, 2-4,2 mm. altis, albidis, basi rubellis, intus axe conico miniato præditis; stipite elongato basi dilatato v. æquali hypostromate parvi-celluloso; conidiis ellipsoideis, hyalinis, intus granulosis.

Hab. in ramis junioribus emortuis Aceris saccharini pr. Kacin Bohemiæ (PEYL). — Species stipite elongato imprimis dignoscenda. — Diagnosim potius ex iconে deprompta, nam descrip-tio auctoris valde obscura.

2. **Tubercularia zythioides** C. Mass., Osserv. fitol., in Madonna Ve- 8778
rona II (1908) Extr. p. 11. — Sporodochiis epiphyllis, subovatis, melleis, gelatinoso-carnosis, minutis, 200 μ . circ. diam., in macu-lis exaridis et zona subvinosa ambitis laxe disseminatis; conidio-phoris curvulis et subunilateraliter subdichotome ramosis, 40-60 \times 1-1,5; conidiis pleurogenis, hyalinis, oblongis, 7-10 \times 2,5, utrinque oblique acutis v. subnavicularibus.

Hab. in foliis languidis Rubi cæsii prope Tregnago Verona, Italia bor. — Sporodochii colore, forma magnitudineque conidiorum distincta. Status pycnidicus verisimiliter est *Sclerotiopsis Rubi*.

3. **Tubercularia eryngiicola** Speg., Myc. Arg. V, p. 456, in An. Mus. 8779
Nac. Buenos Aires XX (1910). — Maculis nullis; sporodochiis erumpenti-superficialibus, subpezizoideis, 1-5 mm. long., 1-2 mm. cr., pallide miniatis, glabris, carnosulis; conidiophoris cylindraceis 20-25 \times 1-1,5 dense constipatis, simplicibus, hyalinis, monosporis; conidiis e cylindraceo subfusoideis 8-12 \times 2,5-3 rectis v. vix sub-inæquilateralibus, eguttulatis v. 2-4-guttulatis, hyalinis.

Hab. ad folia et caules aridos putrescentesque Eryngii pan-danifolii in uliginosis prope La Plata Argentina Amer. austr.

4. **Tubercularia fusispora** Corda, Icones I, p. L, tab. 1, fig. 67 (1837). 8780

— Subsphærica, alba, mollis; stromate grumuloso, luteolo; conidiis fusiformibus, acutis, albis, diaphanis, 5 μ . circ. long.

Hab. in ligno Sambuci putrido, in Bohemia.

5. **Tubercularia olivacea** Schum. in herb. — Cfr. Rost. in Overs. Kgl. 8781 Danske Vidensk. Selbsk. Forhandl. (1884) p. 149, Lindau Deut. Krypt. Fl. Pilze IX p. 441. — *Tuberc. sulcata* Schum. in Fl. Dan. t. 2338, non Tode (= *Ditiola sulcata*). Sporodochiis hemisphæricis subdepressis rugulosis, non sulcatis, subolivaceis seu cinereo-fuscis stipite cylindraceo, crasso; conidiis bacillaribus minutissimis, 3-4 μ . longis.

Hab. in ligno dejecto putrido in Dania (SCHUMACHER). — *Tubercularia olivacea* Bres. in Strasser Verhandl. k. k. zool. bot. Ges. Wien LX (1910) p. 328 (nomen nudum). In ramis Sonntagberg Austriæ. An sit eadem ac Schumacheri dubium est. Putatur forsan esse formam vetustam *Tuberc. confluentis*.

ENDOCONIDIUM Prill. et Del. — Syll. X p. 708, XI p. 646.

1. **Endoconidium tembladeræ** Heraclio Rivas et Ces. Zanolli, La tembladera, in Revista de la Facultad de Agronomia y Veterinaria de la Plata, tom. V. (1909) p. 183, fig. 4-10. — Mycelio imprimis inter cellulas aleuronicas seminis evoluto, filiformi, flexuoso, ramoso, vacuolato, 2-3,5 μ . cr., in segmenta 11-35 μ . longa partito, dein in glomerulos dense intricato-compacto, ramulis periphericis innumeris, divergentibus, tenuioribus (conidiophoris); conidiis sphæroideis 1-2,5 μ . diam., v. ovoideis 5-5,5 μ . long., in apice conidiophoris veluti intra vaginulam singulatim et successive formatis secedentibusque, hyalinis.

Hab. in caryopsidibus, ubi magis evolvitur, nec non in floribus, foliis, culmoque Festucæ Hieronymi Hackel in regione Andina reipublicæ Argentinæ. — Animalia equina, bovina, ovina et caprina, quæ hoc gramine vescuntur sæpiissime morbo gravissimo tembladera dicto afficiuntur. Professores platenses, Rivas et Zanolli, ductu ill. Spegazzinii, tandem causam myceticam morbi ingeniose detegerunt. — Ob vitam tantum, ut videtur, endogenam species a typo *Endoconidii* recedit et propius accedit ad mycetem hucusque asporum, qui vim ebrietatis *Lolio temulento* communicat.

CHÆTOSPERMUM Sacc. — Syll. X p. 706.

1. **Chætospermum Elasticæ** Koord., Bot. Untersuch. Java (1907) p. 244, 8783

fig. 55. — Sporodochiis amphigenis, plerumque hypophyllis, innatis, erumpentibus, 0,3-0,7 mm. diam., pulvinatis, orbicularibus, albescenscentibus; hyphis fertilibus ramosis; conidiis acrogenis, solitariis, continuis, hyalinis, anguste cylindraceis, 21-25 \approx 3,5-4, utrinque rotundatis et 2-6-setosis; setis rectis 10-15 μ longis, vix $\frac{1}{3}$ μ . crassis, hyalinis, interdum inconspicuis.

Hab. in foliis emortuis putridis Fici elasticæ prope Purworedjo, Loano, Penunggalan prov. Kedu, Java (KOORDERS).

TUBERCULARIOPSIS v. Höhn. *Fragm. z. Mycol. VI*, in *Stzb. k. Ak. d. Wiss. Wien CXVIII*, Abt. I p. 42 1 (1909). (Etym. a *Tubercularia*, cui affinis). — Sporodochia gelatinoso-cartilaginea, erumpentia, discoidea, crasse breviterque stipitata; contextu hyalino fibroso-plectenchymatico. Conidiophora parallela, sursum parce ramosa. Conidia continua hyalina, extus mucosa, in stratum firmum approximata, globulosa, v. fusoidea, acroleurogena.

1. **Tuberculariopsis anomala** v. Höhn. l. c. cum icon. — Sporodochiis 0,5-2 mm. lat. 0,5-1 mm. cr., ochraceo-flavis, subdiaphanis, vegetis cartilagineo-gelatinosis; contextu ex hyphis 2-3 μ . cr. dense radiatim fasciculatis, hyalinis, apice minute denticulato-sporigeris; conidiis sessilibus v. brevissime stipitatis, hyalinis, ovoides, 9-12 \approx 8-10, subinde oblongatis v. citriformibus, intus granulosis, stratum 100-300 μ . crassum formantibus. 8784

Hab. in ramis emortuis, Tjibodas Javæ.

DENDRODOCHIUM Bon. — *Syll. IV* p. 650, *X* p. 706, *XI* p. 646, *XIV* p. 1115, *XVI* p. 1092, *XVIII* p. 660.

1. **Dendrodochium verticilloides** Sacc. *Ann. Mycol. VI* (1908) p. 568. 8785
— Sporodochiis dense gregariis, minutissimis, hemisphæricis, superficialibus, 100-120 μ . diam, candidis, in areis intus et extus denigratis orientibus, laxiusculis, ob hyphas sæpe exertas pubescens; hyphis fertilibus bacillaribus, modo simplicibus, modo furcatis, modo iterato dichotomis, 40-60 \approx 3, ramulis obclavatis; conidiis breviter fusoideis, curvulis, utrinque obtusulis, 7-8 \approx 2,2-2,5, hyalinis.

Hab. in canibus languidis v. emortuis Cerei sp. in montibus Apaseo, Guanajuato Mexici (BONANSEA).

2. **Dendrodochium æruginosum** v. Höhn. *Ann. Myc. III* (1905) p. 339. 8786
— Sporodochiis superficialibus, hemisphæricis subinde depresso verruciformibus, ambitu irregulariter orbicularibus, sparsis, v. grega-

riis, sæpe confluentibus, vegetis vivide æruginosis, siccis atroviridis vel nigricantibus, 100-800 μ . diam., mollibus, fere gelatinosis, ex hyphis 1-1,5 μ . cr., simplicibus v. ramoso-intricatis constantibus; hyphis sursum ramos alternos v. oppositos v. 3-4-vermicillatos, plerumque curvulos, fusoideos v. clavulatos, apice acutos gerentibus; conidiis solitarie acrogenis.

Hab. in ramis putridis, dejectis Fagi, Wienerwald Austriæ (v. HöHNEL).

3. **Dendrodochium Traversi** Giuditta Mariani in Atti Soc. it. Sc. Nat. 8787 L (1911) p. 171, fig. 5. — Sporodochiis sparsis vel hinc inde approximatis, subsphæricis, depressis, sessilibus, $\frac{1}{5}$ - $\frac{1}{4}$ mm. diam., albis; hyphis fertilibus furcatis, typice dichotomis $1\frac{1}{2}$ -2 μ . diam.; conidiis copiosis, ovoideis vel breviter subcylindraceis, $3\frac{1}{2}$ - $4\frac{1}{2}$ \times 2, varie guttulatis, hyalinis.

Hab. in cladodiis emortuis Ruscii Hypoglossi in Horto Botanico Conimbricensi Lusitaniæ (A. MOLLER).

4. **Dendrodochium epistroma** v. Höhn. Fragm. z. Myk. VI, in Stzb. 8788 k. Akad. Wiss. Wien, CXVIII, Abt. I (1909) pag. 424. *Hymenula epistroma* v. Höhn. in Syd. Mycolh. germ. n. 648. — Sporodochiis vegetis roseo-incarnatis, siccis fere miniatis, serius rubro-brunneis, depresso verruciformibus, 0,2-0,5 mm. diam., raro crassioribus vel confluentibus et tunc usque ad 5-6 mm. long. singulis vero linea brunnea distinctis; hyphis 2-4 μ . cr., ex hyalino flavidis, in fasciculos connexis, dendroideo-ramosis, radiatim divergentibus, apice in hymenium dilute roseum 40 μ . crassum abeuntibus; hymenii conidiophoris ex hyphis simplicibus, v. fasciculato-ramosis, 1-2 μ . cr., flexuosis formatis; conidiis in apicibus acrogenis, hyalinis, bacillaribus, rectis curvulisve, 3-5 \times 1, mucoso-convexis.

Hab. in stromate Diatrypellæ favaceæ ad ramos betulinos, Tamsel Brandenburg (P. VOGEL) et Triglitz JAAP).

TUBERCULINA Sacc. — Syll. IV p. 653, X p. 709, XI p. 646, XIV p. 1118, XVI p. 1092, XVIII p. 661.

1. **Tuberculina prosopidicola** Spieg., Myc. Arg. V, p. 452, in An. 8789 Mus. Nac. Buenos Aires XX (1910). — Acervulis primo discretis dein confluentibus linearibus carnosulis e rimulis erumpentibus fusco-purpurascensibus, setulis nonnullis, sparsis, simplicibus cylindraceis non v. 1-2-septatis apice obtusiusculis, 30-50 \times 4-5, pallide olivaceis ornatis; conidiis sæpius subglobosis, 5-10 μ . diam.,

dichotomice catenulatis, levibus fumosis, muco deliquescente obvolutis eguttulatis.

Hab. ad ramos, pedunculos nec non legumina *Uredine* prosopidicolæ Speg. infecta in montuosis Catamarca Argentina Amer. austr. — Species a genere setularum præsentia satis recedens.

2. **Tuberculina apiculata** Saccardo, Fungi aliquot africani, Bol. Soc. Broteriana, v. XXI (1904-905) p. 8. — Sporodochiis in tuberculis (gallis?) foliorum subsuperficialibus, pulvinatis, siccis nigrescentibus, 0,3-0,6 mm. diam., 160-170 μ . altis, compactis; conidiophoris indivisis, densissime verticaliter stipatis, cylindraceis, subcontinuis, 5-6 μ . cr., fulvo-rufescentibus, hyphis inferioribus saturatioribus; conidiis in apice conidiophori solitariis, globosis, 10-12 μ . diam., basi sæpissime apiculo prominulo præditis, sordide roseis.

Hab. in foliis adhuc vivis Clerodendri Silviani, S. Thomé, alt. 100 m., Africa (A. MOLLER).

3. **Tuberculina andina** Speg., Myc. Arg. V, p. 452, in An. Mus. Nac. Buenos Aires XX (1910). — Sporodochiis hemisphæricis pseudoperidia æcidii tota obstruentibus 250-400 μ . diam., livido-glaucouscentibus, carnosulis; conidiis subglobosis, 10 μ . diam., tenuiter tunicatis, levibus, hyalinis, eguttulatis.

Hab. in æcidio ad folia Euphorbiæ portulacoidis in summis montibus Puente del Inca prope Mendoza Argentina Amer. austr.

4. **Tuberculina præandina** Speg. Myc. Arg. V, p. 452, in An. Mus. Nac. Buenos Aires XX (1910). — Sporodochiis valde numerosis, fusco-purpureis, pseudoperidia æcidii impletibus, subconfluentibus carnosulis; conidiis globosis tenuissime tunicatis, 10 μ . diam., levibus, eguttulatis, vix fumosis, violascentibus.

Hab. in æcidio ad folia viva Senecionis mendozini, Potrerillos prope Mendoza Argent. Amer. austr.

5. **Tuberculina microstigma** Sacc. Ann. Mycol. VI (1908) pag. 563, 8793 tab. XXIV, fig. 12. — Sporodochiis perexiguis, superficialibus, hinc inde dense gregariis, albidis, granuliformibus, 60-80 μ . diam., epiphyllis; hyphis fertilibus e basi fasciculato-radiantibus, filiformibus, hyalinis, minute denticulatis, subtortuosis, 20-30 \times 2,5, simplicibus v. sæpius e basi furcatis, continuis; conidiis sphæricis, levissimis, e subchlorino hyalinis, intus granulosis, 14 μ . diam., episporio 2 μ . cr.

Hab. in foliis vivis Achilleæ Millefolii, Dahlewitz pr. Zossen Germaniæ, Sept. 1906 (H. SYDOW). — Sane peculiaris et a typo desciscens.

6. **Tuberculina Davisiana** Sacc. et Trav. in Saccardo, Not. Myc. IX, 8794 Ann. Myc. v. V (1907) p. 177. — Hypophylla, in *Rhytismatis salicini* parte aversa parasitica, isabellino-mellea; acervulis minutis, 80-160 μ . latis, pulvinulatis, dense confertis et saepe confluentibus, compactiusculis; hypostromate irregulariter celluloso, subhyalino, 50-60 μ . crasso; conidiophori sex hypostromate, oriundis fasciculatis, paliformibus, 28-40 \times 6-7, dilute flavo-melleis, continuis, raro 1-2-septatis, apice obtusis; conidiis globulosis v. cuboideo-globosis, levibus, 12-15 \times 10-13, intus minute granulosis, hyalino-lutescentibus, interdum, ut videtur, brevissime et labiliter crenulatis.

Hab. in foliis adhuc vivis Salicis cordatæ, parasitica in Rhytismate, Racine, Wisconsin U. S. A. (J. J. DAVIS). — Ut ceteræ generis species videtur parasitica nec cum *Rhytismate* metagenetica.

7. **Tuberculina pallida** Syd., in De Wildem., Flora Bas- et Moy. Congo 8795 t. III, fasc. I (1909) Extr. p. 10. — Sporodochiis globuloso-depressis, roseo-albis, mollibus, 0,3-0,5 mm. diam.; conidiophoris ramulosis, hyalinis, continuis, elongatis, 3-5 μ . c. cr.; conidiis globosis, hyalinis, continuis, levibus, 6-9 μ . diam.

Hab. parasitica in uredosoris Pucciniæ insolitæ Syd. (in Panico) Kisantu, Congo Africa (VANDERYST).

MENOIDEA Mangin et Hariot Bull. Soc. Myc. France, t. XXIII (1907) p. 67. (Etym. *mene* luna, ob conidia lunulata). — Sporodochia pulvinata, carnosula, glabra, pallida, erumpentia. Conidiophora simplicia erecta, dense stipate; conidia lunulata, arcuata, continua, hyalina.

1. **Menoidea Abietis** Mang. et Har., Bull. Soc. Myc. France, t. XXIII 8796 (1907) p. 67, fig. 9, I-II. — Sporodochiis pallidis hypophyllis minutis, parum conspicuis, 300-400 μ . diam.; conidiophoris bacillaribus, hyalinis continuis, 30-35 \times 4-5; conidiis solitarie acrogenis, fusoideo-lunulatis, apice acutiusculis, basi obtusulis, 18-20 \times 8, hyalina.

Hab. in foliis Abietis pectinatæ in silva La Savine dicta, Java. — Probabiliter Discomycetis cujusdam status conidiophorus.

ILLOSPORIUM Martius, — Syll. IV p. 656, X p. 710, XI p. 646, XIV p. 1117, XVI p. 1093, XVIII p. 662.

1. **Illosporium Diedickeanum** Sacc. Ann. Myc. VI (1908) pag. 563, 8797 tab. XXIV, fig. 9. — Maculis vagis latiusculis, subinde confluentibus, cinerescentibus, distinctius epiphyllis, non marginatis; sporodochiis perexiguis, disciformibus, compactiusculis, albo-diaphanis, ambitu orbicularibus, nitidulis, in epiphylo copiosioribus, laxe gregariis, 130-160 μ . diam., puncto minimo affixis, hinc facillime secedentibus; conidiophoris e cellula ima subrotunda 30-40 μ . diam. radiantibus, oblongo-cylindraceis vel clavulatis, integris vel lobulatis, 30-40 \approx 14 μ ., apice obtusis, ibique conidia (genuina?) globulosa vel subangulosa, singula vel plura 13-14 \approx 10-11, hyalina gerentibus.

Hab. in foliis Aceris Pseudoplatani, Steigerwald pr. Erfurt Germaniæ (H. DIEDICKE). — Sporodochia minima, ovula insectorum in mentem revocantia. Species a typo generis aliquid recedens, et denuo inquirenda. Conidiophora apice subinde asperula videntur.

SPHACELIA Lév. — Syll. IV p. 666, XIV p. 1118, XVI p. 1093, XVIII p. 663.

1. **Sphacelia Miscanthi** P. Henn., Engl. Jahrb. XXXVII (1905) p. 166. 8798 — Sclerotiis oblonge turbinatis apice obtuse incrassatis, atris, c. 3 mm. longis, 1 mm. latis; sporodochiis ceraceo-farinosis, pallidis; conidiophoris fasciculatis, continuis, filiformibus, hyalinis, c. 2 μ . cr.; conidiis acrogenis oblonge fusoideis, continuis, hyalinis, 5-8 \approx 2.

Hab. sclerotia in ovariis Miscanthi sinensis, Me Yanaze Tosa Japoniæ (YOSHINAGA).

2. **Sphacelia Allii** Vogl. Staz. sperim. agr. it. XXXVI (1903) p. 89, 8799 tab. I-II. — Rubescens, e *Sclerotio cepivoro* oriens; conidiophoris ex hypostromate appланato nascentibus, fasciculatis, stipatis, septatis, hyalinis, parce ramulosis 40-50 μ . longis, apice pseudo-sterigmatibus subverticillatis acutis brevibus coronatis; conidiis copiosis globosis solitariis v. breviter catenulatis, 1-guttulatis, levibus, hyalinis 2-4,5 μ . diam.

Hab. in *Sclerotio cepivoro* in bulbis Allii sp. in Pedemontio.

ÆGERITA Pers. — Syll. IV p. 661, X p. 711, XI p. 647, XIV p. 1118, XVIII p. 663.

1. **Ægerita perpusilla** Desm., Ann. Sc. Nat. ser. II, v. XIV (1840) 8800 p. 9, tab. I, fig. 3. — Candida, minutissima, conferta, granuliformis; sporodochiis globosis vel ovoideis, vix $\frac{1}{6}$ mm. attingentibus; conidiis hyalinis, inæqualibus, globosis, ovoideis, piriformibus vel difformibus, 10-12 μ . diam.

Hab. ad ligna putrida, in Gallia.

2. **Ægerita Traversiana** L. Gaja, Flora Micol. prov. Padova, p. 24 8801 (sunto litogr.). — Sporodochiis superficialibus, gregariis, inæqualiter subglobosis, 300-350 μ . diam., lacteis, ad instar flocculorum sparsis; hyphis hyalinis subcylindraceis, rectis, septatis, in fasciculos dense unitis, circiter 100-120 \approx 5-6, ad apicem præcipue ramulosis; conidiis subglobosis, solitariis, hyalinis, intus nubilosus, breviter basi apiculatis, 18-20 \approx 13-15.

Hab. in cavernulis trunci cariosi, Arquà in Euganeis ad ripam lacus, Ital. bor. (L. GAJA).

3. **Ægerita Webberi** Fawcett, Mycologia II (1910) p. 167, tab. XXVIII-XXIX. — Sporodochiis epiphyllis superficialibus, subglobosis, albidis, dein rubenti-brunneis, 60-90 μ . diam., appendices 3-5 fermentibus; cellulis conidiomorphis, globosis v. ellipsoideis, hyalinis, tenui-tunicatis, 12-18 μ . diam., glomerulatis; appendicibus rectis, crasse tunicatis, 2-3-septatis, apice rotundatis, 150-200 \approx 6-8, sursum tenuatis ibique 4-6 μ . cr., e sporodochii basi orientibus; hyphis fertilibus e hyalino fuscellis, parce ramosis, remote septatis, pag. sup. foliorum effusis; stromatibus hypophyllis, pustulatis, castaneo-brunneis, e plano convexis, 0,5-2 mm. diam., ex hyphis crasse tunicatis, intricatis formatis, margine submembranaceis, griseo-fusco et mycelio late effuso circumdati.

Hab. ad larvas Aleyrodis Citri et Al. nubiferæ in foliis Citri Aurantii, socia Aschersonia Aleyrodis in Florida. — Quo modo fungillus ex conceptaculis omnino difformibus constitutus sit non liquet.

SPHÆROSPORIUM Schw. — Syll. IV p. 664.

1. **Sphærosporium argentinense** Speg., Myc. Arg. V, p. 451, in An. 8803 Mus. Nac. Buenos Aires XX (1910). — Sporodochiis late effusis suborbicularibus, 5-10 mm. diam., pallide carneis subcarnosulis ambitu araneosulis pallidioribus; hyphis tenuissimis dense intricato-ramulosis, 1-1,5 μ . diam., pauci-septatis; conidiis subgloboso-angulatis, 5-20 μ . diam., crasse tunicatis, levibus, hyalinis, grosse guttulatis.

Hab. ad ramos dejectos putrescentes in silvis prope Formosa Argentina Amer. austr. (E. KERMES).

FUSICOLLA Bonord. — Syll. IV p. 664, X p. 712.

1. **Fusicolla? oidiooides** Speg., Myc. Arg. V, p. 453, in An. Mus. 8804 Nac. Buenos Aires XX (1910). — Maculis nullis; sporodochiis epiphyllis subglobosis 50-100 μ . diam., densiuscule gregariis plagiulam suborbicularem, 3-7 mm. diam., candidam tenuissime farinosulam efficientibus, glabris; conidiophoris cylindraceis, 10-15 \times 2, hyalinis continuis constipatis, apice subtruncatis, 1-2-spermis; conidiis sublunatis continuis, 10-20 \times 3, levibus, hyalinis.

Hab. ad folia viva Cardiospermi Halicacabi in dumetis prope Posadas Argentina Amer. austr.

SPHÆROCOLLA Karst. — Syll. XI p. 648.

1. **Sphærocolla argentinensis** Speg., Myc. Arg. V, p. 454, in An. Mus. 8805 Nac. Buenos Aires XX (1910). — Sporodochiis sparsis v. hinc inde pauci-gregariis, primo subhemisphæricis, 100-250 μ . diam., tremelloideis dein difformibus sæpeque confluentibus; conidiophoris a basi ramulosis, 20 \times 1,5-2, rectiusculis, acutiusculis, continuis; conidiis catenulatis, globos, 2-3 μ . diam., eguttulatis levibus hyalinis.

Hab. ad corpora Dactylopii citricolæ in Citro Aurantio Santo Tomé Corrientes Argentina Amer. austr.

2. **Sphærocolla citrina** Speg., Myc. Argent. V, p. 455, in An. Mus. 8806 Nac. Buenos Aires XX (1910). — Sporodochiis sparsis v. laxè gregariis tremelloideis, primo cupularibus v. patellaribus 0,5-1 mm. diam., superne applanatis v. concaviusculis inferne coarctatulis, non v. breviter stipitatulis, serius subdiffluentibus, et difformibus, per corticis rimulas protrudentibus; conidiophoris tenuissimis diffluentibus; conidiis catenulatis, globosis, 2 μ . diam., eguttulatis levibus.

Hab. ad radices emortuas v. languentes Pini maritinae, Villa Elisa prope La Plata Argentina Amer. austr.

HYMENULA Fr. — Syll. IV p. 667, X p. 712, XI p. 647, XIV p. 1118, XVI p. 1093, XVIII p. 664.

1. **Hymenula Hariotiana** Sacc. Not. Myc. VII, Ann. Myc. IV (1906) 8807 p. 275. — Sporodochiis superficialibus, applanatis, ambitu oblongis, 1 mm. long., 0,5 mm. lat., pelliculiformibus, e miniato auran-

tiacis, anguste albo-marginatis; conidiis copiosis, cylindraceis, utrinque rotundatis, obsolete et minutissime 2-guttulatis, rectiusculis, 5-6 \approx 1, hyalinis, coacervatis dilutissime roseis; conidiophoris dense stipatis, bacillaribus, e strato proligero minute celluloso oriundis, 8-9 \approx 1, subhyalinis.

Hab. in ramulis emortuis *Sarothamni scoparii* prope Parisios in Gallia; legit et communicavit P. HARIOT. — Ab affini *Hymenula rubella* distinguitur sporodochiis albo-marginatis, conidiophoris multo brevioribus, matrice omnino diversa.

2. ***Hymenula aurantiaca*** Lindau, in Rabenh. krypt. Fl. IX, pag. 419 8808 (1909). — Sporodochiis adnatis, oblongis, tenuissimis, ambitu irregularibus, $\frac{1}{2}$ - $\frac{3}{4}$ mm. lat., primo dilute rubris, veluti pellicula alba indutis, dein aurantio-rubris, margine lacinulis minutis cinctis; conidiophoris... non visis; conidiis tereti-oblongis, utrinque rotundatis, hyalinis, 5,5-7,5 \approx 1.

Hab. in foliis vetustis *Vincæ minoris* pr. Triglitz, Brandenburg (JAAP).

3. ***Hymenula Elasticæ*** Koord., Bot. Untersuch. Java (1907) p. 241 f. 52. 8809 — Sporodochiis disciformibus, orbicularibus, calvis, pallide roseis, c. 220 μ . diam.; conidiis in apice conidiophorum simplicium acrogenis, ovoideis, utrinque rotundatis, continuis, hyalinis, 4-5 \approx 2-2,5, levibus.

Hab. in partibus emortuis v. languidis foliorum *Fici elasticæ* prope Purworedjo et Sapuram prov. Kedu Java sept.-oct. 1905 (KOORDERS).

4. ***Hymenula rhodella*** Jaap, Abh. bot. Ver. Prov. Brandenb. IL 8810 (1907) p. 13, et L (1908) p. 50. — Sporodochiis tenuiter membranaceis, oblongis, irregulariter marginatis, usque ad 1 mm. diam., aurantio-rubris, margine albo; conidiophoris dense stipatis, indivisis, raro furcatis, usque ad 23 \approx 1, hyalinis; conidiis oblongo-ellipsoideis, utrinque obtusis, hyalinis, 3-4,5 \approx 1.

Hab. in foliis siccis dejectis *Pini silvestris* prope Triglitz in Brandenburgia (JAAP). — Socia adest *Niesslia pusilla* (Fr.) Schröter.

DACRYMYCELLA Bizz. — Syll. IV p. 671.

1. ***Dacrymycella Beijerinckii*** Koord., Botan. Untersuch. Java (1907) 8811 p. 241, fig. 53. — Sporodochiis discoideis, aurantiaco-roseis, sparsis, amphigenis, subgelatinosis, 650-675 μ . diam., basi angustatis et 300 μ . diam., superficialibus, glabris; conidiophoris filiformibus, distincte

et longe ramosis ubique, basi excepta, verruculoso-conidiferis, hyalinis; conidiis ovoideis, continuis, hyalinis, 4-4,5 \approx 3, utrinque rotundatis, levibus.

Hab. in foliis emortuis putrescentibus Fici elasticæ prope Purvoredjo prov. Kedu Java (KOORDERS).

SPHACELIOPSIS Speg., Myc. Arg. V, p. 457, in An. Mus. Nac. Buenos Aires XX (1910). (Etym. *Sphacelia*, cuius est analogum genus). — Stroma substrato innatum, subceraceum, biophilum, laeticolor; conidia bacillaria hyalina. — A gen. *Kmetia* vita biophila recedens.

1. **Sphaceliopsis cypericola** Speg. l. c. p. 457, cum icon. — Stroma bracteis adhuc inevolutis anthelarum innato, subcoalescenti, ceraceo-subcarnosulo, melleo, pruinula cinerescenti vestito, 5-10 mm. diam.; conidiis rectiusculis, continuis, utrinque attenuato-acutatis 15-20 \approx 1, levibus, eguttulatis. *St. conid. Balansiae cypri Edgerton!*

Hab. ad anthelas deformatas incrassatas Cyperi vegeti in uliginosis prope La Sábana Chaco Argentina Amer. austr.

CYLINDROCOLLA Bon. — Syll. IV p. 673, X p. 715, XI p. 648, XIV p. 1119, XVI p. 1904, XVIII p. 665.

1. **Cylindrocolla cæsia** B. R. S., in Saccardo, Not. Myc. VI, Ann. Myc. III (1905) p. 510. — Sporodochiis gregariis, applanato-effusis, ambitu suborbicularibus v. plus minus elongatis, subgelatinosis, griseo-prasinis, margine albo subbyssino; conidiis cylindraceis, subrectis, utrinque obtusulis minuteque 1-guttulatis, 8-10 \approx 1-1,5, in conidiophoris filiformibus, subramosis, 25-30 \approx 1, acrogenis et catenulatis.

Hab. ad caules emortuos Umbelliferarum, Verviers Belgii.

2. **Cylindrocolla musicola** Speg. Myc. Arg. V, p. 453, in An. Mus. Nac. Buenos Aires XX (1910). — Sporodochiis sparsis superficialibus hemisphæricis 150-500 μ . diam., sessilibus, subgelatinosis opalinis, glabris; hyphis cylindraceis dense constipatis, 50-60 \approx 2-3, flexuosis, continuis, apice subcapitulatis; conidiis catenulatis forma variabilibus, e subcylindraceo subfusoideis 6-12 \approx 3-6, hyalinis levibus, saepius grosse uniguttulatis.

Hab. ad epicarpium Musæ paradisiacæ subputrescens, La Plata Argentina Amer. austr.

SPHÆRIDIUM Fres. — Syll. IV p. 675, X p. 716, XVIII p. 666.

1. **Sphæridium Cubonianum** Sacc., in Ann. Mycol. X (1912) p. 321. 8815

— Sporodochiis superficialibus, pulvinatis, sessilibus, compactiusculis, brunneolis, siccis nigrescentibus, 350 μ . diam. glabris; conidiis in catenas longas, filiformes, dense fasciculatas, saepe furcatae, 100-130 \approx 1,5-2 dispositis, bacillaribus, rectis, utrinque truncatis, satis cohærentibus, 8-12 \approx 1,5, hyalinis, conservatis melleo-flavidulis.

Hab. in ligno putrescente Alni glutinosæ, Vittorio, Treviso, Ital. bor. (G. CUBONI). Species bene distincta.

2. **Sphæridium luteum** v. Höhn. in Lindau Krypt. Fl. Pilze IX, 8816 p. 475 (1909). — Sporodochiis globosis, ad basim conico-tenuatis, superficialibus, luteis, 200 μ . diam.; conidiophoris brevibus, indivisis, parallele dense stipatis; conidiis cylindricis, rectis, utrinque rotundatis, hyalino-flavidis, 12-14 \approx 1,5, in catenulas parallelas dispositis.

Hab. in ramis dejectis pr. Hütteldorf, Wienerwald Austriæ (v. HÖHNEL).

3. **Sphæridium javense** v. Höhn. Stzb. k. Ak. d. Wiss. Wien CXVIII, 8817 Abt. I (1909) p. 423. — Sporodochiis superficialibus, gregariis, globosis, sessilibus, albidis, siccis 100, vegetis 250-300 μ . diam.; parte basilari hemisphærica 130 μ . lata, radiatim minute cellulosa, conidiophoris brevibus simplicibus crebre tecta; conidiis cylindraceis utrinque truncatis, hyalinis, intus granulosis, rectis, continuis, 22-26 \approx 1,7-1,8 in catenas longas mucoso-connexis.

Hab. in ramis, Tjiburrum pr. Tjibodas in ins. Java.

PATELLINA Speg. — Syll. III p. 622, IV p. 677, X p. 717, XIV p. 1120, XVI p. 1095, XVIII p. 666.

1. **Patellina mellea** B. R. S., in Saccardo, Not. Myc. VI, Ann. Myc. III (1905) p. 510. — Sporodochiis discoideis, ambitu orbiculatis v. rarius confluendo elongatis, sessilibus, submarginatis, disco convexo carnosо-ceraceo, 300-500 μ . diam., albido-succineo; conidiis globulosis, numerosissimis, hyalinis, 1,5-2 μ . diam., in conidiophorum filiformium 60 μ . long. ramis copiosis breviusculis, 9-15 μ . long. erectis densis acrogenis.

Hab. ad corticem Pin i silvestris, Hestreux Belgii (MARIA ROUSSEAU).

2. **Patellina subconoidea** Speg., Myc. Arg. V, p. 453, in An. Mus. Nac. Buenos Aires XX (1910) — Sporodochiis sparsis v. laxè gre-

gariis subhemisphæricis, atris, disco depresso albido, serius elongato-conoideis 0,5-1 mm. alt. 350-500 μ . cr., extus cinereis intus albis, sed sub cortice tunica atra tectis, glabris, disco initio farcto subaurantiaco dein diffluente atque cavitatem subcylindricam relinquentे donatis; conidiis ellipsoideis utrinque rotundatis, 3-4 \approx 2-3, levibus hyalinis, minute biguttulatis.

Hab. ad petiolos putrescentes *Phœnicis canariensis* in horto Santa Catalina prope Buenos Aires, Argentina.

THOZETIA Berk. — Syll. IV p. 679.

1. **Thozetia nivea** Berk. — Syll. IV p. 679. — Cfr. ejus descriptio- 8820 nem a cl. v. Höhn. datam in Fragm. Myk. VI p. 149. Species nascitur quoque in Java.

PERIOLA Fr. — Syll. IV p. 681.

1. **Periola cerasicola** Speg., Myc. Arg. V, p. 455, in An. Mus. Nac. 8821 Buenos Aires XX (1910). — Sporodochiis dense constipatis erumpentibus subglobosis, 50-100 μ . diam., primo compactiusculis cereis ochroleucis laxè pilosis, serius subsuccineis ac diffluentibus; pilis vermicularibus 100-150 \approx 2-3, septulatis, saepe furcatis, minute guttulatis; conidiis ellipsoideis v. obovatis utrinque rotundatis, 8-10 \approx 3-4, dichotomice catenulatis, continuis, non v. grosse biguttulatis levibus hyalinis.

Hab. ad fructus Cerasi duracinæ ex *Coryneo Bejerincki* laborantes in hortis La Plata Argentina Amer. austr. — An *Corynei* status metageneticus? An in *Corynei* mycelio parasitans?

VOLUTELLA Tode — Syll. IV p. 682, X p. 718, XI p. 649, XIV p. 1120, XVI p. 1096, XVIII p. 666.

1. **Volutella alba** (Peyl) Sacc. et Trav., Syll. XX p. 1135, *Chætostroma album* Peyl, Lotos VII (1857) pag. 66, tab. II, fig. 9. — Sporodochiis molliusculis, subglobosis, basi in stipitem tenuem flocculosum tenuatis, niveis, a stipite usque ad medium sporodochium setulis longis, tenuibus, albo-hyalinis vestitis, parte superiore nudatis; conidiis minutis, ellipsoideis, hyalinis.

Hab. in foliis dejectis Nerii Oleandri et Cordylynes rubræ, nec non in squamis bulborum Amaryllidacearum, Kacin Bohemiæ (PEYL).

2. **Volutella obtusipila** Speg., Myc. Arg. V, p. 456, in Anal. Mus. 8823

Nac. Buenos Aires XX (1910). — Sporodochiis sparsis v. hinc inde pauci-gregariis, superficialibus sublenticularibus 1-2,5 mm. diam. subceraceis, roseo-aurantiaceis, cinereo-setulosis; setulis erectis 50-100 \approx 5-6, sursum leniter incrassatis levibus obtusissimis saepius biseptatis; conidiis subcylindraceis utrinque subtruncato-rotundatis 10-12 \approx 2 minute guttulatis, rectis v. inaequilateralibus, continuis hyalinis.

Hab. ad caules putrescentes Martyniæ luteæ in arvis circa La Plata Argentina Amer. austr.

3. **Volutella cucurbitina** Peck, N. Y. St. Mus. Bull. 131 (1909) p. 28. 8824
— Sporodochiis orbicularibus, in maculis orbicularibus dense confertis, interdum confluentibus, oculo inermi brunneo-purpureis, ætate brunnescens, setis gracilibus subulatis, nigris, 60-120 \approx 3-4 ornatis; conidiis oblongis, obtusis, hyalinis, 10-22 \approx 4-5; conidiophoris brevissimis v. obsoletis.

Hab. in cortice contuso Cucurbitæ Peponis, Menands, Albany Co. Amer. bor.

4. **Volutella minima** v. Höhn. Fragm. Mykol. IX (1909) pag. 83. — 8825
Sporodochiis sparsis, superficialibus, albis, obconicis, 120 μ . altis, 30-50 μ . lat., superne 40-70 μ . lat., ex hyphis parallelis, 1,5 μ . cr., compactis, transverse zonatis; setis 2-4 e basi orientibus hyalinis, crassissime tunicatis, non v. obsolete septatis, obtusulis, rigidis, parce flexis, 140-400 \approx 5-8, sursum tantum 3-4 μ . cr., in ambitu sporodochii insertis; conidiophoris brevibus, simplicibus, stipatis; conidiis rectis, oblongo-cylindraceis, hyalinis, in capitulum 60 μ . lat. dein congregatis, non catenulatis, 3-5 \approx 1-1,5, plasmate bipartito.

Hab. in foliis putrescentibus Pandani sp., socia *Nectria ignea*, in silvis Tjibodas Javæ.

5. **Volutella Elasticæ** Koord., Botan. Untersuch. (1907) p. 245, fig. 56. 8826
— Sporodochiis sparsis, disciformibus, stipitatis, irregularibus, flavis, 300-400 μ . diam.; disco setis numerosis, hyalinis, filiformibus, continuis, basi spurie septatis, hyalinis, 600-800 μ . longis, acutissimis ornato; conidiis continuis, hyalinis, cylindraceis, utrinque rotundatis, rectis, levibus, 5-6 \approx 1,5-1,7.

Hab. in foliis putrescentibus Fici elasticæ prope Loano Purworedjo prov. Kedu (Java) majo 1906 (KOORDERS).

6. **Volutella Jaapi** Bres., in Jaap, Verh. Bot. Ver. Prov. Brandb. L (1908) p. 50. — Sporodochiis gregariis, saepè confluentibus, sessilibus, pulvinatis v. hemisphæricis aurantiacis, 0,3-1 mm. diam.;

hyphis sterilibus hyalinis, basi ramosis, apice rotundatis, circa sporodochium expansis; conidiophoris ramosis prælongis, basi 3-5 μ . cr.; conidiis ovoideis, ellipsoideis v. oblongis, hyalinis, sæpe guttulatis, 4-6 \approx 2,5-3.

Hab. in trunco emortuo decorticato Pin i sp. Sachsenwald pr. Hamburg Germaniæ (JAAP).

7. **Volutella corticioides** Lindau in Rabenh. Krypt. Fl. Pilze IX, 8828 p. 491 (1909). — Mycelio late effuso, maculas irregulares flavidas v. albidas generante; sporodochiis sessilibus, copiosis, subgregariis, $\frac{1}{5}$ - $\frac{1}{2}$ mm diam. flavis, margine albo-pilosulis, disco convexo-hemisphærico, basi strato nigricante suffultis; setis septatis, hyalinis, simplicibus, crasse tunicatis, apice obtusulis et subinde etiam inflatulis, radiantibus, 100-240 \approx 5-6, superne 2,5-3 μ . cr.; conidiophoris stipatis, bacillaribus, obtusulis, 19 \approx 1; conidiis ellipsoideis, utrinque obtusis, copiosissimis, hyalinis, coacervatis flavidulis, 4 \approx 1.

Hab. in truncis emortuis (Ulm i?) in calidariis Horti botanici veteris Berolinensis, Germ. (HENNINGS).

8. **Volutella javanica** v. Höhn. Stzb. k. Ak. d. Wiss. Wien CXVIII, 8829 Abt. I (1909) p. 425 cum icon. — Sporodochiis albis, stipitatis stipite læte flavo-brunneo, sursum incrassato, prope medium sæpe protuberanti-anulato, 200 \approx 90, ex hyphis 4-5 μ . cr., solidiusculis conflato, supra in discum convexum minute plectenchymaticum, 200 μ . latum, 70 μ . alt. abeunte; disco ex conidiophoris parallelis, simplicibus hyalinis 24-32 \approx 1 constante, et margine setulis tortuosis, hyalinis 2-4-septatis, 40-100 \approx 3-3,5 cincto; conidiis in stratum 250-300 μ . lat. subglobosum mucosum conglutinatis, fusiformibus, utrinque acutis, leniter curvis, 8-12 \approx 1. hyalinis.

Hab. in ramis vivis Tjiburrum pr. Tjibodas Javæ.

9. **Volutella ciliata** Fres. — Syll. IV p. 682. — Huc ducenda est 8830 *Psilonia Medicaginis* de Brond. Recueil Crypt. Agen. III (1830) p. 37, t. 10, fig. 47, *Leptotrichum Medicaginis* (de Brond.) Roumeguère Cryptog. illust. p. 110, fig. 506. — In radicibus putridis Medicaginis sativæ in Gallia.

TRICHOFUSARIUM Bubák, Bull. Herb. Boiss. 2 sér. VI (1906) p. 488 (Etym. *thrix*, *trichos* pilus et *Fusarium*). — Sporodochia pulvinata, subepidermica, mox erumpentia, minuta, læte colorata, gelatinosa, setulis pallidis subsparsis cincta. Conidiophora dendroi-

deo-ramosa. Conidia fusoidea, continua, hyalina. — A gen. *Periola* et *Volutella* imprimis conidiis fusoideis dignoscendum genus.

1. **Trichofusarium Rusci** (Sacc.) Bubák, l. c. p. 488. — *Fusarium* 8831 *roseum* var. *Rusci* Sacc., Syll. IX p. 521. — Sporodochiis subepidermicis dein erumpentibus, subrotundis, v. ellipsoideis, rubellis, subgelatinosis, 90-220 μ . diam., setulis 90-120 \approx 5-7, undulatis, sursum tenuatis apice rotundatis, hyalinis cinctis; conidiophoris 20-100 μ . long.. ramosis, ramis ad apicem tenuatis, 2-3 μ . cr., e hyalino rubellis; conidiis fusoideis, inaequilateris, rectis curvulive, 1-cellularibus, minute guttulatis, rubellis, 10-24 \approx 3-4,5.

Hab. in cladodiis emortuis *Rusci aculeati*, Italia et Montenegro.

2. **Trichofusarium Bartholomæi** (Peck) Sacc., *Fusarium Bartholomæi* 8832 Peck, Bull. Torr. Bot. Cl. XXXVI (1909) p. 157. — Sporodochiis compactis, subglobosis, oblongis v. grulvinatis, in series digestis, albidis, epidermide elevata diu tectis; conidiophoris gracilibus, rectis, confertis, 40-60 \approx 1-2; conidiis pacilibus, curvatis, 5-6 nucleatis, continuis, hyalinis, in setula tenuissima utrinque terminantibus, 15-25 \approx 1-2, setulis 10-12 μ . longis.

Hab. in pagina inferiori foliorum *Sorghhi* (*Sorghastrum*) nutantis, Stockton Kansas, Amer. bor. (E. BARTHOLOME).

Sect. 2. Hyalodidymæ

LEPTOTRICHUM Corda. — Syll. IV p. 690.

1. **Leptotrichum Kickxiæ** P. Henn., Engl. Jahrb. XXXVIII (1905) 8833 p. 126. — Stromatibus conidiophoris ceraceis, pulvinato-erumpentibus, flavidulis; hyphis hyalinis, ramosis; conidiis cylindraceis, obtusis, 8-14 \approx 2,5-3, medic septatis.

Hab. in ramis emortuis Kickxiæ elasticæ, Victoria Kamerum, Africæ centr. -- Status ascophorus est *Nectria Kickxiæ*.

FUSISPORELLA Spæg., Myc. Arg. V, p. 454, in An. Mus Nac. Buenos Aires XX (1910). (Etym. *Fusisporium* (*Fusarium*) cuius affine genus). — Sporodochia gossypinula, ex hyphis tenuibus conferte dichotomis constituta; conidia fusoideo-lunata uniseptata hyalina catenulata, in ramulorum apicibus acrogena.

1. **Fusispora Bufo**nis Spæg., l. c. p. 454 cum icon. — Sporodochiis 8834 subhemisphæricis, 200-500 μ . diam., sordide virescenti-roseolis.

gregariis, saepe confluentibus, superficialibus; hyphis erectis, ter quater bifidis, 50-100 \approx 2, laxissime septulatis levibus; conidiis e fusoideo navicularibus modice curvulis utrinque acutato-subrotundatis, 16-18 \approx 3-3,5, primo continuis dein uniseptatis, hyalinis, levibus, in catenulas 4-5 articulatas digestis.

Hab. ad cutem *Bufonis murini* putrescentis in Parque La Plata Argentina Amer. austr.

POTOUILLARDIELLA Spieg. — Syll. X p. 721, XVIII p. 668.

1. **Patouillardia Mougeotiana** (Sacc. et Roum. ex p.) Sacc. *Leptothyrella Mougeotiana* Sacc. et Roum. Rev. Mycol. (1885) p. 160, t. 55, f. 5 (tantum quoad fructificationem et excl. pycnid.) — Acervulis superficialibus, sparsis, depresso pulvinatis, ambitu oblongis, 300-500 μ . long. 250 μ . latis, ceraceis, roseis, glabris; conidiis ex hypostromate valde depresso obscure celluloso, sordide roseo oriundis, copiosis, fusoideis, saepe leviter inaequilateris, utrinque obtusulis, 1-septatis, non constrictis, 24-28 \approx 4, dilutissime roseis, hyalinis; conidiophoris stipatis, bacillaribus, simplicibus v. e basi furcatis, 20-25 \approx 3 concoloribus, apice monosporis.

Hab. in foliis emortuis *Pini silvestris* in Pyrenæis. — Socia adest *Sirothyriella Pinastri* v. Höhn. ad quam spectant pycnidia et sporulæ allantoideæ minutæ l. c. descripta, non vero conidia bilocularia majuscula! — *Patouill. javanica* Penz. et. Sacc. a typo recedit conidiis breviter catenulatis.

Sect. 3. Hyalophragmiæ.

BACTRIDIUM Kunze — Syll. IV p. 691, XIV p. 1123, XVIII p. 669.

1. **Bactridium minutum** Sacc. Not. Myc. VIII, Ann. Myc, IV (1906) 8836 p. 277. — Sporodochiis gregariis, per exiguis, superficialibus, subglobosis v. hemisphæricis, amœne roseis, 150-160 μ . diam., tenere ceraceis; conidiis cylindrico-fusoideis, plus minus curvis, utrinque obtuse leviterque tenuatis, ut plurimum 6 septatis, non constrictis, 78-84 \approx 5-5,5, ex hyalino roseis, intus granulosis (sæpe germinantibus); conidiophoris stipatis paliformibus utrinque truncatis, 10 \approx 4-4,5, ex hyalino roseis.

Hab. ad ligna putrescentia dejecta in silvis pr. Lyndonville N. Y., Amer. bor., socio *Helicoo Fairmani* (FAIRMAN). — Minutie partium a ceteris speciebus omnino distinctum.

2. **Bactridium americanum** v. Höhnel, Ergeb. Bot. Exp. Südbras. 8837 (1901) Denk. k. Ak. d. Wiss. Wien Bd. LXXXIII (1907) Extr. p. 38. — Sporodochiis globulosis, 500-800 μ . diam., vegetis molibus, lète aurantiacis, siccis ochraceo-flavis, minute granulosis, sessilibus v. basi in stipitellum 280 \approx 250 productis, ex hyphis inæqualibus et laxe intertextis usque ad 16 μ . cr. constantibus; conidiophoris septatis, 5-8 μ . cr., ad marginem brevibus et simplicibus, ad centrum, usque ad 200 μ . longis et subdichotomice ramosis; conidiis solitarie acrogenis, in stratum singulum dense radiatim dispositis, marginalibus 140 \approx 40-45, centralibus usque 220 \approx 40-45, crasse tunicatis, plerumque 7-cellularibus, fusiformibus, utrinque obtuse tenuatis, contentu flavo, cellulis longitudine subæqualibus.

Hab. in ligno et ramis putrescentibus, São Paulo Brasiliæ SCHIFFNER). — *Bactr. flavo* affine sed bene distinctum.

MICROCERA Desm. — Syll. IV p. 727, X p. 731, XI 653, XVI p. 1097, XVIII p. 669,

1. **Microcera curta** Sacc. Ann. Mycol. VII (1909) p. 437. — Sporo- 8838 dochiiis gregariis, depresse globulosis, $\frac{1}{2}$ - $\frac{3}{4}$ mm. latis, subroseis, compactiusculis, nitidulis; basidiis seu conidiophoris dense fasciculatis, filiformibus, apice plerumque trifidis, 25-35 \approx 2,5 hyaliniis; conidiis cylindraceis, utrinque, præcipue apice curvatis, obtusis, 3-septatis, non constrictis, 20-25 \approx 4-5 e hyalino dilutissime roseis.

Hab. in scutellis Coccorum ad ramos vivos Tiliæ platyphylliæ, Tamsel Germaniæ (P. VOGEL). — A *Micr. coccophila*, in Coccis quoque parasiticæ, conidiis admodum brevioribus etc. dignoscitur et pariter ad *Fusarii* genus nutat.

FUSARIUM Link — Syll. IV p. 694, X p. 721, XI p. 649, XIV p. 1123, XVI p. 1097, XVIII p. 670.

Conspectus analyticus specierum plurimarum Fusarii generis
sec. Appel et Wollenweber l. infra c. p. 59 *).

A. Conidia subæquilatera, rectiuscula.

I. Conidia subcylindrica, 1-septata, subrecta, basi subapiculata.

F. didymum Hart.

*) Cfr. amplam de genere dissertationem cl. APPEL et WOLLENWEBER titulo *Grundlage einer Monographie der Gattung Fusarium* in Arb. d. k. biol. Anstalt f. Land- und Forstwirth. Berlin VII (1910), præsertim culturæ ope perfectam. Ex ea conspectum analyticum deponpsi.

II. Conidia subcylindrica, sub-5-septata, leviter curva, utrinque rotundata. F. Willkommii Lind.

B. Conidia conspicue inæquilatere, apicibus varie attenuatis, curvata, basi apiculata.

I. Conidia apices versus magis curvata, quam ad medium.

a) Species chlamydosporis terminalibus præditæ (præter intercalares).

1. Massa conidiorum ochracea, salmoneo-aurantio tincta.

α Conidia typice non septata. F. orthoceras A. et W. (nov. nom.)

β Conidia typice 3-septata. F. cæruleum (Lib.)

2. Massa conidiorum brunneo-albida.

α Conidia typice 3-septata. F. Solani Mart.

β Conidia typice 3-4-septata.

* Mycelium colorem cyaneum secernens F. Martii A. et W.

** Mycelium colorem olivaceum secernens. F. Theobromæ A. et Str.

b) Species chlamydosporis terminalibus carentes (quædam chlamydosporis intercalaribus præditæ). Conidia apice subapiculata.

1. Massa conidiorum ochracea v. salmoneo-aurantio tincta.

α Conidia typice 3-5-septata.

* Mycelium colorem carmineum edere potest. F. discolor A. et W.

** Mycelium colorem carmineum non secernit, sed flavum v.
ochraceum. F. discolor var. sulphureum Schl.

β Conidia typice 5-septata.

* Conidia 5-5,5 μ. cr. F. rostratum A. et W. (n. n.)

** Conidia 6-7 μ. cr. F. rubiginosum A. et W.

II. Conidia medio et apicibus æqualiter curvata.

a) Conidia medio angustata.

α Conidia typice 1-septata. F. aqueductuum Radl. et Rab.

β Conidia typice 5-septata.

* Hypostroma non plectenchymaticum. F. metachroum A. et W.

** Hypostroma paraplectenchymaticum. F. subulatum A. et W.

b) Conidia medio crassiora.

α Conidia typice 5-septata.

F. falcatum A. et W.

β Conidia typice 5-7-septata.

F. gibbosum A. et W.

1. **Fusarium didymum** (Harting) Lindau, Deut. Krypt. Fl. Pilze IX, 8839 p. 574 (1909) *Fusisporium didymum* Harting, Rech. nat. et caus. malad. pomme de terre Amsterd. 1846, p. 228, cum tab.; Appel et Wollenw. Arb. k. biol. Anst. f. Land- u. Forstw. VIII (1910) p. 38 et 42, c. ic. — Hyphis sterilibus repentibus, dense intricatis

infra brunneis, sursum albis; conidiophoris albis, tenuissimis, ascendentibus, ramosis, parce septatis, suberecto-ramosis; conidiis acrogenis, vix curvis, obtusis, 1-septatis (2-sept. sec. Lindau) 26-33 μ . longis.

Hab. in tuberibus *Solani tuberosi* in Hollandia (HARTING).

2. **Fusarium orthoceras** App. et Woll. n. n., Arb. k. Biol. Anst. f. 8840 Land.- u. Forstw. VIII (1910) pag. 141, t. I, f. 60-64, t. III, f. 2, *Fusarium oxysporum* Sm. et Swingle, non Auct.

Hab. in tuberibus, radicibus et partibus caulis hypogæis *Solani tuberosi* in Germania, Norvegia, verisimiliter in tota Europa et Amer. bor.

3. **Fusarium Martii** App. et Wollen. Arb. k. biol. Anstalt f. Land.- 8841 u. Forstw. VIII (1910) p. 78-83, f. 5 (in textu p. 82), *Fusisporium Solani* Martius p. p. — Cfr. Syll. IV, p. 705.

Hab. in tuberibus partim emortuis *Solani tuberosi* non raro in Germania etc.

4. **Fusarium discolor** App. et Woll. Arb. k. biol. Anst. f. Land.- u. 8842 Forstwirtsch. VIII (1910) p. 108, p. 104, t. I, f. 50-59, t. III, fig. 7.

Hab. in caulis partim emortuis *Solani tuberosi*. — Var. **sulphureum** (Schlecht.) App. et Woll., l. c. p. 115, *Fusarium sulphureum* Schlecht. Fl. Berol. II, p. 139. — In cavitatibus tuberum putrescentium *Solani tuberosi* in Germania.

5. **Fusarium rostratum** App. et Wollenw. n. n., Arb. k. Biol. Anst. 8843 f. Land.- u. Forst. VIII (1910) p. 30, fig. E, 1-13, p. 60, 193 etc. *Fusarium roseum* Auct. ut stat. conidioph. *Gibberellæ Saubinetii* (Mont.) Sacc. — Syll. II, 554.

Hab. in caulis plantarum variarum in tota fere Europa.

6. **Fusarium rubiginosum** App. et Woll. Arb. k. biol. Anst. f. Land- 8844 u. Forstw. VIII (1910) p. 95 et 108, t. I, f. 31-48 et fig. 8, in textu, *Fusisporium Solani* Schacht, non Auct.

Hab. in tubere momificato, subputri *Solani tuberosi*, socio *Fus. subulato* in Germania. — Conidiorum acervis ochraceo-rubiginosis imprimis dignoscenda species.

7. **Fusarium metachroum** App. et Wollen. w. Arb. k. Biol. Anst. f. 8845 Land- u. Forstw. VIII (1910) pag. 132-141, t. II, f. 111-118, t. III, f. 8.

Hab. in caryopsidibus *Triticum vulgaris* in prov. Posen.

8. **Fusarium subulatum** App. et Woll. nov. nom., Arb. k. biol. Anst. 8846 f. Land- u. Forstw. VIII (1910) p. 131, cum icon. p. 39 et tab.

II, f. 65-87, *Fusarium roseum* var. *Lupini-albi* Sacc. — Syll. IV, p. 700 — *Fusarium diffusum* Carm.

Hab. copiose in Solanaceis et forte quoque in Chenopodiaceis, Graminaceis, Leguminosis in Germania, Britannia, Italia etc.

9. **Fusarium falcatum** App. et Woll. nov. nom. Arb. k. biol. Anst. 8847
f. Land- u. Forstw. VIII (1910) p. 175-184, tab. II, f. 100-110,
t. III, f. 9 et fig. 10 A (in textu p. 187), *Fusarium vasinfectum*
var. *Pisi* Schikorra, non Van Hall.

Hab. in caule *Pisi sativi*, cui, teste Schikorra, morbum affert, rarius in caule *Solani tuberosi*, in Germania.

10. **Fusarium gibbosum** App. et Wollenw. Arb. k. biol. Anst. f. Land- 8848
u. Forstw. VIII (1910) p. 185-190, fig. 10 C-D (in textu p. 187).

Hab. in tuberibus partim emortuis caulibusque *Solani tuberosi*, raro, in Germania.

11. **Fusarium elegans** App. et Woll. ad interim, Arb. k. biol. Anst. 8849
f. Land- u. Forstw. VIII (1910) pag. 54, 94, fig. 2 B (in textu
p. 38).

Hab. (matrix non indicata) in Germania.

12. **Fusarium Violæ** Wolf in Mycologia II (1910) pag. 21, t. 18. — 8850
Hyphis mycelii hyalinis, 4-7 μ . diam., irregulariter ramosis, matricem truncorum et radicum penetrantibus; sporodochiis innatis, forma indefinitis; macroconidiis hyalinis, fusoideis, falcatis, 28-38 \times 4-6, 3-5-septatis; microconidiis continuis 8,5-12,5 \times 2-3,5 e conidiophororum ramulis brevibus oriundis.

Hab. in caulibus radicibusque *Violæ tricoloris* quam des-
truit, Lincoln Nebraska Amer. bor.

13. **Fusarium niveum** E. F. Smith, Proceed. Amer. Ass. f. the Ad- 8851
vanc. of Sc. XLIII (1894) p. 289; Un. St. Dep. of Agricult. Div.
veget. Pathol. Bull. 17 (1899) p. 49, tab. 1-5 p. p. — A *Fusar.*
vasinfecto imprimis differt colore candido.

Hab. in caulibus *Citrulli vulgaris* cui valde noxium, Amer.
bor. — Est status conidiophorus *Neocosmosporæ vasinfectæ* var.
niveæ.

14. **Fusarium candidulum** Sacc., Ann. Mycol. VI (1908) p. 567. — 8852
Sporodochiis dense gregariis confluentibusque et hinc cæspitulos app-
planatos laxiusculos 2 mm. diam. efformantibus, candidis; hyphis
sterilibus filiformibus repentibus, 2-3 μ . cr., parce tenuissime se-
ptatis, hinc inde ramulos breves simplices v. trifidos continuos co-
nidiophoros ascendentes gerentibus; conidiis initio oblongis, cur-

vulis continuis dein fusoideo-falcatis utrinque plerumque obtusulis, 3-septatis, non constrictis, minute guttulatis, hyalinis.

Hab. in magnis ulceribus et circum ea in caule *Cerei* geometrizantis, Apaseo, Mexico (BONANSEA). — Quo morbo dicta ulcera generentur tam magna et crebra, in *Cerei* caulis, nondum liquet, sed ea fungillis modo descriptis, forte saprogenis, ægre tribui possunt; tamen sub iisdem interdum caulis substantia (ob eorum mycelium?) late et profunde nigrescit.

15. **Fusarium udum** Butler, Mem. Departm. of Agricult. in India II 8853 (1910) p. 35 et 54, cum icon. — Sporodochiis effusis, udis, ex albo roseo-salmoneis; mycelio intra matricem parasitico, extra vero saprophytic; hyphis tenuibus, hyalinis, copiose ramosis; conidiis (microconidiis) primo ex typo *Cephalosporii* in conidiophoris ramulis simplicibus v. aggregatis acrogenis 1-cellularibus (v. pauci-cellularibus) ellipsoideis v. falcatis, coacervatis salmoneis, 5-15 \times 2-4; macroconidiis ex typo *Fusarii* conidiophoris brevioribus suffultis, falcatis, 3-5-septatis, hyalinis, mox liberis, 15-50 \times 3-5, plerumque serotinis; chlamydosporis globosis v. ovoideis, crassiuscule tunicatis, hyalinis, subinde breviter catenulatis, 5-10 μ . diam.

Hab. parasitice in radicibus *Cajani* indici, cui valde noxiū, in India orient. — Conferenda expositio plena, imprimis chemico-biologica, ap. Auct. l. c.

16. **Fusarium subnivale** von Höhn., Ann. Naturhist. Hofmus. XX 8854 (1905) Heft 4, Extract. p. 6. — Sporodochiis minutissimis, saepe confluentibus et tunc massam usque ad 300 μ . cr. et 2 mm. long. efficientibus, saepe subiculo tenui albo ex hyphis 4 μ . cr. septatis composito insidentibus, siccis applanatis, cinnabarinis, madore incarnatis, verruciformibus; hypostromate minute parenchymatico, cellulis 3-4 μ . lat.; conidiophoris dense parallele stipatis 60 \times 2, apice monosporis ibique incurvatis; conidiis hyalinis plerumque uniseptatis lunulato-falcatis utrinque acutis, 10-16 \times 3, rarius duplo longioribus et tunc biseptatis.

Hab. in caulis foliisque putrescentibus *Astragali* sp., Erd-schias-Dagh 2700-2900 m. Anatoliæ. — *Fus. minimo* Fuck affine.

17. **Fusarium lateritium** Nees — Syll. IV, p. 694 — var. **Tulasneanum** Sacc., Not. Myc. VII, Ann. Myc. IV (1906) p. 274. — Sporodochiis sanguineis, confluentibus, margine breviter albo-fimbriatulis; conidiophoris repetito dichotomis; conidiis anguste fusoideis, curvulis, 40-45 \times 3, ex hyalino dilute roseis, 5-7-septatis.

Hab. in cortice ramorum *Robiniae Pseudacaciae*, Clamart

pr. Paris (TULASNE, comm. HARIOT). — Præcipue colore amœne sanguineo dignoscenda forma. Forte huc spectat *F. Robiniæ* Pass., sed ex diagnosi brevissima nil certi dici potest.

18. **Fusarium Cydoniæ** (Schulz.) Sacc. et Trav. — Syll. XIX, p. 724 8856 — *Selenosporium Cydoniæ* Schulz. v. Mügg., Verh. zool.-bot. Ge-sellsch. Wien 1871, pag. 1240, tab. 13, fig. 20. — Acervulis postuliformibus initio subcutaneis dein erumpentibus emersis, sordide flavis, 400-450 μ . diam.; conidiophoris brevibus cylindraceis continua ex hypostromate compacto orientibus, conidio paullo brevioribus; conidiis fusoideis curvatis triseptatis non constrictis utrinque subrotundatis, 26-28 \times 4.

Hab. in ramulis corticatis Cydoniæ vulgaris in Hungaria.

19. **Fusarium pirinum** (Fr.) Sacc. — Syll. IV, p. 720 — Notæ myc. 8857 VIII, Ann. Myc. vol. V (1906) p. 494, tab. X, fig. 15, *Fusisporium pirinum* Fr. Syst. myc. III, p. 445.

Hab. in fructu putrescente Piri communis cultæ, Champigny pr. Paris (HARIOT). — Effusum, mycelio adpresso albo late cinctum, demum centro conidiophorum, roseum; hyphæ steriles ramosæ septatæ varie intertextæ, albo-hyalinæ, 4-5 μ . cr., fertiles breves et pseudobasidiis verticillatis, obclavato-fusoideis 14 \times 4 terminatæ; conidia fusoidea, curvata, 3-4-septata, 33-40 \times 4-5 utrinque acutiuscule tenuata, e hyalino rosea — Videtur omnino species Friesiana, etsi ab affinibus parum diversa.

20. **Fusarium fissum** Peyl, Beschr. einig. neuer Pilze in Lotos VIII 8858 (1858) p. 30, t. I, f. 17. — Sporodochiis verruciformibus, sparsis, sessilibus, intus brunneolis, extrorsum rubris, sed strato conidiophoro rubescente dein albo præditis, mox in fragmenta 3-6 elongata radiatim diffractis; conidiis cylindraceis, curvis, utrinque rotundatis, 3-septatis, diaphanis.

Hab. ad ramos emortuos Citri Aurantii in frigidariis in Bohemia. — Verisimiliter ab hoc non differt *Fus. fractum* Sacc. et Cav. — Syll. XVI p. 1100.

21. **Fusarium Spicariæ-colorantis** Sacc. et Trott. ex De Jonge in Rec. 8859 Trav. bot. Néerl. VI (1909) t. II, f. 9 et t. III, f. 10-13. — Conidiophoris ex mycelio *Spicariæ colorantis* oblongo-cylindraceis, pleurogenis, dimidium conidium non attingentibus, simplicibus, continua v. 1-septatis, hyalinis; conidiis falciformibus, utrinque acutis, maturis sub-triseptatis, non constrictis, intus granulosis, hyalinis, 70-80 \times 6.

Hab. in corticibus et ligno Theobromæ Cacao, quam una

cum *Spicaria* maxime vexat, Surinam. — Diagnosis ex iconibus deprompta.

22. **Fusarium decemcellulare** Brick in Jahresb. d. Vereinig. f. angew Bot. VI (1908) p. 223, cum figuris. — Conidiis longissimis 10-cellularibus.

Hab. in ramis Theobromæ Cacao, cui noxium, Kamerun Africæ.

23. **Fusarium vasinfectum** Atk. in Agric. Exp. Stat. Auburn Ala. 8861 Bull. 41, p. 19, cum icon. (1892). — Mycelio endogeno, conidio-phora conferta, irregulariter ramosa, brevia emittente; conidiis falcatis, hyalinis, 3-5-septatis, 30-50 \approx 4-6.

Hab. in caulis, quos enecat, Gossypii, Vignæ, Citrulli in Amer. bor. — Occurrit simul st. conidicus alter: *Cephalosporii* species: conidiis ovoideis v. ellipsoideis, rectis v. curvulis, 4-15 \approx 2-6, continuis, hyalinis. — Var. *Pisi* van Hall in Ber. deutsch. Bot. Ges. XXI, p. 4, tab. 1 (1903). — Mycelio (culto) læte rubro, flavo-tincto; hyphis 3-6 μ . cr.; conidiis falcatis, hyalinis, 2-5-septatis, constrictis, cellulis extimis longioribus et acuminatis 50-65 \approx 3-5. — In caulis *Pisi sativi*, cui valde noxium in Germania et Hollandia.

24. **Fusarium pestis** Sorauer, Ueber Stengelfäule der Kartoffeln, in 8862 Österr. Landw. Wochenbl. 1888, n. 32, et Atlas Pflanzenkrankh. tab. 25, fig. 1. — Mycelio corticem et medullam penetrante et in superficie caulis cæspitulos candidos efformante. (Cætera ignota!).

Hab. in parte ima caulis Solani tuberosi in Germania et Belgio. — Caulis inferne nigrescit et tota planta moritur.

25. **Fusarium erubescens** Appel et v. Oven Thiel H. in Landwirtsch. 8863 Jahrbüch. Berl. (1905) p. 518, t. V-VI et pag. 499, f. 1. — Mycelio hyalino, septato, vario, nunc elongato, albo, nunc (in fructibus siccis ex causis meteoricis variis) roseo; sporodochiis salmonis, erumpentibus; conidiophoris brevibus copiose ramosis; conidiis acrogenis, leniter falcatis, utrinque obtusulis v. acutis, 1-7-septatis, hyalinis, coacervatis roseis, 24-38 \approx 3,5-6

Hab. in fructibus immaturis et maturis Solani Lycopersici. — Cfr. fusiorem descriptionem apud auct. l. c.

26. **Fusarium tabacivorum** Delacroix, Ann. Inst. Nat. agron. 2 ser., 8864 V (1906) p. 67, cum icon. — Mycelio ramoso, hyalino, matricem penetrante, 3 μ . diam., parce septato; conidiophoris erectis sursum simpliciter rarius iterato ramosis; ramulis sæpe verticillato-ternis, cuspidatis; conidiis acrogenis elongato-fusoideis utrinque

obtuse rotundatis, leviter curvis, typice 3-septatis, non v. vix constrictis, hyalinis, 25-35 \approx 4,5-6.

Hab. ad collum radicis Nicotianæ Tabaci quam vexat et putrefacit pr. Périgueux Galliæ.

27. **Fusarium glæosporioides** (Speg.) Sacc. et Trott., *Selenosporium* 8865 *glæosporioides* Speg., Myc. Arg. V, pag. 458, in An. Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; sporodochiis punctiformibus lenticularibus, 120-150 μ . diam., dense gregariis confluentibus subceraceis, melleis, ex hyphis tenuibus ramulosis gelatinosis mox diffluentibus efformatis; conidiis fusoideis 45-50 \approx 5, abrupte incurvatus 5-septatis, ad septa non constrictis, hyalinis.

Hab. ad ramulos, frigore hiemali enecatos Pircuniæ dioicæ, Santa Catalina prope Buenos Aires Argentina Amer. austr. — E subgen. *Selenosporii*.

28. **Fusarium vinosum** Massee Brit. Fungus-flora III, p. 479 (1893). — 8866 Sporodochiis minutis, gregariis, erumpentibus, saturate vinoso-brunneis sæpe denique confluentibus crustamque subgelatinosam formantibus; conidiis fusoideis, arcuatis, utrinque acuminatis, 37-40 \approx 4-5, quinquesep-tatis, in conidiophoris opposite ramosis insertis.

Hab. in fructibus Fagi silvaticæ putrescentibus in Britannia.

29. **Fusarium javanicum** Koord., Botan. Untersuch. (1907) p. 247, 8867 fig. 58. — Sporodochiis effusis, superficialibus, amphigenis; hyphis sterilibus repentibus, hyalinis, septatis; conidiis acrogenis, fusoideo-falcatis v. navicularibus, hyalinis; 5-septatis, ad septa haud constrictis, 40-47 \approx 4,5-5,5, utrinque acutis.

Hab. in foliis putrescentibus Fici elasticæ prope Purwo-redjo, Loano provinc. Kedu Java nov. 1905 (KOORDERS). — E subgeneri *Eu-Fusarii*.

30. **Fusarium Schawrowi** Speschn., Arb. Kaukas. Stat. f. Seidenzucht, 8868 X (1906) Heft 2, p. 30-41 cum icon. (rossice).

Hab. in ramis Mori in Asia minori (SCHAWROW).

31. **Fusarium juglandinum** Peck, Bull. Torr. Bot. Cl. XXXVI (1909) 8869 pag. 157. — Cæspitibus minutis, superficialibus, floccosis, subconfluentibus v. effusis, albidis, deinde colore rosaceo leviter tinctis; hyphis brevibus, gracilibus, densis, hyalinis; conidiis fusiformibus, curvatis, utrinque acuminatis, 3-7-septatis, vulgo 4-6-septatis, 30-60 \approx 6-8.

- Hab.* in ramulis emortuis Juglandis nigræ, Stockton Kansas Amer. bor. — (E. BARTHOLOMEW). — E subgen. *Fusisporii*.
32. **Fusarium acicola** Bres., in Strass. Verh. k. k. zool. bot. Ges. 8870 Wien LX (1910) p. 328. — Sporodochiis minutis, punctiformibus, erumpentibus, sparsis, rubellis v. roseo-lateritiis; conidiophoris ramosis; conidiis subfusiformibus v. subcylindraceis curvatis, 1-septatis, 35-45 \times 3.
- Hab.* in foliis putrescentibus Abietis, Sonntagberg Austriæ.
33. **Fusarium pallidulum** Sacc. et Trott., *Fusarium pallidum* (Bon.) 8871 Sacc. et Trav. — Syll. XIX, p. 727 — non B. et C., *Atractium pallidum* Bonorden, Handb. p. 135, tab. 10, fig. 219. — Sporodochiis gregariis subsuperficialibus pulvinatis pallidis; conidiophoris adscendentibus, hyalinis, iterato furcatis, ramulis sursum paullo incrassatis; conidiis fusoideis subrectis, hyalinis, continuis (semper?).
- Hab.* in corticibus putrescentibus in Germania. — Diagnosis ex iconе.
34. **Fusarium heidelbergense** Sacc., Ann. Mycol. VIII (1910) p. 346. — 8872 Effusum, maculicola; hyphis sterilibus prælongis, repentibus, filiformibus, 5 μ . cr., parce ramosis parceque septatis, amœne rubentibus (culturâ), intus granulosis; conidiophoris ex hyphis sterilibus hinc inde assurgentibus, fasciculatis, repetito- (5-6) dichotome ramosis, totis 50-70 \times 6-7, subtoruloso-articulatis; conidiis crasse fusoideis, curvulis, utrinque oblique apiculatis, ut plurimum distincte 5-septatis, senio ad septa constrictulis, 30-42 \times 7-8 e roseo hyalinis.
- Hab.* in foliis Cymbidii aliarumque Orchidearum exoticarum in calidariis Horti bot. Heidelberg. — Folia fungo pervasa caulesque nigro-maculantur, languescunt et forte necantur. Speciem descripsi secundum exemplaria culta in tubere solanaceo in Instituto parisiensi Pasteur a cl. G. SELIBER apud prof. Etard. Præcipue conidiis proportione crassis et fortiter septatis distinguenda videtur. Subgeneri *Fusisporio* spectat. Cfr. supra: *Cephalosporium subsessile*.
35. **Fusarium Heleocharidis** Rostr. in Thüm., Myc. univ. 2185 (1883) 8873 (sine diagnosi).
- Hab.* in inflorescentiis Heleocharidis palustris in insula Fünen Dania (ROSTRUP). — Occurrit cum sclerotio Clavicipitis nigricantis.
36. **Fusarium Graminearum** Schwabe, Fl. anhalt. II, p. 285 tab. VI, 8874

fig. 7. — Sporodochiis carnosis, compactis, miniatis; conidiis uniformibus, majusculis, curvulis, utrinque acutatis, plerumque 6-septatis.

Hab. in inflorescentia Graminum e. g. Psammæ arenariæ, Anhalt Germaniæ. — Forte *Fus. graminum* Corda huc ex p. spectat, teste Rabenh.

37. **Fusarium Secalis** Fée, Mém. sur l'Ergot du Seigle in Mém. du Mus. d'Hist. nat. Strasbourg, 1843, pag. 35, t. II, f. 1 a-e. — Aurantiacum, crustaceum, inæquale, madore deliquescens; conidiis angustis prælongis, utrinque acutissimis, leviter curvis, pluriguttulato-septulatis.

Hab. ad spiculas (ovaria, glumas) Secalis cerealis in Gallia et Germania.

38. **Fusarium Phyllachoræ** P. Henn., État indép. du Congo, Mission Laurent, fasc. IV (1907) p. 363. — Sporodochiis erumpentibus, ceraceis, pulvinatis, aurantiacis; conidiis filiformibus curvatis, hyalinis, 10-15 \times 0,6-0,8.

Hab. in foliis Panici sp. inter Léopoldville et Kwamouth Congo Africæ trop. — Socia adest *Phyllachora heterospora*.

39. **Fusarium hordearium** Ducomet, Rech. sur développ. Champ. paras. etc. Thèse, Rennes (1907) pag. 87, tab. V-VIII. — Maculis brunneis dein subalutaceis, elongatis 10-12 mm. lat.; mycelio subcuticulari; conidiophoris sparsis, hyalinis, brevissimis, 3-5 μ . long., simplicibus, curvulis, geniculatis, ad conidii insertionem incrassatis; conidiis falciformibus, acutis, hyalinis, 1-septatis, rarius 2-3-septatis, 18-24 \times 3-4.

Hab. in foliis vaginisque vivis Hordei vulgaris in campo experientiæ Instituti agronomici Rennes Galliæ. — Ob conidiophora brevissima a typo generis recedit.

40. **Fusarium loliaceum** Ducomet, Ann. Ecole Nat. Agricult. Rennes t. II (1908) Extr. pag. 14, fig. 1-6. — Maculicola, mycelio initio subcuticulari, dein profundo; conidiis hyalinis, fusoideo-claviformibus, apice obtusis, basi attenuatis, rectis v. curvulis, continuis v. plerumque uniseptatis, raro biseptatis, 15-21 \times 2,5; conidiophoris ex articulis mycelicis ascendentibus, incoloribus, 4-6 \times 1,5-2.

Hab. in foliis Lolii italicici, Rennes Galliæ.

41. **Fusarium Paspali** P. Henn., Engl. Jahrb. XXXVIII (1905) 8879 p. 129. — Acervulis ceraceis, flavo-fuscidulis fructicolis; conidiis longe fusoideo-sigmoideis, utrinque acutis, 3-septatis, hyalinis, 30-60 \times 3,5-4,5; conidiophoris fasciculato-ramosis, hyalinis.

Hab. in fructibus Paspali sp., Bipindi Kamerun Africæ (ZENKER). — A *F. heterospermo* diversum.

42. **Fusarium Sorghi** P. Henn., in Fl. du Bas- et Moy.-Congo, Ann. 8880 Mus. du Congo, vol. II, fasc. II (1907) p. 105. — Sporodochiis effusis, pallide incarnatis, subvelutinis; conidiophoris ramosis septatis, 5-7 μ . cr.; conidiis falcatis, utrinque acutis, 20-50 \approx 5-8, 3-7-septatis, hyalinis.

Hab. in glumis Sorghi vulgaris, Kisantu Congo, Africa (VANDERYST).

43. **Fusarium moniliforme** Sheldon, Nebraska Agric. Exp. Stat. Rep. 8881 XVII (1904) p. 23. — A typo generis dignoscitur præsentia microconidiorum in catenulas moniliformiter dispositorum inter conidia normalia occurentium.

Hab. in caryopsidibus Zeæ Maydis, quam vexat in Amer. bor. — In mediis pluribus facile colitur.

44. **Fusarium mycophytum** (W. G. Sm.) Massee Brit. Fungus-flora, 8882 III, p. 483, *Fusisporium mycophytum* W. G. Smith, Gard. chron. (1884) pag. 245, cum icon. — Mycelio pallido v. hyalino, tenui, subinde toruloso, stratum tenue subgelatinosum formante; conidiis fusiformibus, amplissimis, curvis, 3-8-septatis, nucleatis, primo hyalinis, demum pallide brunneis v. salmoneis.

Hab. in lamellis Agaricorum viventium in Britannia.

45. **Fusarium coniosporiicola** P. Henn., in Fl. du Bas- et Moy.-Congo, 8883 vol. II, fasc. II (1907) p. 106. — Sporodochiis pulvinatis, ca. 0,6 μ . diam. pallide cinnabarinis; conidiophoris ramosis, hyalinis 2 μ . c. cr.; conidiis fusoideis, utrinque acutis, hyalinis, 10-12 \approx 2-2,5, pluriguttulatis.

Hab. in mycelio Coniosporii Albizziæ ad folia Albizziæ, Gongola Congo, Africa (VANDERYST).

46. **Fusarium Ustilaginis** Rostr., in Festschr. Botan. Foren. Kopen-hagen p. 137 (1890). — (Absque diagnosi).

Hab. in cæspitulis Ustilaginis grandis in Phragmite communi in Dania. — Species omnino dubia, nomen vero etiam mutandum quia extat diversum *Fusarium Ustilaginis* Kell. et Sw. — Syll. X, p. 728. — Sec. ic. Rostrupii (Cfr. Lind, Dan. Fungi, t. IX, fig. 118) conidia breviter fusoidea, curva, 1-septata, vix 12 \approx 3; an genuini *Fusarii*?

47. **Fusarium cirrosum** v. Höhn, Fragm. z. Mykol. Sitzb. k. Ak. d. Wiss. Wien Bd. CXVI, Abt. I (1907) p. 153. — Sporodochiis subimmersis, depressis, minutis, versiformibus; conidiophoris co-

nidio brevioribus, dense parallele stipatis, sæpius indivisis; conidiis acrogenis ut plurimum regulariter falcatis, utrinque sensim obtusuleque acutatis, maturis 3-septatis, hyalinis, coacervatis roseis, 60-70 \approx 6,5-7 in cirros rubros exslientibus, cellulis binis mediis paullo brevioribus quam extimis.

Hab. in acervulis *Steganosporii* piriformis in cortice *Aceris*, Wienerwald Austriæ (v. HÖHNEL). — Vita parasitica in *Steganosporio* et cirris peculiaribus mox dignoscenda species.

48. **Fusarium lichenicola** (Speg.) Sacc. et Trott., *Selenosporium ?lichenicola* Speg., Myc. Arg. V, p. 459, in An. Mus. Nac. Buenos Aires XX (1910). — Sporodochiis primo scutelliformibus serius repandulo-difformibus sæpeque miniatis, 0,25-1 mm. diam., sessilibus; conidiophoris tenuissimis 100-200 \approx 3-5, sursum liberis simplicibus septulatis hyalinis; conidiis cylindraceo-fusoideis 75-100 \approx 6-9, 3-5-septatis ad septa non constrictis eguttulatis, hyalinis (an catenulatis?).

Hab. ad thallum *Lichenum* e.g. *Candelariæ* parietinæ etc. in cortice arborum viventium, La Plata Argentina Amer. austr. — E subgen. *Selenosporii*.

49. **Fusarium Speiseri** Lindau, in Rabenh. Krypt. Fl. Pilze IX p. 580 (1909). — Mycelii hyphis insecti corpus impletibus, irregulariter ramosis, densis albo-floccosis, plerumque 3-4 μ . cr., intus plasmate vacuolisque præditis; sporodochiis hinc inde formatis, firmis, albis ex conidiophoris stipatis, ramosis, septatis constantibus; conidiis modo in mycelii ramis, modo in conidiophoris acrogenis, falciformibus utrinque acutis et sæpe uno apice validius arcuatis, hyalinis, 3-5-septatis, 20-31 \approx 3,5-4,5.

Hab. in corpore Cicadæ sp. pr. Karthaus in Borussia occid. (SPEISER).

50. **Fusarium bufonicola** (Speg.) Sacc. et Trott., *Selenosporium bufo-nicola* Speg., Myc. Arg. V, pag. 459, in An. Mus. Nac. Buenos Aires XX (1910). — Mycelio primo albo arachnoideo effuso dein farinosulo serius grumoso carneo, hyphis tenuibus ramulosis mox diffluentibus efformato; conidiis fusoideis arcuatis utrinque acutissimis 40-50 \approx 5-6, 5-septatis, per ætatem valide constrictis, hyalinis.

Hab. ad corpus putrescens *Bufonis murini* in Parque La Plata Argentina Amer. austr. — E subgen. *Selenosporii*.

51. **Fusarium equinum** Növgaard in Science XIV (1902) p. 11, Guég. Champ. paras. p. 262. — Conidiis e mycelio orientibus fusiformibus v. falciformibus (ceteris characteribus ignotis!).

Hab. in cute, quam valde vexat et depilat, equorum, Pendleton Oregon. — Culturâ, colonias efficit circulares roseo-salmoneas.

52. **Fusarium cuticola** (R. Blanch.) Guéguen, Champ. paras, p. 262 8890 (1904), *Selenosporium cuticola* R. Blanch., in C. R. Acad. 1890, p. 479. — Mycelio hyalino, septato, ramoso, 3 μ . cr.; conidiis fusiformibus v. falcatis, 2-6-cellularibus, 25 \times 2,4-4.

Hab. in dermatosi hypertrophica Lacertæ viridis et Chamaeleontis vulgaris in Gallia et Africa. — Cultum, mycelium gignit quoque chlamidosporas apicales et intercalares.

53. **Fusarium Willkommii** Lindau in Rabenh. Krypt. Fl. Pilze IX, 8891 p. 551, cum icon. (1909). — Ita vocandum *Fusarium candidum* (Willk.) Sacc. — Syll. XVIII, p. 674 — nec *Fusarium candidum* (Lk.) Sacc. — Syll, IV, p. 720.

54. **Fusarium hibernans** Lindau, in Rabenh. Krypt. Fl. Pilze IX, 8892 p. 542 (1909). — Ita vocandum *Fusarium nivale* Cesati. — Syll. X, p. 726, nec *Fusarium nivale* (Fries) Sorauer — Syll. XVIII, p. 675 (= *Lanosa nivalis* Fries).

Sect. 4. Dictyosporæ.

SPOROCYSTIS Morg. — Syll. XVIII p. 676.

1. **Sporocystis fulva** v. Höhn., Stzb. k. Ak. d. Wiss. Wien CXVIII, 8893 Abt. I (1909) pag. 426. — Sporodochiis globosis, superficialibus, basi coarctata sessilibns, minute granulosis, fulvis 2 mm. alt., 2,5 mm. lat., subsparsis; hypostromate membranaceo subcirculari, substrato adnato, medio 1 mm. cr., globuloso, minute hyalino-celluloso, cellulis sensim radiatim in conidiophora septata 6-10 crassa productis; conidiis acrogenis, subrotundis, 40-50 μ . diam. ex articulis 5-8 globulosis v. ovoideis v. oblongis, tenui-tunicatis, 20 μ . diam., conglobatis, non ægre secedentibus conflatis, oleoso-farctis, subhyalinis.

Hab. in foliis emortuis in Horto bot., Peradeniya Ceylon.

Sect. 5. Scolecosporæ.

RANOJEVICIA Bubák, Ann. Myc. VIII (1910) p. 400 (Etym. a cl. N. RANOJEVIC, professore belgradensi). — Sporodochia subglobosa v. incurvata, pallida; conidiophoris cæspitosis, dichotome divisus, apice

2 pseudosterigmatibus præditis; conidiis cylindraceis, unilocularibus, hyalinis.

1. **Ranojevicia vagans** Ranojevic et Bubák l. c. p. 401, fig. 12-14. — 8894
 Sporodochiis subglobosis, elongato-incurvatis, albis, siccis flavidis, usque ad 266 μ . diam., crebre distributis, confluentibus; conidiophoris ad medium semel dichotomice divisus, apice unoquoque 2 sterigmatibus tenuibus, acutatis 5-7,5 μ . long. (raro usque ad 11,5 μ .), prædicto, parce septatis, usque ad 36 \approx 1,5-2, hyalin-s; conidiis cylindraceis, rectis v. curvulis, 3,5-5,6 \approx 0,75-1, hyalinis.

Hab. in ligno Betulæ albæ nec non in ramis Berberidis vulgaris, Belgrad Serbia.

LINODOCHIUM v. Höhn. Fragm. Mykol. (1909, VIII, p. 83 (Etym. *linon* pilum et *dochion* pro sporodochium). — Sporodochia appalata, superficialia, adnata; strato inferiori tenui minute plectenchymatico. Conidiophora stipata, brevia, verticillato-ramosa. Conidia filiformi-continua, non catenulata, acro-pleurogena, hyalina.

1. **Linodochium hyalinum** (Lib.) v. Höhn., l. c. pag. 83, *Dacrymyces* 8895 *hyalinus* Lib. — Syll. VI, p. 801 et IX, p. 260 (Synonyma cfr. ap. Höhn. l. c.). — Sporodochiis flavo-brunneolis, plagulas 1-2 mm. long. formantibus, udis 200 μ . diam.; conidiophoris 2 μ . cr.; conidiis parallele stipatis pluri-stratos, minute guttulatis, bacillaribus, 46-64, rarius 70 \approx 1,3.

Hab. in acubus Pini in Belgio, Gallia, Fennia, Germania.

VOLUTELLOPSIS Speg., Fungi Chilenses (1910) p. 197 (Etym. a *Volutella* cuius est analoga). — Sporodochia patellari-hemisphærica, læticoloria, minuta, margine fimbriato-ciliolata. Conidia subcylindracea hyalina transverse pluriseptata, in conidiophoris unicellularibus acrogena.

1. **Volutellopsis chilensis** Speg., l. c. p. 197, cum icon. — Superficialis laxe gregaria, sublenticularis, 150-180 μ . diam., subceracea, succinea, sessilis; conidiis utrinque obtusis, cylindraceis, leniter arcuatus, 3-septatis, 30-36 \approx 5; conidiophoris conidia subæquantibus, septatis, hyalinis, cellulis sterilibus 25-30 \approx 4-5, processum setuliformem incurvatum 35-40 \approx 2-3 gerentibus circumdati.

Hab. in caulis emortuis Lobeliæ salicifoliæ, Cerro Alegre de Valparaiso Chile Amer. austr.

*Sect. 6. Staurosporæ.***DICRANIDION** Harkn. — Syll. IV, p. 738.

1. **Dicranidion ?argentinense** Speg., Myc. Arg. V, p. 459, cum icon. 8897
in An. Mus. Nac. Buenos Aires XX (1910). — Sporodochiis spar-
sis irregulariter hemisphæricis, sessilibus, 250-500 μ . diam., albis,
ceraceis, pruinulosis; hyphis continuis, 200 \approx 2-3, sursum liberis
fusoideo-incrassatulis, minute rugulosis v. denticulatis; conidiopho-
ris filiformibus fasciculatis; conidiis trimeris, cellula basali obovata
minore, 5-6 \approx 3, cellulæ superis parallelis, 10-12 \approx 3-4, primo con-
tinuis dein medio 1-septatis.

Hab. ad faciem internam corticis delapsæ Eucalypti glo-
buli in Parque La Plata Argentina Amer. austr.

ARANEOMYCES v. Höhn, Fragm. Mykol. VII (1909) p. 82 (Etym.
aranea et *myces* ob formam conidiorum). — Sporodochia superfi-
cialia, applanata, laxa, pallida, ceraceo-carnosula, contextu basi
parenchymatico, supra prosenchymatico. Conidiophora simplicia,
apice sporigera. Conidia solitaria cylindracea, bicellularia, hyalina,
ad septum utrinque lateraliter appendicem semilunarem gerentia.

1. **Araneomyces acarifer** v. Höhn, l. c. p. 82, f. 3. — Sporodochiis 8898
cerino-flavis, applanatis, 500-700 μ . lat., 150-250 μ . alt.; conidio-
phoris parallelis, 20 \approx 2; conidiis hyalinis cylindraceis, utrinque
obtusis 12 \approx 2,5; appendicibus semilunato-falcatis conidium supe-
rantibus, nempe 12-18 \approx 1,5, formam substellatam conidio præ-
bentibus.

Hab. in Rosellinia Miconiæ, verisimiliter statum conidio-
phorum *Paranectriæ juruanæ* exhibens, ad folia Miconiæ sp.
Rio Juruá Brasiliæ (ULE).

TUBERCULARIEÆ DEMATIEÆ.*Sect. 1. Amerosporæ.*

EPICOCCUM Link — Syll. IV p. 736, X p. 732, XI p. 654, XIV
p. 1129, XVI p. 1104, XVIII p. 679.

1. **Epicoccum diversisporum** Preuss — Syll. IV p. 741, X p. 732 — 8899
var. **Pseudoplatani** Allesch. in Hedwigia XXXIV, p. 290 (1895).
— Maculis rubris; sporodochiis globosis, atro-purpureis; conidiis
Syll. fung. XXII (VII-1913)

magnitudine ludibundis 7-20 μ . diam., verrucosis, tetrahædro-globosis v. sphæricis, non reticulatis.

Hab. in ramis decorticatis Aceris Pseudoplatani pr. München Bavariæ (SCHNABL).

2. **Epicoccum javanicum** Koord., Botan. Untersuch. (1907) p. 249, 8900 fig. 60. — Sporodochiis convexis, plectenchymaticis, hypophyllis, 50-60 μ . diam., fuligineis; conidiis in conidiophorum simplicium (fuscescentium) dense fasciculatorum apice acrogenis, oblongis v. globoso-oblongis, continuis v. 7-septatis v. murali-divisis 14-16 \approx 12-13, fuscis, exosporio minute areolato, conidiophoris brevibus 8 \approx 4.

Hab. in foliis vivis Fici quercifoliæ, Purworedjo prov. Java (KOORDERS).

3. **Epicoccum hyalopes** I. Miyake, Pilze Reispflanze Japan Journ. College Agricult. Tokyo, II (1910) p. 264, t. XIV, fig. 73. — Sporodochiis nigris, globosis 75 μ . diam.; conidiophoris hyalinis; conidiis levibus, nigris, globosis v. ellipsoideis 14-18 \approx 13-15.

Hab. in glumis Oryzæ sativæ, Soma Japoniæ.

4. **Epicoccum torquens** Messee, Torreya VI (1906) p. 46-50, f. 1-5. 8902 — Sporodochiis sæpius circularibus, convexis, solitariis, v. subconfluentibus, 350 μ . diam., brunneolis; conidiis globosis, sessilibus, 1-cellularibus, brunneis, minute verrucosis, 15-20 μ . diam.; conidiophoris parce ramosis, septatis, ex hypostromatis compacti cellulæ periphericis orientibus.

Hab. parasitice in capsulis Weisiæ viridulæ, quæ inde torquentur, Thomasville in Georgia. — Ab. affini *E. scabro* dignoscitur conidiis continuis, sporodochii cellulæ polygoniis, majoribus, conidiophoris ramosis, septatis, vitaque parasitica.

SPILOMİUM Nyl. — Syll. XVIII p. 678.

1. **Spilomium pertusaricola** Nyl. Enum. génér. des Lichens in Mém. de la Soc. imp. des scienc. de Cherboourg V (1857) p. 91 (extr.). — Habitu *Sphinctrinæ microcephalæ*; distinguitur conidiis oblongis, nigricantibus, 4-5 \approx 2,5-3.

Hab. in Pertusaria in Gallia.

- MELANOBASIDIUM** Maubl., Bull. Soc. Mycol. France XXII (1906) p. 69. (Etym. a *melas melanos* niger et *basidium*). — Foliicola, maculicola; sporodochia minima, erumpentia, atra, ex hyphis ramosis, septatis, intricatis composita; conidiophora cylindracea,

densa, septata, concoloria; conidia solitaria, acrogena, ovoidea, hyalina.

1. **Melanobasidium Mali** Maubl. l. c. p. 70. — Maculis albidis ovatis, 8904 v. elongatis, margine brunneo, angusto cinctis; sporodochiis punctiformibus, epiphyllis demum epidermide fissa superficialibus, 170-190 μ . latis; conidiis ovoideis, hyalinis 4,5-5,5 \approx 2,5-3.

Hab. in foliis vivis Piri Mali prope Sevillam Hispaniæ.

HYMENOPSIS Sacc. — Syll. IV p. 744, X p. 735, XVI p. 1105, XVIII p. 682.

1. **Hymenopsis Elasticæ** Kcord., Botan. Untersuch. (1907) p. 249, 8905 fig. 59. — Sporodochiis scutellato-disciformibus, erumpenti-superficialibus, corticolis, atris, sparsis, 0,5-1 mm. diam., glabris, conidiophoris filiformibus, subsimplicibus; conidiis acrogenis, solitariis, continuis, oblongis, utrinque obtusis v. rotundatis, 4-5 \approx 2,5, fumigatis.

Hab. in cortice Fici elasticæ, Kaliwiro prov. Kedu, Java (KOORDERS).

2. **Hymenopsis paraensis** Syd. Hedwigia XLIX (1909) p. 84. — Sporodochiis amphigenis, inæqualiter distributis, plerumque rotundatis, convexulis, $\frac{1}{3}$ - $\frac{1}{2}$ min. diam., superficialibus, aterrimis, calvis; basidiis dense fasciculatis, elongato-clavatis, hyalino-murinis, ca. 20 \approx 1-1 $\frac{1}{2}$; conidiis ellipsoideis vel fusoideis, utrinque plerumque attenuatis, continuis, olivaceis, eguttulatis, 5-8 \approx 2-3.

Hab. in foliis emortuis Philodendri, Para America austr. (C. F. BAKER).

3. **Hymenopsis hydrophila** Saccardo, New York, Journ. of Myc. v. XIII (1907) p. 47. — Sporodochiis laxè gregariis, longitrorsum oblongis, 400-450 \approx 200 opace nigris, glabris, compactiusculis, subexcavato-hysterioideis, erumpenti-superficialibus; conidiis fusiformibus, rectis v. leviter inæquilateris, 16 \approx 4-4,2, intense olivaceis, obsolete, guttulatis, utrinque acutiusculis. conidiophoris dense fasciculatis, filiformibus, sursum incrassatulis, hyalino-viridulis, 20-20 \approx 2 apice truncatulis et subinde fimbriatulis.

Hab. in foliis emortuis Typhæ latifoliæ, Lyndonville, N. Y., Amer. bor. (Dr. C. E. FAIRMAN). — Species peculiaris, ab *H. Typhæ* (Fuck.) Sacc. omnino diversa. Conidia mutica, sed a conidiophoris liberata hinc v. utrinque massulum mucosam emittere videntur.

EPIDOCHIUM Fr. — Syll. IV p. 747, X p. 735, XVIII p. 683.

1. **Epidochium Oryzæ** I. Miyake Reispfl. Japan, Journ. College 8908
. Agricult. (1910) II p. 264, t. XIV, f. 74-75. — Sporodochiis
superficialibus, verruciformibns, hemisphæricis v. irregularibus 160-
240 μ . diam., olivaceis; conidiophoris 20-25 \approx 2; conidiis solitariis,
fusoideis, biguttulatis, 9-12 \approx 2,5-3,5.

Hab. in foliis *Oryzæ sativæ*, Japonia. — Species verisimili-
ter saprophytica, videretur *Chætostroma atrum* demptis setulis.

ACTINOMMA Sacc. — Syll. IV p. 753.

1. **Actinomma subtropicum** Speg., Myc. Argent. V, p. 461, in An. 8909
Mus. Mus. Nac. Buenos Aires XX (1910). — Sporodochiis sæpius
hypophyllis sparsis v. hinc inde laxæ gregariis superficialibus,
300-350 μ . diam., undique ex hyphis olivascentibus subfascicula-
tis radiatim hirsutis intus carnosulis et subflavidis; hyphis fasci-
culatis sursum liberis subtorulosis, fumosis, in conidia sensin tran-
seuntibus; conidiis cylindraceis utrinque obtusissime rotundatis,
subcatenulatis, 5-10 \approx 3,5, continuis eguttulatis, levibus, fumosis.

Hab. ad folia viva Lauracearum in Silva Bobadal Jujuy
gentina Amer. austr.

SPHÆROMYCES Mont. — Syll. IV p. 753.

1. **Sphœromyces maticola** Speg., Ann. Mus. Nac. Buenos Aires, 8910
t. XVII (1908) p. 141. — Maculis nullis; sporodochiis primo he-
misphæricis dein orbiculari-depressis, erumpentibus v. superficia-
libus, in vivo carnosulis, in sicco subcarbonaceis, ex hyphis apice
gelatinoso-deliquescentibus, efformatis; conidiophoris clavulatis,
20 \approx 2, chlorinulis, deorsum attenuatis fasciculato-coalescentibus,
sursum in catenulas sporarum mucoso-vaginatarum productis; co-
nidiis e globoso subcuboideis tunica mucosa non v. vix perspi-
cua obvolutis chlorinulis (2 μ . diam.) eguttulatis.

Hab. vulgatum ad ramos dejectos putrescentes *Ilicis para-*
guariensis, ubique Misiones Rep. Argentina.

2. **Sphœromyces patagonicus** Speg. Myc. Argent. V, p. 455, in An. 8911
Mus. Nac. Buenos Aires XX (1910). — Sporodochiis sparsis v.
pauci-gregariis et subseriatis erumpentibus subglobosis, compactiu-
sculis, 120-250 μ . diam., atris; hyphis basi breviter coalescenti-
bus sursum liberis 100-200 \approx 8-10, fuligineis toruloso-articulatis
ac sensim in conidia transeuntibus; conidiis catenulatis, subcylin-

draceis, utrinque obtuse rotundatis 10-16 \approx 5-6, pulchre fuligineis levibus sæpe obsolete biguttulatis.

Hab. ad culmos aridos putrescentesque Stipæ speciosæ in rupestribus Carrenleofú Patagonia Argentina Amer. austr.

MYROTHECIUM Tode — Syll. IV p. 750, X p. 737, XI p. 655, XIV p. 1129.

1. **Myrothecium advena** Sacc., Ann. Mycol. VI (1908) pag. 560, 8912 tab. XXIV, fig. 10.— Sporodochiis hypophyllis, gregariis, superficialibus, pulvinatis, 200-250 μ . diam., compactiusculis, nigris sed hyphulis candidis radiantibus cinctis, hinc bicoloribus, ambitu orbicularibus v. subreniformibus; conidiis cylindraceis rectis, curvulisve, utrinque rotundatis, 5,5-6,5 \approx 2, dilutissime chlorinis, utrinque obsolete 1-guttulatis; conidiophoris fasciculatis bacillaribus, modo simplicibus, modo nonnullis e trunculo communi orientibus, 16-18 \approx 1,5 dilutissime chlorinis.

Hab. in foliis subvivis Coffeæ arabicæ in calidariis, Cherbourg (P. HARIOT). — Sporodochia in areis fere arescentibus nascentur.

MYROTHECIELLA Speg. Arg. V, p. 460, in An. Mus. Nac. Buenos Aires XX (1909). (Etym. *Myrothecium*, cuius est analogum genus). Est *Myrothecium* conidiis catenulatis donatum.

1. **Myrotheciella catenuligera** Speg., l. c. p. 460 cum icon. — Sporodochiis scutelliformibus, 0,5-2 mm. diam., olivaceis, albo-marginatis; conidiophoris continua simplicibus sæpius supra medium bifidis apice obtusis, 30 \approx 2, fumosis; conidiis cylindraceis catenulatis, utrinque subtruncatis, 8-12 \approx 3, sæpe minute guttulatis primo hyalinis dein chlorinulis.

Hab. in caulis putrescentibus Lycopersici esculenti La Plata Argentina Amer. austr.

CHÆTOSTROMA Corda — Syll. IV, p. 749, X p. 736, XI 655, XIV p. 1130, XVIII p. 683.

1. **Chætostroma circunicola** Speg. Myc. Arg. V, p. 462, in An. Mus. Nac. Buenos Aires XX (1910) — Acervulis sæpius macula suborbiculari, 5-10 mm., pallida indeterminata insidentibus, erumpentibus laxè gregariis numerosis, sublenticularibus 75-150 μ . diam. atro-ferrugineis; setulis plus minusve numerosis sæpius centralibus, rectis v. vix subflexuosis, simplicibus 100-150 \approx 4-5,

sursum attenuatis acutatis, obscure pluriseptatis nigris subopacis; conidiophoris cylindraceis fasciculatis erectis simplicibus hyalinis 10-12 \approx 1.5-2; conidiis (catenulatis?) subcylindraceis deorsum sæpe subattenuatis, 14-16 \approx 4-5, non v. grosse biguttulatis, levibus, subchlorinis.

Hab. vulgatum ad folia dejecta subputrescentia Pircuniæ (Phytolaccæ) dioicæ in Horto bot. La Plata Argentina Amer. austr.

2. **Chætostroma microspermum** Speg., Myc. Arg. V, p. 461, in An. 8915 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis; sporodochiis globoso-lenticularibus, 150-180 μ . diam., nigris, superficialibus sparsis, setulis laxis rectiusculis simplicibus acutis, 150-200 \approx 5-6, subopace olivaceis adspersis; conidiis cylindraceis, utrinque subacutiuscule rotundatis, 5-6 \approx 1,75-2, eguttulatis levibus obscure olivaceis; conidiophoris bacillaribus, 10-15 \approx 1, dense constipatis, subhyalinis.

Hab. ad folia arida Tillandsiæ cujusdam in silvis circa Bompland Misiones Argentina Amer. austr.

3. **Chætostroma graminellum** Speg., Myc. Arg. V, pag. 461. in An. 8916 Mus. Nac. Buenos Aires XX (1910). — Sporodochiis atris erumpentibus irregulariter suglobosis, 120-250 μ . diam., laxe minuteque setulosis, setulis fuligineis patentiusculis, 50-100 \approx 2-3; conidiophoris hyalinis sursum liberis, bifidis v. capitato-denticulatis; conidiis acrogenis solitariis, breviter fusoideis, 12 \approx 2,5, primo hyalinis dein chlorinis.

Hab. ad culmos emortuos Boutelouæ ciliatæ circa San Luis Argentina Amer. austr.

Sect. 2. Didymosporæ.

ERYSIPHOPSIS Speg., Myc. V, p. 462, in An. Mus. Nac. Buenos Aires XX (1910). (Etym. *Erysiphe* et *opsis* facies). — Sporodochia globosa, atra, subiculo radiante hyalino insidentia; conidia didyma chlorina.

1. **Erysiphopsis myrothecioides** Speg., l. c. p. 463 cum icon. — Sporodochiis sparsis v. hinc inde pauci-gregariis epiphyllis atris minutis 150-200 μ . diam., compactiusculis, subiculo candido ex hyphis tenuibus, 20-30 \approx 1, breviuscule ramulosis subcontinuis suffultis; conidiis elongato-ellipsoideis utrinque rotundatis, 16-18 \approx 6-7, medio uniseptatis sæpe constrictulis eguttulatisque.

Hab. ad folia viva Jacarandæ cuspidifoliæ in Tucuman Argentina Amer. austr. — Subiculum Erysiphem quamdam eximie simulans.

Sect. 3. Phæophragmiæ.

EXOSPORIUM Link — Syll. IV p. 755, X p. 738, XI p. 656, XVI p. 1106, XVIII p. 686.

1. **Exosporium Meliloti** Trav. in Bull. n. 8 Société Flore Valdôtaine, 8918 pag. 31 extr. (1912). — Sporodochiis sparsis vel gregariis confluentibusque, innato-superficialibus, subhemispæricis, 200–400 μ . diam., olivaceo-atris, velutinis, intus pseudoparenchimaticæ contextis, pallide luteo-fulvis vel subhyalinis; conidiophoris erectis, sinuositis, rarius subrigidis, olivaceo-flavis, continuis vel prope basini parce septatis, apicem versus sinuoso-nodulosis et pallidioribus, 45-60 \times 6-7; conidiis acro-pleurogenis, initio continuis limoniformibus, demum cylindraceo-ellipsoideis, apice rotundatis, basi constricto-truncatis, transverse 1-3-septatis, non constrictis, flavis, 18-27 \times 6-8, episporio distincte granuloso-asperulo.

Hab. in caulis emortuis adhuc stantibus Meliloti albæ, prope Valpelline, Valle d'Aosta, Ital. bor., alt. 950 metr. — Pulchra species, fructificatione *Heterosporio* similis, sed ob conidiophora e sporodochio stromatico rite evoluto orientia ad hoc genus adscribenda. Ad subgen. *Trachysporium* referenda.

2. **Exosporium laricinum** Massee Journ. Board Agricult. Sept. (1902) 8919 et Diseases cult. Plants (1910) p. 480, f. 143. — Sporodochiis parasiticis minutis, punctiformibus, nigris, gregariis; stromate subcirculari, saepè centro depresso, fere peziziformi, parenchymatico; conidiis subsessilibus, fusiformibus, utrinque acutis, saepius curvulis, 5-7-septatis non constrictis, subolivaceis, 25-30 \times 6-7; conidiophoris brevibus teretibus, 1-septatis, concoloribus.

Hab. in cortice ramorum Laricis europææ in Britannia. — Corticem rimosum neddit et vexat. Non raro e medio v. ex apice conidiorum conidia secundaria generantur.

3. ? **Exosporium Lauri** Hazsl., Magyar Discom. p. 187, tab. 4, fig. 5. 8920 — Sporodochiis compactis, brunneo-atris; conidiis fusoideis 8-14-septatis, fuligineis, strato mucoso hyalino obvolutis, apice rotundatis, deorsum hyalinis stipitiformi-tenuatis, majusculis.

Hab. in truncis Lauri nobilis, Fiume. -- Dubia stirps.

ACROTHECIELLA Koord., Botan. Untersuch. Java (1907) p. 250. (Etym.

Acrothecio cuius analogum genus). — Sporodochia verruciformia, phyllogena, superficialia, pulvinata contextu plectenchymatico fuligineo. Hyphæ fertiles erectæ, olivaceæ, pluriseptatæ, filiformes, simplices v. apice divisæ, ex sporodochio undique irradiantes. Conidia solitaria, acrogena et pleurogena, olivacea, biseptata curvata v. curvulata, appendicibus destituta, loculo medio maximo obscuræ olivaceo, loculis 2 extimis pallide olivaceis, rarius 3-septata.

1. **Acrotheciella javanica** Koord. l. c. p. 251, fig. 61. — Sporodochiis fuligineis, minimis, 100 μ . diam., hyphis fertilibus 250-400 \approx 10, conidiis 20-22,5 \approx 10-10,5.

Hab. in foliis vivis et emortuis Fici elasticæ prope Loano et Penunggalan prov, Kedu ins. Java (KOORDERS).

TRIMMATOSTROMA Corda — Syll. IV p. 757, XIV p. 1131, XVI p. 1107, XVIII p. 688.

1. **Trimmatostroma Liriodendri** Atkins., Ann. Mycol. VI (1908) p. 60. 8922 — Maculis magnis, 1-3 cm. latis, atris, margine irregulari; sporodochiis hypophyllis, raro concentricis, applanatis, 200-500 μ . latis; conidiophoris dense compactis, brevibus, hyalinis; conidiis oblongis, raro trigonis, 1-4-pluriseptatis, raro longitudinaliter septatis, 12-20 \approx 5-7.

Hab. in foliis languidis Liriodendri Tulipiferae, Mt. Mitchell, Block Mts. N. Carolina America bor.

WISNERIOMYCES Koord., Botan. Untersuch. Java (1907) p. 246. — Sporodochia pulvinata, sessilia v. rarius basi coarctata et stipitata, fusca, subfragilia, non gelatinosa, amphigena, plerumque hypophylla, superficialia, basi setis numerosis curvatis, fuligineis, septatis erectis ornata. Conidiophora brevissima, cylindracea, simplicia, hyalina. Conidia cylindracea, hyalina, curvata, levia, 3-8-septata, mox in articulos cylindraceos, truncatos 4-9 secedentia, in capitulum laxe aggregata.

1. **Wisneriomycetes javanicus** Koord. l. c. p. 246, fig. 57. — Sporodochiis basi setis 150-170 \approx 5 ornatis; hyphis sterilibus repentibus v. endophyllis setis maximis numerosissimis, sparsis, 350-500 μ . longis, obscure fuligineis, rectis v. curvatis, acutissimis, septatis, basi dilatatis; conidiis 50-80 \approx 3,5-4,5 in articulos 10-12 \approx 3,5-4,5 secedentibus.

Hab. in foliis emortuis Fici elasticæ prope Penunggalam prov. Kedu, Java (KOORDERS).

Sect. 4. Phæodictyæ.

SPEGAZZINIA Sacc. — Syll. IV p. 758, X p. 739, XIV p. 1131, XVIII p. 689.

1. **Spegazzinia Coffeæ** P. Henn., Mission E. Laurent, fasc. III (1906) 8924 p. 318. — Sporodochiis atris effusis in mycelio *Meliolæ* parasiticis, amphigenis; conidiophoris filiformibus, hyalino-fuscidulis, c. 2 μ . cr., septatis; conidiis 3-5 composito-sarciniformibus 14-22 μ . diam., cellulis subglobosis, dense verrucosis, atris, 8-13 μ .

Hab. in foliis Coffeæ in mycelio Dimerosporii v. *Meliolæ*, Ubangi Africa trop.

MYRIOPHYSIELLA Speg., Fungi Chilenses (1910) p. 198. (Etym. *myria* numerus copiosus et *physa* vesica). — Sporodochia subglobosa subgelatinosa, olivacea, parenchymatico-cellulosa; conidia peripherica subglobosa, olivacea, parenchymatico-cellulosa.

1. **Myriophysella chilensis** Speg., l. c. p. 198, cum icon. — Sporodochiis habitu magnitudineque sat ludentibus, subglobosis, 80-1500 μ . diam.; conidiis subglobosis 20-30 μ . diam. olivaceis e cellulis etiam globosis, 4-6 μ . diam., olivaceis, grosse 1-nucleatis efformatis.

Hab. frequens in foliis vivis et emortuis Boldoæ fragrantis, Lithreæ causticæ, Aetoxici punctati, Lota, Talcahuano, Concepción, Valparaiso, Chile Amer. austr.

CEREBELLA Ces. — Syll. IV p. 761, VII p. 523, IX p. 290, XI p. 237, XVI p. 1107.

1. **Cerebella Anthistiriæ** Petch, Ann. R. Bot. Gard. Peradeniya v. 8926 IV, Pt. V (1909) p. 307. — Hypostromate circ. 6 mm. long., 3 mm. lat., depressiusculo, superficie transverse cerebriformi-convoluta, atro-olivaceo, dein nigro; conidiis 3-7 in sphærulas plus v. minus globosas connexis, ad septa constrictis, 14-20 μ . diam., pedicello brevi crassiusculo hyalino præditis; conidiis sepositis tetrahedricis basi rotundatis, 8-12 μ . diam., olivaceis, levibus.

Hab. in inflorescentia Anthistiriæ imberbis, Peradeniya, Ceylon.

Sect. 5. Staurosporæ.

CHELISPORIUM Spieg., Myc. Arg. V, p. 463, in An. Mus. Nac. Buenos Aires XX (1910). (Etym. *chele* forceps, chela et *spora*). — Sporodochia erumpentia, coriacella; conidia cheliformia, cellula basali simplici, superioribus parallelis sæpius plurilocularibus. — Est *Dicranidion dematium*.

1. **Chelisporium hysteroides** Spieg., l. c. p. 463 cum icon. — Sporo- 8927 dochiiis gregariis elliptico-linearibus, 0.5-1 mm. long. 200-250 μ . diam., erumpentibus pruinulosis; conidiis dense constipatis, subellipsoideis, 5-15 \times 8, fumosis, cellula basali breviter lateque ovata, ramulis superis 2-3-cellularibus arcuatulis, altero crassiore, altero angustiore.

Hab. ad palos, cortice orbatos, diu intemperiis expositos, Eucalypti globuli, in Parque La Plata Argentina Amer. austr.

FUMAGOPSIS Spieg. Myc. Arg. V, p. 465, in An. Mus. Nac. Buenos Aires XX (1910). (Etym. *Fumago*, cuius habet faciem). — Biophilæ, phyllogena, subiculo fumagineo atro; sporodochiis punctiformibus setulosis, conidiis triradiatis hyalinis.

1. **Fumagopsis triglifioides** Spieg., l. c. p. 465 cum. icon. — Subiculo 8928 tenuissimo submembranaceo effuso adnato; sporodochiis subhemisphæricis, 100-200 μ . diam., compactiusculis, setulis paucis patentiusculis rectis 100-200 \times 3,5-5, subopace fuligineis ornatis; conidiphoris filiformibus 20-30 \times 1,5-2, rectis fasciculatis, hyalinis; conidiis triradiatis cellula basali (seu stipite) cylindracea sæpius unicoculari, 10-15 \times 3, radiis acutiusculis patentiusculis arcuatulis, 2-3-septatis, 20-30 \times 2-2,5, ad septa leniter constrictulis.

Hab. ad folia viva Lucumæ neriifoliæ, insula Santiago prope La Plata Argentina Amer. austr.

MYCELIA STERILIA.

SCLEROTIUM Tode — Syll. XIV p. 1139, XVI p. 1108, XVIII p. 690.

1. **Sclerotium ramulicola** Speg., Myc. Arg. V, p. 467, in An. Mus. 8929 Nac. Buenos Aires XX (1910). — Sclerotiis subglobosis, 90-100 μ . diam., glabris, nigris, astomis, primo nucleo minute denseque parenchymatico subhyalino farctis, serius vacuis, parietibus carnosocoriaceis, contextu dense subimperspicueque parenchymatico fusco-lateritio.

Hab. ad ramulos vivos Loganiaceæ in silvis prope Campo Chico Jujuy Argentina Amer. austr. — Ramuli infecti incrassatuli torulosi e gemmulis in soros subhemisphæricos (1-2 mm. d.) atros verruculosos duriusculos transformatis. Species formam sterilem *Montagnellæ* cujusdam sistens.

2. **Sclerotium Pseudoerysiphe** Speg., Myc. Arg. V. p. 467, in Anal. 8930 Mus. Nac. Buenos Aires XX (1910). — Maculis nullis v. vix manifestis; subiculo hypophyllo candido, araneoso, tenui ex hyphis gracillimis, 1,5-2 μ . cr., repentibus arctiuscule adnatis septulatis v. guttulatis hyalinis efformato; sclerotiis superficialibus laxè gregariis, glabris, levibus subglobosis, 40-80 μ . diam., melleis intus gelatinosis hyalinis, tunica tenui minute parenchymatica vestitis.

Hab. ad folia viva Trixis frutescentis in sepibus prope Tucumán Argentina Amer. austr

3. **Sclerotium aschersonioides** Speg., Myc. Arg. V, p. 466, in Anal. 8931 Mus. Nac. Buenos Aires XX (1910). — Acervulis hemisphærico-depressis, 2-3 mm. diam., superficialibus, matrici arcte adnatis, pallide aurantiacis, extus gossypinulis intus compactis aurantiacis; subiculo membranaceo tenuissimo parum perspicuo e globulis, 200-250 μ . diam., apice subostiolatis dense constipatis ex hyphis tenuibus 4-5 μ . cr. flexuosis continuis efformatis constituto.

Hab. ad hypophyllum foliorum viventium Myrtaceæ cujusdam in silvis prope Puerto León Misiones Argentina Amer. austr. — Certe statum juvenilem v. inevolutum *Aschersoniæ* cujusdam sistens.

4. **Sclerotium clavus** DC. — Syll. XIV, p. 1151 — fm. **andropogonicola** 8932
Speg., Myc. Arg. V, p. 466, in An. Mus. Nac. Buenos Aires XX
(1910). — Sclerotiis e cylindraceo subfusoideis utrinque obtusiu-
sculis, 5-7 mm. long., 1-1,5 mm. cr., extus plumbeis intus cor-
neis albis.

Hab. ad ovaria *Andropogonis nutantis* in Colonia Juá-
rez Celman, Córdoba Argentina Amer. austr.

5. **Sclerotium oicophilum** Speg., Myc. Arg. V, p. 466, in An. Mus. 8933
Nac. Buenos Aires XX (1910). — Globosum, breviter pedicellatum,
in vivo leve, 400-750 μ . diam., plumbeum, nitidum, durum, siccum
subcarnosulum corrugatum, intus grosse selerenchymaticum albo
hyalinum, cellulis e globoso obtuse angulatis, 20-24 \times 15-20, refrin-
gentissimis; mycelio rhizomorphoideo e fibris candidis, 80-120 μ .
diam. dense ramulosis subteretibus tenacellis efformato.

Hab. abunde ad trabes fabrefactas putrescentes in habitationibus
La Plata Argentina Amer. austr.

6. **Sclerotium Erythrinæ** Peyl, Lotos VII (1857) pag. 29, fig. 7. — 8934
Syll. XIV, p. 1174 (nomen). — Adnatum, versiforme, minutum
fere punctiforme v. ellipticum, reniforme, usque ad 3,5 cm. ex-
tensum, sed **vix** 5 mm., depresso, primo albidum subsebaceum,
demum induratum, superficiale, infra nigrum intus album, super-
ficie longitrorsum striatum et medio hysteriformiter fissum.

Hab. in stolonibus emortuis *Erythrinæ laurifoliæ* in ca-
lidariis in Bohemia (PEYL).

7. **Sclerotium Tini** Sacc., in Annal. Mycol. X (1912) p. 322. — Laxe 8935
gregarium, phyllogenum, utrinque conspicuum, disciforme, regu-
lare, nigrum, leve, 1 mm. latum, superne convexulum nitidulum,
inferne planum opacum, intus pallidum, compactiusculum e cel-
lulis sinuose ovoideis 5-7 μ . diam., subhyalinis formatum.

Hab. in foliis emortuis dejectis *Viburni Tini*, Villa del
Papa, Castel Gandolfo pr. Romam (D. SACCARDO). — Cum *Phacidio*
Tini Duby (Moug. et Nestl. Stirp. Voges. n. 1181) quoque sterili,
comparavi sed omnino differt.

8. **Sclerotium Rolfsii** Sacc., in Ann. Mycol. IX (1911) pag. 257. — 8936
Superficiale, subrotundum v. horizontaliter ellipsoideum, 0,5-0,8
mm. diam., facile secedens, levigatum, nitidulum, roseum, demum
fulvescenti-brunneum, carnosso-firmulum, intus pallidum; cellulis
e globoso polyhedricis 6-8 μ . diam. interdum sinuosum, subhyalinis,
peripherice brunneolis; fructificatione nulla observata.

Hab. in caulibus plantarum plurimarum, nempe in *Solanum*

tuberoso, Lycopersico, Melongena, Piso, Cucumeribus, Chrysanthemis, Capsico, Rheo, Faba, Batata, Citrullo, Beta, Arachide, Viola, Brassica, Amaranto, Hydrangea, Desmodio, Erigeronte, Erechtite, Ambrosia, Ficu. Legit in Florida prof. P. A. ROLFS, communicavit, Aug. 1910, prof. F. STEVENS. — Species parasitica et tunc noxia; legitur tamen interdum saprophytica.

9. **Sclerotium Allii** Rivolta, Parassiti veget. p. 544, t. 3, f. 41 (1873) 8937
(in textu ex errore sub *Rhizoctonia*). — Globulosum, seminis papaveris magnitudine, ex fibrillis areolatim anastomosantibus, reticulum fere formantibus, splendentibus compositum.

Hab. in collo bulborum Allii sativi in Etruria (GHIGNOLA).
— Plantulæ affectæ flavescent, arescunt et intra 4-6 dies pereunt.
— Videtur species diversa a *Scl. ambiguo* et *Scl. cepivoro*.

10. **Sclerotium granulatum** Peyl, Lotos VII (1857) pag. 67, tab. II, 8938
fig. 12 — Syll. XIV, p. 1174 — (nomen). — Adnatum, primo albidum, dein e brunneo in nigrum abiens, intus album, initio depresso dein expansum, subglobosum et tunc partim areolatum diffractum, postremo in crustam granulosam, intus lacunosa confluens.

Hab. inter squamas bulborum Allii Cepæ in Bohemia (PEYL).

11. **Sclerotium ambiguum** Dub. — Syll. XIV, p. 1150 — var. **Narcissi** Sacc., Ann. Myc. VIII (1910) p. 347. — Tuberculis adnatis, gregariis applanatis, 0,7 mm. d., ambitu suborbiculari, nigris, demum nitidulis, levibus v. rugulosis, margine tenuiter elevato et tunc patellarioideis.

Hab. in squamis, demum emorientibus, bulborum Narcissi sp. Palermo Siciliæ (J. H. MATTEI).

12. **Sclerotium irregulare** I. Miyake, Pilze Reispfl. Japan, Journ. College Agricult. II (1910) pag. 265. — Tuberculis irregulariter globosis, ovoideis, ellipsoideis v. linearibus, brunneo-fuligineis, intus nigris, supra convexis infra concavis, magnitudine variabilibus 1-6 mm. long., 1-3 mm. cr.

Hab. in vaginis Oryzæ sativæ Japonia. — A *Scl. Oryzæ* differt magnitudine diversa et a *Scl. glumali* colore intus nigro.

13. **Sclerotium Selaginellæ** Peyl, Lotos VII (1857) pag. 68, tab. II, 8941
fig. 14 — Syll. XIV, p. 1174 (nomen). — Innatum, conchiforme v. naviculare, minutissime rugulosum, intus album.

Hab. in caule v. foliis Selaginellæ sp. in calidariis in Bohemia (PEYL).

14. **Sclerotium stipitatum** Berk. et Curr., in Curr. et Hanb., Trans. 8942
Linn. Soc. London XXIII (1860) p. 92 et 93, tab. 9, fig. 1-4. —
Versiforme, ellipsoideo-subglobosum, stipitato-apiculatum v. sub-
rostratum, nigrum, firmum, 1-2,5 cm. lat., superficie nigricans,
glabrum sed subreticulatum, contextu interiore ex cellulis maxime
irregularibus, cylindraceis intricato-ramosis, sæpe hinc inde infla-
tis, hyalinis.
Hab. ad terram, Travancore Sinarum.
15. **Sclerotium Libertarianum** Lindau, in Rabenh. Krypt. Fl. Pilze IX, 8943
pag. 823 (1910). — Ita vocandum *Apiosporium Brassicæ* (Lib.)
Fuck. — Syll. I, p. 33 et in Malp. I (1887) p. 457, *Perisporium*
Brassicæ Lib. Crypt. Ard n. 280, non *Sclerotium Brassicæ* Pers.
— Cellulæ interiores globoso-angulosæ, crasse tunicatæ 12-14 µ. d.
16. **Sclerotium umbilicatum** Lindau, in Rabenh. Krypt. Fl. Pilze IX, 8944
p. 670. — Ita vocandum *Scler. umbilicatum* Rob. ap. Desm. (1845)
— Syll. XIV, p. 1160 — non *Scl. umbilicatum* Lasch, 1844 —
Syll. XIV p. 1145.

CUTICULARIA Ducomet, Rech. sur le développement de quelques champi-
gnons parasites à thalle subcuticulaire, Thèse Fac. Sc. Paris (1907)
p. 235, tab. XXXIV (Etym. *cuticula* ob mycelium subcuticulare). —
Maculiformis, non stromaticæ, mycelio subcuticulari. — Generi
Ectostromati proximum sed characteribus macularum diversum.

1. **Cuticularia Ilicis** Ducomet, l. c. Characteres generis.

Hab. in foliis Ilicis Aquifolii in nemoribus prope Rennes, 8945
Galliæ. — Cfr. pleniorum expositionem ap. Ducomet. l. c.

CLAVARIOPSIS De Wild. in An. Soc. Belg. Microsc. XIX pag. 200
(1895). (Etym. *Clavaria*, cuius habet faciem). — Mycelium endo-
genum, extrinsecus ramos simplices erectos, septatos, apice clava-
tos exerens; ramorum cellulæ supremæ in ramulos 1-3 uni-bicel-
lulares abeuntes. — Teste Lindau, an ramuli 1-3-cellulares ut co-
nidia habendi sint inquirendum est.

1. **Clavariopsis aquatica** De Wild. l. c. p. 201, tab. VI, fig. 1-9. — 8946
Characteres generis; ramuli ultimi (conidia?) breves, recti v. cur-
vuli, 1-3-cellulares, facile secedentes et in aqua seorsim natantes.

Hab. in foliis salicinis putridis, aqua immersis, Ruy Belgii
et Nancy Galliæ (DE WILDEMAN).

ANTHINA Fr. — Syll. XIV p. 1184.

1. **Anthina pallida** de By., Hedwigia I pag. 35, tab. VI fig. 1-11 8947 (1854). — Mycelio tenui effuso, albo; rhabdis ex eo oriundis rectis, filiformibus, simplicibus vel in ramos binos-ternos partitis, initio albis, dein brunneis, apice tamen jugiter albo et tenuiter penicillato.

Hab. in fragmentis ligneis Abietis excelsæ in calidariis Berolini Germaniæ.

OZONIUM Link — Syll. XIV p. 1187.

1. **Ozonium omnivorum** Shear, Bull. Torr. Bot. Club. XXXIV 8948 (1907) p. 305. — Mycelio sordide flavo, interdum initio v. in interiore matrice albido; hyphis in rhabdos fasciculatis et extus stratum arachnoideum formantibus et sursum ramulos 1-4 angulo recto patentes proferentibus, 3-5 μ . diam.

Hab. ad terram et ad radices Gossypii, Medicaginis, Batatae, Pisi, Betæ arborumque fructiferarum, Texas, California, Oklahoma, Indiana etc., Amer. bor., ubi valde noxium. *Oz. auricomum* affine.

2. **Ozonium Muscorum** Roum. et Pat. ap. Roumeg. in Rev. Mycol. V 8949 (1883) p. 29 et 90, tab. 36, fig. 1. — Hyphis in fasciculos connexis, flavo-ferrugineis, filiformibus, parce furcatis, ramosisque, remote septatis, in rhabos, hinc inde plus minusve tumentes intertextis, intus granulosis, 2 μ . cr.

Hab. in caulis Leucobryi glauci, per quos serpit, Fontainebleau et Ouillan Galliæ. — In exempl. ex Ouillan socius aderat *Cantharellus muscigenus* forte metagenetice connexus. — *Geoglossum ozonioides* Letell. Fig. Champ. pl. 672, verisimilime nil est nisi *Ozonium auricomum* varia ætate et forma observatum.

RHIZOCTONIA DC. — Syll. XIV p. 1175, XVI p. 1109.

1. **Rhizoctonia lanuginosa** N. Bernard in Ann. Sc. Nat. Bot. 9 sér. 8950 IX (1909) p. 35 et seq., t. 5. — Hyphis filiformibus parce ramosis. laxe septatis, 3 μ . cr., ramos toruloso-submoniliformes crassiores 6-7 μ . cr. ramuloso-anastomosantes gerentibus.

Hab. symbiotice et endophytice in Orchideis pluribus tam exoticis cultis quam indigenis in Gallia. — Fungillus cultus habitum lanuginosum, initio opalino-album dein ochraceo-aurantium pallidum sumit — Quoad biologiam hujus formæ et duarum sequentium cfr. N. Bernard l. c.

2. **Rhizoctonia mucoroides** N. Bernard, l. c. p. 29, f. 3 et p. 46-47. 8951
 Hyphis filiformibus remote septatis, parce ramosis, 6-8 μ . cr.,
 hinc inde ramos eximie moniliformes multo crassiores, intricato-
 ramulosos, 16-20 μ . cr. gerentibus.

Hab. cum præcedente in Orchideis variis in Gallia, —
 Culturâ habitum mucoroidem griseo-brunneum sumit.

3. **Rhizoctonia repens** N. Bernard l. c. p. 26-31, f. 3, et p. 46-47. — 8952
 Hyphis filiformibus irregulariter ramosis, sæpe glomerulatis, re-
 mote septatis, hinc inde ramos crassiore sexquisite constricto-monili-
 formes, simplices v. furcatos 8-9 μ . cr. gerentibus, numquam
 anastomosantibus.

Hab. cum præcedentibus in Orchideis rarius in Gallia. —
 Culturâ habitum repensem flavidum mucedineum sumit.

RHIZOMORPHA Roth — Syll. XIV p. 1180.

1. **Rhizomorpha subterranea** Pers. — Syll. XIV, pag. 1180 — var. 8953
caudata Nees v. E. in Nees, Nöggerath, Bischof, Die unterird.
 Rhizomorphen, 1823, p. 655 (Acad. Leop.) *). — Atro-brunnea,
 levis, ramosissima prælonga, ramis patulis attenuatis.

Hab. ad ligna in fodinis Germaniæ. — Var. **scabra** Nees, l. c.
 p. 655. — Sordide brunnea, pendula, scabra, ramosa, ramis sub-
 furcatis, attenuatis, hinc inde fasciculatis. — Cum præcedente. —
 Var. **stellata** Nees l. c. p. 655, t. LXII. — Brunnea, levis, ra-
 mosa, ramis furcatis in ramulos subverticillatos partitis, horizon-
 taliter patentibus, variæ longitudinis, subulatis. — Cum præce-
 dentibus.

2. **Rhizomorpha medullaris** J. E. Smith, Traus. Linn. Soc. XII (1818) 8954
 p. 374, tab. 20. — Majuscula, trunco primario fuscescenti tereti,
 intus medulloso flavescente; ramis copiosissimis filiformibus com-
 pressis niveis, ultimis fragilibus, tortuosis.

Hab. in trabibus fabrefactis, quas destruit, Londini. — Usque
 ad 3-4 metra longa.

3. **Rhizomorpha serpiginosa** (Chev.) Sacc. et Trav., Syll. XX p. 680, 8955
Dematium serpiginosum Chevalier Fl. Paris p. 78, t. 3, f. 21 (1826).
 — Rhizoidea, subtus complanato-canaliculata, serpiginosa, passim

*) De Rhizomorphis phosporeis cfr. monographiam Neesianam cit. ubi de
 earum compositione chemica, phosphorescentia etc. ample tractatur.

subnodosa, fusca, filis intricatis brevissimis, crebris erectiusculis, velutina.

Hab. in cella vinaria ad phialas vini, Parisiis Galliæ. — Ex habitu videtur Rhizomorpha.

Species omissæ, in posterum suis locis inserendæ.

Ex « Lotos » VIII (1848).

Agyrium chartarum Peyl — *Trichopeziza Körberi* (Peyl, sub *Peziza*) — *Macrophoma circinans* (Peyl, sub *Sphæronæma*) Sacc. — *Hendersonia cytisporoides* (Peyl, sub *Sporocadus*) Sacc.

INDEX ALPHABETICUS

specierum in volumine **XXII** descriptarum

additis synonymis (*cursive* impressis)

Aberiæ (Phyllachora) 411.
aberrans (Diaporthe) 382.
aberrans (Dothiorella) 942.
aberrans (Microthyrium) 516.
abietina (Amphisphæria) 184.
abietina (Isaria) 1441.
abietina var. (Morchella) 598.
abietina (*Morchella*) 598.
abietinum (*Spondylocladium*) 1384.
abietinum (*Toxosporium*) 1219.
Abietis (Coniothecium) 1401.
Abietis (Macrophoma) 912.
Abietis (Menoidea) 1463.
Abietis (Rhizosphæra) 917.
Abietis (Zignoëlla) 205.
Abietis-pectinatæ (Macrophoma) 912.
abnormis (Lasiodiplodia) 1012.
abscedens (Belonidium) 696.
abscondita (Dasyscypha) 686.
abscondita (Rosellina) 106.
Absinthii (Rhabdospora) 1131.
Abutilonis (Ascochyta) 1018.
Abutilonis (Diaporthe) 387.
Abutilonis-asiatici fm. (Peroneutypa) 362.
abyssinicum (Hypoxylon) 316.
Acaciæ-caveniæ fm. (Valsaria) 392.
Acaciarum (Cryphonectria) 474.
Acænæ (Phoma) 879.
Acænæ (Physalospora) 80.
Acænæ (Pleospora) 263.
Acænæ (Sphærella) 127.
Acænæ (Stagonospora) 1052.

acamptinga (Meliola) 55.
Acanthaceæ var. (Nectria) 463.
Acantholimonis (Bleunoria) 1197.
Acanthosyridis (Colletotrichum) 1204.
Acanthosyridis (Phyllosticta) 854.
acarifer (Araneomyces) 1489.
acericola (Valsaria) 391.
acerigenum (Leptothyrium) 1149.
acerina (Ascochyta) 1033.
acerina var. (Botryosphæria) 93.
acerina (Tympanis) 714.
acerinum (Anthostoma) 372.
acerinum (Cryptosporium) 1233.
acerinum (Myxosporium) 1193.
acerinum (Rhytisma) 749.
Aceris var. (Hendersonia) 1059.
Aceris (Massaria) 237.
Aceris (*Splanchnonema*) 237.
acheniorum (Leptosphæria) 225.
acheniorum var. (Leptosphæria) 225.
Achilleæ (Camarosporium) 1080.
Achilleæ (Cercosporella) 1332.
Achyranthis (Cercospora) 1429.
acicola (Ciboria) 646.
acicola (Fusarium) 1483.
acicola (Hendersonia) 1069.
acinicola (Macrophoma) 907.
Acokantheræ (Capnodium) 60.
Aconiti (Septoria) 1086.
aconitincola (Sclerotinia) 645.
Acoridii (Phyllosticta) 860.
Actinidiæ (Cytospora) 956.

Actinidiæ (Cytospora) 904.
Actinidiæ (Phomopsis) 904.
Actinonema (Diplodiella) 1007.
Actinonema (Sacidium) 1007.
aculeata (Aglaospora) 397.
aculeata (Trichonectria) 499.
Aculeatæ (Phyllachora) 418.
acuminans (Polyblastia) 257.
acuminata (Phyllachora) 425.
acuta var. (Diaporthe) 382.
acuta (Leptosphaeria) 226.
acutispora var. (Rosellinia) 105.
acutiuscula (Leptosphaeria) 226.
acutum var. (Lophiostoma) 551.
acuum (Schizothyrium) 557.
adeloica (Phyllosticta) 866.
Adenostomatis (Polystigma) 448.
Adenostylis (Ascochyta) 1024.
Aderholdi (Moniliopsis) 1248.
Aderholdi (Septoria) 1105.
adesmicola (Cucurbitaria) 1288.
adesmicola (Gibberidea) 251.
adesmicola (Teichospora) 281.
Adianti-curvati (Dimerosporium) 35.
adiposum (Sphaeronëma) 926.
adnata (Arcyria) 811.
Adonidis (Didymella) 154.
Adonidis (Phoma) 869.
advena (Myrothecium) 1493.
Æchmeæ (Sphærulina) 192.
æcidiicola (Cladosporium) 1371,
Ægopodii (Rhabdospora) 1127.
Ægopodii (Sphærella) 130.
Æleuropodis (Didymosporiella) 1002.
æmulans (Nectria) 469.
æquivoca (Ramularia) 1312.
ærugineum (Verticillium) 1299.
æruginosa (Amphisphaeria) 179.
æruginosa (Erinella) 905.
æruginosa (Trichosperma) 1147.
æruginosum (Dendrodochium) 1460.
æruginosum (Sporotrichum) 1284.
Æsculi (Ascochyta) 1016.
Æsculi (Exoascus) 763.
Æsculi var. (Ascomyces) 763.
Æsculi (Taphrina) 763.
Ætoxici (Hendersonia) 1062.
Ætoxici (Lizonia) 167.
Ætoxici (Lizoniella) 167.
Ætoxici (Phyllosticta) 832.
affine (Geoglossum) 606.
affinis (Diaporthe) 378.

affinis (Fracchiæa) 69.
affinis (Vermicularia) 942.
affinis (Vivianella) 550.
africana (Asterostomella) 1160.
africana (Erinella) 705.
africana var. (Xylaria) 339.
africanum (Gliocladium) 1279.
Afzeliæ (Hyaloderma) 27.
Agapanthi (Macrophoma) 913.
agaricola (Coniothyriella) 977.
agaricola (Coniothyrina) 977.
Agaves (Gloëosporium) 1190.
Agaves (Plowrightia) 430.
aggregata (Harknessia) 978.
aggregatula (Phyllachora) 412.
agnita (Leptosphaeria) 225.
agnostoica (Cercospora) 1426.
agnostoica (Phyllosticta) 828.
Agrostidis (Diplodia) 1001.
Ailanthi (Chorostate) 377.
Ailanthi (Dendrostilbella) 1448.
Ailanthi (Diaporthe) 377.
Ailanthi (Graphium) 1448.
Ajugæ (Ramularia) 1325.
Ajugæ pyramidalis var. (Ramularia) 1325.
alaskana (Guignardia) 76.
alaskana (Læstadia) 76.
alba (Menispora) 1283.
alba (Morchella) 598.
alba var. (Morchella) 598.
alba (Spumaria) 802.
alba (Sterigmatocystis) 1260.
alba (Volutella) 1470.
albanica (Diplodina) 1034.
albanica (Phyllosticta) 842.
albanica (Rhabdospora) 1122.
albicans (Penicillium) 1273.
Albicedræ (Cyanospora) 577.
Albicedræ (Robergea) 577.
albida (Detonia) 619.
albido-aurantiaca (Coryne) 731.
albido-granulata (Dictyomollisia) 702.
albido-roseum (Belonium) 699.
albidum (Ascocorticium) 768.
albidum (Eurotium) 1254.
albidus (Aspergillus) 1254.
Albizziæ (Coniosporium) 1337.
Albizziæ (Helminthosporium) 1389.
albo-fuscidulum (Helotium) 654.
albo-granulatum (Trichobelonium) 701.
albo-lateritia (Eriopezia) 674.
albo-lutea (Monilia) 1246.

albo-maculans (*Phyllosticta*) 838.
 albo-marginata (*Orbilia*) 725.
 albo-marginata (*Pseudomonilia*) 1247.
 albo-marginatus (*Cryptodiscus*) 734.
 albo-nigrescens (*Graphium*) 1449.
 albo-ostiolata (*Micropeltis*) 526.
 albo-punctulata (*Xylaria*) 344.
 albo-rubrum (*Gloëosporium*) 1186.
 albo-tectum (*Hypoxylon*) 316.
album (*Chætostroma*) 1470.
album (*Coremium*) 1444.
album (*Gloëosporium*) 1180.
album (*Mastigosporium*) 1310.
album (*Nematogonium*) 1305.
album var. (*Penicillium*) 1265.
album (*Sphæronæma*) 924.
album (*Synpenicillium*) 1275, 1444.
album (*Verticillium*) 1299.
albus (*Aspergillus*) 1260.
